The share of imported commodities in the total procurement ranged between 18.65 and 24.48 per cent during the first four years of OF II. It came down in the subsequent years. Strictly speaking, there is an underestimation of the supply generated by imported commodities. The use of BO in the buffer pool in around 33 per cent (average) in the first three years of the programme. Nothing prevents the project authorities from diverting the imported SMP and BO from other uses to their use as recombined milk. Moreover, a part of the indigenously produced SMP can be recombined with imported BO (meant for direct sale) and marketed as liquid milk. In such a situation, the imported commodities are likely to form an even higher share in the total supply by the Federations. In that case the impact on the producer's price may turn out to be even more adverse. The issue that the import of commodities is confined only to OF II period is taken up for discussion in a subsequent section.

### SUBSTITUTION OF LIQUID MILK

The imported SMP and BO are available to the IDC as food aid from the EEC. This is to be channelled through the Federations for a price and the sale proceeds are to be used by the IDC for investment in the dairy sector of the economy. Our main concern here is to find out what kind of price policy will be followed by the IDC in the case of donated commodities. The relevant provision in the project proposal reads as follows:

> ... a large part of this buffer stock will come

TABLE 1: USE PATTERN OF DONATED COMMODITIES

*(Quantity in 000' tonnes)*

| Years | Total Donated Commodities (Quantity) | | Entering Buffer Stock | | | | Use as Infant Feed | | | | Retailed as Cooking Medium (BO) | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | SMP | | BO | | SMP | | BO | | | |
| | SMP | BO | Quantity | Per Cent | Quantity | Per Cent | Quantity | Per Cent | Quantity | Per Cent | Quantity | Per Cent |
| 1978-79 | 12 | 11 | 9 | 75.00 | 2 | 18.18 | 3 | 25.00 | 1 | 9.09 | 8 | 72.73 |
| 1979-80 | 24 | 18 | 18 | 75.00 | 3 | 16.67 | 6 | 25.00 | 2 | 11.11 | 13 | 72.22 |
| 1980-81 | 48 | 28 | 36 | 75.00 | 6 | 21.42 | 12 | 25.00 | 4 | 14.29 | 18 | 64.29 |
| 1981-82 | 54 | 28 | 45 | 83.33 | 7 | 25.00 | 9 | 16.67 | 3 | 10.71 | 18 | 64.29 |
| 1982-83 | 33 | 20 | 27 | 81.82 | 5 | 25.00 | 6 | 18.18 | 2 | 10.00 | 13 | 65.00 |
| 1983-84 | 15 | 9 | 9 | 60.00 | 1 | 11.11 | 6 | 40.00 | 2 | 22.22 | 6 | 66.67 |
| Total | 186 | 114 | 144 | 77.42 | 24 | 21.05 | 42 | 22.58 | 14 | 12.28 | 76 | 66.67 |

*Source:* NDDB, Operation Flood II: A Proposal of NDDB, Anand, Table IV 7, p 46.

> from imported-donated commodities. These will be priced into the pool at Rs 8 per kg of SMP and Rs 12 per kg of butter annually. ... The Indian Dairy Corporation will offer to add to its buffer stock the stocks of milk powder and conserved milk fat that Cluster Federations wish to market through pool, at prices calculated to offer a reasonable return to producers (Rs 13.75 per kg of SMP and Rs 18 per kg of frozen white butter in 1976-77).[10]

It appears that what is envisaged is a subsidised price policy which means that imported SMP and BO will be cheaper than the liquid milk as also than the SMP and BO produced by the Indian dairy sector. This policy has serious implications. When the organised dairy sector has an access to cheap imported SMP and BO, it will be reluctant to procure costly Indian liquid milk. Left to the authorities controlling the affairs of metropolitan and cluster dairies, there is every likelihood that cheap imported SMP and BO will substitute milk produced by our own farmers either to achieve higher profit margins or to attain the break-even target. Consequently, the procurement and production enhancement programmes in OF II may be relegated to the background.

India's experience during OF I supports the above view-point. A look into the physical performance of OF I (Table 4) suggests that the gap between achievement and target remained considerably high in the case of throughput of milk in the metropolitan as well as the rural milk processing plants. Further, the shortfall was significantly higher in the case of the rural milk plants. For example, while milk throughput in the case of metropolitan dairies was 65.45 per cent of the targeted throughput, it was only 54 per cent in the case of rural plants. The only possible explanation for this is that the metropolitan dairies relied more on imported and cheap SMP and BO and made no serious effort to increase milk output and procurement in the milkshed areas. This is admitted even by the project authorities. The view taken here is that the inflow of food aid in the form of SMP and BO is likely to have a disincentive effect on the domestic dairy production in the country. In the long-run this can threaten the livelihood of many million farmers rearing milch animals for the purpose.

## EXCESS CAPACITY

Investment of funds generated by the sale of donated commodities amounts to incorporating food aid into dairy development. When food aid is used both for financing the purchase of processing plants and for providing inputs (SMP and BO), it may lead to the formation of excess capacity of milk processing. The main reason for this is that there is often a strong tendency for funds to be allocated to easier targets, such as expansion of processing capacity, and may not lead to any quick and sustained increases in the indigenous production of milk.[11] In the long-run a vicious circle may develop: the creation of processing capacity, itself financed through food aid, will call for more aid in the form of inputs, which in turn would lead to an even higher capacity.[12]

TABLE 2: DONATED COMMODITIES AND POOLED BUFFER STOCK

| Years | Donated Commodities 000' Tonnes | | Pooled Buffer Stock 000' Tonnes | | Buffer Pool as Per Cent of Donated Commodities | |
|---|---|---|---|---|---|---|
| | SMP | BO | SMP | BO | SMP | BO |

India's experience during OF I exhibits a somewhat similar tendency. The pattern that emerged during the period clearly shows that the milk processing capacity, both in the urban and the rural milk plants, was out of all proportion to the actual throughput (Table 4). There were two main reasons behind this occurrence. First, because of stagnation in milk output in the milkshed areas of OF I, the level of procurement remained low throughout the period. Second, a relatively higher proportion of funds generated by the donated commodities was ploughed into processing capacity at the cost of production-stimulating action items.[13] The combined effect of this was that the milk plants' dependence on imported SMP and BO continually increased to achieve the processing targets that were initially envisaged. A brief review of the pattern of allocation of funds during the OF II programme years will make the situation clear (Table 5).

The data in Table 5 reveal that the progress has been altogether unsatisfactory in respect of some core items. Out of the total budgeted expenditure, 54.8 per cent was allocated to building up the milk processing and marketing capacity through establishing new urban processing plants; the production enhancement and the organisation of procurement activities got only 36 per cent; and the share of project planning and long-distance transport activities was 9.20 per cent.[14]

The actual expenditure pattern, however, deviated from the one that was planned in many ways. The share of processing and marketing activities turned out to be higher than budgeted. Consequently, the action items relating to production enhancement, such as improved milch cattle, supply of technical inputs, and organisation of rural procurement, received low priorities. The actual expenditure on production programme was as much as 10.30 per cent less than the original allocation.

A further scrutiny of data (Appendix) reveals that low priority was accorded to such action items as resettlement of city milch cattle and provision of inputs. This is apparent from the fact that while 7.52 per cent of the total expenditure was meant for resettlement of city milch cattle and 23.12 per cent for technical inputs, in actual practice only 0.31 per cent of the total expenditure was incurred on the former and 14.08 per cent on the latter.

Implied in the above line of thought is the contention that excess processing capacity was created initially to accommodate cheap donated SMP and BO. Since the indigenous output of milk did not increase, the procurement targets remained largely unaccomplished. The throughput of milk plants stagnated and the need for more SMP and BO became apparent. For want of donated commodities, the processing capacity created during OF I thus remained under-utilised. The aid that flowed in during this period positively acted as a disincentive to milk producers in our own country as it exceeded the absorptive capacity of processing facilities without stimulating indigenous production. There is no reason to believe that the problem will not recur during OF II.

### UNCERTAINTY

The availability of donated commodities cannot be taken for granted in the long run. Their flow in future will depend on the surpluses in EEC, export subsidies in the surplus regions, export prices, commercial exports to less developed countries, and similar factors.[15] An increase in the general export prices of dairy products and access to the markets of developing countries would naturally mean less aid and more commercial trade. This means a reduced level of investible funds originating from donated commodities for the aid-receiving countries. By the same logic, an irregular supply of aid commodities would create fluctuations in the throughput as well as funds available for investment. All this would ultimately retard the implementation of dairy development programmes funded primarily through food aid.

India's past experience is noteworthy in this respect. A number of reasons have been adduced for the slow progress of OF I which had to be extended by about four years. The National Commission on Agriculture has, on the basis of a report by IDC,[16] observed that in the initial years of OF I the limited expansion of processing facilities made it difficult to make full use of the available donated commodities. As a result, the donated SMP and BO could not generate the expected funds in time thus causing delays in investment. In subsequent years, the processing capacity remained under-utilised for want of donated SMP and BO. Not only was the supply irregular, the available supply did not match the processing capacity at times. This reduced the throughput of metropolitan dairies and the flow of funds became uncertain. Consequently, the targets set for the programme remained unfulfilled and the extension of OF I became inevitable.[17]

A brief reference to the future course of EEC dairy exports will help us in understanding the viewpoint developed here.[18] The EAAP and FAO projection studies clearly indicate that the export volume of EEC dairy produce to less developed countries (LDCs) is likely to increase in the years to come. On the supply side, such an expansion is based on the growing export potential of developed countries. The export potential, particularly in the EEC, is generated by technological pressures, inelasticity of demand, and immobility of farm resources. The influence of a Common Agricultural Policy on export subsidies is also an important factor as these subsidies provide stimuli to exporting firms to expand their markets.[19] Hence the share of EEC's net exports is expected to rise to the level of about two-thirds of total world exports. On the demand side, imports are linked to such factors as increases in consumption resulting from a rising level of incomes, growth of urbanisation and balance of payment conditions in the LDCs. It is estimated that, in these countries the demand will outstrip production in course of time.

TABLE 4: PHYSICAL PERFORMANCE OF OF I

| Particulars | Pre-Project 1970 | By June 1977 | Targets |
|---|---|---|---|
| 1 Building up of processing capacity in 4 metropolitan cities (lakh litres/day) | 10.00 | 25.00 | 27.50 |
| 2 Average daily throughput of metropolitan dairies (lakh litres/day) | 9.20 | 18.00 | 27.50 |
| 3 Rural milk processing capacity (lakh litres/day) | 6.55 | 30.00 | 29.80 |
| 4 Average throughput in rural plants (lakh litres/day) | 4.60 | 14.85 | 27.50 |

TABLE 6: SHARE IN WORLD MILK PRODUCTION (VOLUME OF FRESH MILK PRODUCTION) AND SHARE IN WORLD DAIRY EXPORTS (TOTAL MILK EQUIVALENTS) OF A FEW EXPORTING AREAS, 1980 (EEC INTRA TRADE EXCLUDED)

| Particulars | EEC-I | USA | USSR | New Zealand |
|---|---|---|---|---|
| 1 Share in the total milk production (per cent) | 26.0 | 14.0 | 21.0 | 1.5 |
| 2 Share in the total world exports (per cent) | 59.7 | 2.9 | — | 16.0 |

*Source:* Meester and Oskam (original), adopted from Gert van Disk, Jerrie de Hoogh and Jacqueline Vel, op cit, Table 1.

It may be added here that only a small proportion (6 per cent) of the total milk output in the world (430 mt) is traded internationally.[20] Most of the output is consumed domestically by the producer countries. The share of total exports is not proportional to the share of world production. Further, the share of the EEC in world exports is the highest (Table 6). On the other hand, the three principal groups of dairy importing countries are: the developing countries, the OPEC member countries, and the USSR and Eastern Europe. Since the size of imports by the USSR and Eastern Europe depends largely on ad hoc policy decisions of the concerned governments, it is not possible for the EEC-based exporters to actively create a steady market in these countries. It is widely known that the international trade in dairy products is dominated by a few large firms. The thrust of their expansion and consolidation actions is towards the developing and OPEC countries, particularly the latter as they consume almost one-third of the world commercial dairy exports.[21]

The main conclusion to be drawn from the foregoing analysis is that there is a strong possibility of a growing dairy surplus developing in the EEC. The need for a further expansion of its export markets in the LDCs will therefore persist. So long as the surpluses in the EEC exceed the demand of the OPEC and other countries, a part of the surpluses will be disposed of in the form of aid, particularly to those countries which are unable to purchase the required imports. Once the demand picks up and the surpluses fall to the desired level, the donated SMP and BO are bound to become commercial items. This may not happen in the next few years, but in the absence of an assured supply of donated commodities like SMP and BO, projects like Operation Flood which have high dependence on imported ingredients are ultimately likely to introduce an element of uncertainty in the livestock development strategy of a country like India. Efforts by the EEC are already afoot to expand commercial markets for their dairy produce since retaining of surpluses of these commodities has for them an economic as well as a political cost which can be quite high.[22] Countries like India have therefore to be on their guard if they have to protect the long-range interest of their dairy sector.

### OTHER IMPLICATIONS

The mechanics of dairy aid make it clear that it will help the country's food industry to create new tastes and enable the urban rich to adopt European food habits. Once this is accomplished, there will be no going back on it. In many developing countries which are experiencing a relatively higher economic growth the demand for modern dairy produce has already increased spectacularly. The two main factors which have assisted the process are rising incomes of the urban population and locally produced milk being relatively costlier. The latter is due to the fact that the traditional production systems are often not well adapted to the needs of modern processing industries. Thus, the demand generated in the urban centres of developing countries tends to be met by trade and not by aid. Japan's example clearly indicates that a country accepting food aid begins to purchase commercially when such aid is stopped. Although India is not Japan and the aid to India is of a different nature, such a possibility cannot be ruled out.

The direct sale of BO as a cooking medium will affect the market price of the traditional dairy produce like ghee (clarified butter). The traditional dairy products are usually sold without being processed industrially by the farmers (or intermediaries). Most of the products are already part of the common diet of the people in the areas in which they are produced, although a part of the produce also finds its way to the urban markets.

Although adequate information is not available about the trend relationship between the price of ghee and that of BO, the latter is certainly cheaper. Since BO is meant for sale only in the cities, it will compete with ghee in the urban markets and the price of ghee is likely to remain suppressed. Another trend in the city markets, reported in a national daily, is also quite disturbing. Here is an excerpt from the report:

> Unscrupulous traders are indulging in large scale adulteration of *desi* ghee with imported butter oil in the Union Territory of Delhi. The capital experienced an unprecedented shortage of *desi* ghee this summer. It is likely to continue till September-October. Reports indicate that a purchaser visiting ... the neighbouring ghee mandis finds it difficult to collect even 100 tins of ghee.
>
> Super Bazar in Delhi ... sells to the consumer only two kg of butter oil, loose, at one time. The ban on five kg packs came following reports that traders were lifting the tins in bulk and using butter oil for mixing with *desi* ghee.[23]

The above report refers to a particular market and hasty generalisations may not be in order. But the report is indicative of the fact that market distortions become inevitable in the case of direct sale of cheap donated commodities. A part of the donated SMP and BO imported during OF II finding place in the private dairies is a possibility that cannot be ruled out.[24]

Another important implication of the programme is that the processing of SMP and BO into different kinds of convenience and luxury products requires a large investment in high technology equipment required for the purpose. Hitherto we have been depending on multinationals for the supply of equipment. But it is being claimed now that our dependence for high technology equipment has come down to 10 per cent and, overall, we are exporting rather than importing dairy equipment.[25] This is a healthy development by all accounts. But the possibility of import of some specialised equipment in future cannot be altogether ruled out. The import of equipment as such may not be necessary but the import of components will continue. Since the international trade situation in dairy is controlled by large firms, there is enough margin for manoeuvring by these firms to advance their own interests within the broad governmental policy framework. The international trade structure is such that it has always room for multinationals to take advantage of every disequilibrium situation.

*Source:* Baldev Singh, "Economics of Milk Production and Bovine Live-Stock Composition in Growing Economy", *Indian Journal of Agricultural Economics*, Vol XXXIV, No 2, 1978, Table II, p 65.

It is an established fact that foreign influence on modern forms of milk production has continued even after Independence.[26] Between 1953 and 1962, UNICEF invested large sums of money on constructing and equipping dairy plants in India. From 1951 onwards the Government of Denmark has been supporting, through FAO, training courses for middle-level management personnel engaged in the dairy industry in the country. The launching of Operation Flood has vastly facilitated penetration and continuance of this foreign influence.

In relation to plan priorities, the programmes of training management experts and foreign investment in dairy equipment and machinery have had a strong influence on the pattern of allocation of resources within the livestock sector of the Indian economy. Between 1947 and 1972, India received aid in the form of dairy equipment and products equivalent to 133 million US dollars. This amount is almost the same as the outlay under the five-year plans during the same period.[28] The view taken here is that aid exercises a significant influence on developmental priorities of a sector through planned allocation of resources. This is what exactly happened to the agricultural sector when India relied more on imports under PL-480 than on tapping the domestic potential. There is an old saying, "He who pays the piper calls the tune." This is particularly true of the donor countries when they offer aid. The future course of the Indian dairy development is unlikely to remain immune from this influence.

## IV

## Export of Oilcake

### THE FEED

The feed is the weakest link in the chain of measures included in the new strategy of livestock development in India. The scarcity of feed for animals is so apparent that it has attracted attention of almost all the observers in this area. Although the planners and policy-makers have also expressed their concern for this in the light of cross-breeding strategy, yet very little conscious effort has been made to improve the feed situation.[29]

Livestock feeding is a major issue because the success of the new technology depends on the availability of quality feed in the country. Apart from requiring specialised services and better management, cross-bred animals with genetic potential for high milk output also require feed which is highly and readily digestible.[30] The basic reason for this is that a higher input of energy per unit of time is needed to produce a higher level of energy per unit of time in terms of milk. In the case of readily digestible source of energy, the process of conversion will also be faster. Further, the intake of highly digestible feed is normally greater than the feed having low digestibility.[31]

The cross-breeding technology adopted in OF II impinges heavily upon the limited supply of concentrate feeds available in the country. Although cross-bred animals are capable of digesting cell-wall rich feed, typical of crop residues, their production efficiency declines to a very low level because cellulose has a low protein content.[32] In common parlance, the rearing of exotic breeds means feeding them on a typical diet of protein rich meals and green fodder, which are inelastic in supply.

### THE CASE OF CONCENTRATES

Although green fodder too is a highly nutritive feed with an inelastic supply in the short run,[33] concentrates have a special importance for cross-breeding technology. This is so for several reasons. First, as a feed, they are more nutritive and readily digestible. As such, they have no substitutes. Secondly, the supply of concentrates is a function of the cropping pattern in the country which is highly rigid. They are, therefore, likely to remain inelastic for a comparatively long time. Thirdly, concentrates are the only feed that is at present being exported by India to the developed countries of the world.

TABLE 8: EFFECT OF PROTEIN IMPORTS ON YIELD

| Year | Consumption of Oilcake as Feed 000' kg | Yield of Milk in kg Per Cow Annually |
|---|---|---|
| 1939 | 8,77,413 | 2996 |
| 1940 | 2,77,339 | 2895 |
| 1941 | 8,888 | 2289 |
| 1942 | 11,461 | 2123 |
| 1943 | 16,231 | 2309 |
| 1944 | 15,548 | 2484 |
| 1949/50 | 6,12,000 | 2794 |

*Source:* Frands Dolberg, "Livestock Strategies in India", Chapter VIII, Table 7, p 82.

Whereas the first two factors hold in the case of green fodder also, the third one applies only to concentrates. That is why the line of reasoning developed here focuses primarily on the contribution of oilcakes in the new milk production technology. In what follows an attempt has been made to show that the success of cross-breeding technology in India depends on the availability of protein rich meals and the export of concentrates will have a contracting effect on the livestock economy of the country. We have incorporated the findings of other researchers in the field to buttress the argument where possible.

While discussing the possible return of milk to concentrates, the NCA assumed a return of 2.5 kg of milk per kg of concentrates fed over and above the maintenance requirement of milking animal.[34] However, such a simple assumption is not valid because feeds are not always additive. Due to preferential digestion of starch in the concentrates by the rumen microbes, the digestion of cellulose in the roughage may be depressed once the quantity of starch exceeds 20 per cent of rationed dry matter. On the other hand, the inclusion of concentrates upto the 20 per cent limit is likely to yield a high return in terms of milk.[35] This means that a balanced use of concentrates will result in an increase in milk output.

Referring to the findings of Kaasschieter and Perdock, Dolberg observes that the Indian Surti buffaloes in Sri Lanka gave 62 per cent more profit (*sic*) when coconut concentrate was fed at the rate of 8 per cent of the total diet dry matter, instead of zero per cent. This suggests that irrespective of the type of milch animal, concentrate feeds contribute to a higher level of milk yield. Another dimension of the matter is equally important. Quoting from trials conducted by Khan and Davis, Dolberg has pointed out that a higher level of animal biomass can be extracted from the same quantity of straw when the diet is supplemented by concentrates. Cattle on a basal diet of rice straw treated with ammonia reduced their requirement of feed from 48 to 11 kg, and increased their requirement of feed when they received a supplement of 200 gms of oilcakes. This implies that four-times more animal biomass can be available from the available quantity of stalks and straws when supplemented by oilcakes. Concentrates can help in augmenting the use of cell-wall rich feeds in India. It needs to be mentioned here that a typical feed for animals in India is straw and there exists considerable potential for biomass production in the tropical countries.

Nair, while discussing the trends and prospects of milk production in Kerala, has highlighted the importance of concentrates.[36] Referring to the NSS survey of 1975-76, he has pointed out that about 2.1 lakh tonnes of concentrates were used to produce 3.5 lakh tonnes of milk in Kerala. This means that 1.7 kg of milk were produced by using one kg of concentrate. It is further observed that 76 per cent of the total quantity of concentrates used for milk production in Kerala in 1975-76 was imported from other states of the Union. His estimates of demand and supply in the years to come are interesting. According to him, the total demand for concentrates needed to produce the expected level of milk output in Kerala by 1985 will be 3.65 lakh tonnes and by 1990, 4.75 lakh tonnes. The total availability of concentrates from domestic sources in Kerala, even when they are fully tapped, will be only around 1.5 to 2 lakh tonnes. It may be added that as at present Kerala is estimated to have no more than one kg of straw per head of cattle per day. It is obvious that the success of cross-breeding technology in Kerala lies, to a large extent, in the availability of concentrates. The future course of new technology in Kerala, therefore, depends on

TABLE 9: EXPORT OF OILCAKES BY INDIA[1] (PERCENTAGE SHARE OF EEC-9 IN THE TOTAL EXPORTS TO EEC-9)

| Years | Belgium | Denmark | France | West Germany | Ireland | Italy | Luxemburg | Netherlands | UK | Total EEC (Qty 000' Tonnes) | Total World (Qty 000' Tonnes) | EEC as Per Cent of World[2] |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 1969-70 | 0.52 | 0.07 | — | 4.19 | — | — | 0.48 | 0.65 | 94.09 | 164 | 585 | 28.04 |
| 1970-71 | 2.20 | 1.09 | — | 3.73 | 0.67 | — | — | 0.32 | 91.99 | 155 | 879 | 17.67 |
| 1971-72 | — | 1.19 | — | 13.47 | — | — | — | 0.02 | 85.32 | 75 | 742 | 10.17 |

the supply of protein rich meals from other areas of the country.

In this context, an important observation has been made by the official team of experts also.[37] Commenting on the achievements of OF I, the Committee observes in its Terminal Report that in 1980, 5 kg of milk was obtained per kg of balanced cattle feed sold to the milk producers. Assuming that the relationship between the output of milk and its procurement is linear, a higher level of concentrate feed can provide a higher level of milk output and procurement. The significance of concentrates for the dairy economy of the country is obvious.

Concentrates have a special significance for milk producers in cities.[38] It represents the variable cost of milk production. The city milk producers have a high fixed cost since they hire sheds and labour and also purchase fodder from the market. In addition, they invest in milch animals also. In order to earn a higher level of profits they need to feed large quantities of concentrates.[39] Although the principle of diminishing returns becomes operative leading to a lower milk output per unit of concentrates when the feeding level reaches a certain high, it remains a fact that concentrates are the mainstay of city milk producers in India.

Another way of looking into the contribution of concentrates is to compare input elasticities. Although we have not gone into this aspect independently, some available estimates support our contention that concentrates are the key input in the production process. Baldev Singh has worked out input elasticities for three different regions of India using the Cobb-Douglas type of production function.[40] The results obtained are reproduced in Table 7.

A perusal of the data in the Table shows that green fodder and dry fodder have a negligible impact on milk yield. In fact, the dry fodder has a negative effect on the yield in the case of both cows and buffaloes in almost all the regions. It is particularly so in the Delhi region where negative coefficients are satistically also significant. A similar trend is obvious when we look at the coefficients of given fodder for the cow milk production function fitted for Delhi and Mehsana.

The contribution of concentrates is positive and statistically significant in four out of six cases in the Table. Although the coefficients are not significant in the case of buffaloes and cows in Mehsana, they have a positive sign. The technical relationship expressed by the production function suggests that, irrespective of the type of milch animal, concentrates have a positive contribution to increasing the productivity of milk.

Although it is not intended to suggest an alternative method to estimate elasticities, a few aspects of Baldev Singh's exercise need to be taken note of. For example, he has not provided any explanation for the negative coefficients. However, a part of the explanation lies in the fact that the functional form specified by him has certain inbuilt biases. Similarly, using the quantities of green and dry fodder as explanatory variables, irrespective of their quality, has only a limited validity. Further, what matters most is the dry matter content of green fodder and not its quantity as such. Also, the number of observations, the type of milch cattle (breed-wise), and the left out socio-economic variables can also have an influence on the elasticities and explained variations ($R^2$).

The historical experience of Denmark has a special relevance to India because India is looking forward to a technological breakthrough experienced by Europe a long time ago. Analysing the performance of Danish cows during the Second World War, in comparison to their performance before and after the War, Dolberg has worked out the relationship between the milk yield and protein rich meals which is given in Table 8.[41]

The supply of protein from outside Denmark was interrupted during the War. As a consequence, the milk yield fell drastically during the War years. The yield picked up again only when import of protein was restored after the end of the War. Dolberg has cited this as a case to show that socio-economic factors do influence the productivity of livestock. The fall in milk yield cannot be assigned only to decreases in oilcake imports. One can easily argue that War not only forced the stoppage of oilcake imports but also unsettled the entire economic organisation of the country and dislocated all processes of production by generating an atmosphere of uncertainty. However, what cannot be doubted is that a key input has also affected the milk yield. The main point that is being made here is that protein rich meals have a crucial role to play in the cross-breeding technology being pursued in India as a part of OF II.

Technically, the requirements of concentrates in the feed of cross-bred cattle are much higher than in the feed of their local counterparts. Its practical implication is that a cross-bred cattle in itself is not a guarantee of higher milk production. Its genetic superiority for higher milk output can only be utilised by a superior diet and better management. In the present context, concentrates are a pre-requisite because they are a readily digestible source of energy.

### EXPORT OF OILCAKES

India is a major exporter of oilcake meals and ranks fourth in the world, next only to USA, Brazil and Argentina.[42] The available estimates suggest that at present around 20 per cent of India's total output of oilcakes is being exported. This should be a very high proportion of the total marketed surplus.

The data in Table 9 give a brief account of India's export of oilcakes during the period 1969-70 to 1977-78.[43] The data reveal that there are considerable yearly fluctuations although the trend is upward. A large proportion of export has invariably gone to EEC except during 1971-72 and 1974-75 underlining the fact that India is a major exporter of oilcakes to the EEC countries.

The changes in the pattern of export of oilcakes are interesting. UK was the major importer of Indian oilcakes till the year 1972-73 when its share in India's total export to the EEC stood at more than 85 per cent. In recent years, Netherland has emerged as the main importer. For example, during 1974-75 and 1977-78 Netherland's share in India's export of oilcakes ranged between 49 and 58 per cent. Another significant development in recent years is that West Germany, France and Italy have also turned up as important customers for Indian oilcakes.

The foregoing analysis of trends suggests that protein rich meals, representing readily digestible source of high energy, are being exported by India. We have analysed information pertaining to the OF I years but the interpretations would hold equally for the OF II years as the basic relationships and arrangements have not changed. Export of oilcakes amounts, in a way, to exporting raw material which is otherwise basic for the development of the dairy industry in India. The point cannot be stressed too much.

## V

## Implications

What export of oilcakes means to a developing country like India, in the light of the new technology, is the central issue. One aspect of it has already been discussed while highlighting the contribution of concentrate feeds in the new milk production technology. However, it is necessary to extend the scope of the discussion to reinforce the view developed here. This has been done by considering what import of oilcakes means to a developed country like Denmark.[44]

Deliberating the issue, Dolberg has revealed that Denmark does not feed its livestock from its own resources in excess of 60 per cent, as it imports considerable livestock feed. Quoting the argument developed by Gad, he states that the import of protein rich feedstuff creates a self-promoting positive growth reaction in Denmark agriculture. The essence of the argument put forward by Gad is that, due to imports, a large part of the Danish agricultural land can be transferred to roughage production and this gives a greater total biomass than grain production. The availability of feed, therefore, increases due to import of feed on the one hand and a higher domestic output of fodder on the other. Since animal husbandry on the farms is labour-intensive and also provides additional employment in the other sectors of the economy, the import of feed promotes economic growth in the case of Denmark.

Some implications become obvious if we extend the same logic to the export of protein rich feeds from India. First, the export of oilcakes from India results in reducing the total availability of feed. Second, it leads to a decline in the availability of readily digestible sources of energy which has an inelastic supply but is crucial for cross-bred cattle. Third, the export of oilcake meals would bring in inefficiency in the use of cellulose based materials which are otherwise typical feed for animals in India but are a low energy feed. An efficient use of stalks and straws requires a minimum supplement of protein rich meals.

It appears from the above analysis that the export of oilcakes by India has had a self-accentuating negative growth reaction in Indian agriculture. The dairy sector is much more labour-intensive in India than in Denmark. The export of oilcakes from India would positively have a heightened contracting effect in the light of the new technology adopted under OF II. This may be an important reason for the low productivity of Indian milch animals. Although the majority of Indian milch animals are non-descript and have a digestive system which is adapted to low digestibility feed, their production efficiency depends also on the high quality feed.

It is often argued that the export of cattle feed from India is inevitable because the Indian farmer is unable to pay the price which is obtainable in the world market. There are many ways to counter such an argument. Foremost, the inability of the Indian farmer to pay a higher price may be due to the fact that the price paid by the consumer for his produce is low. Second, a higher price of concentrates in the domestic market may be a direct consequence of a decrease in supply caused by exports. Third, the milch animals owned by the Indian farmer may have been less productive because of shortage of quality feed. The animals owned by the European farmer have a lower unit cost of production and outbeat the Indian farmer because the key inputs are available to him at subsidised rates.

Further, what is crucial is not the international price. If we go by the logic of price alone, then one can argue that all that fetches a higher international price should be sold in the international market. Or, for that matter, nothing should be sold in the international market if the international price is lower than the domestic price.

The feed available for the average milch animal is of low digestibility. The concentrate feed is, technically, a key input only for cross-bred animals. But, considering that 50 per cent of the total concentrate feed is consumed by non-milch animals, the export of one-fifth of the total produce should clearly be a matter of concern for the policy-makers.[45] The fact of the matter is that the continuation of oilcake exports and the adoption of new technology in milk production do not go together.

## VI

## Conclusions

The main findings of the study may now be briefly stated.

The analysis of data shows that a large quantity of donated SMP and BO is being imported into India for building up buffer stocks planned under OF II. However, the proposed level of imports is shown to be considerably higher than that required for the purpose.

The unloading of donated commodities in the form of liquid milk is likely to suppress the producer's price in the domestic market because the additional supply thus created is not based on production within the country. The lack of price incentives would further decrease the marginal product of factors of production engaged in milk production. Ultimately, all of this may lead to a diminished supply of milk in the Indian economy.

The use of donated commodities may mean their substituting some of the liquid milk produced by the Indian farmers. Since the IDC is likely to adopt a subsidised price policy to dispose of the donated commodities for use by the Cluster Federations, the imported ingredients may be cheaper than the home produced liquid milk, as also SMP and BO. The organised sector of the Indian dairy will prefer to use cheap SMP and BO to earn a higher level of profits. It will thus have very little enthusiasm to procure the costly liquid milk produced by our own farmers.

Excessive dependence on donated commodities is likely to create idle capacity in the milk processing plants. The funds generated by the donated commodities are meant for financing the processing plants and for providing the inputs (SMP and BO). In case there is a lack of quick and sustained increase in indigenous milk output, a strong bias in the allocation of funds towards easier targets like expansion of processing capacity cannot be ruled out. The creation of processing capacity through finances raised by the sale of donated commodities will call for more aid in the form of inputs (SMP and BO) to ensure optimal utilisation of capacity. Thus a vicious circle may come into being in the long run.

The future flow of donated commodities is uncertain. It would depend on the surpluses in the EEC, export subsidies, export prices, and commercial exports of LDCs. Efforts are under way in the EEC to increase commercial exports of dairy produce to OPEC and other countries. Once the demand in these countries picks up, the donated commodities will become commercial items. Since the new milk production technology, envisaged in OF II, is strongly linked to the funds generated by aid commodities, it may receive a serious setback as investible funds decline.

Food aid is likely to help the dairy industry to create new tastes. The induced changes in consumer tastes would increase the demand for modern dairy produce. Since the traditional production system is often not well adapted to the needs of the modern processing industries, the demand generated in the urban areas in a transitory stage is likely to be met by import of dairy produce

## Appendix

PROGRESS OF EXPENDITURE UNDER OF I UPTO 1977

*(Rs lakh)*

| Items | Allocations | | Actual Expenditure | | Expenditure as Per Cent of Allocation |
|---|---|---|---|---|---|
| | Rs | Relative Share | Rs | Relative Share | |
| 1 Expansion of four city dairies | 266.00 | 2.28 | 223.53 | 3.41 | 84.03 |
| 2 Establishment of new city milk plants | 2387.00 | 20.51 | 1653.64 | 25.19 | 69.28 |
| 3 & 4 Milk collection, chilling centres and feeder balancing milk plants | 3638.00 | 31.25 | 2565.02 | 39.07 | 70.50 |
| 5 Resettlement of city milch cattle | 875.00 | 7.52 | 20.52 | 0.31 | 2.35 |
| 6 Increasing rural milk production through provision of technical inputs | 2691.00 | 23.12 | 924.54 | 14.08 | 34.36 |
| 7 Development of imported milch cattle | 400.00 | 3.44 | 201.86 | 3.08 | 50.41 |
| 8 Organisation of rural milk procurement | 260.00 | 2.23 | 119.03 | 1.81 | 45.78 |
| 9 Project planning, implementation and manpower | 358.00 | 3.08 | 223.47 | 3.40 | 62.42 |
| 10 Storage and long distance transportation | 377.00 | 3.24 | 236.02 | 3.60 | 62.60 |

from outside.

The direct sale of BO would adversely affect the price of ghee. This would create distortions in the market for ghee in those areas which are the sources of supply to the urban centres. Ultimately a situation may develop where production of traditional dairy products will be discouraged because of cheaper imported ingredients like BO.

Highly and readily digestible feed is scarce in India and its supply is also inelastic. However, India exports oilcakes on a large scale. This policy is inconsistent with the new technology adopted in OF programmes.

The typical feed available to the milch animals in India is cell-wall rich. The efficient use of cellulose requires a supplement of protein rich meal. Since protein rich meal is being exported, it does not encourage the optimal use of low quality feed. The available evidence suggests that a considerable volume of animal biomass can be made available if export of oilcakes is abandoned and the same is diverted for use by the domestic products.

The return of milk to concentrates is significant. Technically, the requirement of concentrate feeds in the cross-bred cattle is higher than in the case of their local counterparts. The rearing of cross-bred cattle itself is not a guarantee of higher milk output. Their genetic potential cannot be maintained without quality feed. The success of crossbreeding technology of OF II is doubtful in the face of export of quality feed.

Import of donated commodities and export of oilcakes will continue to weaken the position of the Indian farmers *vis-a-vis* the European farmers. Considering the fact that animals in India are the suppliers of energy in various forms, there is need to take a more practical view in policy formulation. The adoption of new technology as such may create more problems than it will solve or it may not make much headway because of inbuilt contradictions in the overall policy. The combined effect of the import of SMP and BO and the export of oilcakes will be contracting on the Indian dairy sector and may inhibit its growth.

## Notes

1 National Dairy Development Board (NDDB), 'Operation Flood II: A Proposal by the NDDB (Revised)', Anand, June 1978, pp 45-7.

2 Government of India, National Commission on Agriculture, Part VII, 'Animal Husbandry', pp 126-7, New Delhi, 1976. The funds refer to the revised estimate, see note 13 for details.

3 For details, see, NDDB, op cit, p V, Table I.

4 The project authorities intend to make up the entire buffer pool by using indigenously produced SMP and BO in 1984-85.

5 There are 25 Cluster Federations, covering 151 districts of OF II. The districts are widely spread over all the states of India.

6 The information in Table 2 is generated from the project proposal on Operation Flood II. See, NDDB, op cit, Table IV 7, p 46.

7 The general rate of expansion of the economy primarily determines the expansion rate of sub-sectors *via* investment.

8 For example, the persistence of restrictive trade policies may be partly ascribed to the resource immobility phenomenon. The growing milk surplus in the EEC and the continuation of export subsidies is the outcome of resource immobility.

9 This procedure is followed because nothing is mentioned in the Project Proposal or the Techno-Economic Feasibility Report about the milk equivalents of total imported commodities. Only milk equivalents of buffer stock are given.

10 According to the project proposal, the imported BO to be retailed as cooking media in the urban markets will be sold at prices consistent with market condition.

11 Piet Terhal and Martin Doornbos, 'Operation Flood—Development and Commercialization', *Food Policy*, August 1983, p 239.

12 See, Food Aid for Development, Commission Communication to the Council, COM (p 3), 141 Final, Brussels, 1983, p 8 (quoted by Piet Terhal and Martin Doornbos, op cit).

13 The sale proceeds of donated commodities during Operation Flood I were estimated at Rs 960 million. The estimate was later on revised to Rs 1,160 million. See, Bharat Dogra, Operation Flood or Trickle, *Kurukshetra*, June 1, 1980, p 4.

14 Table 5 is taken from Piet Terhal and Martin Doornbos, op cit, who in turn have derived it from UN/FAO World Food Programme, 'Terminal Evaluation Report on Project India 618—Milk Marketing and Dairy Development (Operation Flood I)', WFP, September 1981.

15 These are not the only determinants. Factors which determine the rate of technological progress and the resource mobility in the dairy sector of developed and developing countries also have a decisive role.

16 1973-74, 'Fourth Annual Report of IDC', pp 3-4, IDC, Baroda, Gujarat, in National Commission on Agriculture, see, NCA, op cit, p 128.

17 See, B Dogra, N Rajagopal, 'And the Rejoinder', *Kurukshetra*, June 1, 1980, p 6.

18 The discussion on this point heavily draws upon the paper by Gert van Dijk, Jarrie de Hoogh and Jacqueline Vel, 'The Future of EEC Dairy Exports to the Less Developed Countries—Agricultural Economics of Long Range Projections and Model Studies', *Journal of Agricultural Economics*, Volume XXXIV, No 3, September 1983, pp 279-92.

19 International trade in dairy is dominated by a few large firms and it may be assumed that price formation is influenced by oligopolic competition.

20 This does not include intra-EEC trade. The estimates relate to the year 1981. See, FAO, *Production Yearbook*, 1981, Rome.

21 See, Gert van Dijk, Jarrie de Hoogh and Jacqueline Vel, op cit, p 286.

22 The financial cost in 1982 is estimated at US $ 3150 million, which was 18 per cent of the entire EEC budget. The cost of disposing of dairy surpluses is the greatest single cause of friction within EEC, according to the European Communities Commission's Official Journal of the European Communities, C357, Volume 26, 1983; (quoted by Raymond Croitty). See, Raymond Croitty, 'Operation Flood: Another View', *The Illustrated Weekly of India*, February 19, 1984, p 40.

COMPANY MEETING

# The Tata Iron and Steel Company Limited

## Chairman's Statement

THE following is the statement of Mr. R. H. Mody, Chairman of the Tata Iron and Steel Company Limited, for the year 1984-85.

I think it can be safely said that there has not been another 12-month period in the history of our Company which has witnessed such momentous events. During this period, we have lost our great Prime Minister, Shrimati Indira Gandhi, at the hands of assassins. A woman of outstanding political sagacity and indomitable courage, she had held India together in the face of all difficulties and had dominated the Indian political scene for nearly two decades. A modern and highly civilized person, she more than held her own in dealing with other nations, and there was no facet of Indian life that she did not touch and adorn. She will be deeply missed and mourned.

### Senseless Violence

2. The passing away of Indira Gandhi is sad, but the cause of her death is even sadder. There has emerged in the land of Mahatma Gandhi a cult of violence which is both aimless and senseless. Those who indulge in these acts do not seem to know what they are seeking and, because of their pursuits, hundreds of innocent lives of men, women and children are sacrificed for no apparent purpose. Irrespective of everything else, every citizen of India should give his support, at this grave moment, to our brave new leader and his Government who are facing this most severe ordeal.

3. Although the clouds on the Indian horizon seem dark, they are not without a ray of sunshine. The people of India have elected Rajiv Gandhi as their leader, and India is truly fortunate in having him as Prime Minister. We now have a leadership of youth, burning with a desire to take India into the modern age with all that it implies in efficiency and progress. Beset as he is with enormous problems, both political and economic, we must pledge our full support to him at this juncture.

### Momentous Event

4. For us, another momentous event was the stepping down, after 46 years, of Mr. J. R. D. Tata, in the pink of all his faculties, from the Chairmanship of our Company. He could have continued for several more years but, thinking as he always does about the Company rather than himself, he felt that the time had come for someone to succeed him while he was still around to help. It would be futile for me even to attempt to enumerate the great services that Mr. J. R. D. Tata has rendered to our Company. He has towered over other industrialists and the greatness of our Company is his monument. He has entrenched himself in the hearts of each and every one of us by his staunch championship of the shareholder as well as the worker. In his own person, he has set the highest standards of integrity and is, without doubt, the most respected and loved head of a business organisation in India. No one will ever really succeed him, and I, who have been selected by the Board of Directors to be the Chairman after him, can only assure you that I will try and do my best for the Company in which I have also spent 46 years. I crave your indulgence.

### New Life

5. The pronouncements of the Prime Minister and other Ministers in the last six months have infused a new life into the world of business and industry. Pragmatism has displaced political dogma and many an economic shibboleth which had so far failed to produce results has been cast away. To me the economic concessions announced so far, both through the Budget and otherwise, are not as important as the change of attitude which underlies these pronouncements. For the last three decades, business and industry have been, not entirely without reason, regarded with a certain sense of suspicion. Our new Prime Minister now invites and exhorts us to play our part once again in the mainstream of national life. If we fail to set a high standard of ethics and do not plough back the additional funds made available to us in nation-building activities, we shall have only ourselves to blame, if in the future we once again find ourselves in the wilderness.

### High Performance

6. During the year under review, our Company has received price rises—one in June 1984 and the other in February 1985—and the results of the year reflect these. There are many who feel that we have been the recipient of a bonanza due to a price rise necessitated by the difficulties faced by other steel plants in the country. Whilst there is some substance in this, I would like to assure you that our present prosperity is also due to our high performance which enables us to take full advantage of these price rises. Had we operated our plant at the same level of capacity utilisation as the other plants, we too would have made a marginal loss and, therefore, it is correct to say that the present profitability achieved by our Company, is the result of high performance as much as of price.

7. Much is being made of the precipitous increase in steel prices and its effect on other industries. Let me repeat what I have recently said elsewhere, that the increase in the price of steel in the last fifteen years, including the recent one, is lower than in those of oil, coal, cement and power—all of which are important inputs in the build-up of steel costs.

8. Our Company is the first in the private corporate sector to cross the Rs. 1,000-crore mark in turnover. Our production at 1.71 million tonnes of saleable steel was the highest in the Company's history, and the quantum of bonus to be paid to our workers will

also be the highest. Both our pre-tax and post-tax profits are the best we have ever seen. Let no one be ashamed of high profits, honestly secured and re-employed in strengthening the Company, and the national economy.

### Interminable Delay

9. Our dealings with the Government continue to be cordial, but I must confess to a certain sense of disappointment at the interminable delay that still takes place in obtaining a decision even where the case for it is incontrovertible. A case in point is the proposal we made to the Government in August last year to allow us to import 150,000 tonnes of sponge iron which, with the addition of scrap, would enable us to produce an additional 300,000 tonnes of steel of which about 265,000 tonnes would be billets which are in short supply in the country and would have to be imported at far greater cost than sponge iron. Everybody in Delhi has welcomed the proposal in view of the saving in foreign exchange but, in spite of several follow-ups, no decision has yet been conveyed to us.

10. On two occasions during the year under review, there was a shortage of coking coal at our Works due to a Government decision not to supply coking coal to Tata Steel. Subsequently, the Government was good enough to revoke this decisión, but made it clear that we must rely on our own collieries or on imports in future. We have, therefore, planned a massive investment in our collieries during the next five years to enable us to attain 100% self-sufficiency. Coal of the right quality and quantity has become the paramount need for maintaining production at the high level to which we are accustomed.

11. We are now engaged in a continuous programme of modernisation to upgrade our technology not only in iron and steel making, but also in steel rolling. The Company has drawn up a five-year plan of about Rs. 1,000 crores of capital expenditure, a major part of which will be devoted to new facilities to maintain and improve our steel-making capability. This will enable us, after many years of neglect due to paucity of funds, to rectify some major deficiencies in our plant, such as the absence of a raw material yard and handling facilities, an additional sinter plant, more power generation, etc. With the addition of the Bar & Rod Mill and certain modifications to our existing mills, we hope to maintain our production for some years to come at the highest levels of plant utilisation.

### Korf

12. We are constantly on the lookout for new technologies in steelmaking. For some time now, I have felt that the production of steel in India by the traditional coke oven/blast furnace route is not a viable proposition. In this connection, I have recently signed an agreement with Korf KG of West Germany to set up a new company, subject to Government approval, for the import of steelmaking technology which eliminates the use of coking coal and substantially reduces the necessity for power. At this moment, the size of such a production unit is restricted to about 300,000 tonnes per annum, but it is hoped that higher tonnages might be possible in the near future. This will be a revolution in steelmaking in India and the future growth of the steel industry can be assured on a more viable basis.

13. I am one who believes that there is a great future in India for the steel industry. The per capita steel consumption in our country is only 15 kg. whereas in the developed countries it is as high as 700 kg. Committed as we are to the rapid industrialisation of this country, it is inconceivable that there will not be a higher demand for steel. However, if this demand is to be met from indigenous sources, then we must develop newer technologies which will enable us to produce steel at a reasonable cost.

14. The task is an exciting one as it has to be accompanied by changes in skills and attitudes. We have to create an atmosphere for proper absorption and assimilation of new methods and technologies. Our methodology in all our offices is also under review, ultimately leading, I am sure, to greater efficiencies in all directions.

15. For some time now, we have been considering the setting up of a cement plant based on our slag. The Government is sympathetic to the project, and we are negotiating with the Madhya Pradesh Government to give us the necessary permission to mine the limestone in that State for the production of clinker.

16. An event of some significance has been the permission granted to the Company by the Department of Company Affairs to merge the Indian Tube Company with the Tata Iron and Steel Company. Some procedures which have to be gone through before the merger finally takes effect, should be completed in the next few months.

17. After long-drawn-out negotiations with the Bihar Government, an agreement on the ownership and management of our lands at Jamshedpur was signed. However, I regret to say that the lease between the Bihar Government and the Company has not yet been signed although it is now one year since the agreement was reached.

### Truly Blessed

18. I have always maintained that our technical competence and managerial skills avail us nothing unless our workers are with us. In this regard Tata Steel is truly blessed. A rapport has been established between the Management and the workers of the Tata Steel Works, in the Mines and Collieries, and in the various offices and stockyards throughout the country which it would be difficult to find elsewhere in the world. Our workers are very ably and responsibly led by their respective Unions, and the industrial relations that we have maintained with them is the primary cause of the high level of our performance. Our workers, supervisors and officers are our greatest asset and I would like to assure them of my total commitment to their welfare and happiness consistent with the prosperity of our Company. I would also like to thank our shareholders for the consistent support that they have given to this Company over the past many decades.

# Scheduled Caste and Tribe Students in Higher Education

## A Study of an IIT

**Viney Kirpal**
**Nalini Swamidasan**
**Amitabha Gupta**
**Raj K Gupta**

*This paper presents the results of a study, the third in a series, of academic and social adjustment of Scheduled Caste and Scheduled Tribe students in the Indian Institute of Technology, Bombay. Section I of the paper traces the relationship between the backgrounds of SC/ST students and their academic performance, while section II focuses on the two main problem areas for these students. The recommendations of the study are set out in the final section.*

IT was in 1973 that the scheme of reservation of seats for Scheduled Caste/Scheduled Tribe (SC/ST) students in the Indian Institutes of Technology (IITs) was implemented for the first time. 15 SC/ST students were selected in IIT Bombay in keeping with the recommendations of the Chandy Commitee Report.[1] Since then SC/ST students have regularly been taken in through the concessionary entry scheme. And in all, 220 SC/ST students have been taken in since 1973.

Two studies on the problems of SC/ST students in IIT Bombay have so far been made. The first was undertaken in 1976 when its investigator was a faculty adviser for SC/ST students. It was published in February 1978.[2] It highlighted the failure of SC/ST students to survive in the competitive IIT set-up and the need for additional facilities, extra tutorials so that SC/ST students admitted into IIT Bombay would not leave the Institute after a stay of two to three years for failure of fulfilling the academic requirements. This was suggested in view of the high drop-out rate among SC/ST students admitted to IIT Bombay.

The second study[3] was undertaken by a Committee appointed by the Senate of IIT Bombay in July 1976 to go into the academic problems of SC/ST students and brought out in November 1977. It recommended that the Joint Entrance Examinations (JEE) with two-third marks of the last general category student on the merit list be treated as the cut-off point for SC/ST entrants and that direct admissions (i e, admissions made only on the basis of marks obtained by SC/ST students in Higher Secondary or any other equivalent qualifying examination) resorted to in 1975, 1976, 1977 (in an attempt to fill up the seats reserved for SC/ST students, not filled up by SC/ST entrants through JEE) be discontinued as it was proving counterproductive to the interest of the students.

The present study is the third in the series. It was begun in April 1982 and completed in August 1984. The study addresses itself both to the academic and social adjustment of these students.

48 SC/ST students[4] and 44 non-SC/ST students at different stages of the B Tech programme were interviewed for this project. Non-SC/ST students were interviewed in order to first identify those problems which could be common to all students in IIT Bombay since it is a highly competitive set-up and then to concentrate on problems peculiar to SC/ST students.

SC/ST and non-SC/ST students were chosen from similarly varying backgrounds—rich, poor, academically good, average and weak.

Non-SC/ST students were brought in also to get a feedback on what they felt were the problems faced by SC/ST students. By contrast, SC/ST students spoke of their own problems. The target group of the study was the SC/ST category. The method of study was the unstructured interview aided by a questionnaire partially open-ended.

Two faculty advisers for SC/ST students were also interviewed.

The following are the details of materials and methods used by the present study.

In the present study, the main object was to capture the experience of adjustment of SC/STs in IIT Bombay as a whole, than in statistical categories which would necessarily fragment it. A questionnaire was designed[5] in which some of the items were kept open-ended. The answers expected to these items were qualitative. The subject could write in whatever way he wanted to and upto whatever length he wished to. The questionnaire was individually administered through the interview method. If it was felt that the respondent was trying to conceal some fact, more questions were asked and he was brought around to sharing the required information and the details recorded.

Our method has been more the humanist's and sociologist's method—to get to the experience of the individual and of the group.

Other than some demographic variables, none of the responses were quantifiable. In fact, some of them could not even be categorised. The responses were qualitative. Besides, the range of responses was wide so that the possible number of categories were, if not as many as the subjects, large enough. However, for the sake of convenience in interpreting results, the responses were put into a few manageable number of categories. We have generalised on the basis of general tendencies.

The different categories and classifications of some of the items are:

(1) City/Village: The criteria for this categorisation were the usual ones—urban facilities which included roads, electricity, water, educational institutions, public transport, marketing, etc.

(2) Family Income: Students were classified as belonging to upper, middle and lower income groups on the basis of the following scale.[6]

Below Rs 900 per month = Poor
Below Rs 900-1,500 per month = Middle
Above Rs 1,500 per month = Rich

(3) Familial Education: Three sub-categories were created on the basis of only the father's education:

(a) Post-Graduate, Graduate
(b) High School, Matric, Intermediate
(c) Nil.

(4) Medium of Instruction: The medium of instruction was taken to be English if the student had received his education in English in school; otherwise it was categorised as vernacular.

(5) Preparation for Joint Entrance Examination: This was divided into four sections:

(a) Agarwal Coaching Classes (ACC)
(b) Any other Coaching Centre (AOC)
(c) Self Study
(d) No preparation.

The reason for ACC being identified as a separate category was that many students had mentioned it as the mode of preparation for entrance into IIT.

(6) Ambition: Students were categorised as being (a) highly ambitious, (b) low on ambition, and (c) averagely ambitious. Those students who gave responses like 'I want to reach the top', 'I want to do research in Computer Science', etc, were put in the first category. Those who gave responses like "I just want to pass", "I want to get B Tech degree" were put in the second category. Responses like "I want to get a decent job after my studies", "I want to support my family after B Tech" were put in the average category.

(7) Academic Performance in IIT[7]: This was classified into four sub-categories on the basis of the cumulative performance index (CPI):

(a) Beyond 8 - Very good
(b) 6.5 to 8.0 - Good
(c) 5.0 to 6.5 - Average
(d) Below 5 - Poor, Bad.

(8) Visiting Home or Local Guardians: This

item was divided into two sub-categories—visiting and non-visiting—on the basis of the frequencies of visits made. If visiting was monthly or more frequent, it was put into the visiting category, otherwise into the non-visiting category.

(9) Improvements in Home/Hometown: These responses were put into four types:
(a) General Improvements: If the response indicated general improvements such as additional facilities for the hometown or if the improvement needed was of a socio-psychological type i e, improvements that did not directly affect the individual, they were placed in the general category.
(b) Specific Improvements: If the respondent showed that lots of specific improvements often with a socio-economic thrust were needed (for example, 'we live in a chawl', 'my brother studies with a 60 watt bulb', etc) i e, they were improvements that would affect the individual intimately and directly, they were put in this category.
(c) No Improvements: When no improvement was needed the response was put in this category.
(d) No Response: This formed the fourth category.

(10) Social Life at IIT: The five sub-categories were
(a) Satisfactory: If the answer gave the impression that the student was satisfied with the social life, it was put in this category.
(b) Unsatisfactory: If dissatisfaction was revealed in the response, it was put in the 'unsatisfactory' category.
(c) Tolerable: When the answer revealed that the social life was neither too bad nor was it extraordinarily good, it was put in this category.
(d) Social interaction between faculty and students.
(e) No Response: Sometimes students responded to more than one of these sub-categories.

(11) Social Problems: Item No 19 in the questionnaire was designed for assessing social problems. But it alone did not give us sufficient insight; therefore, items meant to assess 'discriminatory' attitudes, social life at IIT Bombay, problems faced by SC/ST students were also examined to give a fuller picture.

(12) Benefits from special concessions: These responses were classified into 'individual', 'familial' and 'communal' with respect to social and economic upliftment.

The ensuing sections present the major findings and recommendations of the study. Section I traces the relationship between the background of SC/ST students and their academic performance in IIT Bombay. Section II focuses on the two main problem areas for SC/ST students in IIT Bombay. Section III lists the recommendations.

## I

## Background of SC/ST Students and Academic Performance

This Section focuses on the impact of different background variables such as rural/urban origin, financial status, familial education, medium of instruction prior to IIT, preparation for IIT, student ambitions, on the academic performance of SC/ST students admitted through the reserved quota.

Academic performance has been classified into four categories on the basis of a scale given in the preceding Section: Very good, good, average and bad. The results are as follows.

None of the SC/ST students has very good performance and none of the non-SC/ST students has bad performance. The CPI of the majority of SC/ST students ranges from 4 to 6.5. Three of them have CPIs of 6.69, 7.29 and 7.5.[8] The CPI of non-SC/ST students ranges from 5 to 9.73.

Three SC/ST students have good performance. 33 of them have average performance and 12 have performed badly. 10 non-SC/ST students have very good performance. 13 have good performance and 21 have average performance. On an average the academic performance of SC/ST students is poorer than that of non-SC/ST students.

The impression that most IIT students belong to the urban class seem to be true. Out of 44 general category students interviewed, only nine belong to villages. Similarly, only 14 SC/ST students come from villages. A real picture could be obtained by studying more subjects in the general category. Though this observation may not change, it needs to be confirmed.

The cumulative point index (CPI) of the majority of SC/ST students ranges from 4.0 to 6.5. Only three students with CPI of 6.69, 7.29 and 7.5 go above it.

Out of 48 SC/ST students, 24 seem to be reflecting the favourable effects of the fact that they come from cities. However, this also warrants caution since 10 SC/ST students coming from cities have done badly and 12 SC/ST students who belong to villages have performed as well as those 21 SC/STs who belonged to cities. Only two of the respondents who come from a village background performed badly (Table 2).

Similarly, most non-SC/ST students—35 out of a total of 44—belong to cities. So making any absolute statement about favourable effects of an urban background on academic performance may be biased. 16 out of 35 students have average performance, 11 have good performance and eight have very good performance. Of the remaining nine students who belong to villages, two have very good performance, two have good performance and five students have average performance.

Since the majority of non-SC/ST students who have very good performance are from cities and the majority of rural background students have just average performance, it appears that urban background affects academic performance to some extent (i e, at least in helping some students give above average performance). This seems to hold true of SC/ST and non-SC/ST students.

### *Family Income and Academic Performance*

Out of 44 non-SC/ST students, 18 belong to the upper income group, 16 belong to the middle income group and 10 to the lower income group.[9] Out of a total of 48 SC/ST students, nine belong to the upper income group, 18 belong to the middle income group and 21 to the lower income group. Comparatively speaking, the percentage of poor SC/ST students admitted to IIT is higher than in the general category students. It is evident from Table 3 that none of the general category students has bad academic performance and none of the SC/ST had very good performance regardless of financial

TABLE 1: FREQUENCY OF STUDENTS FALLING IN EACH CATEGORY OF ACADEMIC PERFORMANCE

| Category | Academic Performance | | | |
|---|---|---|---|---|
| | V Good | Good | Average | Bad |
| Non-SC/ST | 10 | 13 | 21 | — |
| SC/ST | — | 3 | 33 | 12 |

| Category | | Academic Performance | | | |
|---|---|---|---|---|---|
| | Background | V Good | Good | Average | Bad |
| Non-SC/ST | Rural | 2 | 2 | 5 | — |
| | Urban | 8 | 11 | 16 | — |
| SC/ST | Rural | — | — | 12 | 2 |
| | Urban | — | 3 | 21 | 10 |

TABLE 3: NUMBER OF STUDENTS IN EACH INCOME CATEGORY WITH REFERENCE TO ACADEMIC PERFORMANCE

| Category | | Academic Performance | | | |
|---|---|---|---|---|---|
| | Income Level | V Good | Good | Average | Bad |
| SC/ST | Upper | — | 3 | 5 | 1 |
| | Middle | — | — | 14 | 4 |
| | Lower | — | — | 14 | 7 |
| Non-SC/ST | Upper | 5 | 4 | 9 | — |
| | Middle | 4 | 5 | 7 | — |
| | Lower | 1 | 4 | 5 | — |

status. Most SC/ST students have average performance. The number of those who have bad performance (in SC/ST group) is highest in the poor income category.

In the non-SC/ST category, the number of those who have very good academic performance is comparable in the rich and medium income category. Even students from the low income group have good and very good performance, though the number of such students is very small (5). However, as the Table indicates, the frequency of very good performance is on the decline with the decline in income level. The frequency of students in the poor income category increases from left to right of the Table indicating the gradual deterioration in academic performance. Therefore, there are some indications that income forms one of the determinants of academic performance. But it should be interpreted with caution because most rich students have a good educational background also. So it is not high income *per se* which ensures a student's good academic performance but the quality of educational background and training made available because of high income that prepares a student for a certain kind of performance.[10]

### Family Education

Out of 44 general category students, 21 have parents with graduate level and postgraduate level education. Only five of these students have very good CPIs, five have good CPIs and the rest (11 students) have only average CPIs. In the SC/ST category, among the 15 students, whose parents have had graduate/postgraduate level education, none has a very good CPI, two have good CPIs, 11 have average CPIs and two of them low CPIs.

At the same time, students whose parents have not had any education have done comparably well. Out of nine such SC/ST students, six have average CPIs and only three have low CPIs. In the general category, out of five such students, two have good CPIs and three have average CPIs. Also, out of 18 (general category) students whose parents have had high school level education, five have very good CPIs, six have good CPIs and seven have average CPIs. In the SC/ST category, out of 24 such students, one has a good CPI, 16 average CPIs and seven have low CPIs (Table 4).

From the above it appears that though the educational background of parents does prepare the students for IIT,[11] good performance by the students is not ensured by the level of parental education. Alternatively, it is not necessary that a low level of educational background or no educational background of parents automatically leads to the ward's poor performance.

### *Impact of Medium of Instruction on Academic Performance*

The present study indicates that a majority (35 out of 44) of general category students have studied in English medium schools whereas most SC/ST students (32 out of 48) have come from vernacular language medium schools (Table 5).

When an attempt was made to link academic performance with the medium of instruction, the following were the findings:

All very good performers (10) of non-SC/ST category and two (out of three) good performers of SC/ST category come from English medium schools.

Out of 35 non-SC/ST students, who come from English medium schools, 10 gave very good performance, 10 good performance and 15 students performed averagely. Of the nine vernacular medium general category students, five have good performance and four have average performance.

Out of 16 English medium SC/ST students, four have performed poorly, 10 averagely and two students have good performance. Among 32 vernacular medium SC/ST students, seven do very badly, 24 have average performance and one has good performance.

It appears that medium of instruction in school is not always a parameter that positively determines academic performance in IIT though it may in some cases affect the comprehension level and expression and performance ability, particularly in subjects of a descriptive and analytical nature.

### *Preparation for IIT and Its Impact on Academic Performance*

To prepare for JEE, many more non-SC/ST students joined either Agarwal Coaching Class (ACC) or some other coaching centre (AOC) than did SC/ST students. 26 out of a total of 44 non-SC/ST (Table 6) joined such classes. The percentage of students who do well after attending coaching classes is higher than those who do not.

Students who relied on self-study have mostly average performances. In the SC/ST category, those students who did not prepare for JEE at all either did badly or again gave an average performance; none performed well. Those with no preparation whatsoever are fewer in number (3) in the non-SC/ST category as compared to the SC/ST category (11).

It is seen that most of the very good performers in the non-SC/ST category have attended ACC. Even in the SC/ST category, two out of three good performers have attended ACC. However, it is necessary to

*Notes*: ACC = Agarwal Coaching Centre
AOC = Any Other Centre
*10 SC/ST interviewees did not take the JEE. They entered IIT Bombay through the Direct Admission System in operation during 1975-1977.

regard with caution the impact of ACC on later academic performance of students since ACC select only very good students for training and coaching for JEE. Besides, not all good performers have attended ACC.

Some SC/ST students disclosed that they were aware of the existence of coaching classes but could not afford to avail themselves of this facility. Some, though, were not aware of the existence of such coaching. Yet another section of SC/ST students did not prepare at all knowing full well that they would be admitted through the reservation scheme.

'No Preparation' keeps the students completely alien to IIT's expectations, its standards, also to the amount of hard work and capacity for comprehension required here. Not preparing for IIT later affects negatively the level of motivation to face this absolutely meritocratic set-up.[12] At least this seems to be true of SC/ST students.

### *Ambition and Its Impact on Academic Performance in IIT*

Surprisingly, the number of highly ambitious students is greater in SC/ST category (18) than in non-SC/ST category (13) whereas the number of averagely ambitious students is comparable (SC/ST = 22; non-SC/ST = 22) in both groups. Again, those who are low on ambition are more in number in SC/ST group (8) than in the non-SC/ST group (1). Five of the general category students talk of aims best categorised as miscellaneous.[13] Three of them did not respond (Table 7).

It is observed that not a very good correlationship holds between ambition and academic performance in case of SC/ST students. Those highly ambitious (14) are able to achieve only average CPI; they even perform badly (3). Only one of them has good performance. By contrast those low on ambition perform both averagely (4) and badly (4). Those neither very high nor very low on ambition gave average performance (15), good performance (2) and bad performance (5) (Table 8).

On the other hand, there seems to be some positive relationship between ambition and academic performance among the general category students. Most very good performers fall in the upper two categories of ambition. Only one student with high ambition performs poorly. None in the middle category performs badly. However, more of very good performers are in the middle category of ambition than in the upper category. And one student who is low on ambition performs averagely. In spite of the latter two statements a correlationship is clear in this category.

Our results, on the whole, about ambition do not lead to any conclusive finding, though one observes that non-SC/ST students generally appear to be comparatively more realistic in their ambitions whereas ambition and academic performance do not match in the case of SC/ST students. They tend to dream and to fantasise. However, some SC/ST students (though few) are very realistic. One states: "I never think of cracking A's. My aim is only to pass." Another has observed: "Our academic performance is poor." A third says: "I feel I can't get A or B but I can pass all courses with C or D."

## II

## Problem Areas for SC/ST Students

This section has been sub-divided into two parts. This first part examines the academic problems of SC/ST students. An attempt has been made to relate academic problems to some variables like

(a) Competition in IIT
(b) Difficulty with the core programme
(c) Non-attendance of special tutorials

In the second part, the social problems of SC/ST students have been examined through several socio-psychological parameters in order to present a complete picture. These parameters are

(a) Differences in the background (home *versus* IIT set-up)
(b) Inability to visit home
(c) Social life at IIT
(d) Opinion of students about faculty members of IIT
(e) Criteria for friendship
(f) 'Discriminatory' attitudes towards SC/ST students
(g) General problems created by special provisions for SC/ST students.

### ACADEMIC PROBLEMS

That SC/ST students admitted into IIT through reserved seats experience severe academic problems is a well-known fact.[14] Table 9 confirms this.

Between 1973 and 1979, 174 students were admitted. (The paper reflects data obtained for the study upto June 1984 only.) Of these 68 left on their own or were asked to leave at different stages of the B Tech programme. The majority (58) passed in the second class. The average period of passing out for 1974, 1975, 1976, 1977, 1978 and 1979 batches admitted through JEE has been 7.4 years, 5.33, 5.83, 5.6, 5 and 5 years respectively. Direct admissions were made in 1975, 1976, 1977 and the average number of years taken for passing out has been 7.6, 5.5 and 5.8 respectively[15] (Table 10).

One student admitted in 1974 completed the programme in May 1984. Four students admitted in 1975 have a backlog of 13 to 25 courses. Four students admitted in 1976 have a backlog of 2, 7, 23 and 27 courses respectively. Three students from the 1977 batch have a backlog of 6, 7 and 21 courses respectively. Four students admitted in 1978 have to clear 5, 7, 10 and 18 courses respectively. Eight out of 13 students admitted in 1979 have yet to clear their courses. One student was to have passed out in July 1984 and two in August 1984. The remaining five students have a backlog of 29, 25, 19, 13 and 13 courses respectively. Only one student has passed out with the general category students. Four students had to leave the in-

stitute mid-way, i e, without completing their B Tech programme (Table 10).

The fact that these students come from a weaker academic background than the non-SC/ST students has already been suggested in the previous section. In addition to the handicap of language, the majority have also had no preparation for the IIT system. As a result, they fare badly. Over and above these very special reasons for their adademic failure, there are some others which are peculiar to the IIT set-up and it was felt that these needed to be gone into. The first of them is the highly competitive nature of IITs.

(1) *Competition in IIT:*

Most SC/ST students feel that IIT has cut-throat competition. Though to some extent this meritocratic set-up might mean a far more intensely competitive set-up to them, one needs to offset their impressions with those of non-SC/ST students to find out if they too feel the same way about competition here.

All the non-SC/ST respondents were asked how they viewed competition in IIT (Bombay) to see if competitiveness was a problem area for all students calling for a lot of adjustment on their part. A question was included in the questionnaire specifically to examine this possibility.

The responses indicate that most non-SC/ST students (36 out of 44) find competition in IIT very stiff. Only one of them finds it "just OK". They report competition to be "murderous", "stiff", "intense", "fierce", etc. "It is carried into extra-curricular spheres",[16] they comment. An interesting suggestion is to lessen institutionalised stress on competition and to lessen the emphasis on evaluation as against teaching/learning. They comment that IIT is a place where competition is promoted.

The point is that toughness of competition is not peculiar to SC/ST students but is common to both categories.

Our SC/ST respondents are students who have so far survived in the IIT system. Further, though some of them had backlog courses and other related academic problems none of the respondents has been asked so far to leave. So the conclusions/observations are based on the responses of the more successful SC/STs in IIT.

32 out of 48 SC/ST students said they had academic problems. By contrast, 17 out of 44 non-SC/ST students had or had had academic problems. The highly meritocratic set-up of IIT with its system of continuous evaluation and relative grading is a problem area with all students but more so with SC/ST students. While none of the SC/ST students interviewed for this study continued to be poor performers over a long period, the same could not generally be held of SC/ST interviewees.[18] Once an SC/ST student falls academically, he finds it very difficult to keep up with the class and to make up the difference at the same time. However, there are SC/STs in the present sample who did overcome their academic problems. The effort put in must have been stupendous.

(2) *Difficulty with the core programme:*

A second problem area with all the students appears to be the core programme.[19] Students had been asked to enlist the subjects they found difficult. Though a number of courses were listed by different respondents, there appeared to be an agreement about difficulty with the core subjects.

The frequency of SC/ST students reporting difficulties in various subjects is comparatively higher than non-SC/ST students. However, the subjects that have been found by both groups to be difficult are the core courses—Physics, Mathematics, Humanities and Social Science subjects and Chemistry.[20] A few students found Electrical Engineering subjects also tough. A still smaller number reported drawing workshop and laboratory courses as being difficult.

The reasons given by students for various subjects being difficult were the following:

Physics: "Wide differences in content between school/college physics and IIT physics", "irregular study of the subject", "lack of clarity of fundamental principles".

*Notes:* ** No information about one case. B L = Backlog * All students through JEE but down to 0 per cent level.

"lack of liking for the subject", "absence of good grasping power" and "fast pace of teaching".

Mathematics: "Absence of clarity of basic concepts", "poor grasping power", "all applications are not understandable", "highly theoretical and abstract nature of the subject".

Humanities and Social Sciences: "Absence of competence in English and expression", "the descriptive nature of questions", "lack of effort and interest".

Chemistry: "Its emphasis on cramming", "absence of liking for the subject", "its uninteresting nature".

The majority of the students report I year and II year subjects to be uninteresting, irrelevant. These years create a backlog, they say. However another student comments: "No subject is difficult; the difficulty lies in the very nature of competition here. It matters who registers with one, i e, with whom one competes." Students mention that it is after they enter the departments that courses become more interesting, more relevant and more manageable. Some students even claim that their performance improved after they joined the departments.

A scrutiny was made of their semester-wise SPI (Semester Performance Index) to see if their SPIs were on the increase after they had joined their departments. It was found that there was no such thing as a definite increase in SPI after their entering their particular departments. Rather the increase in SPI, if at all, was erratic. Even if it went up in a few cases one semester, it also very often came down in another.

It appears that students have made the above observations about improvements in their performance in the latter half of the B Tech programme on the basis of some extra academic reasons. This impression on their part may possibly be due to the reduction in the number of students they are competing with resulting in a feeling of reduced pressure. It could also be due to their having got used to IIT as a place, to hostel life, to the IIT system. It could further have been caused by their having developed more regular study habits and due to their attending lectures more regularly. (In the first year, the absence of mandatory attendance of classes often works against the students. Once they perform badly, it is difficult for them to better their performance.)

It is also possible that though they may have experienced an occasional increase in SPI during the core programme as their SPI records show, they seem to remember more the occasional spurt in SPI after entering their department. The data reveal no relationship as such between department level courses and enhanced academic performance.

(3) *Non-attendance of special tutorials*:

To help SC/ST students taken in through the reservation scheme, there are some special facilities (only for SC/ST students) such as (a) permission to drop two courses per semester in the first year, and (b) an additional tutorial in English and other first year subjects so that they do not fall back in their studies because of the IIT pace of work and so that they can also make good their deficiencies.

Almost all teachers have complained that SC/ST students do not come to these special tutorials. SC/ST students say that this is so because the time table for these special classes is very inconvenient and though useful the work load gets doubled.

Since 1982, special tutorial hours in all first year subjects are offered to SC/ST students. Initially, the students used to come to the classes. Then they dropped out. The pattern was repeated last year. This is a matter of concern, especially, if SC/ST students think that they can ignore extra classes knowing full well how important it is that they make up their deficiencies.[21] One wonders, therefore, if classes for SC/ST students should not be made compulsory especially when it appears that they cannot judge what is good for them at that age.

Measures such as special classes for SC/ST students and the facility of dropping courses also tend, say SC/ST students, to set them apart from the general category of students thus creating social problems for them. Perhaps, there is validity in this observation and efforts have to be made to offer special facilities in ways which do not create social problems for SC/ST students.[22]

Proper counselling also is necessary for SC/ST students right from the point of entry so that they can be prepared for the kind of work expected of them in IIT and so that they can be helped to choose those branches for which their academic background is more suited rather than their opting for branches such as Electrical Engineering and Computer Science which even non-SC/ST students find "tough".

### SOCIAL PROBLEMS

Most students, when they join IIT, are quite young. Pressures of academic requirements and adjustments to the new and often unfamiliar set-up of hostel life necessitate that students have diversions from IIT life. Do they, for example, visit their parents/local guardians? What kind of background do they come from? Does that affect their adjustment in IIT? These were some of the questions taken up. Further, what is the quality of social life at IIT? What are the bases of friendship? Is there a healthy faculty-student interaction? How do students view faculty? Do students have social problems? These questions were posed to all respondents.

In addition, there were some questions that were also posed to all students but with SC/STs as the target group. These questions pertained to problems of prejudice and discrimination, problems created by reservation and other special facilities.

(1) *Problems of adjustment due to difference in background:*

Question No 23 in the questionnaire was designed to explore whether there are vast differences in home/hometown atmosphere and the atmosphere at IIT, in case of SC/ST students. If so, they could lead to poor and slower adjustments on the part of SC/ST students.

The results indicate that among non-SC/ST students, 20 felt that not many im-

| SC/ST | 5 | 16 | 6 | 21 | — |
| Non-SC/ST* | 6 | 20 | 8 | 5 | 21 |

*Note*: * Some students have marked more than one type of response. Hence the increase in the total number of responses in the Non SC/ST category.

provements in their homes were needed, 12 of them said that their hometowns needed general improvements, seven of them did not respond and only five (i e, 11.3 per cent) of them have reported that a lot of improvements were needed in their homes.

By contrast, the responses of SC/ST students suggest that at least about 39 per cent of them come from a very different background. Nine of them feel that they need general improvements in their hometowns, 13 of them feel that they do not need any improvements, seven have not responded and 19 of them (38.9 per cent) have indicated that they need lots of improvements in their homes (Table 11).

The data suggest that a good number of SC/ST students feel that the conditions in their home/hometown are not upto the mark. Whether they began to get this feeling after joining IIT is another question. But certainly their adjustment to the IIT set-up could be affected if they felt that there were vast disparities in the conditions at home and in IIT.

(2) *Does inability to visit home or local guardian create social problems?*

24 non-SC/ST students have homes in Bombay or nearby and they visit their parents at short intervals. Nine of them have local guardians and they visit them regularly. One of them, in spite of having a local guardian does not visit him. 10 non-SC/ST students have neither parents living nearby nor local guardians.

Among the 48 SC/ST students who responded, 10 visit their homes regularly, 13 visit local guardians, three of them have local guardians but they don't visit them. 21 students have neither parents living nearby nor local guardians to make visits to. One student has not responded (Table 12).

It is observed that the number of SC/ST students who have no place to go to, or they themselves don't go, is larger (24) as compared to the number of non-SC/ST students (10).

Though it is not always true that whenever students visit parents/local guardians, they will share their feelings, failures and experiences with the people they visit, but surely such visits provide a diversion. And in a situation of extreme distress, home is the best place to turn to. Not visiting home could lead to feelings of loneliness and lack of belonging. Problems arising in the lives of SC/ST students are surely in part contributed by their inability to visit parents at short, regular intervals.

(3) *Social scene at IIT:*

Item no 13 was designed to obtain views on the social scene at IIT. The general impression is that the IIT social scene is very poor. Nevertheless, there are some favourable responses also. The responses pertaining to personal relationships and friendships have been treated as non-answers. The breakdown of the responses follows.

16 students in SC/ST category and 20 students in the general category have opined that social life in IIT is rather dull/poor or is absent. Six SC/ST students and eight non-SC/ST students find social life in IIT just tolerable. A few (five in SC/ST and six in non-SC/ST category) have qualified it as satisfactory. In total, 21 SC/ST responses were non-answers. Five non-SC/ST students have not responded (Table 13).

Most SC/ST students further mention that because of being labelled and identified as SC/ST they can't mix freely with others. It follows that they don't enjoy their stay in the IIT socially.

Another reason for the absence of socialisation given by students of both the groups is academic pressure and tough competition.[23]

One peculiar observation about the SC/ST group is that many of them tend to talk of their own friendships, relationships, experiences, fears, etc, in response to this item. To them, coming out of their shells and achieving friendships is a big thing. Only after they have reached this stage can they really comment objectively about social life.

On the other hand, non-SC/ST students have very well understood the meaning of social life. However, both SC/ST and non-SC/ST students have said that life in IIT is monotonous. During the semester, the regular grind of tests, quizzes, lectures, labs, leaves little time for social interaction.

Many students feel social activity is limited to 'cack' sessions in the hostel wing. Students comment that Mood Indigo and entertainment programmes and films are stereotyped entertainment and are of no social relevance; IIT life is not reflected in them. But some responses suggest that there is a large amount of social activity.[24] Perhaps one's involvement in the social scene depends upon how much one tries to get out of it.

Hostel life gives rise to a rather rich set of social relationships. Another section of students feel that some sort of traditional barriers for social interaction exist in IIT. The faculty does not recognise students outside the class. Faculty houses and students' hostels are built wide distances apart. A better interaction is called for. Students also

TABLE 14: FACULTY-STUDENT INTERACTION

| Non-SC/ST | 5 | 15 | 1 | 2 | 21 |

complain that the IIT set-up fails to create an atmosphere for interaction among boys and girls or of co-operation among students in general.[25]

It appears that the respondents tend to blame the IIT set-up for most of their social problems. They are right to some extent only. IIT is a very academic and competitive set-up both for students and faculty and it leaves little time/scope for anybody to relax for long or to develop social life to any important extent. Hence, the paradoxical nature of responses summarised in this section and in the next.

(4) *Opinion of students about faculty members of IIT:*

This item further gave certain details and clues about faculty-student interaction. Most SC/ST students (30) report that they did not have any problems in getting guidance from faculty members. Only six (Table 14a) of them had problems, nine did not try for guidance. By and large, faculty members are easily accessible to SC/ST students.

The detailed picture of student opinion about faculty is presented in Table 14b. A general comment is that most of them are indifferent towards students.

Non-SC/ST students differ in their opinion about the faculty members. They suggest that it is unfair to generalise faculty attitude, for there exists a wide variety. However, the IIT set-up does not encourage mixing with the faculty either on matters of academics or otherwise. There are intangible barriers between students and faculty.

In general, non-SC/ST students are less satisfied with IIT faculty members than SC/ST students.

(5) *Bases of friendships in IIT:*

Bases of friendships in the two groups are quite comparable except on a few parameters, e g, religion, caste and sub-caste (Table 15). The number of students stating that friendships are based on same caste, same religion and same sub-caste in SC/ST is double those in the non-SC/ST group. General category students don't seem to bother much about these factors while making friends.

The majority of students (SC/ST as well as non-SC/ST) believe that friendships are made on the basis of same wing, classmates living in the same hostel, same class and same hometown in that order.

Among other bases of friendships, common interests got the highest score in both the categories (SC/ST = 13; non-SC/ST = 19).

Factors other than these which have been mentioned by the non-SC/ST category are same language, college/school, background (regional, financial, academic), similar CPI, staying in the hostel on week-ends with fellow hostellers, etc.

Students were asked to report the category/categories to which their own friends belonged. The general trends were more or less the same. Pattern of views on the bases of friendships in IIT in general and bases of personal friendships did not really differ widely.

(6) *Is there 'Discrimination' in IIT Bombay:*

A sizeable section of SC/ST students feel that they are "discriminated".[26] However, some of them report that 'discrimination' was subtle and not obvious. However, the feeling was not conducive to friendship.

Some of the SC/ST students have said that they feel that they are 'discriminated' because they themselves think that they are substandard students. On the other hand, some hostels have SC/ST students as general secretaries, mess secretaries, Mood Indigo organisers, team captains, etc. Perhaps, it depends on how one accepts the whole situation.

A large number of non-SC/ST students feel that SC/ST students are not 'discriminated'. A few even maintain that no question of 'discrimination' arises because they don't even come to know that some of the students are SC/STs unless they see the special merit list. One goes to the extent of saying that the observation that there is 'discrimination' because of special facilities for SC/STs is only an argument given in order to oppose help given to such students.

The majority group (non-SC/ST) can afford to make a minority (SC/ST) feel small because of the larger number on their side, a phenomenon of power relationship. In fact, many non-SC/ST students do not even realise that their remarks hurt and humiliate SC/ST students.

The fact that 14 out of 44 non-SC/ST students confirm 'discriminatory' attitudes indicates that the feeling is not imaginary on the part of SC/STs.

(7) *Do special provisions create social difficulties?*

It has been observed that a majority of students (SC/ST as well as non-SC/ST) feel that special provisions made for SC/ST students contribute to make their adjustment in IIT difficult. SC/ST students feel that they get labelled, that others resent their easy admission to IIT, their getting departments of their own choice (they are given Computer Science and Electrical Engineering Departments in spite of low ranks at JEE). When others pass remarks about them, they develop an inferiority complex and start feeling depressed. They feel humiliated and demoralised during ragging. They feel dejected and defeated and this is how they start here. In spite of their enjoying so many facilities—concessionary admissions, scholarships, dropping of courses in the first year, books, departments of their choice—when they perform badly, they can sense that they are being thought of as some kind of "a standing joke".

Non-SC/ST students are of the opinion that facilities isolate SC/ST students and compartmentalise them. It appears as if they don't belong to the same society as those with whom they have to live. Most SC/STs in the initial phases of their stay withdraw into a shell, don't make friends with other castes. As one non-SC/ST respondent put it, "If they don't come out of the shell in the beginning, then when social groups have already formed, it is difficult for them to join these groups".

Some general category students state that SC/ST students are forced to drop courses in the very beginning and this makes them diffident. Others (non-SC/ST) resent them (SC/ST) both overtly and covertly. However, one student also opines that those resentments are on principle and not on caste. Some general category students feel that

TABLE 15*: VIEWS ON BASES OF FRIENDSHIPS

| Views on | Category | Same Religion | Same Caste | Same Sub-caste | Same Hometown | Same Wing | Same Class | Class Mates Staying in Same Hostel | Any Other Reasons: Language | Any Other Reasons: Miscellaneous Interests including Games, CPI Background |
|---|---|---|---|---|---|---|---|---|---|---|
| General Friendships | SC/ST | 10 | 14 | 8 | 24 | 33 | 26 | 33 | 5 | 13 |
| | Non SC/ST | 4 | 5 | 3 | 22 | 40 | 36 | 38 | 4 | 19 |
| Personal Friendships | SC/ST | 3 | 14 | — | 5 | 23 | 10 | 11 | | |
| | Non-SC/ST | 1 | 2 | — | 5 | 16 | 15 | 16 | | |

*Note:* * Respondents have sometimes ticked more than one basis of friendship. Hence the increase in the total number of responses in each category.

when SC/ST students are told that they can't do well, that they won't complete their B Tech, demoralisation begins but when some teachers in class also tell them the same thing, they get thoroughly convinced about it and lose heart.

Some general category students say that SC/STs, because of the special facilities given to them, are not treated with the respect due to a human being. SC/ST students confirm the general feeling of ill-treatment. As one of them said, "People think SC/STs misuse funds. Foreign students are allowed to keep the books given to them for study by IIT but from SC/ST students they are taken back."[27] Again as another student remarked, "economically poor general category students are treated better than economically poor SC/ST students. Ill-treatment must go."

The most pathetic comment (pathetic because of the innocence and naivete of the respondent) of all was from a young SC/ST who said, "I am fond of the guys (non-SC/ST) in the hostel. But they don't know I am an SC. They comment 'SCs have so many facilities', they think poorly of SCs. I wonder what they would think if they knew that I am an SC. They won't keep up their friendship, I am sure."

All facilities that are meant to help SC/STs academically, including the facilities of dropping courses in the first year, extra tutorials, tutorials with only SC/ST students, their placement in a particular way on the roll list for easy identification by the faculty for extra help, seem to set them apart as SC/STs: privileged, undeserving of such privileges, outside the pale of the general IIT society. Hence fit enough to be ignored or taunted. However, this is only a general trend. There are plenty of exceptions as well.

TABLE 16: RESPONSES ON DISCRIMINATORY ATTITUDES

| Category | Discrimination | | |
|---|---|---|---|
| | Yes | No | No Response |
| SC/ST | 26 | 18 | 4 |
| Non-SC/ST | 14 | 26 | 4 |

TABLE 17: RESPONSES ON WHETHER SPECIAL PROVISIONS CREATED PROBLEMS

| Category | Whether More of Problem | | |
|---|---|---|---|
| | Yes | No | No Response |
| SC/ST | 29 | 14 | 5 |
| Non-SC/ST | 22 | 13 | 9 |

(8) *Does poor academic performance lead to social problems?*

Table 9 shows the frequency of students who had/did not have academic/social problems. The number of students who had either academic or social problems is higher in the SC/ST group as compared with the non-SC/ST group. These students who did not have any academic problems is higher in the non-SC/ST category as compared to SC/ST category but the number is comparable for social problems.

Poor academic performance has been found leading to social problems in a few (6) SC/ST students, to psychological problems in a few (6) non-SC/ST students.

Though a cause and effect relationship cannot be established between academic performance and social problems, yet exploring whether the students belonging to a particular category of academic performance had social problems or not could give a clue. Table 18 gives details.

Two SC/ST students, who are good performers have social problems but one does not have any problem. 14 average performers (SC/ST) have social problems but 19 do not have social problems. Five poor performers (SC/ST) have social problems but seven poor performers don't have social problems. Surprisingly the number of those who do not have social problems (27) is higher than those who have (21).

Among non-SC/ST students, 16 have either not responded or their responses were treated as non answers (since their answers were not relevant). Two of these were very good performers, four good performers and 10 average performers. Besides these, six students in the very good category, six in the good and seven in average category did not have any social problems. Only nine non-SC/ST students had such problems, two were in the very good category, three in the good category and four in the average performance category. It can be safely concluded from these numbers that it is not necessary that poor academic performance generates all the problems. On the contrary, even those who perform very well may have social problems.

It is also interesting to note that a higher number of SC/ST students (27) do not have any social problems in comparison with the non-SC/ST students (19). The reason for this is that some SC/ST students (6) indulge in too many extra-curricular and cultural activities (at the expense of academics it appears) and thus take care of their social problems. They tend to escape from reality (i e, poor academic performance). For them to excel in a new field is easier than to re-attempt to do better in the one in which they have already faced failure. Rather they seek success in doing well in games, in organising cultural programmes, in winning elections, in holding hostel office posts. They try to bridge the difference between their more outgoing, non-SC/ST peers and themselves by aping the former in interests, attitudes and value systems. Since the number of SC/ST students who do not have any social problems includes such cases also, the number of SC/STs who do not have any social problems is higher than the number of non-SC/ST students. Otherwise the number is quite comparable in the two categories.

TABLE 18: ACADEMIC PERFORMANCE AND SOCIAL PROBLEMS

| Category of Students | Social Problem | CPI | | | |
|---|---|---|---|---|---|
| | | V Good | Good | Average | Bad |
| Non-SC/ST | No | 6 | 6 | 7 | — |
| | Yes | 2 | 3 | 4 | — |
| | No response | 2 | 4 | 10 | — |
| SC/ST | No | — | 1 | 19 | 7 |
| | Yes | — | 2 | 14 | 5 |
| | No response | — | — | — | — |

Social problems in SC/ST students are caused by inferiority complex, problems with English, their introverted nature, ragging rooted in the fear of 'reverse discrimination'. The last category leads to many social problems in case of SC/ST students.

The factors which cause social problems in non-SC/ST students are insufficient command over English, difference in social background and ragging.

## III

## Recommendations

There are two parts to this section. Part A pertains to recommendations which IIT Bombay can implement only with the help of the Ministry of Education. Part B refers more specifically to the solutions that IIT Bombay can implement from within and should do so at the earliest.

### A

(1) Because of the numerous academic problems faced by SC/ST students admitted into IIT through reservation (outlined already in the preceding section), it is recommended that an attempt should be made to train bright SC/ST students for competitive set-ups such as IITs at the school level itself. There could also be special coaching at the post-school level, but prior to their entry into IIT. Special coaching after entering IIT[29] overburdens and isolates them. It would be advisable to screen SC/ST students right at the eighth or ninth standard using aptitude tests such as the Differential Aptitude Test (DAT) and coaching them up accordingly.[30]

(2) While admitting SC/ST students into IIT, economically poor, bright SC/ST students should be given preference[31] because rich SC/ST students have the same background as rich non-SC/STs and they can compete and enter IIT on merit.[32]

(3) All second generation SC/ST learners should be considered ineligible for entry through the reserved quota.

Recommendations (2) and (3) are absolutely essential in order to reduce, check and eventually to eliminate the growing resentment among non-SC/ST students against concessionary entry particularly of SC/ST students from upper and middle classes (students who are not in need of upliftment).
(4) SC/ST students admitted to IIT Bombay but who cannot stay on in the institute (because they fail to fulfil the perfomance requirements and are asked to leave or who leave on their own after being put on probation, extended probation) should be rehabilitated. They should be helped to get into some less demanding vocational stream or get admission into some college,[33] otherwise they might end up as 'rejects' for life.

### B

(1) The Panikar Committee recommended that admission forms should be sent by IIT on its own to various schools to be given to bright SC/ST students for applying for JEE. It had also recommended that information such as standards expected in the IITs and the pattern of education here should be sent to all potentially capable students.[34] These recommendations were made in order to get better qualified SC/ST students as well as to prepare them for the rigours of IIT education. They have been implemented since. Both these practices, however, must be reviewed for their success and if beneficial in getting a reasonable number of SC/ST students into IIT, continued. If not, then the process of locating bright, deserving SC/ST candidates would have to be made more rigorous. For example, by extending the same process to villages, small cities with the specific intention of publicising the facilities available in IITs for SC/ST students.
(2) A well established counselling cell[35] should be run to eclectically counsel SC/ST students, specially at the beginning of the B Tech programme. Its job would be:

(a) To familiarise students with the IIT pattern and its expectations.
(b) To help them choose those branches for which their academic background is more suited.
(c) To ensure that students get books through the book lending scheme in time so that they can make proper use of them.
(d) See that students attend special tutorials. If in the first semester, they show good performance, then they could be exempted, if they so wish, from compulsory attendance of special tutorials in the following semester.
(e) Train them up in proper study habits and insist upon hard work on the part of students.
(f) Monitor their academic performance carefully and constantly throughout the B Tech programme but particularly in the first year.[36]

(3) Special facilities created only for SC/ST students like dropping of courses in the first year,[37] special tutorials, extra classes in language learning should be extended to needy non-SC/ST students also. This will prevent segregation of SC/ST students from the main body of students and reduce to a great extent the feeling that they are 'substandard' because they are SC/STs.

In IIT where a performance-based caste system prevails, an SC/ST is one who is given many special facilities at the cost of non-SC/ST entrants but who does not do well. It is necessary to alter the image of SC/ST students by adopting the following measures: (a) by explaining yearly to every fresh batch of general category students admitted the link between reservation and the concept of compensatory justice, (b) by ensuring the entry of more deserving SC/ST students into IIT, and (c) by discontinuing the practice of segregation of SC/ST students for the purpose of additional help.

Unless and until these recommendations are implemented, the stay of SC/ST students taken into IITs on concessionary entry will continue to be an uncertain and uneasy one.

### Notes

[The views expressed in the article are not necessarily those of the IIT Bombay authorities.]

3 Report of the Committee Appointed to Consider the Problems of Scheduled Castes/Scheduled Tribe Students, IIT Bombay, November 1977. (Also referred to as the Panikar Committee Report.)

4 We have interviewed SC/ST students admitted through the reserved quota into the First Year B Tech upto 1983. When we began on the study in April 1982 there were 100 SC/ST students studying in IIT at different stages of the B Tech programme. In addition, in July 1982 and 1983, a total of 18 (5 + 13) SC/STs were admitted. 48 students out of a total of 117 SC/ST students were interviewed. (One SC/ST entrant left in Semester I).

**HUMAN RIGHTS AND CIVIL LIBERTIES**

**POLITICS OF HUMAN RIGHTS AND CIVIL LIBERTIES**

**By Attar Chand**

1985/Pp.300/Price Deluxe Edition Rs. 250/-

Human history is replete with stories of peoples' heroic struggles for liberty and for the enforcement of human rights and fundamental freedoms. The struggle is not yet over and goes on unabated.

Rousseau once said—"Man is born free and is everywhere in chains". Countering the Sophists who preached that every individual was qualified to judge, according to his own beliefs and desires, what was right, the Greeks and the Romans built a society on the noeption of the subordination of the individual to the community and the citizen to the State. Plato and Aristotle regarded the positive furtherance of goodness as the mission and the goal of the state. Plato went to the extent of rejecting democracy as a contemptible form of Govt. The Romans separated state and individual, each having definite right and duties. The Universal Declaration of Human Rights passed by the UN General Assembly on December 10th, 1948 recognised the dignity of the human family and equality of its members as the foundation of freedom, justice and peace in the world. The question whether during the several decades, since the Declaration and subsequent International Covenants on Human Rights were adopted by the world body, they have been realised anywhere.

Man is not everywhere in chains now. By his unity and struggle he has broken the chains at many places to become really free. The struggle will however, continue until the whole of mankind is free from Want, Hunger and Miseries of any kind—until the basic human rights and freedom are achieved and made meaningful.

Written brilliantly, the book will be found immensely useful not only by Politicians, Social Scientists, Historians, Lawyers, Writers and Journalists, but every individual interested in the safeguard of human rights and civil liberties.

This study does not record the responses of 11 SC/ST students admitted to the new Preparatory Course introduced in 1983 to coach SC/ST students (who appeared in JEE but did not get the ⅔rd cut-off point for qualifying for the reserved quota) for admission to IIT subject to their clearing the Preparatory course examination.

5 The questionnaire was designed by an expert though it is not standardised. The reasons for this are—first this study was exploratory, secondly the kind of subjects required were not too many. Administering and readministering the same questionnaire to those few students would not have yielded anything meaningful.
Moreover, the study was specific to our institute and the questionnaire could not have been standardised.

6 These categories are based on the present stratification of income that enable a student to get scholarship in IIT Bombay.

7 IIT's classification of academic performance for the B Tech programme is:
CPI 8.5 and beyond — I class with distinction
CPI 6.5 to 8.5 — I class
CPI 5.0 to 6.5 — Second class

8 Two of them are sons of doctors.

9 Looking at the annual income level data on JEE (Western zone) entrants for 1980, 1981, 1982, we find the percentage of the middle income group to be comparable with the findings of our study. However, the percentages for the upper and lower income groups differ as follows indicating the necessity of going to a larger sample in order to make any conclusive generalisation about the economic background of IIT's general category students (see Table A).

TABLE A

*Percentages*

| Year of Entry | Rs 25,000 and above | Rs 12,000-Rs 20,000 | <Rs 2,000-Rs 9,000 |
|---|---|---|---|
| 1980 | 51.0 | 40.3 | 8.7 |
| 1981 | 61.5 | 28.5 | 9.8 |
| 1982 | 61.5 | 30.8 | 7.6 |

*Source:* JEE Reports to the Senate, 1980, 1981, 1982. (Data for 1983 and 1984 are not available.)

10 A large number of dropouts from school are from among the poor because their schools are in lower income areas and are notoriously ill-equipped to transmit interest, enjoyment or ability in the learning process. Middle class school experience is both more pleasant and more profitable. The difference in the quality of schools that children go to determines the kind of performance ability of the learners.
B R Schiller: "The Economics of Poverty and Discrimination", (Englewood Cliffs, New Jersey: Prentice Hall, 1976), p 107.

11 While trying to see possible correlations between the parents' educational background and the performance of their wards, it was found that children of parents with professional education (engineering, medicine) do better academically. In the general category, out of three students, whose parents are either doctors or engineers, two have very good CPIs and one has good CPI. In the SC/ST category, out of four such students, two have good CPIs and two have average CPIs.

12 There is need to formally coach up bright SC/ST students in the pre-IIT years in order to prepare them for the competitive set-up.

13 Some illustrative responses are "I want to be a ski instructor", "I am still finding out [my aim]", "I want to write stories", "I want to pursue climbing as a profession", etc, etc.

14 See Section I.

15 The data of successful batches of SC/ST students are available only until 1979 so far. Batches admitted since 1980 will complete their B Tech from 1985 onwards.

16 One student has observed: "Competition spills over into the other activities as well and seeps in like cancer. Even close friends have intangible barriers between them which are not spoken out but enter every sphere."

17 Continuous evaluation and relative grading were introduced in 1973. A study to review the efficacy with which they are working is called for at least a decade after their introduction.
The Kool-Gupta report (see note 20 below) has been very forthright in identifying some negative aspects of the two systems. See pp 20 and 22 (3.2 and 1.2) of that report.

18 This does not mean that non-SC/ST students do not fare badly in IIT or are not asked to leave. But that the stated observation is made for this particular sample of non-SC/ST students only.

19 The duration of the core programme being five semesters in the five years B Tech programme and three semesters in the four year B Tech programme.

20 See also V K Kool and M Gupta: "An Empirical Study of the Problems of Students in IIT", IIT Bombay, 1983, p 17.

21 See Section 1, Impact of Medium of Instruction on Academic Performance.

22 Perhaps by offering special tutorials/classes to all students in need of such assistance and allowing all other first year students as well to drop courses if need be. Perhaps even some general category students could avail of these provisions and adjust better to IIT.

23 Though there is a very wide range of extra-curricular activities and almost all students SC/ST and non-SC/ST participate in some activity or other or have some pastime, social interaction remains poor. Even while going to the Gymkhana, students may talk only of adademic performance. Their obsession with academic performance needs to be analysed.

24 In fact, the variety, range and number of extra-curricular activities and sports provided by IIT Bombay could easily be the envy of many an educational institute.

25 A girl student has stated "There is quite a hostile attitude towards girls in IIT. And it is quite difficult to mix with boys here."

26 Let us make a distinction between 'prejudice' and 'discrimination'. "The term 'prejudice' refers to the unfavourable feelings and attitudes that people harbour against others especially other population groups. These are to be distinguished from unfavourable actions, or behaviour which fall under the heading of 'discrimination'". R Schiller, *op cit*, p 131. In IIT, SC/ST students experience 'prejudice' rather than discrimination. Hence the use of quotation marks around 'discrimination' which has been used synonymously with 'prejudice' by the interviewees.

27 This statement that foreign students are allowed to keep books is incorrect. The observation however highlights the insecurity and heightened perception of hostility (towards them from others) in the SC/ST mind.

28 The Preparatory Course—a kind of special coaching programme—being offered by IITs presently merely gives them the illusion that they are part of the IITs. They stay in IIT hostels and study in the IIT but they cannot be registered as students of IIT's B Tech programme until they have cleared the Preparatory Course.

29 Pre-IIT coaching is different from special tutorials being run in IIT Bombay. Those who have already joined IIT's B Tech programme on concessionary entry do need these additional tutorials.

30 This recommendation has been put forward both by SC/ST and non-SC/ST respondents.

31 The reservation scheme was laid down by the Constitution to uplift the 'weaker' sections of society.

32 On checking up with the Academic Office of IIT Bombay, it was found that there is no record of the whereabouts of students who left the institute after completing B Tech, or midway. It is, as if, our responsibility is over once the student leaves IIT successfully or unsuccessfully.

33 Panikar Committee Report, *op cit*, p 15.

34 Ibid.

35 SC/ST students have asked for a counselling cell. This facility should be extended to all IIT students. The existing counselling cell needs to be re-set up in a more professional manner.

36 Also recommended by Panikar Committee, *op cit*, p 14.

37 Students should not, if it can be helped, be forced to drop a First Year Semester I course, which is a prerequisite for another course in the next semester.

REVIEW OF POLITICAL ECONOMY

# Essar : not just a hi-tech shipping company.

# Essar : a profit making, dividend paying and growth oriented company.

Hi-tech shipping ----today, these words are synonymous with Essar.

Essar Shipping is now a name to reckon with in the shipping circles. Essar has diversified its activities in shipping—with a thrust towards the Indian offshore industry.

**Profit Making Company**

Essar is a profit making shipping company. The reasons are simple. Strategic diversification. Specialised operations. Planned growth. Professional Management.

Most of the Company's vessels ply on fixed time charters ensuring regular and assured returns and are instrumental in the steady profitability of the Company.

**Specialised Operations**

Essar's fleet comprises most modern crude oil and epoxy coated petroleum product tankers. Essar is one of the few Indian shipping companies to own specialised offshore supply vessels and is the only shipping company in the private sector to own a computer controlled diving support vessel. Such vessels are used by ONGC for their offshore operations.

**Planned Growth**

Essar's growth in hi-tech areas such as underwater inspection, testing, maintenance and offshore supplies offer long term growth potentials. Essar has an on-going expansion programme in newer vistas of shipping where the future holds great promises. This includes carriage of chemical products, owning vessels catering specifically to the offshore needs in deep waters, etc. etc.

**Professional Management**

Essar has built up and employed a competent team of highly professional and skilled personnel at various levels of operations.

***Little wonder then that Essar has paid 20% dividend for the year 1984.***

**The Issue**

**Essar Shipping is now entering the capital market with a linked issue of 50,00,000 Equity Shares of Rs.10/- each and 3,00,000 — 13.5% Secured Redeemable Non-Convertible Debentures of Rs.100/- each, both for cash at par, aggregating Rs.8 crores.**

And what's more. For investors, a time-chartered investment opportunity with sure, steady and sound returns.

### HIGHLIGHTS

- **Profit making and dividend paying shipping company**
- **Proven track record with high growth rate**
- **Specialised activities in the hi-tech offshore and oil sectors**
- **Assured employment of vessels through time charters**
- **Easy Liquidity — Listing on Ahmedabad, Bangalore, Bombay, Calcutta, Delhi and Madras Stock Exchanges**
- **Pro-rata 12% dividend assured for the current year**

# A Beginning in Punjab

THE overwhelming response to the Memorandum of Settlement agreed upon between the Government of India and the Shiromani Akali Dal on this Thursday will be one of relief tinged with sadness—sadness because the contents of the memorandum make it clear that a settlement on these terms could have been arrived at between the government and the Akali Dal at least as far back as in 1982, before the launching of the Dal's morcha, and the nation at large and the Sikh community in particular could have been saved the trauma of Operation Bluestar, the assassination of Indira Gandhi and the mass massacre of Sikhs which followed it and the escalating, and mutually reinforcing, violence of the terrorists and the security forces which has exacted such a terrible toll mostly from innocent people in terms of killing, torture and wanton destruction and suffering and anguish. It is worth emphasising in this context that five out of the eleven points of the Memorandum of Settlement pertain to redressal of grievances of the Sikhs which need not have arisen at all had not a political agreement on the demands originally raised by the Akali Dal been delayed so long.

At the heart of these demands are the territorial disputes between Punjab and Haryana and those over the sharing of river waters among Punjab, Haryana and Rajasthan. The Memorandum of Settlement now provides that Chandigarh will go to Punjab without, as hitherto insisted upon by the Government of India, linking this to the transfer from Punjab to Haryana of the tehsils of Fazilka and Abohar (which are not contiguous to Haryana so that their transfer to Haryana would have required the creation of a land corridor). Instead, more sensibly, Hindi-speaking villages bordering Haryana, as determined by a commission to be appointed for the purpose, are to be transferred to Haryana in lieu of Chandigarh. Another commission is to be constituted to settle the claims and counter-claims for readjustment of the Punjab-Haryana boundary. On river waters, the farmers of Punjab, Haryana and Rajasthan are to continue to draw water from the Ravi-Beas system at the current levels (as on July 1, 1985) and the claims of Punjab and Haryana over the remaining waters are to be referred to a tribunal presided over by a judge of the Supreme Court. It is well known now that at least on three occasions negotiations had taken the Akalis and the government to the verge of a settlement on substantially similar terms, but every time the prospect of agreement was aborted because Indira Gandhi as the country's Prime Minister was more intent upon pandering to the Hindu vote in the north and in Punjab itself, under the inspiration of such elements as the then Punjab chief minister Darbara Singh and the then Union Home Minister Zail Singh, trying to undermine the Akali Dal by clandestinely encouraging Sikh extremists led by Bhindranwale.

In an atmosphere vitiated by the pursuit over years of low politics of this genre, the signing of a Memorandum of Settlement by Rajiv Gandhi and Harchand Singh Longowal will not by itself solve the 'Punjab problem' or restore peace and normalcy in Punjab. Among the Sikhs the 'United Akali Dal' of Baba Joginder Singh and sections of the All-India Sikh Students Federation are bound to reject the agreement. More important, within the Akali Dal itself, Longowal has not been able to carry with him prominent figures like the SGPC president Gurcharan Singh Tohra and the former Akali chief minister of Punjab Prakash Singh Badal. As recently as on July 5 Tohra, speaking in Amritsar, had said that the Punjab problem could no longer be solved within the framework of the Constitution, obliging Longowal to declare in rebuttal the next day that all the demands of the Akali Dal were indeed within the ambit of the Constitution. On the Congress(I) side, while no public voices may be raised against the agreement with the Akali Dal, this will not mean universal acceptance of it, especially in view of the attitude of the party's top leadership towards the Akali Dal and developments in Punjab till just a few months back. The Prime Minister himself may find that it is not all that easy to live down the virulent nationalist-communal propaganda which played such an important part in carrying him and his party to power all over the north in the last elections. The attitudes of the opposition parties, though they have been all along vociferous in their support for a negotiated settlement, are now bound to be determined by calculations of narrower political self-interest.

What is of immediate importance, against this background, is the political set-up that is likely to emerge in Punjab once President's rule is revoked. For behind the specific demands raised by the Akali Dal has been the question of political power: the aspirations of a numerically large, economically prosperous and socially powerful section of the Sikh community in Punjab, whose political representative is the Akali Dal, for exercise of political authority and control in the state. One essentially valid interpretation of the events of the last five years or so in Punjab would be to see them as the fall-out of the attempt by the Congress(I), with the backing of the Central government, to undercut the Akali Dal and take over the Dal's support base. The Memorandum of Settlement signed this week between the Prime Minister and the President of the Akali Dal puts the seal on the collapse of this attempt—after exacting a terrible cost in terms of human suffering and heightening of communal passions. It is to be seen whether the Central government and the Congress(I) are prepared to accept the imperatives of this failure in the ensuing process of restoration of political normalcy in Punjab. It is the peculiarity of Punjab that, because of Hindus comprising as much as about 40 per cent of the population, the Akali Dal cannot emerge as a regional ruling party in the manner of the AIADMK, the DMK or the Telugu Desam. Within the existing political framework and in the immediate context there is no alternative to some form of coalition politics with the Akali Dal as a major participant.

To be sure, this is not a situation that Marxist and secular political forces can at all be happy about. At the same time, the task of dethroning the Akali Dal, an avowedly religious-communal force, from its pre-eminent position in Punjab politics cannot be achieved through the machinations of the Congress(I). As the events of the last five years in Punjab have shown, this way of dealing with the Akalis, which has from time to time received sneaking support from sections of the Left, can only give a further fillip to communal and religious forces and wipe out class-based politics wherever it may exist in nascent forms.

## *World Economy*

### Growth Hopes Belied

AS had been expected, the US Commerce Department has pared its estimate of the second quarter growth of the US economy from 3.1 per cent to 1.7 per cent (on annual basis). With first quarter growth at 0.3 per cent, the average rate for the first half of this year sinks to an abysmal one per cent. Even if the growth rate were to pick up substantially in the second half—to, say four per cent on annual basis—as the US administration hopes it will, the rate for the year as a whole will not exceed 2.5 per cent, much below the rate which the Administration itself, as well as the IMF and the OECD, had initially forecast. The OECD, for example, in an exercise completed in early May, had forecast a growth of three per cent for the year. The US growth rate was 6.8 per cent in 1984.

As the US economy slows down, the growth of other industrial countries is likely to suffer. The Japanese growth rate in the first quarter of 1985 was a miserable 0.4 per cent on annual basis. This is not surprising as over the years Japan has become increasingly dependent on the US market for its exports. In 1984, 35 per cent of Japanese exports went to the US compared to 24 per cent in 1980. The slow down in US economic activity has also begun to affect the trade performance of other industrial countries, such as Italy. It is very likely that the growth rate of all the industrial countries taken together in 1985 will fall short of the OECD forecast of 3.25 per cent. It may turn out to be in the region of 2.5 per cent.

Such a low growth rate of the industrial countries, compared to the near five per cent rate achieved last year, would have serious destabilising consequences for the world economy. The growth of unemployment in the industrial countries had been arrested in 1984 by the exceptionally good performance of the US economy; now it is likely to rise again in 1985. The major debtors among the developing countries will probably find it difficult to earn trade surpluses on the scale they had done in 1984, so that it may no longer be possible to contain the debt crisis. Countries which rely on primary commodity exports, and which had benefited comparatively less from the strong growth in world trade last year, face an even bleaker prospect.

While everyone is aware of the importance of securing a high growth rate in the industrial countries, there seems to be no consensus on how this is to be done. The Chairman of the US Federal Reserve Board, Paul Volcker, would like to see greater expansion in West Europe and Japan. In a testimony before the Banking Sub-committee of the US Congress on July 17, he said that the United States' trading partners must take steps to stimulate their economies if the US economy is to perform satisfactorily. The US Secretary of State had echoed similar sentiments in April.

However, the IMF, that august body of wise men which the industrial countries have called upon to assume an enhanced role of multilateral surveillance with a view to "assess the consistency and mutual compatibility of national policies in the light of the objectives of international adjustment and financial stability, and hence to identify situations that warrant policy reviews and consultations", as a report of the Group of Ten had put it, is plainly against changing the policy of fiscal and monetary restraint which is being pursued in West Europe and Japan. In its latest "World Economic Outlook", issued in April, the IMF stated: "In the staff's view, the basic demand management strategy being followed by most countries outside the United States is broadly appropriate and is bearing fruit. Domestic demand has been picking up in Japan and a number of European countries, and investment is recovering. Growing confidence in the medium-term stability of policy has been an important feature of this development, and it would be a mistake to jeopardise such confidence by trying to force the pace of expansion. In the case of countries where the balance of payments is strong and inflation at very low levels, there may be some scope to moderate the pace at which medium-term fiscal objectives are approached. In general, however, recent trends give no grounds for change in the basic course of fiscal and monetary policy in the European countries and Japan."

In the IMF's view, growth in the medium-term is best secured by a strategy which brings down public debt and interest rates. A prime prerequisite for bringing down interest rates is, of course, a reduction in US fiscal deficits. The IMF believes that if West Europe and Japan continue to pursue their present course of reducing public debt, which requires a contractionary fiscal policy, then a fall in interest rates induced by a reduced US fiscal deficit will be a strong enough stimulant to generate growth. The IMF also emphasises the need to reduce structural rigidities in West Europe by which it means, roughly speaking, that it should be easier to hire and fire labour and there should be less protection against imports.

It is becoming increasingly doubtful, however, whether such a strategy is adequate to prevent a near recession in the industrial countries. To start with, it is not at all clear that US fiscal deficits will come down in the near future. It is also to be doubted whether a fall in interest rates, following a reduction in US fiscal deficits, will be a strong enough stimulant to compensate for the loss of stimulus resulting from the reduced fiscal deficits. The OECD approvingly quotes the results of a number of world linkage models which conclude that "endogenous reductions in interest rates outside the United States, with money growth and fiscal policies unchanged, would be insufficient to offset the loss of stimulus from the reduced US fiscal deficits". In a similar vein, the Bank for International Settlements observes: "For the global growth performance of the industrial countries to remain a durable 3 to 3.5 per cent . . . a soft landing of the US economy would require as a counterpart some acceleration in the rate of growth of domestic spending of other industrial countries as a group"—though it is unclear how exactly this is to be brought about.

Paul Volcker, for long a symbol of prudent monetary and fiscal policies, recognised the dilemma when he said in his testimony referred to above: "I am a central banker. I can well appreciate and sympathise with the priority that . . . Europe and Japan have attached to budgetary restraint and particularly to the need to restore a sense of price stability in their own economies . . . The effort—along with others—*is justified only by its necessity to their own economic health*" (emphasis added). One could take this to mean that while the policies pursued outside the US are prudent from the point of view of their internal economic management, the international repercussions of these policies imply stagnation in industrial country growth. But which is the country which is prepared to respond by giving greater priority to growth than to budgetary restraint?

## *Mizoram*

### Testing the Waters

THE latest round of talks held early this month between the Union government and the Mizo National Front over ending the latter's two-decade old agitation against the Centre seems to have collapsed. Prior to the negotiations, both parties were highly optimistic that a solution would be worked out.

A similar turn of events—of optimistic initial hopes followed by a deadlock—occurred during an earlier round in March this year. In its wake MNF leader Laldenga had almost given up hopes of a settlement and had planned to return to his self-imposed exile in London, though ostensibly for medical attention. There were three MNF demands that the government had refused, leading to the impasse: doing away with the Governor's special powers in respect of law and order and financial matters, dissolution of the autonomous district councils set up for the Chakmas and safeguards for Mizos in trade and commerce.

Two of the outstanding issues were reportedly sorted out during this month's meeting, with the government agreeing not to confer special powers on the Governor and the MNF giving up their opposition to the councils for the Chakmas. Though disagreement over the safeguards on trade and commerce persisted, it was not said to be of a vital nature. However, Laldenga refused to sign an agreement, insisting that a high court be set up in Mizoram's capital, Aizawl. Government spokesmen have unofficially accused Laldenga of not being keen on an agreement. Laldenga has refuted the allegation that he was raking up a minor issue to stall an understanding. He says that the MNF had assumed, from the inception of the talks last year, that a high court would be set up. The government refused to grant this demand at the latest round of talks, probably when the terms of the likely agreement was being put down in writing. The demand, Laldenga continued, was not a trifling matter since the Mizos have suffered due to the lack of a high court.

Though there is a basis for demanding a high court, other compulsions too seem to have influenced Laldenga to abandon the agreement. The negotiations have now been going on for almost a year. A number of the MNF's major demands were conceded earlier by the government. Consequently, after an accord is signed, Mizoram is to acquire statehood and the present Congress(I)-led Assembly in the Union territory will be dissolved. An Advisory Council, to be headed by Laldenga, is to run the administration till fresh elections are held.

Laldenga is probably unsure of the extent of popular support he commands among the Mizos today. The Congress(I) had won the last Assembly poll with an overwhelming majority. Then there is the possibility of some of Laldenga's lieutenants splitting and continuing the battle with the Union government, if the MNF arrives at an agreement. Laldenga has sent two of his emissaries to discuss the government's latest offer with the MNF executive, reportedly stationed in Bangladesh. The demand for a high court in Aizawl could hence also provide him with an opportunity to guage the response of the Mizos to a likely settlement before committing himself to an agreement.

## *International Economic Order*

### Looking for the Silver Lining

*A Correspondent writes:*

THE past few years may well go down in history as the period when a substantive part of the edifice of international economic co-operation so patiently built in the early post-war years and extended in the subsequent two decades and a half was deliberately dismantled, observes I G Patel in his LSE Society Lecture, 1985. Take the IMF, which "has become the darling of the industrialised world as a kind of international economic gendarme for the erring poor" but which role has not earned for it any significantly larger resources so that it has suffered "emasculation" in its essential role as a provider of internationally created reserves or as an agency for the surveillance of the monetary and fiscal policies of its members, whether big or small, whether debtors or creditors. Further, although the case for the IMF to create and distribute SDRs on a regular basis is in theory unassailable, it is not acceptable to the strong because they "do not stand to gain much by it at present". The reasons advanced for their reluctance, such as not wanting to add fuel to the fire of inflation, seem to I G Patel "rather hypocritical when they are advanced by the country which is most guilty of exporting inflation today".

But Patel is not unoptimistic. "There are", it seems to him, "certainly seeds in the present situation of a rather sudden change in the US attitude towards many areas of international co-operation", including another creation of SDRs. Patel pins his hopes principally on the downward slide of the dollar, which has already begun, "when additional unearned reserves would become valuable even to the US". But Patel omits, possibly deliberately in order not to sound radical in his immediate demands, to say whether the US and other strong countries will be agreeable to a regular allocation of SDRs and that too on a much more equitable basis than at present.

Patel's optimism for the future, indeed the near-future, is not confined to SDRs. He believes that the downward slide of the dollar will also make the US less unwilling to consider an arrangement under which the IMF is given "a lot more muscle in relation even to the big and the powerful" in regard to the determination and adjustment of exchange rates. Patel does not make clear whether he considers the recent recommendation of the G-10 study calling for effective surveillance as a step in that direction. Will it necessarily lead to a greater willingness to observe Fund advice on exchange rates by the high and mighty? Patel does express his doubt though about Fund surveillance leading to greater co-ordination of national economic policies.

Once sentiment in favour of orderly exchange markets, adjusted pegs or more concerted intervention returns, Patel believes, "it would be difficult to resist the temptation to restrict private capital movements also to some extent and on some occasions". So whatever doubts he entertains, Patel does not abandon his optimism that some change for the better in the present international economic order is round the corner.

Patel clearly belongs to that band of economists from the Third World who always spot the silver lining no matter how dark the clouds.

# A Modest Target, Yet Unattainable

THE revival of monsoon about the middle of July after a dry spell of three to four weeks has considerably relieved anxiety about the outlook for kharif oilseeds as also for other crops. Yet another week's delay would have caused serious irreparable damage to kharif production. While the worst fears have been allayed, few knowledgeable observers of the agricultural scene are inclined to share official optimism about achieving the targets set for 1985-86. On current indications, it seems rather unlikely that kharif production would turn out to be better than in 1984-85 which was by no means a good agricultural year, the overall increase in agricultural production being only about one per cent against 13.6 per cent in 1983-84. This would tend to aggravate inflationary pressures unless adequate steps are taken to improve demand-supply management.

All the major groundnut producing areas in Gujarat—Saurashtra alone accounts for nearly 30 per cent of the total groundnut production in the country—Maharashtra, Madhya Pradesh, Rajasthan, Karnataka and Andhra Pradesh are reported to have had sufficient rains for undertaking sowing operations which should really have been completed by June-end. In view of the delayed revival of monsoon, it would be risky to grow the high yielding bold variety which is a 120-day crop. And switch-over to the short duration (90-day) crop is not all that simple. Procurement of requisite seed in adequate quantity could pose a serious problem.

Inquiries with knowledgeable men in the oilseeds trade and industry who closely watch the progress of the crop indicate that kharif groundnut production is almost certain to register a substantial setback in the new season. Estimates of likely decline in production range between 20 per cent and 35 per cent, depending on weather conditions until the harvest is ready. Even the soyabean crop which does not need much rain is not expected to show any significant improvement over the 1984-85 record production of about 9 lakh tonnes.

It is extremely doubtful whether the likely shortfall in kharif production which accounts for nearly three-fifths of the total oilseeds production will be made up through increased production of rabi oilseeds. This is because the impressive increase in rape/mustard seed production—the major rabi crop—in 1984-85 was due to certain fortuitous factors and it did not represent any technological breakthrough which could sustain production at a high level. The view is widely shared that the overall oilseeds production in 1985-86 is unlikely to equal the 1984-85 figure, officially reckoned at 130 lakh tonnes, let alone achieve the 136 lakh tonne target set for the year—78 lakh tonnes of kharif and 58 lakh tones of rabi oilseeds.

The strategy proposed to achieve the target chalked out by the Union Agriculture Ministry includes the implementation of special projects on groundnut, rape/mustard seed, and sunflower in 12 potential states by providing necessary financial support. Stress is also being laid on the implementation of intensive programmes in 17 states for development of groundnut, rape/mustard, soyabean and sunflower. It is one thing to spell out a strategy but quite another when it comes to its effective implementation. The organisational framework continues to suffer from serious deficiencies and the financial support also is grossly inadequate. There is no getting away from the harsh fact that kharif oilseeds are grown mainly in rain-fed areas. In respect of rabi oilseeds also, irrigation facilities are inadequate. Oilseeds production therefore is at the mercy of the unpredictable weather.

No matter how one views it, the 136 lakh-tonne target set for oilseeds production in 1985-86 is very modest. The increase of six lakh tonnes—over the output of 130 lakh tonnes in 1984-85—is small even in relation to the Seventh Plan target of 170 lakh tonnes in 1989-90. The target looks dismal indeed when seen in the context of the massive annual imports of edible oils. Apparently, the government is least bothered about the continuing massive foreign exchange expenditure on edible oil imports. In order to maintain the per capita availability of edibile oils/fats at the 1984-85 level, the government will need to step up edible oil imports. This is most undesirable, to say the least. The need for a really bold plan for boosting oilseeds production can scarcely be overemphasised.

The welcome break in the prolonged dry spell has not had any noticeable effect on the market. Vegetable oil prices have declined by only Rs 150 to Rs 300 a tonne from the high levels registered during the dry spell. This is partly because current prices are substantially lower than a year ago and the scope for a further fall is therefore limited. Seasonal factors also are beginning to weigh on the market. Mid-July to October-end is a lean period from the viewpoint of availability of indigenous oils. This also happens to be the festival season when consumer demand is on the high side. Kharif crop prospects are far from encouraging. All this should make for a hardening tendency in oil prices in course of time.

It is, however, difficult to assess precisely the impact of seasonal factors on prices as imported oils have come to constitute an important element in the aggregate supply of edible oils. Imports of edible oils totalled 16.34 lakh tonnes in 1983-84 and the figure for 1984-85 (crop year) are estimated to be of about the same order. The government is in a position to influence the course of oil prices through the release of imported oils under the public distribution system. How the government will go about allocating the imported oils is anybody's guess. Ad hocism continues to mark the government's policy for import of edible oils as also their allocation and pricing.

Export activity has, of late shrunk to modest proportions and an overwhelmingly large percentage of this is accounted for by USSR and East European countries. Valuewise, there is little chance of exports of deoiled meal during the current fiscal year showing an improvement over the previous year's performance. The outlook for castor oil also does not appear very promising because of intensified competition from Brazil in the wake of its much larger crop this year. The export outlook for groundnut HPS is bleak unless the government adopts an imaginative approach in dealing with the problem of price disparity.

## *Tyre Industry*

### Familiar Refrain

THE tyre industry is complaining with increasing insistence that it is running into cash losses on account of high duties and escalating cost of raw materials. This familiar refrain is not surprising considering that the Union government is under pressure to impose price and distribution controls on the industry.

Tyre manufacturers have an informal understanding with the government that they would raise prices only after the prior approval of the latter. But this year, both in January and April, the industry decided to rise prices unilaterally. These two hikes totalled about 10 per cent. As a result, goods, including essential commodities, transported by road have become more expensive. Apparently, partly to curtail the inflationary impact and partly in response to pressure from tyre dealers and users, Union Minister for Industry, Veerendra Patil, warned the industry against any further price increase while inaugurating the Annual General Meeting of the All-India Rubber Industries Association at Bombay on June 29.

Tyre prices have been periodically raised during the past two years. But curiously even as the prices were being pushed up and the account books of companies showed cash losses, manufacturers were offering discounts of as much as Rs 600 per truck tyre between April and October 1984. At present too there are companies that are selling below the collectively fixed prices. Such undercutting is undertaken for expansion of market shares. In this context, it is worth mentioning that the manufacturers are pressing the government to treat tyres as an essential commodity—on the ground that they are used for transporting essential commodities—and accordingly grant the industry various concessions and subsidies.

No doubt the cost of raw materials used

in the industry, particularly natural rubber, has been rising. The excise duty at 66 per cent can also be regarded as high. Yet the extent of rise of tyre prices is hardly justifiable. A study by the Ministry of Industry's Bureau of Industrial Costs and Prices has found that even the informally agreed upon hike in tyre price of January 1984 was not justified. The All-India Motor Transport Congress has alleged that major tyre companies are acting as a cartel to fix prices, distribution as well as appointment of dealers. Similarly, the All-India Tyre Dealers Federation has charged that manufacturers are evading excise duty and defrauding on exports.

Apparently the increases in price, the offer of discounts and so on constitute a jumble of measures undertaken by the companies to overcome a crucial 'obstacle' within the industry. Presently, with the establishment of several new companies in recent years, potential capacity far exceeds demand. The industry seems to be operating at reduced capacity to forestall excess supply from pushing down the price. As a result costs have escalated, which the manufacturers are pushing on to the consumers. Licences for setting up new plants were liberally issued in the late 1970s because the few companies then operating were acting in collusion to push up prices in a situation of shortfall of supplies. Now, the companies seem to be trying to get around the situation of excess capacity while keeping the price high.

## LETTERS TO EDITOR

# Agrarian Policies of Left Front in West Bengal

I ACCEPT the validity and relevance of Ashok Rudra's findings as regards 'attached' agricultural labourers in West Bengal. But I would like to raise some questions of theoretical interpretation of these empirical results.

First, why does he insist that 'unfree labour' and wage differences in similar villages conclusively prove the absence of labour-power being a 'commodity' and hence the absence of capitalist relations (p 1016)? All labour-power may be regarded as 'homogeneous' labour-power plus 'compounded' labour-power, but workers' preferences may still restrict mobility and result in wage differences. (These preferences may be individual or 'collective' preferences—linked with trade union solidarity, or 'political' solidarity behind a political party, which Rudra mentions.) All this is not only *compatible* with capitalist wage-relations, but is, in any ultimately realistic model, an *essential* feature of such relations. Although this aspect was ignored by Marx (and also by Sraffa) in their simplified models of a capitalist economy, there are no analytical—still less realistic—problems in recognising it.

Second, I agree that 'group actions' by sections of workers (in agriculture or elsewhere) which are at the expense of interests of other sections do not promote 'class consciousness'; also that Left parties seem to specialise more and more in promoting 'selfish', restrictive, monopolistic trade unionism (not only in India, but everywhere). But is it necessary to jump to the conclusion that *every* group action must *necessarily* be so? For example, is it not possible to find instances where if "party people tell workers to remain within their own villages" they may be genuinely promoting the interests of workers' solidarity? After all, if we recognise that not only the wage, but also other objectives such as security (economic or political) matter and should matter, there may be instances where the Party's advice may be sound.

Third, I am not sure about this, but it seems to me that both Rudra and the targets of his criticism seem to agree that capitalist relations do *not* dominate agriculture in West Bengal. The difference seems to be as to whether share-croppers or 'attached' agricultural workers (*both* representing *non*-capitalist agrarian relations) constitute the 'largest target group' for agrarian policy. I have already stated above that in my understanding 'attached labour' is capitalist labour as much as mobile labour. I would also like to state, without elaboration here, that share-cropping is similarly best regarded as a 'semi-feudal' feature of capitalist relations (and *not* an expression of some 'semi-feudal mode of production').

ARUN BOSE

Calcutta.

## Withdrawal of Mahmood Mamdani's Citizenship by Uganda Government

WE have received information that on April 13 a leading Third World political scientist was stripped of his citizenship as a result of a public lecture in which he freely expressed his opinion as an acadmic and a scholar. Mahmood Mamdani was an Associate Professor at Makerere University College in Kampala at that time. He is well known for his outstanding contributions to the field of political science research. He has authored two well-received books, "Politics and Class Formation in Uganda" and "Imperialism and Fascism in Uganda". These works have gained him international recognition and respect.

His active involvement in the life and work of the academic and scientific community in Africa and the world is illustrated by his membership in the African Association of Political Scientists (AAPS) as Secretary of the Ugandan Chapter, his leadership at Makerere University as Acting Dean of the Faculty of Arts and Social Sciences and by his membership in the International Political Science Association (IPSA). He is the editor of a leading academic journal *Mawazo* published by the Faculty of Social Sciences, Makerere University. He is also known for his active participation in the struggle that brought back democracy to Uganda in 1979.

Mamdani was born in the then Tanganyika. He moved to Uganda with his parents in 1952 and was registered Ugandan citizen in 1963.

Because of his Asian origin he was expelled by Idi Amin in 1972. He lectured at the University of Dar-es-Salaam until 1979 when he returned to Uganda after the overthrow of Idi Amin. He was issued with a new Ugandan passport in the same year, which was renewed in January last year.

The present withdrawal of citizenship was precipitated by a public lecture at a Red Cross Conference in Kampala entitled 'Disaster Prevention: Defining the Problem' where he argued that famine was not a result of drought but the exploitation of the peasantry.

It is alleged that Mamdani's line of argument was vehemently challenged by the Minister of State for Security who officiated at the closing of the meeting. The Minister singled it out for a vicious attack in his closing address. Subsequently the same Minister appeared on television and repeated the attack.

Soon after officials affiliated to the Ministry of State for Security (the Criminal Investigation Department, Immigration Officials) interrogated him on his immigration status.

Subsequently, he received a letter from the Immigration Department dated April 1, pretending to solicit certain information for the purposes of, as it put it, 'updating the files'.

On April 10, Mamdani supplied the requisite information. On April 13, he left for Spain to attend a conference. On April 19, a letter was received purporting to declare Mamdani an alien and asking him to surrender his passport.

(2) Figures in brackets denote percentage variation over previous period.

# Shadow-Boxing in OPEC

### ISG

TWO very interesting developments have taken place with respect to oil. One is that OPEC was put on notice by Saudi Arabia that the organisation must evolve and establish effective procedures, more effective than in the past, to monitor the observance of price and production discipline because the Saudis were unable to play any more the role of a swing producer, i e, of a producer who varies his output with a view to so balance market of oil supply, including supply from other OPEC members, with its demand that the price agreed upon among the producers is possible to maintain. The other development is that Mexico, a non-OPEC net exporter of oil, which until the other day, was observing voluntarily the OPEC discipline, has decided to break rank and unilaterally reduce the price of its oil by an average of $ 1.50 per barrel.

How does one assess these developments? Do they presage the break-up of the oil cartel and a free fall, as they put it, of the price of oil? Writing on the eve of the OPEC's abortive meetings, just ended in Vienna, the *Wall Street Journal* posed the same issue in the following words: "When the oil ministers of the financially pressed and divided nations meet in Vienna at the end of next week to try to stabilise the sagging oil markets they will be staring over the edge of a precipice. At the bottom: the spectre of a smashed cartel and a $ 20 barrel of oil."

It is true that the share of OPEC in world oil production has declined considerably over the past decade starting with 1974, the year of the first round of oil price rise. The decline has been from a share of over half in 1974 to less than a third in 1984. OPEC's share in world net oil exports (defined as the aggregate of oil trade balances of countries that are net oil exporters) has declined during the same period from over 90 per cent to a little below two-thirds.

So there is absolutely no doubt that the leverage that OPEC enjoyed at one time is nowhere as strong as it once was. But the way issues are now being posed makes one ask what, if any, leverage still remains with OPEC to influence world oil price.

While the fact that OPEC still accounts for quite a substantial part (almost two-thirds) of world net exports is certainly worth bearing in mind, it cannot be overlooked at the same time that at the current level of its exports, OPEC as a group is operating at a level of less than 60 per cent of the production reached in 1979, the peak year.

The decline in the OPEC's share of world production and exports of oil has been caused primarily by two factors. Firstly, the contraction in total demand for oil. Between 1979 and 1984 the decline in world consumption of oil was of the order of nine per cent; the consumption of the western industrial countries including Japan declined by almost twice that proportion. Secondly, the increase in the non-OPEC production of oil was by almost 15 per cent. Behind both these factors the sharp increase in oil prices of the past decade had no doubt a major role to play. And behind these price increases was the clear hand of OPEC.

But the point to note, for our present purposes, is that while OPEC members were, as the IMF's "World Economic Outlook" for 1985 puts it, able to absorb the fall in demand with relative ease during the period 1979-81 when their balance of payments position improved considerably due to the higher oil price, this was no longer so subsequently when the oil price started weakening with demand for OPEC oil continuing to fall. Earlier, "there were no production sharing agreements in effect and the fall in exports was brought about by voluntary reductions in output levels of individual countries to match the fall in world demand". More recently, with the sharp deterioration of the OPEC's current account balance of payments position from a surplus of $ 110 billion to a deficit of $ 18 billion in 1983, not only "voluntary output restraints became increasingly more difficult to achieve" but also there were increasing signs of competition among OPEC members to protect, or even enhance, their respective market shares in an overall declining market. That is how OPEC felt obliged to agree in March 1983 on production quotas for individual members within an overall ceiling and at the same time to reduce the price of benchmark crude from $ 34 to $ 29 a barrel. But while agreement was reached on individual production quotas, no effective machinery was set up to police the observance of these quotas. As a result, within OPEC itself several members observed production quotas more in breach than in compliance and there was "an increasing predilection" to offer discounts below the official price in various direct or indirect ways. Faced with an effective decline in export price and distribution of export volumes among individual OPEC members totally out of tune with that envisaged in the quota-scheme, it became necessary to introduce a formal system of auditing production and export volumes. Also, the marker crude's price was reduced to $ 28 a barrel and the overall production ceiling was brought down from 17.5 mbd to 16 mbd.

It would appear from the Saudi complaints and the Mexican action that even the latest arrangements have not been possible to put into effect. The reason seems to be two-fold. Firstly, it would appear that it has not been possible yet to restrain partly the individual members from violating these quotas and, secondly, non-OPEC exporters have attempted to unload additional quantities on the world market in various ways with a view to taking advantage of OPEC's attempt to restrict its exports. A situation has thus been reached where after one makes allowance for the various discounts, direct and indirect, offered on oil exports, the effective price is at least one dollar below the official OPEC price, the total quantity OPEC as a whole is able to unload is below the OPEC ceiling by one to two million barrels per day. The combined OPEC output since May 1985 is estimated to have been hovering around 15 mbd as against the ceiling of 16 mbd.

The Saudi complaint acquires substance because as a swing-producer Saudi Arabia has had to reduce its output considerably below its quota of 4.3 mbd. So is the case with the Mexican complaint because in trying to keep in tune with OPEC, as a major individual producer-cum-exporter, Mexico too had to keep its output considerably below the level it had agreed to maintain.

The question, however, is whether the Saudi threat and the Mexican action combine to strengthen or weaken the OPEC. Recent events have no doubt demonstrated the weakness of OPEC in maintaining either the price or its market share. Naturally, therefore, any breaking of rank within OPEC is bound to affect its position adversely. But what has Saudi Arabia to gain from forcing the issue at this state? It is true that because of the sharp fall in OPEC's export volume, OPEC carries an unused capacity of 45-65 per cent of its 1984 output, as the IMF's World Economic Outlook' estimates. But if this is considered a sign of weakness, by the same token the Saudi position should be even weaker, certainly not stronger, since its unused capacity should be close to 75 per cent, if not higher. Moreover, Saudi ability to withstand an even further reduction in output, given its sizeable foreign holdings, monetary and non-monetary, is still not anywhere as vulnerable as is possibly the case with some of the other OPEC members who are currently violating their quotas. Here, however, one must hasten to add that primarily a lot more is being blamed on the latter than is justified. OPEC is more under attack from outside, from non-OPEC oil exporters, principally Britain and Norway, than from inside now. But non-OPEC oil exporters have little additional unused capacity left to exploit. So if OPEC holds out a little longer, it may well be in a position to call the bluff of its antagonists. And Saudis have everything to lose if the member countries break ranks. Surely, the world price of oil will then fall precipitously. It may well go below $ 20 a barrel. But are the Saudis sure that they will then be able to sell substantially larger quantities than today? Basically, what is going on within OPEC today is a sort of shadow-boxing, with Saudis trying in the process to share their burden with other OPEC members. But it may well be over-playing its hand.

# Excise Irritants

### Hansavivek

*STRAW PRODUCTS* has produced good results for 1984 with increases in production, sales and profits. Production of paper and board was higher at 65,848 tonnes against 61,807 tonnes in the previous year. Production at the paper mills in Orissa reached an all-time high. The output of board mills located at Bhopal would have been substantially higher but for the tragic incident of gas leakage from the Union Carbide India's plant there in December last resulting in complete dislocation of normal operations for nearly a month. There has been an improvement in the demand for paper, but the market for kraft paper and duplex board remained sluggish. The high excise duty differential enjoyed by smaller units in the case of these varieties affected the company's board mills. The directors feel that the increase in excise duty on certain varieties of paper produced by large integrated units through the Union Budget for 1985-86 may affect the sales of the integrated paper mills. They also contend that the increase in the price of the controlled variety of white printing paper from Rs 5,400 to Rs 6,400 per tonne in May 1984 is still "far too inadequate" to cover the cost of production and the industry continues to suffer heavy losses on this account. The full requirement of raw materials for the paper mills in Orissa could not be met from the company's leased forests, and sizeable quantities had to be brought in from distant regions like Assam, North Bengal and Maharashtra or purchased otherwise at considerably higher costs. Exemption of import duty on wood pulp should help the paper industry to overcome to some extent the difficult raw material position. About 20 per cent of the coal required at the paper mills had to be transported by road at higher cost and the quality of coal continued to be poor. With the recent hike in railway freight, increase in the price of petrol and petroleum products and general rise in prices, the costs will be further pushed up. The company is implementing a Rs 23-crore scheme of modernisation and renovation of its paper mills in Orissa, which was set up in 1962. Orders for most of the equipment have been placed. The scheme would be implemented before the end of 1987.

The production of cement increased from the previous year's 2,88,954 tonnes to 4,81,144 tonnes and the plant attained 96 per cent capacity use. The power position in Rajasthan continues to be very unsatisfactory. The company had to use captive DG power to the extent of about 50 per cent of the total requirement at a very heavey extra cost. There has been a substantial rise in the cost of coal and other inputs as well as in railway freight, gunny bags. Due to the Central and Railway Budgets for 1985-86, there have been further increases in freight and cost of petroleum and other products which in turn have increased the cost of production of cement. Excise duty on cement has also been enhanced by Rs 20 per tonne. Moreover, cement production in the country has increased by six million tonnes in the last two years and it is now available freely in almost all parts of the country. The prices of non-levy cement have substantially gone down. Decrease in price realisation, coupled with increase in production costs has particularly affected adversely the new cement plants. The JK Batteries' factory was closed down following a tripartite settlement with the workmen. The government of MP also accorded its permission for the closure.

In association with Industrial Promotion and Investment Corporation of Orissa the company has promoted a joint sector company, 'Orissa Synthetics' for setting up a project for the manufacture of 15,000 tonnes per annum of polyester staple fibre at Dhenkanal, a backward area in Orissa at an estimated cost of Rs 73 crore. The latest world-renowned 'Du Pont' technology will be made available for the project through Chemtex of USA. The financial arrangements for the project have been tied up. Orders for the imported equipment and long delivery indigenous machinery have been placed. The civil construction work is in full swing and the project is expected to go on stream during 1986. The fixed assets of the paper mills division have been revalued as on January 1, 1984 and the resultant increase of Rs 47.49 crore in the value of these assets has been credited to capital reserve. During 1984, the company earned a gross profit of Rs 9.44 crore against Rs 6.19 crore in the previous year following a turnover of Rs 82.41 crore against Rs 65.88 crore. These figures also reflect an increase in margins. After depreciation, there was a net profit of Rs 172 lakh compared to a net loss of Rs 94 lakh previously. The unchanged dividend was covered 1.67 times by earnings.

*KESORAM INDUSTRIES AND COTTON MILLS* has selected Balasore, a 'no-industry' district of Orissa for locating its project for the manufacture of one million tyres and tubes per annum. The company has already got a letter of intent and is negotiating for foreign collaboration, for technical know-how, basic engineering and other necessary assistance for the implementation of the project. Its applications for capacity expansion of its cement plant in Karnataka, from 5 lakh tonnes to 15 lakh tonnes per annum, and for the manufacture of white cement in Rajasthan and sponge iron in Orissa are pending with the government. Meanwhile, the company started clinker production towards the end of March last at its new plant at Sedam in Karnataka. Certain teething difficulties were detected and steps have been taken to overcome them. Even though power was released by the KSEB for commissioning of the plant, a power-cut to the extent of 80 per cent was imposed unexpectedly from April 1, 1985. The company, therefore, had to stop the plant. The matter has been taken up with the Electricity Board to find a solution to this difficulty. The company has placed orders for two diesel generating sets of 4 MW each, which are expected to be commissioned in July 1985. The company's other cement plant in AP produced 7,61,581 tonnes of cement against 7,49,197 tonnes in the previous year. Production would have been higher, but for the heavy power-cut during April 1984. Moreover, erratic and inadequate availability of wagons, particularly from November 1984 to March last, adversely affected cement despatches and consequently production had to be curtailed.

There has been steep increase in the cost of production. The price of coal supplied by the Singareni Collieries has been recently increased from Rs 210 to Rs 323 per tonne, which has increased the company's cost by Rs 16 lakh per month. Apart from cost increase, the realisation of non-levey cement has come down due to greater availability of cement in the market. The company alongwith other cement producers challenged in the Supreme Court the increase in the Minerals Rights Tax imposed by the AP government to 900 per cent, that is, from 4.50 to Rs 40.50 per tonne. The Supreme Court has issued an order asking the industry to pay the tax at 300 per cent immediately and submit suitable security for the remaining 600 per cent. After a detailed review, the Central government agreed to de-rate the company's installed capacity from 9 lakh tonnes to 8.26 lakh tonnes per annum from November 15, 1984 till end of March 1985. The company has now asked for further capacity reduction on a permanent basis in view of the fact that the expansion of 2 lakh tonnes capacity, granted earlier by the government, was based on the availability of dry fly-ash from APSEB, which has now practically stopped supplies since its 5-year agreement with the company has come to an end in March last. The working of the textile division was marginally better than that of the previous year. On February 16 last, workmen of the Card and Frame departments struck work in a "deliberate, concerted and illegal" manner. This led to heavy accumulation of process-stock and a shortage of materials in succeeding processes resulting in complete stoppage of production. The management imposed a partial lock-out the next day. After a week lock-out was declared in the other departments of the textile section. In spite of the conciliation efforts by the Government of West Bengal, the dispute could not be resolved and the lock-out continued.

Due to competition from imported rayon yarn and demand recession during the first few months of the year, prices of rayon yarn continued to be unremunerative and production had to be curtailed for some time. Gradually, however, the offtake improved and full production was resumed. The offtake of transparent paper was also poor earlier in the year, but subsequently the situation improved. In the last Union Budget, import duty on wood pulp was abolished, which would help improve the profitability of these sections. The cost of production, however, will increase due to higher charges for power, coal, diesel and other inputs. Production of the spun pipes and foundaries section was lower at 28,010 tonnes as against 31,886 tonnes in the previous year. Export prices are absolutely unremunerative because of the high cost of production. The performance of this section can be improved but for demand recession. Offtake of the refractory section continues to be sluggish and prices are unremunerative. The directors expect the offtake to improve by the end of 1985. Considering the various constraints it had to face, Kesoram's overall working has been satisfactory with the gross profit a shade higher at Rs 16.57 crore against Rs 16.27 crore in the previous year following increase in sales from 125.84 crore to Rs 133.48 crore. These figures show a decline in margins. With a saving in tax liability, however, net profit has expanded from Rs 4.12 crore to Rs 8.05 crore. The unchanged dividend of 23.5 per cent is covered 3.84 times by earnings as against 2.18 times previously. A S Gupta resigned from the board during the year.

*WESTERN MINISTIL* has suffered a mild setback in its working during 1984 on account of lower sales realisation in the first quarter of the year due to a sluggish demand for its products, coupled with an increase in input costs in the latter half of the year. Production of steel ingots/billets was higher at 45,086 tonnes against 43,044 tonnes in the previous year and sales were 45,185 tonnes against 42,734 tonnes. Although sales brought in Rs 17 crore against Rs 15.17 crore, gross profit declined from Rs 95 lakh to Rs 77 lakh reflecting contraction of margins. Net profit was also lower at Rs 42 lakh (Rs 58 lakh). Dividend has been stepped up by 5 points to 20 per cent which is covered 5.25 times against 9.66 times previously. The company created additional assets to the extent of over Rs 40 lakh as against Rs 17 lakh in 1983. The bulk of these assets were in the form of plant and equipment required to be installed for the abatement of smoke nuisance. The company's performance during the current year has been satisfactory. The company made a 'rights' issue of Rs 20 lakh to the existing shareholders on a one-for-two basis, which was oversubscribed.

*SOORAJ AUTOMOBILES* will be entering the capital market on August 6 with a public issue of 7 lakh equity shares of Rs 10 each at par to raise a part of the finance required for its expansion project estimated to cost Rs 80 lakh. The company is manufacturing diesel motorcycle for the first time in India. The plant at Saharanpur in UP is in trial production for the last one year manufacturing 50 motorcycles a month. The Automotive Research Association of India, Pune, has certified the optimum fuel consumption of the vehicle at 86 km a litre. The product has been well received in Gujarat and Tamil Nadu where it is being marketed at present. The company now proposes to increase production to 500 motorcycles a month. It has already booked orders to cover six months' production. The company purchases 70 per cent of the components required for the vehicle from various existing manufacturers in the field. This has enabled it to drastically reduce the project cost. The major raw materials required for the manufacture of the remaining components are all indigenously available. The main promoters of the company are two entrepreneurs—Ajay Paul, Managing Director, who is a mechanical engineer, and Nirbhay Paul Sharma who is a business management graduate. They are brothers and their family has been in the automobiles business for the last two decades. According to Ajay Paul, the vehicle is light and versatile and as such can be used more effectively both in the rural and urban areas. The company produces two models—one being the kick-start model and the other self-start model. This is again for the first time that a motorcycle is being manufactured in the country with a self-start arrangement. The cost of running the company's vehicle is almost ⅓rd of a 50 CC motorcycle moped. Moreover, it has lower maintenance and has a good appearance and competitive price for the same horse power. About 40 dealers have been appointed in different states. The company does not foresee any problem in selling its meagre production of 500 motorcycles per month, keeping in view its well organised marketing network. The board of directors is of the opinion that the company will earn sufficient profits to pay a minimum *pro rata* dividend of 12 per cent for 1985 to new shareholders. The issue is managed by MEFCOMS, New Delhi.

### INDO-PAK RELATIONS

# Climate of Mistrust

**Rita Manchanda**

THE wonder is that the present phase of the Indo-Pakistan dialogue has not foundered upon the layer upon mounting layer of mutual suspicion and mistrust about each other's intentions. In New Delhi especially, suspicions about Pakistan's nuclear intentions have acquired alarmist proportions with the recent disclosure of Islamabad successfully testing the US-made Kryton detonators, normally used in a nuclear explosion. Misgivings continue also to persist on Pakistan's support for terrorist activity in Punjab.

In Islamabad, there is sharp resentment over what the controlled press there has described as Rajiv Gandhi's 'Pakistan bashing' during his recent foreign tour. India has been accused of seeking to drive a wedge between the US and Pakistan and what is infinitely worse of partially succeeding in convincing the Reagan administration that American policy towards Pakistan as a front-line state must be moderated by India's perception of its 'genuine' interests in South Asia. The suspension of the agreement to transfer the E-2 Hawkeye system to Pakistan is seen as a demonstration of a shift in US thinking. However, the recent announcement of Washington's decision to speedily despatch 100 AIML sidewinder missiles comes as a timely reminder that as long as the situation in Afghanistan and the Gulf remains, the US-Pakistan special relationship will continue.

Yet despite this backdrop of acute misgivings, officials in the Foreign Ministries of the two countries are currently engrossed in working out confidence-building cooperative interaction. Consequently although the euphoria was missing, the second meeting of the Indo-Pakistan joint Ministerial commission did take place in the first week of July. And at the end of the month, the foreign secretaries of the two countries will meet to discuss the gamut of bilateral political relations. Significantly, Pakistan's Foreign Minister Yaqub Khan commenting on the meeting in New Delhi said that the two Foreign Secretaries would address themselves to finalising a common draft that would marry the Pakistan proposal of a no-war pact and Indian offer of a Friendship Treaty. Indian officials however have been at pains to say that the draft will be but one of the things that will be discussed. The exchanges between Niaz Naik and Romesh Bhandari are being projected here as a continuation of his exploratory April visit to Islamabad and not as a follow up of the May 84 visit of the then foreign secretary M K Rasgotra when the talks were specifically on finalising a synthesised third draft. Presumably, through this subtle nuance in approach, policy-makers in New Delhi wish to stress their increasing wariness about talking of peace when misgivings about Islamabad's hostile intentions are so acute.

This dualism in Indo-Pakistan interaction was in sharp evidence during the meeting of the Joint Commission in New Delhi. The inaugural addresses of both the Ministers struck a cautious note about the 'modest' progress that could reasonably be expected. Yaqub Khan stressed that direction was more important than speed in the finalisation of the agreements and added that "while neither side should procrastinate ... they should not be unduly discouraged or daunted if issues arise that require further and more thorough consideration".

However, the initiative taken by President Zia to telephone the Prime Minister encouraging him to give a political impetus to the talks, had led some to hope that a breakthrough might be expected on such intractable issues as bilateral trade. The importance of the meeting taking place on the thirteenth anniversary of the Simla agreement was also noted by both sides. Indeed, the political impetus given to the talks by Zia and Gandhi was reflected in the discussion on general principles but when it came to concrete details, the difficulties seemed as insurmountable as ever.

Yaqub Khan had acknowledged at the outset that the present level of trade was not satisfactory. However, Pakistan refused to budge from the position that bilateral trade would be within the framework of an agreed list of 42 or more items to be traded only through its state trading corporation: India has rejected this negative and discriminatory trade regime offer and insisted upon the same terms as applied by Islamabad to its other trading partners. If Pakistan had fears of its infant industry being swamped a list could be drawn up of items for restricted entry, it was suggested. No progress was possible and the deadlock remained fast.

On travel, India proposed the opening of a second route through Kokrapar on the Gujarat Sind border. Pakistan refused. Exemption from police reporting was proposed for all visitors staying only a fortnight. This was enventually whittled down to businessmen and transit travellers. On the cultural side the two were able to agree upon a draft but the finalisation of the accord was again postponed. It excluded exchange of films, songs, dances, newspapers and periodicals.

While the details of step-by-step functional co-operation were being worked out by the four subcommissions, Yaqub Khan in his meeting with Rajiv Gandhi and G Parthasarathy sought unsuccessfully to allay their misgivings about Pakistan's nuclear pro-

## APPOINTMENTS

**Sardar Patel Institute of Economic and Social Research**

Thaltej Road, Ahmedabad 380 054

Invites applications for the position of DIRECTOR to head this Institute. The post will be filled in for a period of five years with a possibility of further extension. The applicant should have a good academic record with a Masters' degree, preferably Ph. D. with outstanding teaching/research experience and published work of recognised merits. Ability to provide academic leadership in conducting and guiding research is essential. The pay-scale of the post is the same as that of University Professor i. e. Rs. 1500-60-1800-100-2000-125/2-2500 with other allowances such as DA/HRA/CLA etc. admissible as per rules of the Institute. The Director will get a special allowance of Rs. 500/-p.m. and residential telephone facility.

Persons interested may submit detailed bio-data on or before 20/9/1985.

gramme and assistance to terrorists in the Punjab. Yaqub Khan proposed mutual or international inspection of each other's facilities. His offer was treated with little credibility. Even if it was accepted, Pakistan could have already secreted away a few bombs before the regime could come into force. In any case the IAEA has no experience in inspecting uranium enrichment facilities like that of Pakistan. Besides, it would imply that India as well as Pakistan would have to surrender their political use of the nuclear option. On the Punjab problem, Yaqub Khan was told of intelligence reports of inflammatory propaganda aimed at the Sikhs who crossed the border and training facilities and supply of arms.

No doubt these suspicions will continue to retard the efforts of the two sides to reduce tension by undertaking such confidence-building measures as a no war pact-cum-friendship treaty or functional co-operation through the joint commission. In the prevailing climate of mistrust, South Block feels that the no war pact offer is designed to dilute Pakistan's commitment to bilateralism under the Simla agreement. The agreement in any case guarantees all that the no war pact would assure, 'non-aggression'. The friendship treaty involves not only active co-operation but also includes a clause prohibiting the granting of bases to any foreign country. Pakistan has persistently refused to accept this restriction on its 'sovereignty'.

Yaqub Khan had confidently assured some correspondents in New Delhi that the third draft would be finalised in time for the SARC summit in Dhaka in December. However in view of the prevailing climate of mistrust, the Naik-Bhandari meeting can be expected to do little more than go ove already covered ground.

# Loans, Doles and the Poverty Line

**Bharat Dogra**

VARIOUS schemes of loans, subsidies and grants to the poor have been prominent in the government's poverty-alleviation efforts. Recently the loans made under the Integrated Rural Development Programme (IRDP) have received a lot of prominence as a means of raising people 'above the poverty line'. On the basis of several interviews about the impact of such programmes, this is an assessment of their functioning in the villages of Manikpur block of Banda district, Uttar Pradesh.

One fact which stands out clearly is the prominence of such schemes which involve giving subsidised loans or grants to selected beneficiaries in the government's overall perspective on fighting poverty. Whether one talks to officials or to the rural poor, or examines official publicity handouts, it is clear that in everyone's perception poverty alleviation by government is equated with such programmes. Although there is much scope for redistribution of ceiling land in this area of sharp land inequalities and of improving the terms of share-cropping or minimum wages, all this is hardly talked about in the context of poverty alleviation. At the most, distribution of community land is considered.

Specifically, we may examine the performance of two programmes based on this loan and dole approach. One relates to the rehabilitation of bonded labour and the other is the more widespread IRDP.

In the case of the first programme, at first it was estimated that there were 2,316 bonded labourers in Manikpur block. This was stated on the basis of a study of bonded labour in this block sponsored by the labour department, and carried out by the Uttar Pradesh Development Systems Corporation. According to the same study, 45 per cent of the bonded labourers had been bonded for over 10 years.

Following this study, an office for the rehabilitation of bonded labourers was set up in Manikpur. It was found on the basis of a door-to-door survey by this office that only 252 bonded labourers existed in this block. The cases of all these bonded labourers were referred to the office of a sub-divisional magistrate who decided that only 117 of them were bonded. While all this was going on, many bonded labourers were of course being forced under threats to say that they were 'free'. These 117 bonded labourers were then rehabilitated by giving them several types of assets, including weak and sick animals and a 'band and bugle' in at least one case.

It is anyone's guess how much cash assistance was actually given to the bonded labourers after the tortuous process of identifying them had continued for several years, and how much money was spent on the research work, survey, transport, salaries, etc, relating to the identification of bonded labourers. The money spent under the second head is likely to have been much higher than that under the former head. Needless to add, no legal action has been taken against any employer of bonded labour.

As for IRDP, according to official statistics, nearly 600 people became its beneficiaries in Manikpur block in 1984. The population of Manikpur block is nearly one lakh, and the percentage of people living below the poverty line is likely to be higher than the national average. In the context of these facts it would appear that despite all the publicity, the coverage of IRDP is still quite narrow compared to the overall number of the poor.

In the case of IRDP loans, the feeling is quite widespread that at least the subsidy component is wiped out because of corruption and the expenses incurred by the beneficiary in pursuing the loan. Whatever contribution such schemes make to the alleviation of poverty, they have at least spawned a new breed of middlemen who get something for the beneficiaries, something for the officials, something for the dealers (from whom 'income-earning assets' are purchased) and of course something for themselves. It is quite common to come across beneficiaries who feel they have been cheated, or who claim to have learnt from some source or other that a higher loan has been shown against their name than what they had got. Even if all these complaints are not true, the fact that the 'beneficiaries' should be so uncertain and suspicious of the benefits they have received speaks for itself. Their suspicions need to be judged against the past experience of bank loans where people have sometimes even been held responsible for loans taken by others in their name in collusion with officials.

The poor quality of the animals or other income earning assets received by the beneficiaries is another frequent complaint. What is more, insurance claims are generally not settled for dead animals despite assurances to the contrary.

It may well be asked, in view of this unfavourable experience with these loans, why there is demand for them among the poor? One reason is that the middlemen who settle several of these deals are never anxious to convince the beneficiaries that the loans have to be paid back. In at least some cases the loan is taken in the spirit that 'if the government is giving something, why not take it?' instead of being treated seriously as a means for permanent improvement in income generation. The harsh truth that the loan has to be paid back is faced when the payments become due. Then some of the beneficiaries start fleeing when they see the vehicles of officials approach, but cannot always escape and are sent to the lock-up.

Lastly, some changes in the attitudes of the beneficiaries (specially tribals who live here in large numbers) brought about by the emphasis on this type of development programmes are also significant. Instead of redistribution of land and then mobilisation of the masses for land-improvement or small irrigation schemes (or the mobilisation of co-operatives of the poor for work in forests or quarries), this kind of development leads to the poor running around middlemen and officials to get some help and each individual competitively trying his luck in this effort instead of there being any community effort for improvement of working and living conditions.

# Women, Personal Laws and the Struggle for Secularism

### Vimal Balasubrahmanyam

RECENTLY, on April 23, the Supreme Court in a landmark judgment upheld the divorced Muslim woman's right to maintenance. The case got good coverage from the media. Some Muslim groups have reportedly criticised the judgment saying that it violates their personal law, while a Muslim lawyer has filed a petition seeking a review of the judgment. Judgments such as these need to be publicised for two reasons. One, unless Muslim women of all classes and especially from the disadvantaged sections are aware of the Supreme Court's ruling, it would be easy to dupe them into continuing to believe that the destitute divorcee has no right to maintenance according to the personal law. Secondly, all issues regarding various laws applicable to different religions are of relevance to the women's movement and information on them needs to be spread.

A major demand of women's groups in this country is that the government should enact a uniform civil code applicable to people of all religions. This was promised decades ago under Article 44 of the Constitution but there is no sign of any action towards implementing it. The laws relating to marriage, divorce, custody of children, maintenance and inheritance are still different for different religions although ours is supposed to be a secular state. Knowledge of how these different laws discriminate against women of different religions is necessary so that women, regardless of which religion they belong to, will realise their common cause in the demand for a common civil code. And for such knowledge to spread the media has a crucial role to play.

Consider, for example, the April 23 Supreme Court judgment. It made front page news; it was followed up by articles describing the finer legal details. There were editorials welcoming the judgment, while letters to editors expressed shades of opinion both for and against the judgment. And yet, in 1979, when the same Supreme Court gave a similar judgment on the same issue of maintenance for Muslim divorcees, there was hardly a ripple by way of press or public response.

In the *Bai Tahira versus Ali Hussein* case (AIR 1979 SC362), the Supreme Court had said that the payment of trifling amounts of *mehr* to a divorced Muslim woman is no substitute for maintenance. Earlier the Bombay High Court had adhered to a rigid interpretation of the personal law and had refused to grant maintenance allowance to the woman petitioner concerned. This was reversed by the Supreme Court in the first of the landmark judgments on this issue which is now, six years later, being discussed with so much animation.

Again, in 1980, the Supreme Court in its second important judgment on this subject (*Times of India*, Bombay, May 9, 1980) granted maintenance allowance to a divorced Muslim woman, this time reversing the judgment of the AP High Court. On this occasion the Supreme Court also passed severe strictures against the AP High Court for not complying with the precedent already set by the *Bai Tahira* ruling.

The role of the media is undeniable in making the public conscious of the implications of liberal new interpretations of the law, especially personal laws. If the April 23 judgment got the media treatment which the earlier two failed to generate, it is probably because it is only in recent months that the media has become more responsible to legal issues affecting the status of women. In the past couple of years a number of petitions have been filed by individual women challenging obsolete and discriminatory laws covering various religions. The media has taken note of some of these happenings and helped in generating public consciousness as well as public support on these issues. However, while the print media has responded, the government-controlled audio-visual media has not fulfilled its potential for raising awareness on such a socially relevant matter. Further, some channel of communication has to be devised by which such information also reaches those sections which are well beyond the influence of the formal media.

This is necessary not only in regard to landmark judgments but even in the matter of basic and indisputable legal rights. For example, when the Committee on the Status of Women in India was making its investigations, umpteen cases were noted of women not exercising even their limited property rights under existing laws, mainly because of ignorance. Obviously, ignorance about liberal *new* interpretations of laws is likely to be even greater.

Coming back to personal laws, since the Muslim personal law is rather topical at the moment, it is interesting to note that there have been important judgments beneficial to Muslim women (not necessarily in the landmark category, but significant enough) and one wonders how many of them are aware of these legal possibilities.

For example, in the case of custody of male children, the courts have allowed Muslim mothers to take recourse to the more speedy remedy of the *habeas corpus* petition rather than go through the lengthy litigation inevitable under the Guardian and Wards Act. Under personal law, Muslim mothers are entitled to preferential custody of sons upto the age of seven. In a number of decisions the courts have acknolwedged that custody cases can drag on for years and that the son may then cross the seven-year age mark, leaving the mother very little chance of getting custody.

Similarly, there have been important decisions on the Muslim wife's right to divorce if she has been denied maintenance for two years. There have of course been conflicting decisions and some courts have ruled that if it is the woman's 'fault' and the husband is 'justified' in denying maintenance, then she cannot 'take advantage of her own wrong'. Other judges have held that the wife's right to divorce in this circumstance is absolute regardless of whose 'fault' it is. The Status of Women Committee had dwelt on this aspect at some length and had recommended that the Muslim woman's right to divorce on denial of maintenance should be an absolute one. This is another issue where awareness and discussion would be helpful to affected Muslim women.

Another important judgment which deserves publicity was given last year by the Madras High Court (*Hindu*, August 6, 1984). A Muslim employee of the Indian Airlines was refused permission to marry a second wife under the Airlines' rule enforcing monogamy. He had challenged this in a petition, claiming that the rule violated his rights under personal law. The court, however, dismissed the petition and said that notwithstanding the position under personal law, the employee would have to abide by the Airlines' rule.

In an interesting case reported this April (*Patriot*, April 24, 1985) a Muslim woman has challenged her husband's right to marry a second wife. According to the news report, one of the points of argument is that according to Qoranic law, a man can marry again only if he can financially support both wives and ensure equal treatment for both.

The most significant case in recent months is of course the petition in the Supreme Court by Shehnaaz Sheikh of Bombay who has challenged the constitutional validity of Muslim personal law. She has argued that it violates Article 14 by treating Muslim women as unequal to Muslim men. She has also pointed out that the government has enacted laws which have given benefits to Hindu women but has failed to introduce similar legislation to do justice to Muslim women, thus violating Article 14. The case has received good media coverage and generated much public support. And yet, how many members of the public are aware that a similar petition challenging personal law was filed by another Muslim woman last year?

According to a news report (*Patriot*, July 27, 1984), a Muslim woman of Pune has challenged personal law and, interestingly, is supported in her action by her husband. Their grievance relates mainly to the topic of adoption which, I understand, does not have clear recognition under personal law. The couple have an adopted son and they have said that as his legal status is *not* acknowledged by the Muslim community, his future is uncertain. The petition says that since polygamy and unilateral divorce are permitted under personal law, childless wives are at a disadvantage. Like Shehnaaz's petition this one also refers to the government's initiative in reforming Hindu laws to benefit Hindu women but failing to introduce similar reforms in Muslim law.

Incidentally, the *Patriot* item mentions that CPI(M) general secretary E M S Namboodiripad, had issued a statement applauding the courageous action of the Pune couple. The news about this petition, to the best of my knowledge, did not appear in any of the other newspapers. One wonders if even *Patriot* would have picked up this piece of news but for the fact that a senior, veteran Leftist leader happened to make a public statement on it! And yet, this petition deserves as much public support as Shehnaaz's petition has rightly evoked. The role of the media in publicising such initiatives and generating support is obvious.

While Muslim personal law is in the news off and on, one must remember that discriminatory laws covering other religions too have been challenged in recent months by individual women, backed by women's groups. The latter have been vocal and active in publicising these issues and hence the greater general awareness about them as well as the more positive media coverage. These cases relate to inheritance laws which discriminate against Christian women in Kerala, Hindu joint family property law which discriminates against daughters, and Indian Divorce Act applicable to the Christian community which is unfair to Christian wives.

Against this broad background, the question naturally arises: what should be the stand of the women's movement on this issue of personal laws? There is of course a tacit agreement that women should unite in the demand for a common civil code. This was in fact highlighted and emphasised at the women's studies conference at Trivandrum last year. However, since the struggle to achieve this is going to be long and hard, it seems necessary for the movement to adopt also the more immediate objective of creating public opinion in favour of more liberal interpretations of existing laws covering different religions. The April 23 judgment on maintenance for Muslim divorcees is an example of an enlightened interpretation of the law which was earlier viewed from a rigidly traditional stand. Predictably, voices of protest against the judgment have emerged and these need to be actively countered, perhaps drowned, by voices of support and approval. The very climate of public opinion needs to be guided into favouring such liberal judgments which help in an important way to nullify to some extent the inequities in the existing laws.

Of course, the question may also be asked, why should women alone be uniting on this issue? Undeniably, all progressive sections, male and female, are agreed on the need for a uniform civil code. In fact, when two years ago there was this demand for a Sikh personal law, civil liberties groups were as vocal as women's groups in strongly condemning this retrograde step. (If a Sikh personal law comes into being, it would erode women's rights to property and would enforce compulsory marriage of a widow with the dead husband's brother.) However, two examples will illustrate why women of all religions have a special stake in uniting on this personal law issue.

It will be recalled that in the late 50s, when former justice V R Krishna Iyer was law minister in Kerala, he had introduced a Bill seeking to amend the inheritance laws which discriminate against Christian women in that state. He failed in his effort because he was opposed not only by the Christian Establishment but also by Muslim leaders and other members of the Opposition. The reason is obvious. Any success in reforming the laws governing one religious community is bound to pave the way for similar reform in the laws applicable to other religions. The fundamentalist, conservative and patriarchal bastion of all religions, however communal or fanantical they may otherwise be towards one another, are bound to unite when it comes to defending personal laws and opposing their reform. There is also the patently political angle.

Last year, when former Chief Justice Potti of Gujarat High Court stated during a seminar in Trivandrum that there ought to be a uniform civil code, he was criticised not only by Muslim leaders but reportedly also by Kerala's Hindu chief minister, K Karunakaran. Obviously, vote-catching requires refraining from 'offending' religious sentiments. And leaving personal laws untouched suits conservative and opportunist males of all religions and political parties.

The second example is more bizarre. Once again, this was an item in the *Patriot*. (Some time in 1982, I have the cutting but not the exact date.) According to the news report, a Hindu male had filed a petition in the Supreme Court charging that the Hindu Marriage Act enforcing monogamy is discriminatory and violates Article 14. His contention is that the state allows Muslim men to have four wives and Jewish men to have two wives but discriminates against Hindu men by allowing them to have only one wife.

Thus, the discriminations inherent in the laws for different religions can be viewed differently depending on whether you are male or female. Muslim personal law, for example, can be seen either as a potential source of oppression to Muslim women or as a source conferring 'benefits' to Muslim men which the men of other religions too wish to enjoy. The irony is that in both cases Article 14 is the bone of contention.

Against this general picture, the need for action by women's groups on these discriminatory laws becomes logical. And along with the demand for a single civil code, the stake which the women's movement as a whole has in achieving a truly secular state also becomes obvious. The Status of Women Committee had long ago observed that no religion in its institutionalised form concedes or accepts the concept of gender equality. Secularism has not so far been seen as an issue of specific concern to the women's movement as such. In recent times, women's groups doing relief work among victims of communal violence have realised how devastating the impact has been, especially on women in the affected areas. Although women's groups do have myriad issues to take up, hopefully there will be increasing realisation among them that secularism and the goal of a truly secular state are also important areas for stimulating awareness and action.

SELF AND SOCIETY

*A Study in Gandhian Thought*

*Self and Society* is a systematic reconstruction of Gandhi's thought about man and his relationship with society and nature, viewed against the back-drop of the inadequacies of related Western thought.

Dr. Roy focuses on the nature of the predicament of modern man, tracing its roots in the perspectives of history and philosophy. He identifies the basic cause of the predicament as the modern tendency to emphasize the augmentation of fortune as the necessary prop to the development of human personality and as the basic desideratum of the man-man and man-nature relationship.

# Thatcherism and Reform of Welfare State

### Michael Jacobs

THE British government has unveiled its plans for the most comprehensive reform of the Welfare State since the latter was established after the Second World War. The consultative Green Paper published in May by Social Services Secretary Norman Fowler may have failed to live up to its pre-publication billing as a coherent, systematic reformulation of welfare provision: it looked more like a simple cost-cutting exercise. But within its proposals do lie fundamental changes in the principles of the welfare state which reveal clearly the ideological drive of Margaret Thatcher.

The proposals are based on four reviews of social security instituted by Fowler last year, on pensions, low-income support, family allowances and housing benefit. The public face of the reviews was impressive: over 40,000 consultation documents were issued and 4,500 pieces of evidence received. But privately the process was characterised by political calculation and ministerial infighting—principally between Fowler and the Chancellor of the Exchequer, Nigel Lawson, over the savings to be made—and the final proposals differ substantially from those recommended by the review teams. The latter's remit had already precluded the establishment of an integrated tax and welfare system, for which many who gave evidence pressed, while the goal of cutting costs prevented the proper 'rationalisation' of the system the Prime Minister had ordered. Contrary to her claims, there was little fat that could be cut off welfare provision without hurting the poor who depend on it. So it has proved.

The reviews—which were not part of the Tories' 1983 Manifesto—were forced on the government in mid-term by financial considerations. In common with all the industrialised nations, recession-hit Britain has encountered a 'fiscal crisis' in which the rising cost of welfare (five times faster than the rate of inflation since 1945) can less and less be afforded out of the profits of industry and the taxation of a declining number of employed workers. While welfare provision has always been an important social base for economic growth—controlling and moulding the labour force—industrial profitability has fallen so low over the last 20 years that the State has found itself with a simple problem of financing it. In Britain the social security budget is now £40 bn pa, nearly one-third of all government expenditure. In the last six years alone it has risen 30 per cent in real terms, and the trend remains upwards. Upto half of this rise is due to the three-fold increase in unemployment since Margaret Thatcher came to power in 1979—with 3½ mn officially out of work, the direct cost of unemployment benefits is a huge £ 7½ bn—and the rest is due to a rise in low-wage-based poverty. Five per cent of the population now lives below the subsistence-level poverty line. Cost has been compounded by complexity: the social security system's rules run to 16,000 paragraphs, administered by a staff of 38,000.

But alongside financial necessity stands Margaret Thatcher's ideological antipathy to the whole concept of State welfare. "Can we afford a system which encourages idleness and irresponsibility, and discourages initiative and enterprise?" asked her protégé Nigel Lawson recently. For Margaret Thatcher and her followers, social security reduces the incentive to work: many of the unemployed, they claim, are better off on the dole than in a job. In its crusade to 'free the labour market' the government has already been pushing the wages of low-paid workers down—through its own public sector pay policy, a variety of low-wage subsidies for young and part-time workers, and by the forthcoming abolition of the statutory councils setting minimum wages. Now welfare benefits are to follow. Although it is not yet known at what levels the new benefits will be set, the direction is clear. Under the Fowler proposals, the 'Family Income Supplement' to low-paid workers with children will be replaced by a new 'Family Credit' paid through the wage packet. This will encourage employers to set lower wages—the Credit will act like a subsidy. Similarly the new 'Income Support' for the poor (in and out of work) is to be based on net not gross income, thus reducing the high marginal rates of tax experienced by workers coming off the dole into low-paid jobs. The aim in both cases is to open up the labour market at the bottom end of the wages scale.

Even more fundamentally, the 'Thatcherites' are opposed to what they deride as the 'nanny State'. In looking after citizens 'from cradle to grave', the State, they say, saps individual independence and self-reliance, and removes the moral compunction to 'stand on one's own two feet'. Margaret Thatcher has frequently spoken of her desire to return to 'Victorian values'. The individualist self-help philosophy of Samuel Smiles has always been prominent amongst them. It is this philosophy which underpins both the two fundamental changes of principle embodied in the Fowler reforms.

First, there is a major move away from the principles of contributory insurance and of universality. These were the key features of the Beveridge Plan which laid the foundations of the welfare state in 1942. State pensions, unemployment and sickness benefits, child allowances, maternity and death grants—these were to be paid at a universal flat rate to every citizen *as of right*, regardless of income. They were to come out of a National Insurance Fund into which all those in work would contribute, proportionately according to income. However much or little, the individual's contributions were the moral basis of the provision he or she received. The Beveridge Plan assumed that governments would maintain full employment, so that the system would be self-financing. It envisaged 'National Assistance', paid according to the claimant's needs relative to income and wealth ('means-tested') being necessary only as a 'safety-net' for those permanently out of work who could not contribute to the National Insurance Fund.

As unemployment has risen, the contributory principle of the system has collapsed. There are now over eight mn people, more than one in seven of the population, dependent on Supplementary Benefit, the successor to National Assistance, set at subsistence level. (The rise in long-term unemployment means that only a third of those out of work actually receive Unemployment Benefit—which is contributory—since it lasts only a year.) Supplementary Benefit is means-tested, which involves claimants in a complicated and often humiliating bureaucratic enquiry into their personal circumstances. Many people still feel shame at claiming 'hand-outs'—means-tests remove the belief in a 'right to welfare' which attaches to universal benefits. As a result, more than £one bn worth of means-tested benefits go unclaimed every year.

The Fowler reforms make no effort to reinstate the principle of insurance. Unlike the Beveridge Plan it purports to emulate, the Green Paper does not mention the need to reduce unemployment. What it does do is to extend the principle of means-testing. Under the label of 'targeting relief to the most needy'—a goal which the low take-up of means-tested benefits suggests will not in fact be achieved—Fowler intends to abolish the universal maternity and death grants and replace them by discretionary means-tested payments. In replacing Supplementary Benefit by 'Income Support', he proposes to cut all additional grants paid to the poor, such as for heating, special diets, laundry and basic furniture. These will now have to be claimed, with a separate means-test, from a discretionary Social Fund, sometimes in the form of loans. In an explicit throwback to the Victorian values of blaming the victim, claimants "will be given help by social workers (and psychologists) on how to manage their budgets". As the Social Fund is to be cash-limited (the first part of the Welfare State ever to be so) this may be of particular use to claimants at the end of the financial year for whom no money is left

Fowler has not abolished Child Benefit, the widely popular (and almost 100 per cent claimed) universal allowance paid direct to mothers, largely because of pressure from the Conservative Women's Group and other lobby organisations. But from his statement—after the Green Paper—that Child Benefit would not be raised in line with inflation this year the government has clearly broadcast its intention to phase it down, and replace it in importance by the non-universal Family Credit and means-tested Income Support.

(This year's cut will immediately hurt seven mn mothers and 12 mn children, and specifically reneges on a government promise that Child Benefit would be uprated each year to retain its value. The move against the Benefit is only one of the Fowler reforms which affects women adversely: the new Family Credit will be paid to men. Abolition of maternity grant and of the state earnings-related pension scheme—which allows for maternity leave and gives divorced women a right to share in their husband's pension—will particularly hurt women, while the cutting of benefit to young people under 25 will create more dependency at home, reducing women's disposable income and the possibility of independence. An attack on the position of women has been a recurring feature of the Thatcher administration.)

The second fundamental principle underlying the Fowler reforms is that of privatisation. This has been a major theme of the Conservative government. It has taken the form both of selling off public industries, such as British Telecom, Britoil, British Aerospace and the Gas Boards, and of contracting out elements of the National Health Service, local government and social services to private firms. The government's aim has again been both financial—raising money for the Public Sector Borrowing Requirement—and ideological. Its desire to 'roll back the frontiers of the State'—opening up new areas for profitable investment—neatly dovetails with its determination to diminish the strength of public sector trade unions.

The Fowler Green Paper outlines a third component of the privatisation programme, the abolition of the state earnings-related pension scheme (Serps). In effect, the government intends to privatise occupational pensions. Under Serps, eleven million contributing workers are guaranteed on retirement a second, earnings-related and inflation-proofed pension on top of their basic State pension. The scheme particularly benefits lower-paid workers, who receive a higher proportion of their earnings than the higher-paid, and those who change their job or who are made unemployed, since the pension is based on the best 20 years of employment. Serps was introduced with all-party support in 1975 (and reaffirmed by Norman Fowler 18 months ago) as a means to minimise inequality in old age. The government now plans to abolish it.

Ostensibly this is on grounds of finance. As the number of pensioners rises, the cost of Serps will rise, from £100 mn pa now to £23 bn (at current prices) in 50 years' time. But as the three specialist advisers appointed to the review team showed, Serps could have been modified to keep its cost down without abolishing it. Private pensions, which are run at a profit (and which attract tax relief) ultimately cost more. In fact, one of the advisers subsequently revealed, abolition was not discussed by the review team at all: the members were opposed to it. Fowler ignored their advice. The proposal he has put forward is an ingenious phasing out of the scheme so that those already in it are not affected. But for others abolition will hurt: the minimum employer's contribution to a private pension has been set at four per cent, which for lower-paid workers will mean a much smaller retirement income, while the unemployed will lose their additional pension rights altogether. One commentator has described the proposals as 'planned pauperisation'.

Meanwhile the City is preparing for what the *Financial Times* called a 'bonanza', as an expected £four bn is switched to private occupational pensions. Following the Green Paper announcement, shares in pension funds and Life Assurance companies shot up.

Despite the far-reaching nature of the Green Paper, the government has not released figures showing exactly who will benefit and who will not, and how much money it is intending to save. The figures were in fact removed (along with some intended changes, such as a reduction in unemployment benefit) at the printers: the government was clearly nervous about the public impact of the proposals. Unofficial estimates suggest that the savings will amount to about £one bn, principally through the cuts in housing benefit. Although this is less than the government would originally have wished, it is still a significant addition to recent cuts in the National Health Service and the education budget, aimed at reducing the State's welfare 'burden'. It also reinforces the regressive trend in the government's fiscal policy. Since 1979 £8.2 bn has been cut, in real terms, from the social security incomes of the poorest 15 per cent of the population, while tax cuts have furnished an extra £six bn to those on higher pay, including £2.6 bn to income-earners above £20,000 pa. (The UK average wage is about £8,000.) Michael Meacher, the Labour Party's Social Services spokesperson, recently described this redistribution as "Robin Hood in reverse ... a shift to the rich from the poor on an unprecedented scale".

Margaret Thatcher's calculation is that such a shift will gain her support rather than lose it. The savings made in the Green Paper will contribute to an estimated £five bn worth of tax cuts the Chancellor aims to give away in two years' time, just before the next General Election. The proposals carefully avoid touching the 'hidden welfare state' of tax relief on mortgages, company cars and other perks which benefit the more affluent. Meanwhile the abolition of Serps, it is hoped, will create a new class of private occupational pension holders with a financial and philosophical stake in Conservative rule. (Labour has pledged to reintroduce the State scheme.)

Yet this is not necessarily safe ground for the Tories. Public support for the principles (if not the practice) of the welfare State is one of the Labour Party's strongest bases, and its attack on the Green Paper has already been vociferous. "If this review is a series of reforms with the beneficial purpose of refining the system of social security, then the blitz was an exercise in town planning", said Neil Kinnock, Labour leader. The Party has already outlined its own proposals for reform, centering on the integration of the tax and benefit systems, with minimum and maximum wage limits, a progressive reform of the tax structure and universal benefits based on a 'participation' rather than 'subsistence' standard of living. Along with many organisations representing women, children and the elderly, it will seek to publicise the Green Paper's likely effects through the summer and into the autumn when the government finally publishes its figures. Already Fowler has come under pressure from backbench Tory MPs to modify the proposed housing benefit cuts, particularly as they affect pensioners. With the government sliding backwards in the polls, Margaret Thatcher's latest assault on the post-war consensus may prove a dangerous course.

# Jyoti Basu and Multinationals

### Ashok Rudra

SO now we have it from the horse's own mouth! Of course, the horse has spoken similarly many times in the past. But we never had a verbatim report. One knew from press reports about various steps taken by the West Bengal government and various declarations made by its chief minister about the government's industrial policy, but references to them by critics like ourselves were vehemently dismissed by the intellectual supporters of the Left Front as mischievous press distortions and we were advised to consult sacred party documents. But now we have the benefit of the full text of a speech made by Jyoti Basu on the occasion of the inauguration of the Hindustan Lever Fertiliser Factory on June 26 of this year. Thanks are due to the *Telegraph* for doing this important service to the public.

The chief minister stated in one place in the speech: "I, being a Communist, am being very frank." As such, we are entitled to take his observations as reflecting truthfully his views *as a Communist*. They are mostly about private industrial capital, both national and international. We present below some delectable passages.

Firstly, take his view about the aim with which capitalists invest capital. Speaking about the plant he was inaugurating he says " ... this particular factory which, I believe, represents an investment of Rs 22 crore for *helping agriculture* ..." (emphasis added). So, now we know! We had it wrong all along! Ever since the genesis of capitalism, one has taken for granted that capitalists invest for making profit. This assumption has not been restricted only to Marxists or other opponents of capitalism. It is a central principle of neo-classical economics as well as a matter of commonly held public opinion about businessmen's motivations. Now we know that when a multinational invests in the fertiliser industry, it does so "for helping agriculture"! Elaborating further his attitude towards multinationals and Indian monopoly capitalists, he had the following to say: " ... when somebody comes and tells me that he is interested, I do not take more than half a minute to agree with that industrialist. I tell him, you come along with me, we shall give you all the help necessary. I think a technical team has come from West Germany and America today along with Mr Goenka. It is a good thing. *I will show them around*" (emphasis added). The reader may not miss the last sentence. The chief minister promises to go around himself with Goenka and his German and American collaborators. Is this not what in English figurative speech is called red carpet treatment? As to Free Trade Zones, he said: "We have now got the tax-free export zone near Calcutta ... I am informed it is going ahead very well". Readers of *EPW* may remember that repeated angry fulminations in the columns of this journal against such zones, when they were being considered for other parts of the country, made by that passionate enemy of capitalism and ardent supporter of the Left Front writing under the signature of AM. But that was yesterday and they are all lost in "Yesterday's seven thousand years". Lost, along with many other things, like the equally passionate arguments against the kulak lobby forcing the government to raise the prices of farm products, for by now the West Bengal government has also fallen in with the line laid down by the Punjab rich farmers.

But we are digressing. We shall wait for another occasion when the chief minister will speak frankly as a communist about his red carpet treatment extended to jotedars. Let us come back to the multinationals. We do not want to quote the chief minister out of context. His red carpet treatment is subject to the following qualification: "The Union government has made guidelines for implementing laws in regard to not only foreign and multinational companies but monopolies as well. If any company following those guidelines ... operates and invests and reinvests ... it will be foolish not to support such ventures". In the course of the speech he made several references to having "differences with our planners and the Union government on many basic issues". But obviously there are no such differences on matters of policy towards monopolies and multinationals. For we have a clear statement that once the Union government's guidelines are followed multinationals and monopolies are all welcome. Anyway, we have further categorical declarations of policy in such words as the following: "We have a mixed economy. We mobilise the private sector, we mobilise the state sector so that *all of us together can advance the cause of our country*" (emphasis added). Surely, this sounds like a familiar tune! When did we hear it? It is difficult to answer; for it is like an immemorial folk song, chanting the role of private capital advancing the interests of the people. Listen again to the same tune: "We are now receiving applications from the private sector. We are inviting them for the joint sector. We have also invited the private sector to take the land and go ahead and do the needful *for the advancement of our economy*" (emphasis added). Do we recall faintly people in general, not only those calling themselves communists, getting upset at the very idea of a joint sector?

The occasion being the setting up of a fertiliser plant, we have also the benefit of the chief minister's views about the Green Revolution strategy. Thus: "Our farmers and agricultural labourers have had the ability to absorb the technology which is called high technology, along with appropriate technology of various kinds made available to them". What a pity that the chief minister should slip up in this fashion, especially as he has the benefit of advice from so many highly competent economists. How can "high technology" go along with any kind of "appropriate technology", given that the latter is conceived of as its anti-thesis? The New Technology in Indian agriculture consists of a package of chemical fertilisers, private pump irrigation, mechanisation, chemical pesticides, etc. The appropriate technology alternative would call for much less dependence on chemical fertilisers and much more on organic manures to be gathered from various unconventional sources; much less dependence on plant nutrients and plant protectors (e g, chemical pesticides) and much more on water; much greater reliance on public irrigation with the help of non-energy consuming contraptions, much less on privately owned energy consuming industrially manufactured pumps and other gadgets; improvement of traditional agricultural implements rather than the induction of tractors, harvestors and other mechineries; and so on. No kinds of appropriate technology are being made available to our farmers, either by the Government of India or by the Government of West Bengal.

That the Green Revolution strategy is inequality aggravating and unemployment creating (in its mechanisation aspect) has now been definitively established. Among the countless articles and books that have contributed to this is a book by Biplab Das Gupta who happens to be one of the economists attending upon the chief minister. How strange that despite this the chief minister should speak with the voice of Ludhiana. It is also strange that one can possibly ignore the all too well-known fact that the Green Revolution strategy has been sold to the country by American experts and that among the powerful forces behind it lie the lobby of multinational fertiliser manufacturers and fertiliser plant manufacturers. The chief minister s warm welcome to any industrialist who will invest in West Bengal is totally devoid of any awareness of the imperialist menace represented by these lobbies.

Those right-wing economists who support the technology associated with the Green Revolution sometimes argue that there is, after all, no other viable alternative. That there is an alternative to the massive use of chemical fertiliser and farm machinery has been firmly established by international experts in several reports issued by the FAO as well as the Government of India.* The designing of new instruments requiring little capital and scarce energy and absorbing a great deal of human and animal labour has taken the form of a powerful movement in many countries of the world, though unfortunately not in India. The Left Front Government of West Bengal has not shown the slightest interest in encouraging a technological approach to agricultural development which would be an alternative to the one being pursued by the Government of India and which has for its motto 'Growth at the Cost of Social Justice'. Jyoti Basu's speech fully exposes the total bankruptcy of the Left Front government's development policy.

## REVIEW

# Technological Underdevelopment

### M R Bhagavan

**Technological Capability in the Third World** edited by Martin Fransman and Kenneth King; London, Macmillan, 1984; pp 404.

LOOKING back over the last three decades, it is apparent that the ruling groups and the ruling classes in most underdeveloped countries (UDCs) have failed signally in generating sustained growth per capita in modern agriculture, industry, transport and communication. The crisis in capital accumulation that this signifies for the ruling groups has been further exacerbated by their inability even to organise the maintenance and proper functioning of the small modern sector they took over from the colonial regimes. There are both underlying and proximate reasons for this failure. The book under review deals with one of the important proximate causes, *viz*, the inability to create the conditions under which imported western technology can be assimilated, adapted and changed to overcome local constraints, and thus can be efficiently used, reproduced and further developed.

The building-up of technological capability within the confines of a nation-state is affected not only (i) by the technical, economic and educational conditions prevailing inside the country, but also even more (ii) by the social relations of production (both national and international) and the workings of imperialism (as experienced through the terms of foreign trade, foreign investment, etc). Most of the authors in this book deal with aspects of the first set of conditions. The notable exceptions are Colin Leys who puts the social relations of production at the centre of the stage and Manfred Bienefeld who discusses the impact of imperialism, *albeit* very obliquely.

In analysing the technical, economic and educational conditions that inhibit or promote indigenous technology-learning and technology-creating capacities, the various papers in the book crystallise around two approaches: the first approach asks why some among the 'newly industrialising countries (NICs)' have been so much more successful than others, such as for example South Korea as compared to India; the second approach compares a NIC, say Brazil, with itself over a span of decades and asks how it managed to make the transition from a level of low technological capacity to a level of high capacity.

The comparison of India with South Korea brings out clearly the areas of agreement and disagreement among neo-classical economists on the technology question: They generally agree that the intervention of the state in protecting 'infant' industries during the early phase of import substitution has greatly helped in establishing a technological base, especially in the key sector of capital goods (i e, embodied technology)—this is accepted as established even for Japan and South Korea. Disagreement surfaces when they analyse the period that follows the 'early phase': one group of neo-classicists (who appear to be in a majority) lovingly cite the strategy of the South Korean state of liberalising technology imports and actively promoting exports, which exposed the domestic firms to the rigours of foreign competition. This competition, they maintain, forced individual firms to adopt the latest western technology and innovate further on the basis of assimilation of that technology. They point to India as the classic case which did not adopt the 'South Korean strategy', but persisted in providing protection to domestic oligopolies and monopolies, with the result that technological stagnation has deepened in that country. The other group of neno-classicists challenges this analysis, and maintains that if the gates had been opened wide to foreign technology before import-substitution had matured, the process of creating local technological capacity would have been subverted. They claim that as a result of the restrictions on technology imports imposed by the Indian state, the indigenous technological capacity of Indian industry is deeper and wider than that of South Korea. However, both these groups in the neo-classical camp are agreed that at least now, when import-substitution is long past its prime, the 'laggard' NICs (e g, Barazil, India, Mexico) should follow in the footsteps of the 'leading' NICs (e g, South Korea, Taiwan, Hong Kong and Singapore). In general, the neo-classicists are opposed to state intervention and across-the-board policies and measures. They want to see the initiative for technological development left to the individual firms. If they see a role for the state in the technology area at all, it is one of implementing measures tailor-made to suit the specificities of firms, which is where the second approach in the book comes to its own, i e, examining a country's specific experience with respect to itself over time. The major conclusions that emerge from the second approach are that (i) productivity increases in *some* capital goods industries have occurred as a result of state-imposed protection from technology imports, (ii) investment decisions involving import of foreign technology should explicitly allow for, and insist on, the technology-learning process, i e, mechanisms for assimilating within a firm both the know-how and the know-why of imported technology, and (iii) a proper sequencing must be identified and established in allocating resources to technological capacity building among various industrial branches, because advances in some branches depend upon prior advances in others.

The two editors, Martin Fransman and Kenneth King, provide good overviews of the debate and able summaries of the papers contained in the book. Fransman deals with the technical and economic aspects, while King concentrates on the learning and educational aspects. I entirely agree with Fransman when he points to the demise of the neo-classical and the dependency paradigms (page 6). But that has not prevented him (as an editor) from giving the lion's share of the book to neo-classicists—the odd dependista and Schumpeterian had to rest content with the meagre leavings! Which presumably goes to show how hard it is to escape the tentacles of the Sussex-Oxford-World Bank octopus! *Plus ca change, plûs la même chose*.

Many Third World governments had high hopes that by rapidly expanding the number of students entering higher education in science and technology, they would equally rapidly build up national technological capacity. It took them over a decade to discover, and at great cost, that a mere churning out of hundreds and thousands of science and engineering graduates from 'examination factories' was not synonymous with technological capacity building. (One of the leading practitioners of the self-delusion that confuses quantity with quality is India, whose official and non-official spokespersons are forever bragging about India having the third largest number of engineers in the world. Ronald Dore is entirely justified in his caustic remarks on the general lack of quality and the widespread shoddiness in Indian industrial goods and infrastructural services.)

In his able and wide-ranging review of the complex of issues that affect the utilisation of off-the-job science and technology education for technology capacity building, Kenneth King spotlights the critical importance of complementing formal school and college education (i e, off-the-job education) with on-the-job learning of both the technological and non-technological kind, the latter in particular for entrepreneurs. He finds (page 52) that "in several countries in Africa, the firms with a very high indigenous technology capacity record have a very poor record in off-the-job training, while the government, parastatal and multinational sectors which patronise the state training system are not considered particularly innovative". He points out further that the spreading-disease of the "bureaucratisation of science manpower is a direct counterpart of the theoretisation of science and technology in schools and colleges" (page 54) in those underdeveloped countries where job-opportunities and research careers in industry are extremely limited.

The title of the book is somewhat misleading: it is really more about the NICs than the Third World in general. Of the eight NICs that figure prominently in the book, four have already made the transition from the Third World to the first world (South Korea, Taiwan, Hong Kong and Singapore), while two (India and Brazil) with their enormous natural resources and very large economies are hardly representative of the bulk of the Third World countries. The book may prove of interest to those who are looking for plausible-sounding proximate explanations by well known neo-classical analysts of why the four East Asian NICs have succeeded so dramatically where the other NICs are stagnating of faltering in their attempts at technological development along the capitalist route. The analyses advanced are of little relevance and hardly of any help to those who want to understand the continuing, or even deepening technological backwardness of most of Africa and large parts of Asia and Latin America. NICs are clearly not the whole of the Third World! Colin Leys is surely right when he points out that (page 181) "to understand the process of state-directed development of production relations we must first understand the class forces of which the operation of the state is an expression. In relation to the NICs, this means that we cannot explain the emergence of a class of industrial capitalists and the rapid expansion of manufacture by reference to the operation of a 'strong state'; on the contrary, we must seek an explanation of the operation of a 'strong state' in the prior strength of the class of capital."

To get at the *underlying* reasons for the technological underdevelopment of the Third World, one has to get to grips with on the one hand the political-economic interests of the dominant classes at the national level, and on the other hand the imperialist interests of international capitalism at the global level, and the intermeshing of the two. There are several substantial studies within the framework of Marxian political economy which attempt this task, but none of them appear in this book. As for the World Bank's strategy for sub-Saharan Africa, one should heed Bienefeld's warning that (page 172) "using this [NIC] experience to urge sub-Saharan African economies in 1982 into export-promotion, import and capital liberalisation, and a withdrawal of governments from economic activity, is not only inappropriate, but borders on the incredible".

**INDISPENSABLE BOOK**

**FOR**

**ALIGNED & NON-ALIGNED NATIONS**

**POVERTY OF NATIONS & NEW ECONOMIC ORDER**

**By Usha Garg & Jagdish Vibhakar**

1985/Pp.275/Price Deluxe Edition Rs 150/-

The Third World countries have been gripped by the severest crisis in the past thirty years. They are particularly worried about their acute economic-social problems, including poverty, inflation, hunger & malnutrition, illiteracy, brain-drain, population explosion, environment pollution, energy crisis, arms race etc. These difficulties are by and large not their creation. The root cause, in fact, lies in the policy of the major industrial countries of the West, in particularly the USA. This is precisely why the economic development rates of the developing countries have been declining rapidly. All this has compelled these countries to rely on foreign credits, which have now reached astronomic figures. Consequently, the recession in the West has adversely affected their export earning while the import bill has not gone down.

No viable world economic order is conceivable today without consideration of the interests of the developing countries. The democratisation of international economic calls for the total normalisation of East-West relations, ending the discrimination in economic relations on political and ideological grounds, and correcting the deformation of international division of labour under the impact of the politics of the Western powers and economic groups.

There is no doubt that new international economic & information orders can help in stimulating the development of Third World countries. This book is an interesting study, written with scholarly insight & precision. It is a detailed study of the different faces of colonialism which is jeopardising the advance of these countries. The authors have suggested ways & means of making these countries free from the clutches of colonialism. This will prove useful to all students of international affairs, in particular developing countries.

# Peasants, Workers and Freedom Struggle
## Jalpaiguri, 1945-47

Ranajit Das Gupta

*This essay makes a preliminary attempt to deal primarily with the stream of popular movements, particularly peasant and worker movements, in Jalpaiguri, a district in North Bengal that had a significant role during the climactic years of 1945-47 in India's struggle for freedom. It discusses popular participation and analyses the nature and significance of such participation in the national movement. It also touches on the links and interactions between different streams of the national movement, different approaches to freedom struggle and, further, the interventions made by the major anti-imperialist political forces.*

## I

### Society and Economy of Jalpaiguri

IN 1945 the Jalpaiguri district included present day Jalpaiguri and five other *thanas* (Boda, Debiganj, Pachagarh, Titalya and Patgram) now in Bangladesh. Formed in 1869, the district comprised two distinct tracts, *viz* (1) the regulation portion lying to the west of the river Tista, and (2) the non-regulation portion, the Western Duars or commonly known as Duars, annexed at the end of the Anglo-Bhutan War of 1864-65, covering the portion east of the river Tista.[1]

The first tract was a permanently settled one. It was also a long settled tract with little margin for extension of cultivation and a large but decadent population. The Western Duars was very sparsely populated when first acquired. The British classified the land into three types: the tea plantations subject to privileged Regulations, the reserved forest areas, and the *Khas Mahal* area, i e, all other cultivable land owned by the government. By early twentieth century the entire Duars area came to be studded with tea gardens. Cultivation also expanded rapidly and between 1872 and 1931, population increased seven-fold mainly through immigration.[2]

One distinctive characteristic of the Jalpaiguri society was its variegated composition. In 1931 the district's total population was 9,83,357.[3] Of them the Hindus constituted 67.5 per cent and the Muslims 24 per cent. The Rajbansis, an autochthonous group, constituted about 34 per cent of the 1931 population. The precise origin, status and folk history of the Rajbansis are, however, not yet well-known.[4] The early history of the local Muslims too is obscure.[5] These two population groups formed the bulk of the landholders of various categories and also the core of the working peasantry. Most important among the landholders were the *jotedars*, and among the peasants, the *adhiars* or share-croppers.

Oraons, Mundas and Santals whose immigration into the district was organised by the tea planters to meet growing labour requirements numbered two lakhs in 1931 and constituted one-fifth of the district total. A large section of the ex-tea garden tribal labour later on also came to be settled as *adhiars*.

Upper caste Hindus (Brahmans, Baidyas and Kayasthas) formed in 1931 a meagre 1.7 per cent of the population. Following the formation of the district in 1869 Bengali caste Hindus hailing mainly from East Bengal districts and Bengali Muslims from Noakhali, also an East Bengal district, moved into the district as service holders, professionals, traders or *maulavis*. The district also came to be traversed by Marwari financiers and merchants. The two small towns of the district—the district town Jalpaiguri and the sub-divisional town Alipur Duar—grew essentially as settler towns, Rajbansis and local Muslims having only a marginal presence.

The most noteworthy feature of the Jalpaiguri economy, especially in the Duars, was the growth of an economic enclave in the form of the tea plantation sector.[6] By 1931 there were 151 gardens in the district with 132,000 acres under tea. Except eight gardens located in the area west of Tista, all the gardens were in the Duars. But the plantation sector failed to have any significant spread effect in the region. The Bengal Duars Railway (BDR) line, launched in 1893 under the aegis of Octavius Steel and Co to connect the tea garden areas and meet the narrow requirements of the planters, by and large bypassed all non-plantation settlements.

The plantation sector itself remained under extensive and firm British control in terms of ownership and management. But certain circumstances prevailing within Jalpaiguri's society and economy led quite early in the history of the district's tea industry to the emergence of a core of indigenous capitalist entrepreneurship. In terms of social origin the Indian entrepreneurs came mainly from Jalpaiguri town based families of Bengali Hindu and Muslim service holders, legal practitioners, traders, contractors, etc, and also of a few Marwari merchants.[7] However, within the European controlled plantation sector and administrative framework the Indian entrepreneurship had a subordinate status. As late as in 1947-48 out of a total of 155 tea gardens in the district, 100 gardens or 65 per cent of the total covering 81 per cent of the tea garden area were under the ownership and management of European concerns.[8]

As regards the labour force employed in the industry in 1931 it numbered 116,853 constituting 11.8 per cent of the district's population. The overwhelming majority was composed of various tribal groups, mainly Oraons and Mundas, recruited from Chota Nagpur and Santal Parganas. There was a sizeable chunk of Nepali labour too.

The Duars labour was, however, unlike the Assam system, not recruited under the indentured arrangement. But that did not mean that the conditions of work and living of the Duars labour were less harsh. Government enquiries made in 1945 revealed that their life situation was brutish, maternity benefits non-existent and sickness benefits existed only on paper.[9] Though not recruited under penal contracts, the labour suffered from various kinds of unfreedom. Corporal punishments including flogging were common practices. It was kept under guard day and night and had little freedom of movement. Tiny plots of paddy land were given to the labour as a means of binding it to the garden as cottar on the plantations. This allotment of paddy land also enabled the planters to cut down their cost for the maintenance and renewal of the labour force. The estate manager was for all practical purposes the only authority for labour. Under the circumstances, the labour was reduced to a semi-servile status.[10]

While the plantation system occupied the key position in the economy of Jalpaiguri, the large majority of population remained wedded to land. The form of control over land and labour that emerged as the dominant one in Jalpaiguri was the *jotedar-adhiar* relations or the *barga* system under which the *bargadar*, or in local parlance *adhiar*, virtually a semi-serf, usually cultivated the *jotedar's* land with his (*adhiar's*) plough and cattle and handed over half of his produce to the *jotedar* in kind rent. He did not have any tenancy right and suffered from various forms of exorbitant exactions.

In Jalpaiguri and also in the neighbouring districts of Dinajpur and Rangpur the system was old and fairly common. In the closing decades of the 19th and early decades of the 20th centuries the system became still more widespread in these three North Bengal districts. In Jalpaiguri the tea garden development, the influx of a large labouring population, the expansion of roads, railways and communications and the colonialised commercialisation of agriculture—all led to a rapid and substantial extension and consolidation of the *jotedar-adhiar* relations.[11] The big *jotedars*, particularly those in Duars, not infrequently owned hundreds of acres of land and had scores of *adhiars* under them. The Settlement Officer Milligan noted that by mid-1910s elements of an extensive and serious crisis were being accumulated within Jalpaiguri's agrarian economy.[12]

The Depression of 1929-32 aggravated the process and brought about certain structural changes in agrarian relations.[13] The Land Revenue Commission of 1938-40 expressed concern over the phenomenal growth of the share-cropping system.[14] In Jalpaiguri this growth was particularly pronounced. The Commission found that of the total land transferred in Bengal between 1928 and 1940, 31.7 per cent was cultivatd by *bargadars*. For Jalpaiguri the relevant figure was much higher—42 per cent of the transferred land. Further, in the province as a whole, of the families enquired into 12.2 per cent lived mainly or entirely as *bargadars*. For Jalpaiguri the figure was 26.6 per cent. Again, while in the province 21.1 per cent of the total cultivated area enquired into was cultivated by *bargadars*, in Jalpaiguri 25.9 per cent of such area was cultivated by *bargadars* or *adhiars*.[15]

To sum up, Jalpaiguri came to provide a microcosm of maldevelopment caused by colonial commercialisation. The plantation system and the *jotedar-adhiar* relations evolved as two sub-systems of the colonial socio-economic order. The system of oppression that involved the plantation labourers and the working peasantry was based on a social existence form of labour that was essentially unfree. The requirements of colonialism also led to the growth of fairly large and heterogeneous body of town-based petty bourgeoisie engendering its own contradictions.

## II

## Trends in Anti-Colonial Movement: Early 1920s to Mid-1946

The above provided the background to the unfolding of the nationalist movement in the early 1920s. There was a fresh spurt in the early 1930s.[16] The District Congress Committee led by nationalists coming from immigrant, caste Hindu, town-based educated Bengali or *bhadralok* families, however, remained indifferent to explicit peasant grievances. It displayed a remarkable apathy to the brutal expolitation of the tea garden workers, the 'coolies'. (One major reason for this was the inhibiting influence of close social connections that many of the Congress leaders had with Jalpaiguri's Hindu planters. No less important were the ideological constraints of the Congress leaders and also the socio-cultural distance between the town-based *bhadralok* nationalised and the plantation labourers.)

It was only in the wake of the formation of the District Krishak Samiti (December 1938) and of a unit of the illegal Communist Party (February 1939) that a peasant movement involving large sections of Rajbansi and Muslim peasants and *adhiars* took shape in the winter of 1939-40 in Boda and Debiganj *thana* areas—areas having also a tradition of Congress-led activity since 1921. The agitation was against collection of excessive tolls at the *haats* (weekly rural markets), various levies or *abwabs* exacted by the *jotedars* from the *adhiars* over and above the half share and exorbitant interest on *karja* or consumption loan in paddy and also for the right to stack harvested paddy at *nij kholan*, that is, at a threshing place chosen by the *adhiars*. The movement did also spread to the adjoining areas of Dinajpur and Rangpur districts. The administration responded by conceding some demands and also by launching quite severe repression against the Krishak Samiti and the Communist organisers.[17]

The first trade union of the district, the BDR Employees Union, was formed in November-December 1938 as a branch of the Bengal-Assam Rail-Road Workers' Union. From the initial days some Communists were associated with the BDR Union.[18]

In the early forties there was not much of Congress-led mass activity. The Quit India movement caused comparatively little trouble to the district administration.[19] Congress leaders considered dangerous were arrested in early August. However, students and younger elements[20] helped to maintain a skeletal Congress organisation and carried on nationalist activity in various forms.[21a]

In terms of future potentiality for an anti-feudal, anti-imperialist popular movement, perhaps the single most significant development in the years between 1942 and 1945 was the spread of Communist activities in Jalpaiguri town and particularly in the rural areas of Debiganj, Pachagarh and Boda *thanas*. Despite the repression following the *adhiar* agitation of 1939-40, with the help of Rajbansi and Muslim peasant activists and peasant women militants the Communists of the district[21b] were able to maintain an effective underground network. After the withdrawal of the ban on the CPI in July 1942, they fanned out to the villages, and open activities of the Krishak Samiti were revived.

Though Jalpaiguri district was spared the severity of the 1943 famine and the mortality rate was relatively low,[22] mass suffering was nonetheless extensive and acute. The exploitative grip of the *jotedars* and *mahajans* over the rural masses, particularly small peasants, *adhiars* and day labourers was intensified through famine and wartime inflation.[23]

The response of the Communists to this situation, as elsewhere, was mass-oriented activities—vigorous campaign against hoarders and blackmarketeers, formation of broad-based food committees, dehoarding and vigil against smuggling, organisation of famine relief and other related activities and interventions against bureaucratic bungling and corruption.[24] Through such activities the Communists and the Krishak Samiti were able to a marked extent to expand and strengthen their influence and support base in the Debiganj-Pachagarh-Boda area. Further, the sort of resentment and opposition the Communists at times faced in the town because of their stand on the Quit India movement was not a problem in the rural areas.[25] These years also witnessed the growth and consolidation of the BDR workers' Union.[26]

Some of the activities of the Communists, particularly the campaign for seizure of food hoards and criticisms of the bureaucracy for its handling of the food and cloth situation, increasingly brought them into conflict with the administration.[27] By March 1945 it was being complained that the Communists "were causing disquiet to the District Officers of Jalpaiguri and Rangpur" and in Jalpaiguri they were "inciting *adhiars* against *jotedars*".[28]

The end of the war did not bring much relief to the people. Acute food shortage, scarcity of essential commodities, continuing inflation, blackmarketing and bureaucratic corruption and inefficiency plagued the life of the common people.

But socio-economic dislocation, though very important, was only one element in the post-war situation. The defeat of fascism, the demonstration of the might of the Soviet Union, a perception of the coming collapse of British rule in India—all combined to provide the background in which a new stage began in the history of political currents and cross-currents in the district. The urban middle class, particularly students and youth, and the rural population were in a restive mood. There was also an undercurrent of labour unrest in the Duars gardens that found occasional manifestations.

In mid-1945 the Congress leaders arrested in 1942 were released. But the activities of the district Congress leaders, as at the national and provincial levels, were not geared to the launching of any mass agitation but primarily to the preparation for the coming Assembly elections.[29] At the same time, a campaign was started against the Communists for their 1942 stand.

Of all the parties and groups, according to secret official reports, the CPI was most active in giving shape to popular discontent, particularly in the rural areas.[30] Yet with the launching of a tirade against them, the Communists faced an adverse swing of public opinion. Placed in such a situation the Communist leaders of the district chalked out a programme of mass agitation for relief and dehoarding and against interests on *karja*. The party also decided to set up a candidate from the constituency reserved for Scheduled Castes.

But the election preparations of the differnt political parties and the political lull were broken by eruptions of massive popular outbursts over the issue of release of INA prisoners first in late November and then again in February as well as the RIN Revolt. The impact of all this was felt in the district, particularly in the two towns Jalpaiguri and Alipur Duar, in the form of popular agitations—frequent strikes in schools and colleges, *hartals*, processions, meetings, hoisting of the National Flag, etc. While the established Congress leaders kept away from these agitations, all the Left groups and parties—Forward Bloc, Congress Socialists, Revolutionary Socialist Party and CPI—particularly their student organisations, took a leading part in these agitations. Muslim students and the District Muslim Students League also joined these agitations.[31] These agitations, however, mostly remained confined to the urban and semi-urban centres and their rural repercussions were limited.[32]

But the rural areas, particularly the Debiganj, Pachagarh and Boda *thana* areas were also in the midst of a peasant agitation against exploitation by *jotedars* and *mahajans*. In this agitation taking place in the winter months of 1945-46 the key demand put forward by the District Krishak Samiti was the demand for ending the practice of charging of interest on *karja*—a demand around which widespread *adhiar* unrest had taken place earlier in 1939-40.[33]

This and other issues relating to the grievances of the rural masses figured prominently in the election campaign of the CPI in favour of the party's candidate from the Jalpaiguri constituency—Radamohan Barman, a Rajbansi Krishak Samiti leader coming from a poor peasant family. In their campaign the Krishak Samiti and the Communists tried to link up the *adhiar* agitation and also the issue of abolltion of the *zamindari* system with the struggle for freedom. They put forward the perspective of a final bid for power on the basis of Congress-League-Communist unity, that is, mass struggle along non-communal lines.[34]

Understandably enough, the *adhiar* agitation aroused the ire of the big *jotedars*. The Rajbansi big *jotedars* flocked to the Congress or to the Kshatriya Samiti, a caste-based Rajbansi organisation, and the Muslim *jotedars* to the Muslim League. The Congress leadership, not to speak of the Kshatriya Samiti and the League, took an indifferent and even hostile attitude to the *adhiar* agitation.[35] This indicated the sort of tension that existed at the local level between the two major segments of the anti-imperialist leadership—one imbued with Marxist ideology and working for radical social transformation and the other one, much older, more powerful and commanding far greater popular support and prestige but afraid of attacks on the existing social order.

The election took place in March 1946. From the Jalpaiguri general constituency the Congress candidate defeated his Hindu Mahasabha rival by a huge margin. In the reserved constituency the CPI candidate was defeated by a Congress candidate by a margin of two thousand votes.

In the months following the election, barring two agitations—one in June-July 1946 and the other one in late January 1947,[37]—anti-colonial mass political activities were at a low ebb in the towns. However, in late 1946 and early 1947 large parts of Jalpaiguri witnessed an upsurge in popular movements of a nature and magnitude that had never before been experienced in the district.

## III

## Labour Upsurge in Duars

An entirely new and highly significant dimension was the beginning and rapid spread of unrest and agitation as well as nationalist and leftist political activities among the Duars plantation labourers. Prior to mid-1946 these labourers had not been organised in trade unions and by and large remained untouched by the national movement. But several developments during the War and immediate post-War years converged to bring about a critical change in the life-situation of the labourers. The sort of exploitation and bondage to which the labourers had been subjected under the plantation system has been indicated earlier. In the War years the extent of exploitation and misery was greatly increased. An official enquiry made in 1946 revealed that between 1939 and 1945 while the cost of living had gone up by at least 200 per cent in the Duars plantation area, the labourers' total earnings including concessions had only doubled.[37] The planters, however, minted money. Thus in 1945 some of the Duars tea companies distributed dividend ranging between 65 per cent to 110 per cent.[38]

The workers suffered from irregular and inadequate supply of and also from very bad quality of rice, adulterated mustard oil, scarcity of kerosene oil, and acute cloth shortage.[39] The end of the War did not bring in any improvement. In his Report for the year 1946 the Chairman of the Duars Planters Association (DPA) representing the European planters' interests said, "The past year should go down in the history of our Association as the year of shortage".[40] Wheat and wheat products partly substituted rice, while the labourers were habituated to take rice. The annual cloth quota was reduced from 20 yds per capita to 10 yds.[41] Evidently enough, the problems were much worse than these had been when the War came to an end a year earlier.

At the same time, the workers' perception of deprivation and exploitation must have been accentuated by other developments. As the ITA Chairman in his address before the DPA's 1946 Annual Meeting observed, "... the War has stimulated new demands and new standard of living for labour ..."[42] Another factor was the emergence of a situation of relative labour shortage in the gardens. The Eastern Front War projects had led to an increased demand for labour[43] which helped to create a bargaining power in favour of labour.

But economic factors alone do not provide the explanation for the widespread unrest that broke out in the Duars tea garden area. In the country as a whole there was what may be characterised "crucial shifts in collective mentalities".[44] The components as well as the determinants of such shifts require further probe. But the shifts and tumultous developments that had been taking place must have been affecting the Duars labourers.

Already Assam and Darjeeling labourers were in ferment. The Duars labourers too were in a restive mood. In June 1946 it was being officially reported that the labour situation in the tea gardens was "far from normal"[45] and by the end of the year the Communist Party, Congress and Gurkha League, as noted by the Rajshahi Divisional Commissioner K A L Hill, were active in the area.[46] To the typical imperialist bureaucratic mind and also the planters the workers were, in the words of ITA Chairman G A Rainey, "thoroughly healthy in themselves", but "new forces, working amongst an illiterate labour force are bound ... to produce stresses and strains".[47] ITPA Chairman T P Roy who was noted for his support to the Congress and public cause observed that labour unrest was "caused by agitators who seem to take advantage of the present difficult conditions of the country to excite labourers for the purposes of party strength".[48]

Among the different political forces active in the Duars gardens in 1946, the CPI was the most potent force. Available evidence suggests that the message of the Red Flag, and in large parts of Duars even that of nationalism and freedom were for the first time carried to the plantation workers by the CPI at the time of the 1946 election campaign.

Also, very important were the activities of the Domohani Branch of the CPI-led B A Railroad Workers Union and particularly the impact of a significant victory won by the unionised railway workers as part of an all India agitation of the railway workers in May-June 1946. The BDR Union leaders and activists carrying the news of the concessions granted by the authority to far-flung areas moved in a railway engine and bogey bedecked with Red Flags, victory banners and flowers. This highly visible demonstration of the strength of the Union and the information that even the powerful railway *sahibs* had to bow down to the Red Flag had a great impact on the tea garden workers.[49] Around that time some of the Union leaders and railway worker cadres[50] took the initiative in mobilising tea garden workers. Their work was facilitated by locational factors. The railway lines went by the side of, or even through the tea gardens, and railway stations like Mal, Banarhat or Madarihat had a cluster of tea gardens around them. Moreover, the lowest ranking railway workers—the unionised pointsmen and gangmen, themselves mostly immigrant tribals, and having some relative working in the gardens—came into frequent contact with the plantation labourers. However, the initial work had to be done in a clandestine fashion. As the 'cooly' lines and most of the roads and pathways through the tea gardens belonged to the private property of the estate, making contacts with the labourers openly or within the gardens was virtually out of question. Contacts and group meetings had to be held on railway lines, in a dark corner of a railway platform or in the gangmen's quarters.[51]

After some spade work, a meeting of worker representatives from about thirty gardens was held in Mal sometime in June or early July and from that meeting the Zilla Cha Bagan Mazdoor Union—the first union of the Duars plantation workers—was formed.[52] Soon thereafter a Memorandum containing demands for wage increase, regular supply of ration, supply of good quality rice and other commodities, better housing, improved medical facilities and introduction of welfare measures was prepared and submitted to the government.[53]

In the meantime the seething labour discontent burst forth in a series of disturbances—petitions and representations, gheraos, sudden work stoppages, strikes, riotous actions, assaults on managers and *babus* or clerical employees notorious for their *zulum*, corruption and violence, against Marwari shopkeepers considered to be responsible for high prices, adulteration, short weight, etc. The secret political report for the first half of July mentioned "signs of trouble developing in some of the Duars gardens . . .".[54] In the second half of July two strikes "in one of which labour made an organised attempt to cut off the garden from the outside world and to sabotage the factory arrangement" was reported.[55] A DPA Committee meeting held on July 30 considered labour troubles at Dumchipara, Banarhat, Nya Sylee and Jiti tea gardens.[56] In August it was officially reported that the situation was "not normal in Jalpaiguri gardens" and that the Communists were "active in organising unions".[57] In September the Divisional Commissioner reported "unrest, rioting and a strike in three different gardens".[58] In early November trouble broke out in nine tea estates of the Alipur Duars subdivision. It was officially reported that ". . . considerable violence was used by the staff particular targets being the houses and property of Bengali clerical staff and the shops of some Marwari garden shopkeepers".[59] *Ananda Bazar Patrika*, a nationalist daily, reported that there was a "revolution" on the part of labour of Salbari, Dima, Kalchini, Raimatang, Chinchula and some other tea estates in the Kalchini area and that not only the workers but also the peasants of the area joined the "revolution".[60] In two other gardens there was "renewed agitation" following the expulsion of labourers alleged to have been implicated in earlier disturbances along with all of their family members.[61] In February 1947 it was reported that the workers of several gardens were stirred to action by the Communists and assaulted guards and clerks.[62]

That the planters as well as the officials held instigation or manipulation by 'outside agitators', usually Communists, as primarily

responsible for the labour unrest in Duars has been noted above. But while the Communists certainly acted as a catalytic agent in the unfolding labour upsurge, and were also the first to carry even the message of nationalism and anti-imperialism to large sections of labour, in a situation of social and political turmoil, in a very large number of cases, the workers acted on their own, set up impromptu organisations and threw up leaders from their own ranks. This is what seems to have happened in Dumchipara garden in June 1946.[63] In some gardens political elements other than the Communists, for example, some of the Congress leaders and workers of Alipur Duars took the initiative in establishing contacts with the plantation workers.[64] Socialists working within the Congress too started to organise the workers of some gardens around Bagrakote in late 1946.[65] Around that time the RSP also began work among the tea garden workers.[66]

The Gurkha League was also active. But it acted mainly as a disruptive force and received support from the European planters.[67] But such disruptive tactics could not put to a halt the labour unrest that continued to surge forward and engulf previously unaffected gardens. Reports of strikes and work stoppages continued to pour in. Violence and assaults provided a sort of perpetual background.[68] But the unrest was not a reflection of mere economism. In the situation prevailing in the country the labour upsurge came to have an anti-imperialist political content. Slogans such as British owners go back to London, *Inquilab Zindabad*, etc, rent the air.

All this caused serious alarm among the planters, particularly the European planters, and the British rulers. The alarm was compounded by the knowledge that the upswing in labour unrest was not a phenomenon localised in the Duars. The whole of the plantation area extending from Darjeeling to Assam was in the midst of an unprecedented upheaval. In fact, it was an integral component of the labour situation in the entire country which, according to a secret note by the Director of Intelligence Bureau (dt 9.8.46), was "becoming increasingly dangerous".[70] Making a similar point the Jalpaiguri Superintendent of Police Cottam told an Emergency General Meeting of the DPA held on February 19, 1947: "Trouble now being experienced on [Duars] garden was by no means local; Communist activity was, in fact, widespread throughout India".[71]

A 'Top Secret' Note prepared by the Bengal Governor Burrows on his return from a North Bengal tour in February 1947 specifically referred to the dangerous conditions prevailing in the tea gardens of North Bengal.[72] Earlier, in December 1946 in their communication to the British High Commissioner in India, the Calcutta-based European Association had spoken of "the danger of a complete breakdown of law and order" in the planting areas of Bengal and Assam and also of the "crude form of Communism" assuming in the planting areas "an anti-British form".[73]

The responses of the planters and the British officials to the situation prevailing in the Duars plantation area and also elsewhere were essentially four-fold. One was to admit the genuineness of some of the grievances and redress these.[74] Interim increases in wages and allowances were made in two instalments, one in October 1946 and another one in February 1947.[75]

At the same time, the labour problems were viewed essentially as law and order problems. Hence, the second response was to handle the labour disturbances and the agitators firmly, that is, to take resort to repressive measures. These included dismissals, *hata-bahar* and arrests. The Jalpaiguri Superintendent of Police advised the DPA that "complaints require to be made to the Police before action can be taken either by the Police or the authorities". He assured the meeting that wide powers existed under the Special Powers Ordinance which was already in force. But to enable the Police to use these powers "clear cases" should be made out.[76]

The third response was a panicky planning for the evacuation of the Europeans from the plantation belt.[77] The fourth one was a political response in the form of a coordination between the Indian Tea Planters Association, the Duars Planters Association and the District Congress Committee.[78] In the face of continuing labour unrest and 'disturbances' and increased activities on the part of the Communists, the planters, both European and Indians, on the one hand and the district Congress leadership on the other were devising plans to help each other. This once more brought out some of the contradictions within and the limits of the national movement in Jalpaiguri.

## IV

## Tebhaga Struggle

While the Duars plantation area was going through a wave of labour unrest, a major peasant outbursts took place in large parts of the district (and also in adjoining areas of Dinajpur, Rangpur and Malda districts in North Bengal as well as pockets in most of the other districts in Bengal). In September 1946 the Bengal Provincial Kisan Sabha gave the call for *tebhaga*, that is, two-thirds share of the harvests in favour of the *adhiars* recommended by the Land Revenue Commission in 1940. This call coincided with continuing peasant agitation against the exploitation made by *jotedars*-cum-*mahajans*, sharpened perception of the increasing non-viability of *jotedar-adhiar* system tellingly revealed by the 1943 famine and, perhaps more importantly, the growing awareness that the days of British rule in India were numbered. The *Fortnightly Report* considered the call as "clearly most dangerous for the peace of the countryside".[79]

### DEBIGANJ-PACHAGARH-BODA AREA

In the district of Jalpaiguri the Debiganj-Pachagarh-Boda area provided a favourable setting for response to the BPKS call. First, the area had a long tradition of political activity and peasant movement and broad sections of Rajbansi and Muslim peasants, particularly of rural poor and *adhiars* of the area came to have an orientation for peasant struggles and also for viewing such struggles as part of the struggle for national freedom. Second, there was a band of dedicated Communist organisers who, though coming from petty bourgeois intelligentsia background, sank themselves deep into the masses. Third, there were scores of Rajbansi and also Muslim peasant activists and cadres, many belonging to poor peasant and *adhiar* families. These peasant cadres made possible a regular and lively functioning of the Krishak Samiti Committees at the Union and village level. Thus, the area also had an organisational structure for mass struggles.[80]

With the call for *tebhaga*, the district leadership of the CPI and the Krishak Samiti began active preparations for launching the movement. Group meetings, mass meetings, demonstrations, *haat* squads, peasant marches through the countryside and such other forms of both propaganda and mobilisation became a regular feature; volunteers were recruited, trained and assigned with specific responsibilities. *'Ek bhai, ek taka, ek lathi'* became a major rallying slogan.[81]

From late November onwards *tebhaga* began to be enforced by organised peasants and Samiti volunteers, and the movement spread rapidly to villages under Debiganj, Pachagarh, Boda and parts of Kotwali and Rajganj *thanas*. Paddy was harvested collectively. After stacking it in the *adhiar's* place or a common place, the *jotedar* was asked to come there and receive his one-third share of the crop. The police was also informed. But neither the *jotedars* nor the police turned up.[82]

For the colonialist bureaucrats the movement was the outcome of manipulation by "outside agitators". According to a report submitted by the Jalpaiguri SDO in March 1947, "... the movement was organised ... by educated Communist workers of town and outside agitators. Without [them] there would be no movement ... in the subdivision".[83] But as *The Statesman* correspondent covering the movement reported, the peasants were "moving with a momentum that does not need any aid from outside".[84] In fact, the SDO himself indicated the mass character of the agitation. He stated:

> . . . during the harvest season Communist volunteers in batches visited different localities, established camps in the interior, enlisted local support and they helped the selected *adhiars* to cut and take away the entire produce from their lands and stack these in places suitable for the purpose of the Communists. The *jotedars* could not oppose . . . Large number of volunteers armed with lathis, scythes, etc, would gather together and cut paddy of some land on each occasion . . .[85]

One major indicator of the broad peasant awakening was the active participation of Rajbansi peasants and *adhiar* women in the movement. Led by Punyeswari Debi, Makri and other women activists of Debiganj area and Tilak Tarini Nandi, Sikha Nandi and a host of militant women activists of the Pachagarh area the Rajbansi peasant women took part in meetings, processions, paddy harvesting and threshing and even clashed with the armed police with broomsticks and scythes in their hands.[86]

For several weeks, that is, from late November to early February the peasants and *adhiars* in particular remained on the offensive. Many *jotedars* made a retreat and arrived at compromises and some even left the area temporarily. According to the SDO's report, ". . . the *jotedars* were on many occasions kept confined in their houses under threat of assault and violence".[87] The *jotedars* sought police help. But for several weeks even the police did not dare to enter the strongholds of the *tebhaga* movement. With the help of children, young boys and girls and women an elaborate forewarning arrangement was organised. For two months or so administrative control over these areas was virtually non-existent and the provincial government expressed its serious worry over the "parallel government" run in Jalpaiguri, Dinajpur and other parts of the province.[88] Thus, the militant peasants threw up a powerful challenge to the established structure of authority.

The *jotedars*, however, were only bidding their time and carried on a conspiracy to smash the movement. Many of the big *jotedars* in Pachagarh were Muslims and they tried to divide the peasantry along communal lines. Though they failed to create any communal clash, they succeeded in keeping the bulk of the Muslim peasants away from the movment. The *jotedars*, irrespective of their community identity, held confabulations among themselves, raised funds and put increasing pressure on the district administrative officials and the Muslim League government in Bengal for police intervention.

Soon an opportunity was provided by a new turn of the movement, which once begun tended to generate its own momentum, a turn that was not anticipated by the district leadership or even by the provincial leadership. In villages and areas where the Krishak Samiti had no previous base or strong organisation, the *adhiars* had stored the paddy in the *jotedar's kholan* (threshing place). But the success of the movement in the organised areas and also the publication of the Bargadar Bill incorporating some of the demands of the movement in January 1947 gave a new impetus to the *tebhaga* struggle.[89] The *adhiars* in the unorganised areas, such as parts of Kharija Berubari Union under Kotwali PS and certain areas under Debiganj, Pachagarh and Boda PS too, and previously remaining untouched by the movement, now on their own and without any directive from the Samiti leadership, started what came to be known as the *kholan bhanga andolan*.

This was the second phase of the movement both in Jalpaiguri and other districts of movement, particularly Dinajpur and Rangpur.[90] The SDO reported:

> The second phase of the movement was forcible taking away of paddy stocks and plough cattle from the khamars and houses of the *jotedars*. Some cases of removal of paddy from *golas* [granaries] were also received. Allegations were also made by many *jotedars* that the volunteers were armed with *lathis, daos* (chopper), bows and other weapons and the *jotedars* were threatened with violence and assaults . . ."[91]

With reference to this phase *The Statesman* correspondent commented: "It was an attempt to alter custom by force, but it is doubtful if it amounted to criminal breach of the law . . ."[92] But these actions provided the opportunity sought for by the *jotedars*. They lodged the charge of dacoity and looting and immediately thereafter a well-prepared police offensive followed. Sec 144, banning the gathering of five or more persons at one place, was declared in Pachagarh, Debiganj, Boda, Kotwali and other adjacent police station areas; large scale arrests were made and severe repression was launched.[93]

### WORKER-PEASANT-TRIBAL UPHEAVAL

But while by late January or latest by early February the *tebhaga* movement was put on the defensive in its old bases and massive repression was let loose also in neighbouring Dinajpur and Rangpur, the other two North Bengal districts in the forefront of the *tebhaga* struggle, peasant unrest again took a new turn, a turn which was once more neither planned nor even foreseen by the Jalpaiguri district leadership of the CPI and Krishak Samiti. This was a virtual tribal peasant uprising in wide areas under Mal and Matelli PS in the Duars.

In the countryside of Duars too, as noted earlier, the basic production relations was that between *jotedars* and *adhiars*. Exploitation of the *adhiars*, overwhelmingly immigrant tribals—Oraons, Mundas, Kharias, Santals, etc—in large parts of the Duars by the *jotedars*, mostly Muslims and Rajbansis but also some Marwaris and immigrant Bengalis, knew no limits.[94] But there was no tradition and experience of peasant movement and organisation in most parts of the Duars.

Between late January/early February and April 1947 a peasant upsurge around the issue of *tebhaga* flared up in the Oodlabari-Dam Dim-Mal-Chalsa-Baradighi area. It is not quite clear how the tribal peasants and *adhiars* of this area came to know of the *tebhaga* agitation. That this peasant outburst had substantial elements of relative autonomy can be inferred.[95] However, a close examination of the unfolding of the movement shows that it did not begin so "spontaneously" as has been suggested by some scholars.[96] In the first place, in this area too the organised railway workers and their Union having a nearly decade-long experience of mass activities and movement played an important role. Some of the railway workers, particularly the leading cadres,[97] must have come to know about the *tebhaga* struggle and its advance from *Swadhinata*, Krishak Samiti leaflets and various party sources.

Further, in early December 1946 the Fourth Annual Conference of the Bengal and Assam Rail-Road Workers' Union (the Union to which the Domohani Branch was affiliated) was held at Lamding in Assam. This conference, attended by a number of Domohani Branch organisers and cadres and also two tea garden worker activists, Jagannath Oraon and Faguram Oraon, adopted a Resolution in support of the *tebhaga* demand.[98] On their return from the Conference the railway union, cadres some of whom themselves were tribals, carried the message of the *tebhaga* movement to the tribal peasants.

In the meantime, the story of success achieved by the *tebhaga* struggle in the organised bases in the district had spread to the peasants of the Mal-Matialli area through the railway workers and Union activists and also through various other channels. Messages must have also circulated through 'rumour'.[99] The wave of labour unrest continuing in the surrounding plantation areas for several months had also certainly stirred up their minds.

All these elements—some determinate and others indeterminate—converged to give shape to the seething discontent and anger of the peasants. In early 1947 four distinct forces—the Communist leaders and cadres, the railway workers who had been unionised and were being led by the Communists for several years, the plantation labourers who were just in the midst of a process of being organised and were in a state of turmoil, and the peasants (mostly tribals), unorganised in the conventional sense but in a restive and militant mood—joined hands, and the outcome was an outburst of peasant movement.

Samar Ganguly who had earlier been an organiser in Debiganj and had come to Mal to attend a conference of the tea garden workers was assigned with the responsibility of looking after the peasant struggle in Duars. He set up a sort of operational camp at a place near Chalsa—a *jote* owned by Balgovinda, a Marwari *jotedar*. The peasants took possession of it without any resistance from any quarter.[100] Apart from Ganguly, several other experienced party and Krishak Samiti leaders were placed in the Mal-Matially area for providing active assistance. Along with them a host of peasant leaders and organisers like Birsa Oraon and Sukra Oraon, who came to be known as 'Lal' (Red) Sukra of Matha Chulka near Baradighi, Buni Oraon and Deocharan Nayek of Oodlabari, Puria Manki Munda of Dhumsigara, Hopna Majhi of Khagrabari or Sarbaru Mohammed were thrown up from amongst the peasants, Jagannath Oraon, a victimised tea garden worker activist, was also given the responsibility of looking after the peasant movement. Several militant peasant women activists too emerged. The peasants of the area also showed a remarkable degree of organisation and leadership pattern and fairly rapidly set up an organisational network. In the Oodlabari area an organisation was formed with Buni as the leader, Deocharan as the Captain and Sarbaru as the Lieutenant.[101] Available evidence shows that something in the nature of a parallel government was set up in the Duars areas of the movement.

The pattern of unrest was fairly uniform. Hundreds and sometimes even thousands of peasant men, women and even children—mostly tribals with a sprinkling of Nepalis, Rajbansis and Muslims—joined in by a large number of tea garden labourers who had struck work in support of the agitating peasants and bands of railway workers, carrying Red Flags and in many cases armed with *lathis*, spears and bows and arrows marched from village to village. Tribal drums, *nagras* and *madals*, were used to spread the struggle message and mobilise the peasants. By the time this upheaval took place in Duars the harvesting was over and paddy was already stored with the *jotedars*. Under this circumstance the *tebhaga* struggle in Duars inevitably took the form of forcible seizure of paddy for securing a two-thirds share. Here one witnessed not only something unprecedented in the history of popular movement in Jalpaiguri but also one of the rare instances of close physical interaction in the sphere of action between peasants, workers and tribals in the history of popular movements in India.

Describing the course of movement the following observation was made in the ITA's Annual Report for 1947:

> [Early in 1947] as a result of outside agitation bands of labourers had left their work and, headed by Communist leaders, were roaming the countryside, in many cases armed with *lathis* and spears, with the object of entering *bustees* and raiding paddy stocks in support of the general demand by the ryots of the district for a two-third share of the crop, instead of half the share which they had always received in the past from the Zamindars.[102]

Nani Bhowmik, a well-known litterateur of 1940s and a Communist, who was on the staff of *Swadhinata*, spent several days among the rebel peasants and workers. Here is an extract from his long first-hand account[103]:

> The spectacle of how the down-trodden people got roused up into a new life of unbounded vitality—that is what I witnessed. Nobody lent a hand to the paddy accumulated in the *kholans* of *jotedars*, no threshing till *tebhaga* is realised. A mammoth contingent of Santal, Oraon and hill peasants are on the march night and day. Each and every village and hamlet in two to three *thanas* are being covered. Only a few words to the village folk and they instantly realise what is afoot. With heads covered in dirty *chaddars* (wrappers) they leave their home and join this thrilling procession. The coolies at work in the fields lock in eager expectation as the noise reaches their ears. They too go on strike and join in. They lend their support to their *kisan* brothers. In the gang quarters inside the jungles the gangmen troop out. They hoist high the iron gang plates like banners and head the demonstration.
>
> In all the corners of the hills, forests and lands, amongst all the sections of the people, a new wave of inspiration finds its way through.

The *jotedars* were totally taken by surprise. Not only the big Rajbansi and Muslim *jotedars* but even some tribal *jotedars* were affected.[104] Particularly exposed were the Muslim and Rajbansi *jotedars* in villages and areas with large tribal peasant population. In many cases they had no alternative but to concede the demand. Where necessary, coercion was used against the *jotedars*. Government officials too were not prepared for such a situation. Sometimes one *daroga* with a small police force appeared but on seeing large crowds of armed villagers hastily retreated. There were also a few instances of a *daroga* or a police party being surrounded and temporarily confined by rebellious peasants.

It was in the context of such a situation that the terrified *jotedars* begged for police help. Their plea was reinforced by the planters. An emergency meeting of the Dam Dim Sub-District of the DPA held on February 4, 1947 "decided to instruct the Chairman to request the Superintendent of Police to provide an adequate armed police force in the Dam Dim Sub-District and to remain there until the wave of unrest, now being experienced, subsides, and conditions return to normal".[105] In the emergency General Meeting of the DPA held immediately after the above meeting the SP gave a resume of the Communist effort "to stir up troubles amongst our labour and *adhiars*" and advised the members present to take advantage of the wide powers existing under the Special Powers Ordinance.[106]

By late February the situation began to change and the police force was strengthened. On March 1 at Mathachulka near Baradighi under Mal PS a large number of peasants raided the paddy stocks stored in a *jotedar's* granary. An armed police force was already posted there. A scuffle took place and, according to several accounts, the peasants snatched away some guns from the police. The police opened fire and killed five peasants including one woman.[107]

The district leadership was taken aback by this incident and showed utter confusion. Couriers were sent to Domohani where the district leaders were holding a meeting seeking advice and instruction from them. While several leaders along with a large number of Rail Union activists rushed to Mal and made arrangements for first-aid, the advice sent by the leadership was two-fold: a) Throw away the snatched guns in wells; and (b) Ganguly, the most prominent leader of the *tebhaga* struggle in Duars, was to evade arrest.[108]

The peasants did not expect the brutal police attack. But they were not demoralised. On the contrary, they were incensed and cried for retaliation. The movement continued to spread throughout the month of March. But another major incident of indiscriminate firing by a police party led by the Sadar SDO himself on a group of peasants and tea garden workers took place on April 4, 1947 at village Mahabari situated near Mangalbari *haat* (Chalsa area) under Matialli PS. Nine persons including one thirteen year boy were killed and a few others were seriously injured. Among those killed two were workers of Oodlabari tea garden and thus here a new kind of worker-peasant alliance was forged in blood. Available accounts show that there was no attack on the police or no scuffle. The brutal firing was a preplanned one with the aim of smashing the spread of peasant-worker rebellion.[109]

Following this incident the police repression which had earlier been unleashed was intensified. By late February Sec 144 had been in force in as many as eleven police stations. By the end of April criminal cases were lodged against more than one thousand persons, more than two hundred leaders and peasants and workers were in jail, and arrest warrants were issued against two hundred and fifty leaders and activists.[110]

Here it deserves mention that the Congress leadership, the bulk of the non-Communist nationalists and the urban middle classes were by and large apathetic to the *tebhaga* struggle and some were even hostile to it. However, sections of them reacted against the brutality of police repression. Following the Mahabari police firing three enquiry teams went there. One team included several Communist and non-Communist doctors and one college teacher. The second team consisted of representatives of the

Students Congress (the students organisation of the Congress Socialists and RSP), District Muslim Students League and Students Federation. The third one was composed of three prominent Congress leaders including a provincial leader. All the teams condemned the police firing in the most unequivocal terms.[111] It was also possible to organise a successful students strike and hold a students demonstration in Jalpaiguri town in protest against the police firing.[112]

Yet the *tebhaga* movement in general and the peasant worker upsruge in the Dam Dim-Chalsa area received a most serious set back. Massive state repression was one major factor. That the movement even at its height remained deprived of support from the non-Communist nationalists and also remained in a state of isolation from most of the rural areas in the district and from Rajbansi and Muslim peasants in large parts of the Duars as well as from the masses of urban population and middle classes in particular were also very important factors. No less important was the transformation in the political climate of the province in general and Jalpaiguri district in particular. That freedom with partition was in the horizon overshadowed all other events.

When freedom came, the Debiganj-Pachagarh-Boda area went to erstwhile East Pakistan. The Duars upheaval, however, created durable bases for the future movement and organisation led by the Communists and other Left groups and parties, particularly the Socialists and RSP.

## V

## Concluding Remarks

Before concluding, certain points emerging from this study of a microcosm may be made. Though Jalpaiguri because of its socio-economic specificities cannot be viewed as a paradigmatic pattern, it brings out some of the very significant aspects and multiple complexities of popular struggles within the national movement.

That the years 1945-1947 witnessed a marked decline in the stream of national movement that was led directly by the Congress leadership not only at the national and provincial levels but also at the district level has been noted above. But quite independent of the attitude of the district Congress leadership there was an upsurge in multi-ethnic, multi-community and multi-tribe—Rajbansis, Muslims, Oraons, Mundas, Santals, Nepalis, Rabhas, Meches, etc—united popular movements[113] never before experienced in the story of freedom struggle in the district. Parts of the district also witnessed one of the rare instances of the principle of worker-peasant alliance taking shape in the history of anti-feudal, anti-imperialist struggle in the country.[114] But the two streams, though not infrequently criss-crossing and influencing each other, not only flowed in separate courses but in some respects the gulf between the two even widened.

The popular movements, the two major components of which in the context of Jalpaiguri district were the *tebhaga* struggle and the Duars labour unrest, though segmentary and partial in character and usually spurred on by economic issues, produced broader political repercussions. It was not that demands of these movements were by themselves of an explicit political nature. It was also not that the Communist leadership was always able to concretely link up the immediate issues with the broader perspective of freedom struggle. But the overall situation in the country, the growing mass awareness about the imminent crumbling down of the power of the British rulers and also the logic and dynamics of the popular movements themselves gave these struggles a definite political, anti-feudal, anti-colonial dimensions.

It may be quipped that the plantation labourers did not aim at the abolition of the European-dominated plantation system. Seizure of land or outright elimination of *jotedari* exploitation was also not on the immediate agenda of the *tebhaga* struggle. But it is important to stress that the Duars labour unrest forming an integral component of the turmoil in the Darjeeling-Duars-Assam plantation belt was directed against the formidable power of the managers and their direct or indirect agents, such as *munshis, chowkidars, babus* and *kayas*, that is, against the existing power structure in the plantation area. In the *tebhaga* struggle too radical changes in the agrarian relations as well as breaking of the socio-political power of the *jotedars*-cum-*mahajans*, and not merely quantitative dispute over the share of produce, were the substantive issues. Not only that. The rebellious peasants and their allies challenged the authority of their direct exploiters and oppressors and in course of their struggle also of the law-enforcing agencies and administration and sought to set up alternative centres of power.

True, the *tebhaga* movement remained by and large free from certain forms of violence—bloodshed and killing of the *jotedars*. Some scholars have viewed the absence of such forms of violence as indicators of the reformist character of the movement.[115] But, as shown in the preceding section, the unfolding of the *tebhaga* movement was not free from violence. The enforcement of *tebhaga* itself essentially involved the application of direct, organised, collective force and violence. This was also true for the Duars labour upheaval. It should also be added and stressed that whether a movement is revolutionary or not is not determined by the extent of violence and bloodshed involved but by the content and direction of the movement. It is by this criterion that the character of the two movements need to be evaluated.

Put differently, both the movements went, directly and indirectly, against the two subsystems of colonialism that kept the direct producers in a state of semi-bondage and also against certain essential components of the established rural order and of the colonial power structure too. And all this was accompanied by the diffusion, though certainly in a vague and inchoate fashion, of a new radical ideology and glimmer of a superior social and political order.

Related to all this was also the process of emergence of a new kind of leadership—a Left and Communist leadership as an alternative to the prevailing bourgeois liberal one. That the implications of such a development were not missed by some of the interests that were being directly affected and endangered—particularly the planters and the Congress leadership—was indicated by the sort of understanding and co-ordination which they were beginning to have.

Another aspect, not entirely unrelated to the above, was that the progress of popular movements in Jalpaiguri unmistakably showed a *complex interplay* between and blending of ideologically and politically motivated conscious and sustained attempt on the part of the Communists to mobilise and activise the peasants and workers and a relatively autonomous stirring amongst the latter that led to an unprecedented popular outburst. Undoubtedly, there was an area of autonomous activity and perception. At the same time, it requires to be emphasised that the popular upsurge in Jalpaiguri was to a very large extent an outcome of intensive and sustained ideological, political and organisational preparations over a number of years.

Yet the radical potential that was latent in the situation could be realised only to a very limited extent. Several studies show that a major responsibility for this lay with the dominant segment of the anti-imperialist leadership at the national level. But the micro-study made in this essay suggests some of the serious weaknesses that were there even within the Left and Communist-led popular movements. The story of Jalpaiguri reveals the inability of the Communists to link up in the sphere of actual practice the peasant and worker upheaval with the question of state power, and also to establish and extend the linkages between the labour upsurge, *tebhaga* struggle and town middle class agitation. That the *tebhaga* struggle itself remained territorially localised and did not spread to other parts of Duars was another manifestation of their limitations. The Communist leadership was also found to be confused and ill-equipped for the task of facing state repression. It also appears that the 1942 stand of the Communists put a serious limit on their ability to mobilise a wider mass of the peasantry and middle classes. These were, however, not the limitations of the Communist at the local or district level only but reflections of their weaknesses and limitations at the provincial and national level.

It is not that the Communists and the movements led by them lacked courage and heroism. It is also not that they did not try to give anti-feudal, anti-imperialist political content to struggles around economic issues. Yet they were unable to intervene effectively. They failed to respond to the requirements of the situation and to put forward a positive alternative to the bourgeois leadership. This brings one to the character of the Communist-led movement and leadership. One may hazard the suggestion that the seminal distinction made by Antonio Gramsci between corporate economism and national popular collective will[116] may be of considerable help in understanding the nature of Communist default in 1945-47. Here only a few questions of a fundamental nature can be posed: Did the class struggles and Communist-led movement of those years remain confined to corporatism? Can the failure of the Communists to lead the process of formation of national popular collective be traced to the corporate nature of the Communist movement? Related to these is another fundamental question: Why did the radical yearnings manifested at popular levels of the anti-imperialist struggle remain unfulfilled when political independence came? Reasonably satisfactory answers to these questions demand further exploration and thought.

## APPENDIX I

### Note by Sir F Burrows (R/3/1/130: ff. 77-80)

[Extracts only]

[February 14, 1947]

"I understand that the contingencies for which planning is required are:

A An announcement by H M G that they intend to withdraw their power in India within a time limit irrespective of a constitutional agreement:

B A situation of widespread disorder and confusion.

"The Communists are actively fishing in all our troubled waters and would give the disorders both an agrarian and an anti-British colour—the latter would not be difficult in the tea gardens of North Bengal or the industrial areas along the Hooghli in West Bengal and at Narayanganj (Dacca).

"The "internal security" problem as it presented itself from time to time during the past ten months has been the subject of frequent discussion by me with successive Army and Area Commanders, and as a result of my recent tour in North Bengal I am proposing to discuss more especially the arrangements to be made in that area when I see the Army Commander on the 15th February. (In this matter I share the apprehensions of the Commanding Officer of the Northern Bengal Mounted Rifles regarding the suitability of the existing scheme in present conditions in the Jalpaiguri and Darjeeling districts. The scheme, I understand, even in its most recent form, still envisages the evacuation of the European population of the Jalpaiguri (plains) tea area by the very vulnerable "cart road" to Darjeeling. That may have been a good—and the only safe plan—when there were no aerodromes in the Duars, when the loyalty of the hill people was not questioned, and when retreat to Darjeeling would have been only till restoration of order in the plains. In all these respects the situation has now changed. The existence of an airstrip at Baghdogra (near Siliguri) and of an airfield at Hasimara (in the east of Jalpaiguri district) render evacuation to Calcutta or even out of India feasible if aircraft can be made availabe and this would obviate retreat to Darjeeling where (if it could be reached at all) the friendliness of the hill population can be no longer counted on to anything like the former extent and where, with the plains in chaos and no airfield available, the European community may find themselves quite cut off amid a population which may soon be very short of food. Evacuation from East Bengal (Dacca and Chittagong) will have to be by air (for the former) and by sea or air (for the latter). There are possibilities of road, rail and air evacuation from West Bengal, I do not at present know how we could evacuate Darjeeling except by air from Baghdogra."

## APPENDIX II

### Congress, Duars Planters Association and Indian Tea Planters Association

(1) *Extract from the Proceedings of the Special Meeting of the Executive Committee of the ITPA held on 13.4.47*

"Resolved that Trade Unions be encouraged to be formed on every garden under the Association on proper and non-political and healthy basis and the Association should help in forming such unions with model rules".

[*Source*: ITPA Annual Report for 1947, pp 102-03.]

(2) *Extract from the Proceedings of the Speical Meeting of the Executive Committee of the ITPA held on 2.8.47*

"The meeting considered the letter dated the 25th July 1947 from the Jalpaiguri District Congress Committee wherein the Congress informed the Association of its desire to organise Trade Unions amongst Tea Garden Labourers. The Congress in its letter made it clear that as designing parties were exploiting the labourers for purposes other than for real benefit of the labourers, it intended to establish Trade Unions which would be run on the proper Trade Union lines. The meeting also considered the report of an informal discussion held on the 25th July 1947 between the representatives of the DPA, the Congress and the Association on the subject . . . the meeting decided to advise member bodies to give every possible help and assistance to the Congress, it being the policy of the Association all along to promote all round welfare of the labourers . . . "

[*Source:* Ibid, p 112]

(3) *Extract from the Proceedings of a DPA Committee Meeting held on 11.8.1947.*

"The Labour Officer elaborated points brought up regarding Gurkha League and Congress Trade Unions. Agreed that Congress members with cards of identification will be given permission to hold meetings in gardens with a view to forming Trade Unions."

[*Source*: DPA Annual Report for 1947.]

(4) *Extracts from the Proceedings of the Nagrakata Sub-Dist Committee Meeting held on 17.9.1947.*

"Letter from Deven Sarkar, Secretary of Jalpaiguri District Congress Committee to the Chairman, Duars Planters Association dated 8.9.47 was read and discussion ensued. It was hoped by all members that Mr Jenkins [Labour Officer] would be able to arrange for a Senior Congress Official to be appointed by the Secretary, Jalpaiguri District Congress Committee."

## Special Steels

SPECIAL STEELS has been showing significant improvements in production as well as productivity since the takeover of its management by the Tata Iron and Steel Company (TISCO). It ended 1984 with a small cash surplus, as against a cash loss of Rs 3 crore in 1983. There has been a further improvement in its performance in the current year. During the first 5 months, the output of the wire division increased by about 25 per cent and that of the wire rod mill by 60 per cent over the same period last year. Total turnover advanced by 65 per cent to Rs 37.3 crore. A further hike in steel prices has enabled the company to absorb the substantial increase in the prices of scrap, increase in wages and dearness allowance, and increases in the post-budget prices of fuel, transport and stores. In view of the good demand for wire rods and wires, the company is seeking endorsement of a higher capacity of 96,000 tonnes for the wire rod mill, as against the current licensed capacity of 60,000 tonnes. Also, in view of the sustained demand for PC wires from the power sector, and the railways for concrete sleepers and from the construction sector, the management is planning to revive a project that the company had begun some years back for manufacture of these wires at Tarapur, which had to be abandoned half way as a result of the financial stringency and collapse of the wire market. This project will result in significant productivity improvement because of a modern machine being installed and will also enable the company to fully utilise the licensed capacity of 75,000 tonnes per annum. Commenting on the company's prospects, the new Chairman, S A Sabavala, hopes that the demand for steel wire rods and wires will be maintained in the years to come. The Seventh Plan envisages continuing investment in core sectors like power. The company is a major supplier to the power sector for PC wires, cable armour and conductor wires.

# Classical and Contemporary Approaches to Agrarian Capitalism

**Shâpan Adnan**

*The classical sources on the 'agrarian question' were concerned with developing general theoretical principles as well as applying them to particular social and historical contexts. The recent discussion on the mode of production in Indian agriculture drew upon the theoretical categories and arguments developed in these earlier texts, in particular the paradigm of capitalist development.*

*The objective of this paper is to dwell upon certain key issues in the classical texts so as to show how these provide insights into, and in some cases anticipate, the controversies arising in the Indian debate. Equally it is to focus upon those aspects of the South Asian experience which have thrown up certain anomalies requiring critical reformulation of the paradigm itself.*

THE classical sources on the 'agrarian question' were concerned with developing general theoretical principles as well as applying them to particular social and historical contexts. The recent discussion on the mode of production in Indian agriculture, in its turn, drew upon the theoretical categories and arguments developed in these earlier texts, attempting to apply them to the historical experience of South Asia. In particular, it was the paradigm of capitalist development which served as an available ordering framework for evaluating Indian evidence.

At the same time, specific features of the South Asian agrarian structure, as well as its distinctive historical passage, meant that the paradigm as it existed could not 'accommodate' this case without certain critical extensions becoming necessary. The Indian debate, therefore, was not altogether free of a certain tension between uncritical acceptance of earlier texts—which by imposing their pre-existing patterns might underplay the significance of new patterns and problems—and the need for innovative 'breakthroughs' to reconcile old and new patterns within a consistent framework. As such, the advantage as well as the disadvantage, of applying the paradigmatic case to subsequent instances was in evidence—and explicit recognition of this consideration is both useful and necessary.

The objective of the discussion which follows is not, however, to provide 'another' critical review of the 'mode of production' debate *per se*. Rather, it is to dwell upon certain key issues in the classical texts so as to show how these provide insights into, and in some cases anticipate, the controversies arising in the recent Indian debate. Equally, it is to focus upon those aspects of the South Asian experience which have thrown up certain anomalies requiring critical reformulation of the paradigm itself. In particular, I have referred to evidence from the history of colonial Bengal to illustrate some of the difficulties involved. Overall, the method which I have followed has been one of 'reconstructing' aspects of the paradigm from first principles, rather than that of 'proof by quotation' from classical sources.[1]

## I

## The Issues

There is no unique version of the paradigm which is applicable to all cases—rather, there are different, and differing, accounts of the process of capitalist development in specific social and economic contexts. These differences arise not only from the diversity of historical experience, but also from contending interpretations of the causality at work. Marx's original account was in places amended and extended by Kautsky and Lenin; correspondingly, the subsequent debates on Europe and South Asia raised questions which were not all that apparent in any of the classical texts.

The essential core of the debate has revolved around the question of whether the growth of the market is the 'prime mover' of capitalist development in agriculture [Sweezy, 1976: 41-46, 103] or whether it is a conjunctural factor ('stimulant' or 'catalyst') [Postan and Hatcher, 1978: 27], such that its effective consequence depends upon antecedent determinants, and, in particular, the pre-existing class structure [Dobb, 1963: 38-42; 1976: 61, 166-167; Brenner, 1976: 43-45, 60; 1977: 41-47]. It is this particular question, central to the causality of capitalist development, which is taken up for discussion below. Only by defining the alternative ways in which the market relates to peasant production, and its conditions of reproduction, is it possible to specify the role which it can play in the differentiation of the peasantry. Correspondingly, whether such differentiation is historically followed by capitalist transformation depends upon whether the pre-existing relations of production are able to establish dominance upon the market and its incremental growth. In particular, whether or not the growth of the market necessarily corresponds to the development of capitalism, requires critical appraisal. The issues here subsume not only how (i e, in what forms?) but also why (i e, for what reasons?) capitalist development does take place.

A methodological consideration is also pertinent at this juncture. Capitalist development constitutes a particular outcome amongst manifold patterns of possible historical change. In attempting to identify the causality of the process, the possibility of alternative historical outcomes cannot be ruled out *ab initio*. To do so, far from strengthening the argument, weakens it. That is, the paradigm of capitalist development rests on a stronger analytical base if it does not rely upon any evolutionary or functional presuppositions regarding the inevitability of the process. Rather, it has to explain why such an outcome is, or is not, realised in practice. If what has to be explained is presupposed, then, even if capitalist development does take place in history, it will not be apparent from the argument itself why that should have been the case, rather than otherwise.

## II

## Peasant Production

Commenting on the development of capitalism in Russia, Lenin notes that the critical question was not "how fast?", but "how exactly? and where from? (i e, what was the nature of the precapitalist economic system in Russia?)" [Lenin: 1960a: 380]. In his view, "the precapitalist countryside constituted (from the economic point of view) a network of small local markets which linked up tiny groups of small producers, severed from each other by their separate farms, by the innumerable medieval barriers between them, and by the remnants of medieval dependence" (emphasis removed)[ibid, 381]. The scattered and isolated nature of peasant production and its weak, and only partial, integration through local-level markets are echoed in Marx's and Kautsky's respective accounts of the French and German peasantry [Marx, 1973: 238-239; Kautsky, 1976: 3].

What is of theoretical interest here are the categories to be applied to the economy in peasant agriculture. At one level of analysis, the classical texts make heuristic use of the concept of natural economy, i e, one involving transactions in kind rather than money.[2] The category of simple commodity production is somewhat more realistic because it incorporates some markets and provides specification of the productive units. Viewed as an ideal-type construct, the set of economic agents here consist of peasant families for whom "agriculture is wholly or mainly a part of [the] household economy" [Kautsky, 1976: 36]. Much of productive and distributive activities take place 'within' the productive unit, i e, do not enter circulation *via* the market [Kautsky, 1976: 35; Lenin, 1960c: 124-125]. To the extent that peasant households are unseparated from their means of production (primarily land), they do not need to participate in either lease or labour markets. They do, however, participate in produce markets, to sell part of their output and buy non-produced goods. In effect, they constitute a set of equal and independent agents, who are mutually interdependent *via* processes of commodity exchange [Kautsky, 1976: 12].

As both Dobb and Sweezy agree in the context of the decline of feudal Europe, simple commodity production does not (*sui generis*) constitute a separate mode of production [Dobb, 1976: 61-62; Sweezy, 1976: 51]. Rather, it is to be historically found, not in its pure form, but in 'mixed' states, subject to some other dominant mode of production, such as feudalism [Kautsky, 1976: 12]. In practice, therefore, simple commodity producers exist in subordination to exploiting classes, whether landlords, merchants or usurers. The construct of simple commodity production is accordingly modified: it becomes part of a class system, with the peasant or serf, *qua* simple commodity producer, subject to varied forms of coercion, as the very condition of the extraction of surplus product [Marx, 1981: 926-927; Dobb, 1963: 58].

In trying to capture the relationship between 'production and the market' as it obtains within this modified construct, the critical question is: 'why does the peasant come to the market'? This entails examination of how market participation fits into his conditions of reproduction, and whether these include pressures generated by exploitative arrangements (e g, if payment of precapitalist rent in the money-form makes participation in the product market unavoidable) [Marx, 1981: 933; Kula, 1976: 43]. A preliminary step in this direction is to specify the patterns of market participation (or its absence) of different classes of agents.

It is possible to extract from the texts of Kautsky and Lenin certain patterns which capture qualitative differences in market participation between classes [Lenin, 1960a: 70-141; 1961b: 380-388; Kautsky, 1976: 21-28]. These well-known categories, which may be termed as 'real types', can be summarily listed as follows. Amongst producing classes/farms are: (1) rich peasants (kulaks/large farms/capitalists, etc); (2) middle peasants (medium, even small farms); (3) poor peasants (semi-proletarians/proletarianised peasant households). In addition, there are two broad categories which do not operate farms (productive units) themselves, but obtain shares of the agrarian product *via* market or extra-market circulation processes; (4) the proletariat (full-proletarians); and (5) precapitalist exploiters, consisting of landlords, merchants, usurers, etc.

What is innovative about the analyses of Kautsky and Lenin is that, apart from providing this typology of agents, the ways in which the various types/classes come together in market relationships are also indicated. These can be sketched out as follows in terms of (i) the specific markets participated in and (ii) the transactional roles, i e, buyers and/or sellers [See Figures 1 and 2]:[3]

(a) Rich peasants hire wage workers from the ranks of the proletariat, poor peasants and, in some cases, even middle peasants.

(b) Poor peasants and the proletariat buy some or all of their means of subsistence from produce markets, where the sellers are predominantly rich peasants [Kautsky, 1976: 34].

(c) When tying of labour is necessary, rich peasants (or landlords) provide tiny allotments to the poor peasants, which may involve lease-labour interlocked market relationships [Kautsky, 1976: 39; Lenin, 1960a: 197-198].

(d) Pure landlords lease out to all categories of peasants; there is also some incidence of 'reverse' tenancy.

(e) Merchant-usurers, often rich peasant themselves, operating *via* credit and/or produce markets, establish rights on the product of middle and poor peasants, which may also involve credit-product interlocked market relationships [Kautsky, 1976: 25; Lenin, 1960a: 114, 285-287].

It is also possible to discern certain properties of the economy, which serve to bring out the complex relationship between production and the market:

(1) While market participation typically involves competitive relationships between producing classes, there is also significant incidence of complementary alignments between them: e g, rich peasants selling produce to, and buying labour power from, poor peasants [Kautsky, 1976: 34; Hussain and Tribe, 1981a: 108].

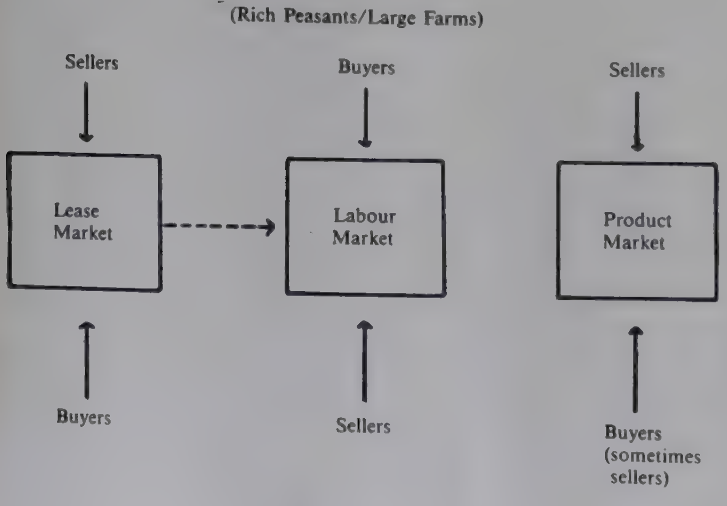
(2) Over and above the classical forms of precapitalist ground rent (based upon extra-economic coercion) [Marx, 1981: 925-949] a market-based form (to be distinguished from capitalist ground rent) has come into operation.

(3) The market sector as a whole displays considerable heterogeneity: it is unevenly developed, and displays some incidence of interlocked market relationships (with or without further dependency relationships).

(4) There is no necessary one-to-one correspondence between 'forms' of the market

MARKET RELATIONSHIPS BETWEEN CLASSES IN THE ANALYSES OF KAUTSKY AND LENIN

FIGURE 1



(Rich Peasants/Large Farms)

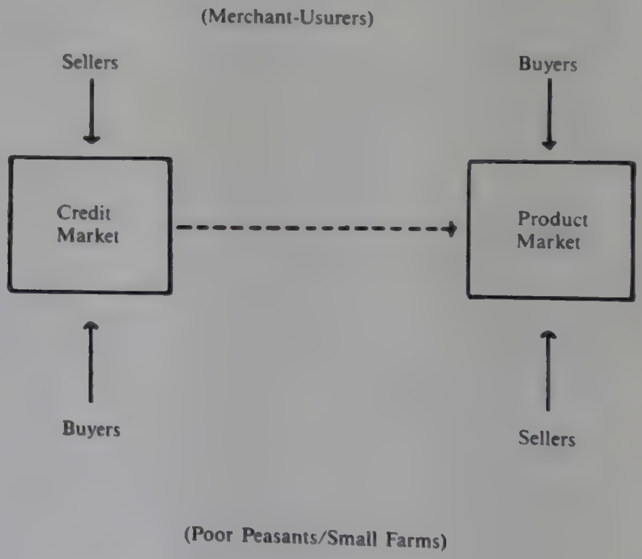
(Poor Peasants/Small Farms)

FIGURE 2



*Note*: --→ Denotes interlocked market relationships and 'forms' of production: e g, the lease market mediates both capitalist and precapitalist rent; interlocked market relationships are 'used' by both rich peasants *qua* capitalist farmer (for tying workers) and the merchant-usurer *qua* precapitalist exploiter.

(5) There are sectors of resource allocation where the market does not operate, i e, non-market sectors: firstly, the retention and deployment of resources 'within' the productive unit and secondly, where circulation is mediated by extra-market mechanisms, e g, varied forms of surplus extraction from the peasantry by feudal rent, 'customary' dues, or state revenue [Marx, 1981: 941; Kautsky, 1976: 36, 40; Lenin, 1960c: 124-125; 1964: 65].

Thus, what emerges from Kautsky's and Lenin's texts is a much more realistic theoretical construct of the economy in peasant (precapitalist) agriculture than, say, ideal-type simple commodity production. For, once the latter has served to distinguish the 'simple' from the 'capitalist' commodity producer, it fails to shed further light on the characteristics of real type peasant classes. It is also a decidedly part-market construct of the economy, in which production and distribution are interlinked by market as well as non-market mechanisms. Furthermore, it situates these varied mechanisms of resource allocation in the context of production relations, thus remaining sensitive to the distinction between capitalist and precapitalist production (as well as transitional forms which are analytically 'intermediate'). There is thus theoretical space for posing the problem of the transition to capitalism in the first place—a question which cannot even be raised within the framework of conventional economic theory.

## III

## Conditions of Reproduction

Real type peasant classes are thus distinguished by distinct patterns of participation in market and non-market sectors. For any particular type (class) of agent, these may appear as discrete strands of its economic activity, unless viewed in terms of its conditions of reproduction. The discrete strands then acquire a certain coherence constituting interdependent elements of an integrated strategy of reproduction. Correspondingly, classes are interdependent not only in terms of possible complementary (market) alignments, but also because their conditions of reproduction, as a whole, are interconnected in certain ways. The limits within which such interdependent reproduction can take place also help to indicate the conditions under which a given class structure can no longer be reproduced. The conditions of reproduction, therefore, bear upon the conditions of change.

### REPRODUCTION OF AGENTS

If the condition of simple reproduction is defined as the minimal requirements for the renewal of production from one cycle to another, then both Marx [1981: 935-942] and Kautsky [1976: 24-26, 34] specify these for (i) the capitalist and (ii) the peasant, considered as a simple commodity producer.

The capitalist, to start with, produces in a social context, where to justify undertaking production at all, he must obtain what he could get in other capitalist sectors of the economy, i e, the normal rate of profit, arising from the interaction of individual capitals on a social-scale. Furthermore, if he leases in land for production, he must pay absolute ground rent to the landowner, i e, a surplus above his normal profit must be generated.[4] If the capitalist produces in a milieu where precapitalist peasant producers co-exist, then both types of producers interact *via* common lease markets, and the opportunity cost of land for each is set by the other. If the level of precapitalist rent exceeds the (notional) level of capitalist rent, then it is the former which would also apply to the capitalist producer.

On this basis, the conditions of reproduction of the capitalist can be specified as follows: after meeting all costs of production, he must generate both a normal profit and a surplus for rent [Patnaik, 1979: 400-401]. Since he produces for profit alone, it is self-evident that he will cost all inputs, whether actually purchased on the market, or owned, but having realisable market value. However, the one resource which the capitalist cannot own, but must buy on the market, is labour power. He cannot, therefore, ignore or undervalue the costs of labour power, 'even if he were constrained to do so'—a consideration which, despite its counterfactual nature, is of significance in distinguishing him from the peasant.

In contrast, the peasant 'owns' labour power (in the sense of family labour) and can deploy it in 'own' production, i e, on-farm. What is crucial here is that, if it has not undergone prior alienation *via* extra-economic coercion (or market sale), then, family labour, deployed in an on-farm labour process, performs as non-alienated labour power.[5] Furthermore, the simple commodity producer does not undertake production for profit alone, nor is such production subject to the dictates of capital on a social scale (i e, social capital). In his conditions of reproduction, there is thus no systematic counterpart to the capitalist's normal profit [Marx, 1981: 941-942]. Nevertheless, this does not imply that he is not subject to other kinds of social pressure. If he does not own, or have direct access to, the means of production, he must of necessity resort to the landlord or merchant-usurer. In other words, reproduction may not be possible without becoming subject to exploitation.

The conditions of reproduction of the simple commodity producer can be defined accordingly: he reproduces provided he meets familial consumption requirements over the cycle of production and surrenders surplus to the exploiting classes to ensure renewal of his access to the means of production. In other words, to survive, he has to generate a minimal level of necessary and surplus product which (purely for the purposes of comparison) corresponds to the capitalist's 'surplus for rent' and 'costs for production' (inclusive of the 'wage' fund). Whether or not he can produce and retain an analogous component of 'normal profit' depends upon the degree of exploitation to which he is subject but, crucially, he survives even if he does not [Marx, 1981: 932].

Thus, what distinguishes the simple commodity producer from the capitalist is his access to non-market labour power and produce, which enables him, if so constrained, to undervalue, or ignore, the costs of family labour in terms of the retained product that serves as its ('factor') payment. This does not mean that such costs are 'fictitious'—they are, or can be, perfectly real, as pre-eminently manifested in the possible 'overwork and underconsumption' of family workers [Patnaik, 1979: 394-395].[6] This (actual or potential) capacity to transfer what would otherwise be market costs and returns to the capitalist implies that the simple commodity producer can survive under conditions which would compel the capitalist to 'go out of business'.

It follows that the simultaneous use of market and non-market resources by the simple commodity producer, far from being discrete and unrelated acts, are in fact interdependent elements of an integrated strategy of reproduction. He can participate and 'survive' in some markets precisely because he can avoid participating in others.

Thus even though the simple commodity producer participates in common markets with the capitalist, and to that extent is subject to identical price 'rules', both the quantitative extent and the qualitative nature of such participation differ. What impels them to 'come to the market' in the first place, is not the market *per se*, but the respective conditions of reproduction to which they are subject. Capitalist production based upon wage labour, with productive units competing with each other for survival, generates a unique relationship between production and the market, impinging upon the conditions of reproduction of the individual capitalist. As Brenner [1977: 32] puts it:

> Only under conditions of free wage labour will the individual producing units (combining labour power and the means of production) be forced to sell in order to buy, to buy in order to survive and reproduce, and ultimately to expand and innovate in order to maintain this position in relationship to other competing productive units. Only under such a system, where both capital and labour power are thus commodities ... is there the necessity of producing at the 'socially necessary' labour time in order to surive,

and to surpass this level of productivity to ensure continued survival [Cf Marx 1976: 739].

The simple commodity producer, on the other hand, participates in the market to have access to means of production which he does not possess and to acquire necessary goods which he does not produce. For him, 'making a profit' is a possible, but not necessary, condition of such participation. The circulation processes generated differ accordingly: while the simple commodity producer can reproduce *via* C-M-C', the capitalist must necessarily generate M-C-M' [Marx, 1976: 247-255].

Despite possible participation in common markets and subjection to identical price rules, the capitalist and the simple commodity producer are, in effect, involved in 'playing different games'. In other words, they undertake qualitatively different 'production problems', corresponding to their respective conditions of reproduction. These, in turn, reflect qualitatively different relationships between production and the market. Equally, since the simple commodity producer has the capacity to part with what would otherwise be normal profit to the capitalist, as well as to 'underpay' family workers in relation to what would otherwise be the capitalist's wage-bill, his economic calculations are qualitatively different, i e, the two have different 'calculation problems' to solve.[7]

A further implication regarding the level of productive forces used by the two categories follows from these considerations—as is noted by Kautsky [1976: 21-23] and cogently re-stated by Patnaik [1979: 401]. If the capitalist and the peasant (*qua* simple commodity producer) co-exist, then for comparable plots of land, the former must extract an additional element (normal profit) than the latter, in order to survive and reproudce. He must, therefore, use a technique which results in sufficiently greater land productivity to yield him this additional component—given that the peasant can be expected to be making the most productive use of land within the set of techniques available to him.

Kautsky is able to draw a crucial inference from this argument: namely, that the relative capacity to survive (reproduce) of the two categories of producers is a consideration analytically distinct from that of their comparative efficiency in terms of market-valuation and technical conditions [Kautsky, 1976: 24-26]. The peasant, *qua* simple commodity producer, survives, 'on the market', not because he is competitively superior to the capitalist, but because he addresses a different (and in some ways, a less 'demanding') production problem. Their relative capacity to survive cannot be necessarily reduced to any principle of 'natural selection', based upon the 'survival of the fittest' [Hussain and Tribe, 1981a: 111].

### REPRODUCTION OF THE CLASS STRUCTURE

It is crucial to distinguish between the conditions of reproduction of the individual agent and those of the class structure in which he is located—for, the individual agent may well cease to reproduce, while the structure persists, replacing him by another.[8] This requires focusing upon the division between necessary labour and surplus labour (the respective products of which accrue to classes of direct producers and their exploiters). While these two components combine into the conditions of reproduction of the individual agent (*qua* simple commodity producer), it is the distributive tension between the two—cutting across individual productive units, but along class lines—which assumes significance in the conditions of reproduction of the structure.

In Marx's [1981: 926] analysis of precapitalist ground rent, the structure of exploitation is viewed as 'parasitic', i e, one in which the burden of reproducing those who exploit them, as well as of themselves, fall upon the class of direct producers. In Dobb's [1963: 42-46; 1976: 165-166] and Kula's [1976: 65-66, 75, 118-119] subsequent analysis of feudalism, this is precisely the consideration which defines the fundamental contradiction underlying the long-run dynamic of the economy. If the direct producers as a class are unable to reproduce, then they cannot also deliver surplus. This, in turn, undermines the entire class structure of exploitation itself. There is thus a 'technical' limit to the intensity of exploitation which is compatible with the reproduction of the class structure as a whole. This technical limit corresponds to the minimal share of the produce which must accrue to the class of direct producers, if they are to reproduce their labour power (i e, the necessary product) [Marx, 1981: 926-928].

In practice, as Kula [1976: 47] notes, the encroachment of exploitation to this level of maximal intensity can be resisted by the overt or covert class struggles of the direct producers.[9] Thus, the 'social' limit to the extent of exploitation depends upon—in Kula's evocative phrase—the 'coefficient of realisable coercion' [ibid]. The essence of the conditions of reproduction of the precapitalist class structure, therefore, boils down to this: that the social limit of exploitation cannot exceed the technical limit. If it does, 'the system breaks down'—as is historically noted for feudal Europe [Dobb, 1976: 100, 165-169; Hilton, 1976: 111-117; Kula, 1976: 118-119; Brenner, 1977] and the agrarian system of Mughal India [Habib, 1963: 322-329; 1969: 40].[10]

While this argument is developed in terms of the 'normal' form of exploitation in precapitalist production (ground rent), it can be extended to subsidiary forms, of which exploitation by mercantile and usurious capital are the most notable instances. Marx regards these as forms of capital which historically predate the emergence of 'industrial' (productive) capital [Marx, 1981: 440-455; 728-735]. To a certain extent, these do prepare the ground for the latter through the twin mechanisms of usurious interest and mercantile profit, which can impoverish peasant producers as well as their rent-receiving exploiters. Nevertheless, mercantile and usurious capital confine themselves to 'mediating' between 'spheres' of (precapitalist) production without 'taking hold' of production itself and remain, in that sense, unproductive capital.

What is particularly relevant here is Marx's view that while mercantile and usurious capital can, and do, undermine the reproduction of individual agents, they do not necessarily undermine the prevalent relation of production itself which, as it were, constitutes their social premise [Marx, 1976: 1022-1023; 1981: 446-447, 729-732, 745]. That is, like the extraction of precapitalist rent, these forms of capital, too, have a 'parasitic' role which is confined to exploiting peasant production without transforming it. Thus, taken together, provided the social limit of precapitalist exploitation (rent, interest, mercantile profit) does not exceed the technical limit, the class structure upon which it is based has an 'on-going' rationality. Even though individual agents (whether direct producers or exploiters) may be ruined, there is no logical or historical necessity for the pre-existing relation of production itself to be transformed (e g, for capitalist development to take place). In fact, Marx further suggests that there is an inverse relationship between the development of productive and unproductive capital—that the predominance of the latter can, in effect, become a barrier to the historical emergence of the former [Marx, 1981: 445-446].

Now, as these propositions appear in Marx's (posthumously published) texts, they do not constitute a complete argument: what is available, in a sense, are the premises and the conclusions, without the intervening logical steps.[11] In the Indian debate, this has led to certain disagreements about the respective roles of productive and unproductive capital in the process of capitalist development [Chattopadhyay, 1972a: A-43; Banaji, 1977: 1375-1376; Bhaduri, 1973; 1974; 1976; 1977; 1981; 1983]. Some of these arguments are taken up in context below.

## IV

## Differentiation of the Peasantry

Marx's [1976: 863-875] original treatment of the differentiation of the peasantry and primitive accumulation was based on the English experience, where the forcible expropriation of peasant property (e g, through the 'enclosure movements') served as the mechanism of dispossession. This, however, could only be a special case because such outright dispossession is only possible if the affected peasant classes lack the necessary juridical property rights, and/or the political power, to resist. Where this was not the case, as for example in France, forcible dispossession could not serve as the premier mechanism of differentiation.[12]

Under such conditions market-based interaction provides an alternative mechanism of differentiation. Both Kautsky and Lenin extend Marx's model on these lines. However, for Lenin, market-based differentiation appears to be an unilineal process, leading inexorably to the eventual polarisation of the peasantry. In contrast, Kautsky takes account of the complex forms of market-based differentiation, and also provides a sophisticated analysis of the possible constraints limiting this process. In his classic treatment of the matter, Kautsky links differentiation with the process of capitalist transformation by looking at the possible barriers which confront 'outside' capitalists intending to 'enter' agriculture. (However, unlike Lenin [1960a: 32-33; 1962b: 238-239], Kautsky's analysis of the problem is concerned with 'outside' capitalists, rather than potential 'insiders' (e g, kulaks) amongst the peasantry.) It is this vantage-point which enables him to focus upon pre-existing property rights, and the peculiarities of land as a means of production [Kautsky, 1976: 17-19, 30, 38-39] which distinguish it from those in industry (e g, machinery):

(1) It is a non-producible good and in limited supply in the short-run (i e, a given stock).

(2) Its quality (e g, fertility) varies from plot to plot and is not transferable between them.

(3) It is (geographically) location-specific, i e, immovable.

(4) It can be 'pre-occupied' by systems of private property, whether of peasant producers or of exploiting classes.

Using these properties as 'premises', Kautsky is able to deduce certain 'barriers to entry' confronting capitalists who come in from the 'outside'. Such capitalists have to displace the pre-existing owners, or contract with them, in order to have access to land in the first place—the precondition of undertaking production at all. In contrast, emerging capitalists in industry do not have to 'capture' the prevalent stock of the means of production from existing owners (e g, the tools of artisans) in order to 'enter' productive activity. Essentially, differentiation of the peasantry, to be conducive to capitalist development, requires a class redistribution of the pre-existing stock of land in favour of actual or potential capitalists (insofar as incremental additions to stock are not possible).

Indeed, as Brenner [1977: 48-49, 73-75] points out, the control of land by precapitalist/peasant production results in complementary resources such as labour power and the means of subsistence remaining 'tied' into its particular (non-market) ways of organising production. Thus, in addition to land, even these co-operant inputs are not necessarily available on the market—to be bought and converted into productive capital. In effect, by simply 'pre-occupying' land, precapitalist/peasant production can set defined limits to the 'entry' of any new form of production, such as capitalism [Hussain and Tribe, 1981a: 124-125].[13]

In fact, Kautsky does not quite push through this argument to its logical conclusion. It is not simply geographical space (as he puts it), but more fundamentally, 'production-space' which is 'pre-occupied' by precapitalist/peasant production (subsuming land as well as co-operant inputs, such as labour power and the means of subsistence). Since this cannot be by-passed, as in industry, it is precisely the limited and 'pre-occupied' 'production-space' of agriculture which can become a critical barrier to possibilities of change. Capitalist development, therefore, is not simply a matter of having access to land through displacement of its direct owners or occupants. Rather, what is involved is the displacement and/or 'self-transformation' of the entire hierarchy of classes who have interwoven interests in maintaining the existing forms of property, inclusive of those who appropriate surplus on that basis (e g, landlords, merchant-usurers or even agents of the state) [cf, Lenin, 1962b: 239-242]. Reformulated thus, Kautsky's arguments apply as much to potential 'insider' capitalists amongst the peasantry as to 'outsiders': for no individual agent, whether peasant, landlord or merchant-usurer, can necessarily ensure that the specific commodities (e g, land or labour power) which he requires for undertaking (or expanding) capitalist production are available 'on the market', without facing possible hindrance from pre-existing class interests.

All the same, Kautsky is able to provide from his analysis a seminal treatment of the role of the market in generating a process of differentiation, as well as the possible limits to this process. In particular, he indicates how differentiation based upon market interaction can be retarded in certain ways.

Firstly, the peasant, *qua* simple commodity producer, survives on the market, not because of his competitive or technical efficiency, but rather because he 'plays a different game', i e, undertakes a different production problem than the capitalist. Secondly, to the extent that peasant producers are able to retain direct access to their means of subsistence,[14] the elimination process based upon product market competition—the mechanism *par excellence* by which capitalism undermines pre-existing production in industry—may not be able to come into play [Hussain and Tribe, 1981a: 108-109, 124-125]. Thirdly, even if peasant producers have to buy some of their means of subsistence from the market, their relationship with the classes which are the sellers, can be complementary rather than competitive. While these considerations are inter-related, they are still analytically separable—for, even if the peasant producer is forced into product market competition, he is not compelled to meet the particular conditions of reproduction applying to the capitalist.

If peasant producers are not necessarily subject to elimination by straightforward product market competition, then, in what other ways can differentiation take place? This is where the political and juridical underpinnings of peasant property rights assume significance. Kautsky [1976: 31] notes that, given "bourgeois property" rights, expropriation of land by direct coercion is not feasible. Under such historical conditions, only the mechanism of debt default in mortgage contracts (the credit-land interlocked market) provides the legally recognised basis of land alienation.

The implication of what Kautsky only hints at here is crucial: even if the peasant cannot be dispossessed, or eliminated by straightforward product market competition, his frequent cash needs—reinforced by interested surplus appropriating classes—can be manipulated to this end. In particular, the compulsion of cash needs can provide the entry-point for market-based contracts by merchant-usurers—the dynamics of which may eventually lead to the dispossession of land. In effect, what is involved is a view of differentiation *via* the market which is much more complex than that of straightforward product market competition (leading to the elimination of less 'efficient' producers). In the Indian context, this is precisely the thesis which has been advanced and extended by Bhaduri—namely, that it is 'forced commercialisation' [Bhaduri, 1983b: 41-42, 85-87, 106-107] initiated in the lease or credit-product interlocked markets, with possible adjustments in the lease (subtenurial) and land markets for debt settlement, which has been the prime mechanism of the differentiation of the peasantry.[15]

As Bhaduri [1976] has pointed out, the historical experience of South Asia displays further complexities which do not accord with the classical paradigm even in the amended version provided by Kautsky. The issues can be illustrated by taking a brief look at the historical evolution of landed property in Bengal under the impact of growing commercialisation and, in particular, the growth of lease, credit and produce markets [Sen, 1982; Chatterjee, 1982; Bose, 1982]. Unlike Kautsky's unproblematic notion of 'bourgeois' property rights, what actually emerged in colonial Bengal was a 'layered' pattern of hierarchical rights in rent, revenue and occupancy in which, typically, no single agent had complete rights on a given plot of land.[16] It was in this framework that peasants caught up in cycles of indebtedness were compelled to sell the particular right which they happened to possess at any given point of time. Over time, however, the pattern was one of indebted peasants going down (or up, as the case might be) along this hierarchy of rights. Only at the limit, when all subtenurial rights had been lost did an indebted peasant become a 'rightless' share-cropper, or a wage worker [Bhaduri, 1976: 51].

Now, while the emergence of wage workers accords with the classical paradigm, the existence of the 'rightless' share-cropper does not.[17] For, here is a class which is totally devoid of rights in the means of production, while not being 'owned' by others (*qua* serf) under extra-economic coercion, i e, "free workers in the double sense" [Marx, 1976: 874]. Nevertheless, the fact of alienation from the means of production did not result in this class being necessarily converted into wage workers. Rather, it appears that such 'rightless' share-croppers were 'retained' by the prevalent class structure as *de facto* 'base-tenants'—who had to undertake production on 'their own account', based primarily on family labour, while being compelled to surrender surplus to those with varied rights upon the cultivated land [Sen, 1982: 29-45; Chatterjee 1982: 145-181].[18] In other words, complete loss of occupancy or ownership rights on land did not mean that such a class was 'relieved of the burden' of organising production and being accountable for its outcome. This pattern, in which a segment of landless producers in colonial Bengal were compelled to survive *via* the lease, rather than the labour market, suggests that there is more to capitalist transformation than the emergence of a (potential) proletariat through the differentiation of the peasantry. However, before any attempt to explain this problematic pattern can be made, it is necessary to look at the distinctive ways in which the market relates to capitalist and precapitalist relations of production.

## V

## Forms of Agrarian Capitalism

The central problem addressed by Kautsky [1976: 2-3], and Lenin [1960a: 95-96; 1960b; 1960c] in his earlier works, is that of the phenomenal forms in which capital 'takes hold' of agriculture, i e, how does it 'penetrate' pre-existing peasant production? The task, as Kautsky puts it, is "to investigate whether capital is bringing agriculture under its domination and how it is dominating it, how it transforms it, how it invalidates old forms of production and forms of property and creates the need for new forms" [cited in Lenin 1960c: 112].

Given the apparent persistence of peasant production in Germany and Russia respectively, Kautsky and Lenin bring to bear the arguments noted earlier to propose that this appearance is deceptive, and that capitalist development is taking place in forms more complex than those specified in Marx's model [Hussain and Tribe, 1981a: 107-108; 1981b: 31-35]. The gist of their argument can be stated as follows. Since involvement in the market has become integral to peasant production, a significant proportion of resources (land, labour power and the means of subsistence) are available as commodities to be bought and converted into productive capital. Furthermore, a class of rich peasants, *qua* capitalist producers, exist in defined market linkages, complementary as well as competitive, with the other peasant classes—middle and poor peasants as much as full proletarians [Lenin, 1960a: 71-187]. Thus, in effect, for the circulation of productive capital to come into play, it is by no means necessary that the differentiation of the peasantry must proceed to the extent of complete polarisation, i e, the emergence of a fully-fledged proletariat in the classic sense used by Marx [Marx, 1976: 874; Hussain and Tribe, 1981a: 108; 1981b: 35].

Rather, what is sufficient is that there are requisite numbers of peasant households (particularly poor peasants/semi-proletarians) who are willing to sell their labour power and, perhaps, even buy capitalist produce on the market (for subsistence). The fact that they retain the phenomenal appearance of tiny 'enterprises', with miniscule holdings of their own, does not detract from the indubitably capitalist nature of their integration to off-farm activities. The constituent 'elements' of such peasant farms are integrated into the circulation of productive capital *via* the labour and produce markets. To that extent, their conditions of reproduction approximate to those of full proletarians.

Thus what Kautsky and Lenin demonstrate is that the actual locus of capitalist production, traced along the lines of the circulation of productive capital, is much more pervasive than would appear from a simple view of the distribution of farm-sizes.[19] Since capitalist relations of production penetrate the 'peasant' sector, the development of capitalism cannot be 'measured' by simply 'counting' and 'adding up' capitalist farms compared to peasant ones [Ennew, Hirst and Tribe, 1977: 304]. (This is a point which has been largely missed out by the Indian debate.)[20] Rather, the extent of capitalist development has to be evaluated by taking account of the conditions of reproduction of all classes of farms, inclusive of the interdependence between them. It is this innovative reconceptualisation of the complex forms in which capital takes hold of agriculture—extending the classic formulation provided by Marx—which constitutes the pre-eminent contribution of Kautsky and Lenin to the paradigm of capitalist development.

However, while this account of how capitalism takes root in peasant agriculture may well have reflected what was actually happening in Kautsky's Germany and Lenin's Russia,[21] there are other difficulties which they seem to leave out of account. Crucial, in particular, is the methodological point that they do not perceive market-based exploitation by precapitalist landlords and usurers as significant sources of resistance to capitalist development, and hence do not take account of alternative historical outcomes other than capitalism. These difficulties can be brought out by examining the premises of their argument as well as the historical patterns from Bengal noted earlier.

Crucial to this formation of Kautsky and Lenin is the fact of an already existing capitalist sector (i e, rich peasants/large farmers who are regarded as such). Thus, existing capitalists are viewed as striving to expand—but being constrained from doing so, by the properties of land and peasant production. Whenever incremental supplies of land, labour power, etc, from the peasant sector appear on the market as commodities, these are perceived to be readily taken up by the capitalist sector. That is, if, (i) a capitalist sector pre-exists, and (ii) all incremental commoditisation is functional to the expansionist requirements of such a sector, then, of course, no alternative outcomes are possible. In particular, the following theoretical problem cannot even arise: what determines that commodities entering the market from the peasant sector are systematically incorporated into the circulation of productive capital, rather than any other (forms of circulation)?

This problem has to be confronted in historical contexts such as South Asia, where a capitalist sector does not pre-exist; or, even if it does, where it co-exists with a 'residual' peasant sector which is subject to other forms of exploitation based upon the market, such as precapitalist rent or usury. When capitalist and precapitalist exploitation co-exist and interact *via* common markets—particularly where the resource is in limited supply, as is pre-eminently the case with land—their relative dominance over specific markets (as well as the conflict between their respective class structures), may well affect the possible historical outcomes. Thus, if markets are dominated by precapitalist exploiters, then incremental commoditisation from the peasant sector may well be incorporated into forms of circulation other than that of productive capital. To the extent that such exploitation is based upon small peasant producers, with distinctive production problems from those of the capitalist, much of the limited 'production-space' of agriculture may continue to remain 'pre-occupied'. Given the peculiar properties of land, precapitalist relations of production in agriculture may thus be able to deny production-space to emergent capitalism in a way that is not possible in industry.

Both Kautsky and Lenin do refer to Marx's view that mercantile and usurious capital can play a retrogressive role in the process of capitalist development, but difficulties arise because they do not actually take up the problem of how precapitalist forms of production and exploitation are subordinated by productive capital [Kautsky, 1976: 4, 25, 45-46; Lenin, 1960a: 78-79, 138, 177, 183-186]. In their analyses, the distinction between productive and unproductive capital becomes blurred. In some passages, Lenin [1960a: 138] treats mercantile and usurious capital virtually as extensions of productive capital. Nor is there an attempt to analyse how either of these may come to dominate the other: " . . . the threads both of merchant's capital . . . and of industrial capital . . . merge in the hands of the peasant bourgeoisie. It depends on surrounding circumstances, on the greater or lesser degree to which the Asiatic way of life is eliminated and culture is widespread in our countryside as to which of these forms of capital will develop at the expense of the other" [Lenin, 1960a: 79]. Similarly, in some places, it would appear that Kautsky treats the emergence of capitalist production relations as something which happens 'automatically'—as a matter of evolution: "At a certain stage of development, capitalist commodity production replaces simple commodity production, that is, the worker ceases to be the owner of his means of production . . . It is not difficult to see that instead of extorting products from the [simple commodity] producer below their value, the merchant may prefer to exploit the worker's precarious situation to convert him into a hired labourer . . . [Kautsky, 1976: 12-14].

Since different forms of market growth are equated to the circulation of productive capital—and the 'common' process is regarded as eventually leading to capitalism alone—Kautsky and Lenin are unable to avoid arguing in terms of the 'tendencies' of capitalist development [Hussain and Tribe, 1981a: 103-109]. What remains absent is the theoretical treatment of the possibility—noted by Marx—that the class structure of precapitalist exploitation may not necessarily give way to that of capitalism. However, in his later writings, when Lenin acknowledges the earlier 'overestimation' of capitalist development in Russia, he also goes on to argue how different class configurations can affect the pace and nature of capitalist development [Lenin, 1962b: 238-242, 291-292]. Not only is this stressed in his argument that the Prussian path to capitalism under the hegemony of the landed nobility is likely to be protracted and reactionary, but also his observation that the regional variations in capitalist development in Russia showed an inverse relationship with the strength of the 'survivals of serfdom' can be seen to anticipate the views subsequently put forward by Dobb and Brenner [Lenin, 1963a: 82-83; Dobb, 1963: 42; 1976: 61, 166-167; Brenner, 1976: 60; 1977: 45-47].

It is hardly surprising that the mere invocation of Lenin's earlier writings in the Indian context lacks conviction. For example, Chattopadhyay's [1972b: A-191] claim that capitalist development has been the 'tendency' is not backed up by analytical specification of the conditions under which such transformation did, or may, take place. Putting it another way, while it may well be the case that capitalist development has historically taken place in India, it is not apparent from the assertion of this fact, why that should have been so. In the absence of such analytical specification, the explanation of capitalist development becomes, by default, a function of time. In fact, Chattopadhyay [1972b: A-190 to A-191], regards capitalist development as the only possible historical outcome: what, therefore, concerns him is variations in the temporal pace of this process. Correspondingly, the processes of the (a) differentiation of the peasantry, (b) primitive accumulation and (c) capitalist transformation become part of a unilinear evolutionary sequence [Hussain and Tribe, 1981a: 103-105]. Such a view also exhibits strategic vulnerability to criticism: for, the proposition that capitalist development is the 'tendency' becomes either non-falsifiable (i e, a 'perpetual possibility'), or 'all-too-easily-falsified'—depending upon the time-frame of its critics.

Similar problems arise as well in other attempts at identifying forms of capitalist development in India. Indeed, these also serve to underscore the difficulties with the analyses of Kautsky and Lenin noted above. The matter can be sharply posed by taking a classic example of market-based exploitation, the credit-product interlocked market transaction—widely known in South Asia as *dadan*. The merchant-usurer establishes claims on the peasant's produce by lending to him in cash or kind, and may continue to permit debt-rolling by the indebted peasant, with the further objective of laying claims on his collateral (e g, land). While Bhaduri [1977; 1983] has viewed this as a mechanism of differentiation and primitive accumulation, Banaji regards it as a form of capitalist development. In a study of the peasantry in nineteenth century Deccan, he proposes that when the merchant-usurer permits debt-rolling, his control over the reproduction of the indebted peasant corresponds to "capitalist relations of exploitation", even though the "monied capitalist" is not the "immediate owner of the process of production" [Banaji, 1977: 1376].

This relation of production, where some (or all) of (i) the means of production, (ii) the produce and (iii) the means of subsistence, have become commodities, provides a test-case because of its apparent resemblance to the state of 'generalised commodity production' characteristic of capitalism [Marx, 1976: 733]. However, if the capitalist producer is identified with the merchant-usurer, and the wage worker with the indebted peasant, then it is pertinent to ask whether this formulation sheds light on capitalist development and the forms it may assume in a transitional context. In particular, it is necessary to examine whether it accords with the relation of production obtaining at the 'origins of capitalism', when capital "takes over an existing labour process, developed by different and more archaic modes of production . . . as it finds it" (i e, the formal subsumption of labour under capital) [Marx, 1976: 1021].

There is a certain similarity between the indebted peasant and the wage worker, to the extent that the former works himself, i e, is a direct producer involved in the labour process. However, unlike the wage worker, it is the indebted peasant who buys the inputs of production even though he has to borrow from the merchant-usurer to do so, and must repay both principal and interest. In contrast, the wage worker neither owns nor borrows the means of production—these remain the property of the capitalist and are provided to him for utilisation in the labour process.

Secondly, the share of the product accruing to the indebted peasant is a residual, after his obligations to the merchant-usurer have been met. Thus, the peasant must in this sense 'own' the product, in the first place, to be able to part with it as loan repayment. In other words, both purchase of inputs, and the means for their payment, are 'credited or debited' to his account. In contrast, the wage worker never owns the product, and his wages are not a residual category, but a fixed amount stipulated by contract. His means of subsistence are bought in exchange for his share of the product (wages)—they do not take the form of usurious advances to him by the capitalist.

Thirdly, to the extent that the peasant has to buy and sell on the open market, and/or with the merchant-usurer in accordance with interlocked market stipulations, his absolute and relative share of the product is determined by either prevalent market prices or the 'accounting prices' stipulated by the merchant-usurer. Thus, the outcome of production for him is affected by the prices at which his product is realised. In contrast, the wage worker is not even concerned with the realisation of the product (which belongs to the capitalist), nor do the prices which they eventually fetch affect his money wages as determined in the wage contract. Unlike the indebted peasant, the risks and uncertainties of production outcomes, arising from market interaction, are not borne by the wage worker.

Thus, the burden of 'ownership' of the 'process of production' is systematically 'inflicted' upon the indebted peasant in manifold ways.[22] It is in this sense that he is the "immediate owner of the process of production": he who bears operational accountability [Marx, 1976: 1023]. Such accountability implies that the peasant, *qua* operator, cannot be indifferent to the outcome of production, nor to the efficiency of the labour process, because his share of the product depends upon it. This, then, is also what distinguishes him (and his non-alienated labour power) from the wage worker. For the latter, labour power is alienated, and hence unburdened by operational accountability—it is this which impels the capitalist to supervise the labour process [ibid, 1011]. It follows that the indebted peasant cannot be reduced to a wage worker. Equally, the merchant-usurer cannot be analytically equated to the capitalist, because he appropriates surplus without assuming the accountability of production outcomes.[23]

In fact, far from being capitalist, here incremental growth of the labour market is neither a necessary, nor a systematic, consequence of the relation of production at work. For, whatever the extent of commoditisation of other resources, the one resource which is systematically not required to be a commodity is labour power.[24] If labour power has to become a commodity, then it is necessary that someone other than the direct producer himself 'buys his labour power', i e, 'takes over' as the organiser of production, bearing the accountability of its outcome. It is in this sense that such relations of production have a rationale which is diametrically opposite to that of capitalism and, on this basis, can be analytically distinguished as precapitalist.[25] Banaji's approach conflates diametrically opposite relations of production, i e, that which systematically generates the incremental growth of the labour market with that which does not. There is thus not even theoretical space for posing the question of capitalist transformation: it becomes, by default, a 'continuous' function of time and cumulative indebtedness.[26]

The argument above would appear to vindicate Marx's perceptive insight, noted earlier, that the development of unproductive capital stands in an inverse relationship with that of productive capital. While only one particular relation of production has been discussed above, much the same arguments can be advanced with respect to extraction of precapitalist rent *via* the market (in cash or kind).[27] What differs between the two instances is the mechanism of surplus extraction: whether it is the lease market, or the credit-product interlocked market. However, what is common to them is that, unlike the capitalist, the exploiting classes do not have to buy the commodity labour power, and are thus able to remain distanced from the accountability of production outcomes.

Given these considerations, it is possible to indicate the conditions under which the growth of the market may not correspond to the development of capitalism. Thus, if precapitalist relations of production are able to establish dominance over incremental growth of the market, then it is perfectly conceivable that the 'rise of commerce' goes hand-in-hand with the non-commoditisation of labour power. Indeed, the 'retained family labour' of the producing classes may even be subjected to greater coercion—corresponding to an intensification, rather than erosion, of the pre-existing relation of production.[28] Here, growth of the market (commercialisation) can be divergent from capitalist development, because, while all other resources can be commoditised, labour power must be systematically excluded.

On this basis, the following explanatory hypotheses may be put forward regarding the problematic historical patterns in colonial Bengal, noted earlier: the significant bias against converting the class of 'rightless' share-croppers into wage workers was the necessary consequence of prevalent relations of production under which market-based exploitation took the form of (precapitalist) rent, usurious interest and mercantile profit.[29] At the same time, because individual agents (e g, share-croppers) could be ruined as producers altogether—to be replaced by others—a stratum of actual or potential wage workers could, and did, emerge in colonial Bengal. The point to note, however, is that such emergence of wage workers could not have been functional to pre-existing relations of production which were based upon making 'family workers' accountable for the outcome of production. On the contrary precisely because it was dysfunctional, it constituted an unintended consequence of that historically evolving agrarian structure, reflecting (the 'dialectics' of) its contradictory dynamics. The limited, if undoubted, growth of the labour market over this period was not thus the result of any "capitalist relation of exploitation", but rather took place despite the absence of capitalist production relations—laying the basis for its possible emergence in subsequent periods.

Assessment of both classical and contemporary (Indian) discussion indicates why the explanatory framework of capitalist transformation must be made free of any functional or evolutionary presuppositions. This allows the paradigm of capitalist development to be not only more sensitive to diverse historical experiences, but also theoretically more defensible. In particular, the question of why (rather than how) the capitalist sector emerges must be posed. This is crucial, for the second part of Kautsky's and Lenin's argument depends upon it: it is only if the capitalist sector pre-exists and dominates the market in relation to precapitalist exploitation, that the growth of the market (in land, labour power, means of subsistence, etc,) becomes systematically 'functional' to the expansionist dynamic of capitalism.

## VI

## The Logic of Capitalist Transformation

It is not until the debate on the 'transition from feudalism to capitalism' in Europe that that the question of 'why capitalist production relations emerge' is squarely posed [Sweezy, 1976; Dobb, 1976; Brenner, 1976; 1977]. The problem here is that of explaining how a given economic system changes into another. This is not simply a matter of the transformation of individual agents, but rather that of the transformation of the relations of production in which they come together, i e, not only why a landlord or merchant-usurer becomes a capitalist, but also why the relationship capitalist-worker displaces those such as usurer-debtor, and does so in a systematic manner. What is involved is the historical transformation of class structures, subsuming the individuated relationships constituting the 'system' as a whole.

The stock argument used here—by Marxist and conventional economists alike—is that of the comparative 'rates of return'. However, a sophisticated exponent is Patnaik, who attempts to explain the historically limited development of capitalism in Indian agriculture by the argument that the potential rate of profit from capitalist production has been lower than the corresponding rates of 'return' through mercantile profit, usurious interest and/or precapitalist rent [Patnaik, 1971a: A-126; 1972: A-146]. Correspondingly, the necessary condition of capitalist development, if and when it takes place, is specified as an increase in the rate of profit from capitalist production of the requisite order [Patnaik, 1979: 401].

This argument has an intuitive appeal, particularly if viewed in a static framework. However, it pitches the logic of capitalist transformation at the micro-level, i e, choices made by individual agents, and displays some methodological inconsistency. Two analytically distinct problems are placed on *par*: (i) how capital flows between sectors within a well-behaved capitalist economy and (ii) how capital flows between capitalist and precapitalist avenues. In effect, both sets/classes of agents (capitalist and precapitalist exploiters) are assumed to be subject to the dictates of comparative profitability, in the capitalist sense of the term. This raises the following questions: if both sets/classes of agents are subject to the same decision-making rules, then (i) what is there to distinguish between them, in the first place? and (ii) how can the transformation of one to the other be posed? In fact, the invariance in decision-making rules of agents in the *ex ante* and *ex post* states can only be arrived at by ignoring qualitative differences in the respective conditions of reproduction. This amounts to a presupposition which is inconsistent with the explicandum. The method cannot, therefore, explain the dynamics of how the *ex ante* state is transformed into the *ex post*.

However, this does not mean that the comparative rate of return (and/or profit) has no place in the chain of causation underlying capitalist development. Rather, the condition under which the logic of comparative profitability, invested with the primacy characteristic of capitalist production, can come into play has to be theoretically established. To do so, however, it is first necessary to distinguish between the ways in which 'profitability' impinges upon capitalist and precapitalist classes—a distinction which, in turn, must be derived from their qualitatively different conditions of reproduction.

Under capitalism, profitability is not simply a quantitative magnitude but has a social-relational character, as enforced by the dictates of social capital. The normal profit received by the individual capitalist is determined by the social interaction between individual capitals (and sectors of production) and the working class. Since capital is mobile between sectors of production, this social-relational character is manifested in the dynamic tendency of profit rates to equalise. To say that the individual capitalist 'maximises profits' is a truism, for the perpetual threat to competitive elimination (i e, 'going out of business') leaves him little choice in the matter.[30] Furthermore, the average profit rate of productive capital, as the normal form of the surplus product (here surplus value), determines the capitalist rent received by landlords as well as the 'aliquot' share of total surplus value accruing to that fraction of social capital which serves as commercial and interest-bearing capital [Marx, 1981: 398-403, 776]. It is this interactive discipline imposed upon the various forms and fractions of surplus value by the normal form which is the distinguishing social-relational trait of capitalism, and imparts a certain primacy to the logic of comparative profitability.[31]

In contrast, when peasant production is subject to precapitalist exploitation, it is rent (and in some cases usurious interest or mercantile profit) which constitute the normal form of the surplus-product, determining what accrues to the class of direct producers, and not *vice versa*.[32] The exploiting classes extract surplus, not by organising production themselves (and being accountable for its outcome), but by their class monopoly of the means of production or the means of payment (e g, money advances which do not serve as capital in the process of production itself). Since capital does not organise production on its 'own account', there is no systematic counterpart to the average rate of profit, which can impose a corresponding interactive social discipline upon the varied forms of the surplus-product.

As noted above, the qualitatively distinct social condition of reproduction bearing upon such classes is that the intensity of exploitation cannot be such as to jeopardise the capacity to deliver surplus of the direct producers (as a class rather than as individual agents). Barring this consideration, they 'do not go out of business', even if they do not match (i) actually realised profit rates in other capitalist sectors of the economy (if any) or (ii) counterfactual rates of (capitalist) rent and profit which could be obtained, if they were to 'become' capitalist.[33] Mere revelation of 'inefficiency' neither undermines the reproduction of the individual exploiter, nor compels him to become transformed into a capitalist [Lenin, 1961a: 129-133; Brenner, 1977: 42].

Given these qualitative differences in the conditions of reproduction, the choice between capitalist and precapitalist avenues of surplus appropriation cannot be treated as if 'other things are equal' (i e, *ceteris paribus* assumptions cannot be made). It is not only that there is no social imperative which systematically impels capital flows between capitalist and precapitalist sectors according to the dictates of comparative profitability. Whether or not the 'rate of return' in precapitalist avenues—even if it could be computed as a rate[34]—can be warrantedly compared (i e, treated as additive and commensurable) with rates of profit and rent under capitalism, cannot be presupposed.[35]

Indeed, historical evidence suggests that considerations of comparative profitability may well be suspended in the short-run, so as to meet the long-run requirements of a class of emergent capitalists. As Marx [1981: 736-740] and Dobb [1963: 123-135] have noted, confronted with the dominance of pre-existing mercantile and usurious capital, the historical response of emergent capitalism has been to create new commercial and financial institutions geared to its own requirements. For example, by charging lower (rather than higher) rates of interest, finance-capital (e g, banks) can undercut and loosen the grips of pre-existing usurious capital—thus permitting the dynamic of industrial capital to come into play (cf Abdel-Fadil [1975] on Egypt). This is not simply a matter of capital flows (free or otherwise), but rather one of direct contentions between classes, with possible state intervention having a crucial role to play [Dobb, 1963: 23-25]. Since long-run considerations of capturing agricultural production-space from precapitalist relationships may be at work, the historical emergence of capitalism may not be necessarily predicated upon short-run considerations of greater profitability.

Viewed in this light, the 'rate of return' argument remains essentially static. Furthermore, as in the Kautsky-Lenin formulation, once a significant capitalist sector has emerged, its very operation may undermine the social premises of precapitalist exploitation.[36] If, during the historical passage, the 'rate of return' in precapitalist avenues is forced down by shifts in the bargaining power of classes, then the rate of profit in capitalist production may concomitantly rise (e g, when the level of precapitalist rent falls, capitalists no longer have to match the 'hunger'-rents of poor peasants, and can retain some of the 'surplus-profit' for themselves). Thus, given a dynamic, rather than static, view of the causality of the process, any initial differential between the 'rates of return' in precapitalist and capitalist avenues may well be 'squeezed out' by the contrary trends of the two.[37]

Indeed, it is only when shifts in the balance of class forces leads to capitalists progressively subordinating merchant-usurers, as well as the owners of landed property, that the pre-existing forms of the surplus-product give way to the rate of profit of industrial (productive) capital as the normal form (here, surplus-value). In other words, as precapitalist rent, usurious interest and mercantile profit become subject to the interactive social discipline of the normal rate of profit, they also undergo a social metamorphosis, becoming transformed into the counterpart categories under capitalism [Marx, 1981: 735, 935-936]. It is thus that a social basis for systematically impelling capital flows, in accordance with the dictates of comparative profitability, is established.

It follows that the emergence of this kind of social-relational profitability is the consequence rather than the condition of capitalist development. It cannot thus be used to explain capitalist transformation: on the contrary, its very emergence requires explanation, i e, it, too, becomes part of the *explicandum*. With respect to the logic of capitalist transformation, if Rk and Rp stand for the 'rates of return' in capitalist and precapitalist avenues respectively, then Rp > Rk does not explain why capitalist development has not taken (or did not take) place. Nor does Rk > Rp explain why capitalist development has (or will) come about. Rather, the theoretical problem becomes that of specifying the conditions under which the primacy of comparative profitability can come into play.

The logic underlying capitalist development cannot thus be grasped in terms of a market-based explanatory frame. Such an approach fails to shed light on the historical transformation of structures precisely because it treats economic rationality as being invariant under qualitatively different relations of production [Dobb, 1963: 28-32]. Viewed in this framework, economic agents remain neither capitalist, nor precapitalist, but bear an uneasy resemblance to the familiar *homo oeconomicus* of conventional economic theory. Shifts from one relation of production to another are reduced to unproblematic choices between alternative 'contractual arrangements'. Correspondingly, economic rationality is pegged on the notion of an innate, and omnipresent, propensity to maximise 'profitability' in quantitative terms, irrespective of qualitative differences in the relations of production.

In order to explain capitalist development (or its absence), it is first necessary to establish whether a shift to capitalist relations of production is at all feasible—given (i) the pre-existing class relations, (ii) the extent to which labour power, the means of production and the means of subsistence, have become commodities as well as (iii) the possible limits to the development of productive forces. Secondly, even if this possibility is technically feasible, there is the distinct consideration of whether it is systematically necessitated [Brenner, 1977: 32]. If precapitalist classes—whether direct producers or exploiters—have to shift to capitalist relations in a systematic manner, then it cannot be simply a matter of the voluntary choice of individual agents. Rather, the factors must be such as to compel individual agents to produce in a different way, because they cannot continue to reproduce otherwise. This requires that the social bases of precapitalist relations of production be undermined in a way such that exploiters, as a class, are no longer able to distance themselves from the accountability of production outcomes—while direct producers are able to shed off this 'burden' in the manner of wage workers.

Such 'systemic' changes come about only through technical progress (development of productive forces), demographic shifts, class contentions (leading to collectively resolved changes in rents, wages, interest rates, etc) as well as interventions of the state.[38] It is only such shifts on a social scale, cutting across individual productive units and contractual arrangements, which can compel classes of micro-agents, who share common conditions, to make adaptive changes which are systematic and *en masse*. In other words, capitalist development cannot be explained as the 'cumulation' of (voluntary) decisions by individual agents to 'play a different game' (i e, switching from precapitalist to capitalist options), but rather as their constrained adaptation to macro-level changes in the 'rules of the game' (i e, transformation of the conditions of reproduction).

## VII

## Perspectives

In postulating the process of capitalist development, the classical sources on the agrarian question take as their 'starting-point' a construct of precapitalist/peasant production which incorporates both market and non-market sectors. Furthermore, they indicate that the relationship between production and the market is by no means unproblematic, but varies in complex ways, in accordance with the relations of production. It is on this basis that Kautsky and Lenin are able to argue that capitalist development in agriculture can take place in complex forms, despite the apparent resilience of peasant production. Nevertheless, when it comes to exploring the systematic bases of capitalist transformation, both of them give insufficient weight to other barriers to capitalism which operate *via* the market, and the possibility of alternative historical outcomes. This results in disparate forms of market-growth being equated to the development of capitalism, so that the process is perceived as unilineal and as a function of time. Such a critique applies as well to some of the contemporary discussion in India.

The agrarian history of colonial Bengal helps to bring out this aspect of the problem, because here precapitalist exploitation based upon the purely economic coercion of the market has been of much greater historical significance. It is possible to suggest now prevalent relations of production structured the growth of the market, such that 'commercialisation' in other markets could take place without necessitating the systematic growth of wage labour. At the same time, the undoubted, if dysfunctional, growth of the labour market over this period assumes significance as an unintended consequence of the prevailing agrarian structure. Such an interpretation may help to explain how the class structure of a given economic system undergoes historical transformation—without having to take recourse of any functional or evolutionary presuppositions.

The need for an explanatory frame on these lines is also evident from the limitations of the 'rate of return' argument in explaining why capitalist development may or may not take place in a given instance. While different relations of production may have superficial resemblances in terms of market-based contracts, the crucial distinction lies in whether the class which extracts surplus is systematically compelled to be accountable for production outcomes. When this is not the case, the necessary precondition of capitalist transformation is that the conditions of reproduction of the pre-existing class structure must be undermined, because, otherwise it can continue to occupy the limited 'production-space' of agriculture without 'going out of business'. It is in this context that factors of change at the macro-level, subsuming technical and demographic shifts as well as state and class actions assume significance.

The classical texts of Marx, Kautsky and Lenin put forward what might be regarded as a 'nineteenth century' paradigm, which orders patterns of resilience and change in precapitalist/peasant production in terms of a process of capitalist development. Despite certain anomalies brought out by subsequent historical experience, what is striking is that a framework laid down nearly a century ago continues to be relevant to much of the discussion on the agrarian question today. Nevertheless, as I have tried to point out, there remain questions which are not raised, or which are not satisfactorily resolved, in classical and contemporary approaches to agrarian capitalism. Before such problems can be tackled, these have to be correctly identified and clearly stated. The specificity of historical experience provides pointers towards what the relevant and correct problems are in a given case. It is only such reciprocal interaction between theoretical ideas and empirical evidence which holds the possibility of shedding light on historical experience. Critical extension of Marx's views on these lines are in evidence in the writings of Kautsky and Lenin; correspondingly, subsequent debates on capitalist development in Europe and South Asia have underscored the limitations of the latter. If this tradition of critical reformulation can be kept alive by contemporary discussion of the 'agrarian question', then it will serve to make the paradigm of capitalist development not only more sensitive to the diversity of historical experience, but also theoretically more defensible.

## Notes

1 Invocation of Marx or Lenin as 'holy writ'—bearing an uncanny resemblance to clerical pedagogy—has plagued much of the Indian debate. It does both of them little justice since neither Marx nor Lenin could be imagined to be 'citing himself' as 'proof' of the argument. Both changed their views over time, and as rational thinkers, did not hesitate to acknowledge when they felt they had been wrong. On Marx's changing views (on India), see Anderson [1974: 473-495]; on Lenin, Lenin himself [1962b: 291-292].

2 However, as Hussain and Tribe [1981a: 114-115] point out, devoid of markets and specification of the nature of productive units and property relations, this construct is far too slender to approximate meaningfully to any precapitalist economic formation.

3 For convenience of exposition, a two-class model has been used in both the illustrative figures.

4 Differential rent may also accrue to the landowner—but this is not of relevance to the present argument [cf Marx, 1981: 941-942].

5 In contrast, precapitalist rent in the form of labour-service of serfs or bonded labour involves deployment in an "off-farm" labour process under extra-economic coercion [Marx, 1981: 926].

6 Non-alienated family workers can overwork and underfeed themselves to an extent which the capitalist cannot induce voluntarily amongst alienated wage workers—who labour according to the stipulations of their market-based wage contracts, and not beyond. Kautsky's view that family labour is ". . . . taken to cost nothing" is inconsistent with his other observations on the 'overwork and underconsumption' of family workers [Kautsky, 1976: 36, 26-27]. This is because he equates costs to only monetised inputs, so that non-monetised (more accurately, non-market) costs are ignored.

7 The calculation problem is not simply a matter of the 'scales of measurement' (e g, whether non-market resources are to be valued at market prices), but also, more fundamentally, a matter of the 'measurement exercise' in which the 'scales of measurement' are to be deployed. See discussion of economic calculations in Bettleheim [1976: 33] and Adnan [1984: 117-180].

8 See Cohen [1978: 35-37] for analysis of the distinction between (i) the structure and (ii) its constituent elements.

9 Of relevance here is the peasantry's "working definition of exploitation—their view of which claims on their product were tolerable and which intolerable" [Scott, 1976: 3].

10 It is not necessary that the social limit has to go up to the technical limit: the class resistance of direct producers may well be activated prior to that stage.

11 I have attempted to reconstruct this argument elsewhere, by filling in the intervening steps [Adnan, 1984: 189-233]. See discussion below.

12 Brenner [1977: 73-75] notes in this context the emergence of a strong freeholding peasantry in France following the fall of serfdom, which further had a relationship of mutual dependence with the absolutist state [Brenner, 1976: 70-75]. This, he argues, retarded the development of capitalism in France compared to England.

13 Furthermore, even if capitalism does get a foothold in agriculture, its subsequent

expansion, if based upon contiguous farm-area, may come up against the barrier of the location-specific property of land [Kautsky, 1976: 30-31; Patnaik, 1979: 414; Adnan, 1984: 28]. Kautsky presents this argument in the context of the accumulation of capital rather than the differentiation of the peasantry. He draws the important inference that unlike industry, accumulation of capital in agriculture must proceed *via* prior concentration of capital (in terms of consolidating land), rather than *vice versa*. However, it is clear from the context that the problem he is dealing with is not the accumulation of capital *per se* (involving the elimination of less efficient capitalist productive units 'going out of business' *via* market competition) but that of differentiation of the peasantry/primitive accumulation (the demise of precapitalist/peasant productive units). The point to note here is that Kautsky's argument applies as much to primitive accumulation (a condition of capitalist development) as to the accumulation of capital proper.

14 That is, without having to acquire it *via* product market exchange, as for artisans [Brenner 1977: 52, fn].

15 The argument also indicates that, in this instance, the role of the market constitutes an intermediate link in the chain of causation—for what underlies its particular form (a certain kind of interlocked market relationship), and the end to which it is deployed, are class relationships and the pressures exerted by the corresponding forms of exploitation.

16 It is not possible here to go into a detailed discussion of the nature of property rights in colonial Bengal. See Bagchi [1981], Sen [1982], Chatterjee [1982] and Bose [1982].

17 A sizeable stratum of wage workers did exist in colonial Bengal [Sen, 1982: 82-83; Chatterjee, 1982: 160-181] as well as other parts of India [Patnaik, 1972: A-147 to A-148].

18 For example, the practice of settling 'rightless' share-croppers is observed widely in the early twentieth century—frequently, it is the erstwhile occupancy *ryot*, who having sold his rights to the merchant-usurer, is 're-settled' on his earlier plot, but with enhanced rental rates [Chatterjee, 1982].

19 The use of farm-size as a 'proxy' for the scale of production is subject to extensive critique from both Kautsky [1976: 32-33] and Lenin [1960c: 132-133; 1964: 67-71] [cf Patnaik, 1979: 410-411]. This point goes even further: that is, the statistical distribution of farm-sizes does not, by itself, provide any understanding of the social relations of production between the size-groups.

20 A crucial implication is that the unit of analysis in the evaluation of capitalist development cannot be the individual enterprise or productive unit. In the Indian debate, however, both Rudra *et al* [1970: A-85 to A-87] and Patnaik [1971a: A-123 to A-128], in their differing ways, treat the individual enterprise as the unit of empirical investigation: i e, the problem is reduced to that of identifying that 'elusive animal'—the capitalist farmer. While Frank [1973: 36-37] does point this out, his analysis (elsewhere) shifts the unit of analysis to the other extremity—that of capitalism on a 'world-scale' [Frank, 1967: 1-12]. The result is that the interdependent relationships between classes within the same agrarian formation cannot be captured, nor the bearing of the 'world capitalist system' upon such relationships, by analytically specified.

21 For a contrary interpretation of Russian evidence, see Chayanov [1966] and Shanin [1982].

22 This does not necessarily imply actual legal ownership of the means of production which are used, e g, land can be leased-in by both peasant and capitalist operators.

23 A preliminary version of this argument is provided in Adnan [1980]. The alternative conditions under which the form of this market relationship can correspond to capitalist relations of production is taken up in Adnan [1984: 226-231].

24 This does not mean that wage labour may not be hired by the peasant operator to supplement family labour—but this is qualitatively different from the generation of wage labour as a necessary consequence and condition of capitalist production [Marx, 1976: 716].

25 As presented here, this proposition is definitional. It thus accords with what Bhaduri makes a matter of assumption in defining precapitalist exchange [Bhaduri, 1974]. However, it is possible to argue that precapitalist exploiters must systematically disassociate themselves from the accountability of production outcomes as the very condition of their reproduction [Adnan, 1984: 192-196]. To reach this conclusion, however, other premises become necessary—and these cannot be presently taken up.

26 In fact, Banaji [1977: 1375-1376] does not argue from first principles, but simply cites Marx as 'proof' of his argument. Ironically, Marx says exactly the opposite [Marx, 1976: 1022-23]. The critique applies to those who follow Banaji in this line of argument [Pearce, 1983; Gupta, 1980].

27 Constraints of space do not permit a fuller discussion of this point here [see Adnan 1980; 1984: 192-197].

28 Cf Marx [1981: 449]. This is exemplified by the onset of the 'second serfdom' in Eastern Europe [Dobb, 1963: 38-42; 1976: 61; Kula, 1976; Brenner, 1976; 1977]. For some parts of Bengal, Bose [1982] notes the inverse instance: namely, that the collapse of the credit and produce markets in the depression of the thirties undermined the bases of precapitalist exploitation by merchant-usurers.

29 For assessment of nearly a hundred years' evidence from the mid-nineteenth to the mid-twentieth centuries, see, in order, Sen [1982: 42-44], Chatterjee [1982: 122, 190] and Bose [1982: 39-209].

30 Note the sharp contrast with conventional economic theory in which the propensity to maximise profits by the individual agent (implicitly presumed to be capitalist) is taken as axiomatic, rather than being derived as a corollary of the particular conditions of reproduction applying to the capitalist.

31 Marx [1981: 918] regards the average rate of profit as the "overall regulator of production" which "presupposes very elaborate mediations".

32 It is the inverse of the relationship between profit and rent under capitalism [Marx, 1981: 929-932].

33 Cf Marx [1981: 942] and Engels' editorial comment [in Marx 1981: 860], as well as Kautsky's subsequent discussion of the inability of German capitalist farmers to compete against precapitalist exporters in the international grain market in the closing decades of the nineteenth century [Kautsky, 1976: 42-43; Hussain and Tribe, 1981a: 20-28].

34 The notion of a 'rate' requires specification of a determinate relationship between definable 'costs' and 'returns'. In the context of peasant production and exploitation, these are far from being clear-cut. See discussion in Adnan [1984: 192-194].

35 In a later contribution, Patnaik [1980: 486], commenting upon Sau [1979], does note the non-commensurability of capitalist and precapitalist rent. This, however, is inconsistent with the 'rate of return' framework she continues to retain in her argument.

36 For example, increased opportunities of wage employment in industry and agriculture give alternative avenues of reproduction to poor peasants and proletarians, simultaneously decreasing their dependence on landlords and merchant-usurers [Lenin, 1960a: 208].

37 There is no need to presuppose the outcome of the process. Rather, the point is to simply work out the possible causality underlying capitalist development (or its absence) in dynamic terms. It is this 'domain of contingency', in the macro-level interaction of productive and unproductive accumulation, which is captured by Bhaduri [1981], though he, too, presupposes a 'rate of return' framework.

38 See, for example, Kula's graphic account of the collapse of the feudal economy in Poland [Kula, 1976]. Some of these processes can be integrally related to industrialisation of the economy, transforming it as a whole [Kautsky, 1976: Lenin, 1960a; 1963a], while others such as the parameter of land-man availability are affected by the pace and nature of demographic change [cf Postan and Hatcher, 1978]. See Adnan [1984: 210-233] for further discussion.

# The Kaniatchi Form of Labour

**Mihir Shah**

*Marxist writing on Indian agriculture has, in recent years, tended to concentrate on the question of the mode of production. The development of capitalism in agriculture has been the major focus of the discussion. This emphasis is quite understandable since for over the last two centuries, capitalist forces have had an unprecedented, profoundly transformative impact on the indigenous cultures of millions of people, not only in India but throughout the continents of Latin America, Africa and Asia. To arrive at a conception of the nature of present-day agrarian relations in these areas, therefore, it becomes vital to study the process of this transformation.*

*The debate on the mode of production in Indian agriculture, however, can hardly be said to have contributed to our understanding in this regard. This paper argues that owing to the adoption of a fairly crude Eurocentric model, the debate seems to have got bogged down in a series of false problematics with a number of extremely important questions getting neglected in the process. The paper attempts to chart only a bit of the way in bringing to the fore just one such question. It seeks to highlight the possibility that there could be important differences between the agrarian structures of pre-colonial Indian and feudal Europe quite apart from significant regional variations within the Indian sub-continent itself. Variations which could imply that peasant differentiation and a growth in landlessness may not be the only or even the most important indicators of change following capitalist transformation and that the process may take very diverse forms in different parts of the country. Thus, in many areas the much more significant process may be the qualitative transformation in the relationship between agricultural labourers and their employers.*

*This proposition cannot be fully understood, however, unless we have some conception of the nature of these relations in the immediately pre-colonial period. Although they show a remarkable diversity of form across different regions, there is hardly any detailed study of these relations in even a single region or district in pre-colonial India. The following account drawn from immediately pre-colonial and early colonial Chingleput is an attempt—doubtless still quite fragmentary—towards filling this lacuna.*

## THE MODE OF PRODUCTION CONTROVERSY

MARXIST writing on Indian agriculture has, in recent years, tended to concentrate on the question of the mode of production.[1] The development of capitalism in agriculture has been the major focus of the discussion. This emphasis is quite understandable for over the last two centuries, capitalist forces have had an unprecedented, profoundly transformative impact on the indigenous cultures of millions of people, not only in India but throughout the continents of Latin America, Africa and Asia. To arrive at a conception of the nature of present-day agrarian relations in these areas, therefore, it becomes vital to study the process of this transformation.

The debate on the mode of production in Indian agriculture, however, can hardly be said to have contributed to our understanding in this regard. This has much to do with the kind of approach adopted by most of the participants in the debate. A major preoccupation of the discussion has been with specifying the necessary and sufficient conditions which would allow one to speak of the existence of capitalism in Indian agriculture. This has given rise to an excessive concern with questions of characterisation, identification and measurement. Thus, the task has widely been understood to be one of assessing, *at a point of time*, whether capitalism can be said to exist, how far it has developed, etc. And so a major portion of the debate has been devoted to arguments over the adequacy of different criteria of measurement. The method followed, with minor variations in criteria, has been to estimate the proportion of farms which may be said to be capitalist at a given moment of time. This is then used as a basis to arrive at an approximate measure of the *extent* of capitalist development at that point of time.

Such a narrowly quantitative, basically static, at best comparative-static approach is obviously inadequate for the study of a social process which involves *time* and *qualitative change* in an essential way. It could, of course, be argued that some of the measurement criteria being used do suggest an implicit conception of a social process which has also been explicitly put forward by some participants in the debate, *viz*, the process of the differentiation of the peasantry and the growth in the proportion of wage labour as a result of depeasantisation. What we need to recognise, however, is that this conception is based on a model of the transition from feudalism to capitalism in Europe, the implicit assumption being that the process of capitalist transformation in India fundamentally mirrors the European process.[2] For one thing, an identity of points of departure is presumed. What is overlooked thereby is the possibility that there could be important differences between the agrarian structures of pre-colonial India and feudal Europe, quite apart from significant regional variations within the Indian sub-continent itself.[3] Variations which could imply that peasant differentiation and a growth in landlessness may not be the only or even the most important indicators of change following capitalist transformation and that the process may take very diverse forms in different parts of the country.[4] The contrast with Europe becomes even sharper when we recognise that the impact of capitalist forces on agrarian relations begins to be significantly felt in India following colonialism and not through the growth of an indigenously engendered rural bourgeoisie—once again in a manner characterised by significant inter-regional diversity. Thus in India the process that has to be studied is that of the transformation of agrarian relations after the advent of colonialism—how the conditions of reproduction of these relations were altered—in particular, through the unprecedented penetration of market relations and the rise of the institutions of the bourgeois state, first in the colonial and then in the post-colonial period. An essential element of this study would be the conflicts within the relationship of the state and the dominant rural elites, and those within rural society between the latter and their tenants and labourers. The resultant qualitative transformation in agrarian relations may then be seen as a complex product of these struggles, each set of relations being subtly redefined in the process.[5]

The very manner of our posing the central question, therefore, differs sharply from what it would be in a historical context where capitalist development occurs under the aegis of a local rural bourgeoisie. This is all the more reason why it would be a serious error to reduce the study of the process in India to a "search for the capitalist farm or farmer"—one would, rather, in the spirit of Kautsky's appeal, attempt to document the entire gamut of transformations occurring in the antecedent agrarian structure, once the process of penetration of bourgeois forces begins to occur. The tracing of the rise of an agrarian bourgeoisie, as and when it takes place, would be only one, *albeit* an important part of this attempt.[6]

The final implication of the contrast with Europe is that one cannot study the process of capitalist transformation in India with a fixed, linear, teleological, Eurocentric conception of what agrarian capitalist relations must "ultimately" look like. Such a view could give rise to facile arguments of changelessness or could make one characterise production relations, at any point of time, as necessarily "semi-capitalist", or worse, as "semi-feudal", even if important changes following capitalist penetration have occurred. For, after all, compared to a certain fixed notion of a 'pure' capitalist form, (which in any case does gross injustice to the European experience[7]), Indian agrarian relations are perhaps destined forever to remaining semi-capitalist. Not only are the "semi" prefixes utterly inadequate in capturing crucial *qualitative* aspects of and the *diversity of forms* in which the impact of capitalist development occurs in different parts of India, they also convey the misleading and erroneous impression that a 'greater' development of capitalism would lead to the emergence of 'fuller' or 'purer' capitalist forms.[8] Such terminological quibbling ultimately evades the very real complexity and specificity of agrarian relations in our context. Its teleological character does not allow for the possibility that capitalist relations could well be *overthrown* before they come to "fruition" in any Eurocentric sense—that what we are witness to in India may be a unique *form* of penetration of capitalist relations, a distinctive trajectory of rural proletarianisation, which given the specificity of the historical context, defies encapsulation in European teleologies.[9]

## AGRARIAN RELATIONS IN PRE-COLONIAL INDIA: A DISTINCTIVE ELEMENT

Elsewhere (M Shah, 1984a and 1984b) I have attempted an elaboration of each one of these propositions. In this paper I limit myself to providing a preliminary and partial substantiation of just one of them by highlighting a distinctive element of the agrarian structure of pre-colonial India.

Evidence from large parts of India suggests the existence of a highly differentiated agrarian structure in the immediately pre-colonial and early colonial periods. While the quality of the evidence is variable, there in no doubting the general direction in which it points, First we have the evidence for high levels of inequality in the structure of land control—for North India broadly in I Habib (1984) and S Chandra (1974), for Rajasthan in D Singh (1976) and M Tandon (1978), for the Deccan in H Fukazawa (1984), for Punjab in I Habib (1963, p 119), for Uttar Pradesh in E Stokes (1975) and A Siddiqi (1973, pp 32-41), for Bengal in R Ray (1979, Ch 3) and for South India in D Kumar (1975) and M Shah (1984b, p 48). At the same time we have wide-ranging evidence from all over late 18th-early 19th century India, of the existence of a fairly substantial stratum of individuals who had access to little or no land and who relied on agricultural labour for the major part of their livelihood. In a series of classic studies on agrarian relations in pre-colonial, especially Mughal India, Irfan Habib (see especially I Habib, 1963 and 1983) has stressed the unique significance of such a stratum of labourers in Indian history. Most recently, he has suggested that in North India during the Mughal period this labour-force could have formed as much as 20-25 per cent of the rural population (I Habib, 1984, p 249). The most decisive demonstration of this phenomenon is provided by Dharma Kumar (1965) for South India. In her view, agricultural labourers might have formed as much as 17-25 per cent of the agricultural population of the Madras Presidency around 1800 (D Kumar 1965, p 181). Supportive evidence for these views may be found for North India generally in T Raychaudhari (1984, p 12) and S Chandra (1974, p 51), for Uttar Pradesh in A Siddiqi (1973, pp 49-54), for the North-West Provinces in L Alaev (1976), for Gujarat in J Breman (1974), for Maharashtra in H Fukazawa (1974), for Rajasthan in H Mukhia (1977), D Singh (1976) and M Tandon (1978), for Bengal in R Ray (1979, pp 266-271), for Bengal and Bihar in B Chaudhari (1984, pp 164-166), for South India generally in B Hjejle (1967), and for the districts Shimoga in E Harper (1968), Tirunelveli in D Ludden (1978) and Thanjavur in K Gough (1981).

Moreover, most of these authors relate this high level of agrarian differentiation and the presence of a significant proportion of agricultural labourers to the operation of strictures associated with the caste-system. A vast majority of these labourers, in particular, belonged to castes occupying the lowest rungs in the social hierarchy.[10] Thus, both the order of magnitude of these phenomena and their social origin imbue the agrarian structure of immediately pre-colonial India with a definite distinctiveness which must seriously modify the way the question of transformation following capitalist penetration is approached. For one thing, this should displace somewhat the centrality of the question of peasant differentiation. For an already highly unequal agrarian structure may not show too remarkable a rise in differentiation even after capitalist development, especially if checks operate on the differentiation process within agriculture and the rate of growth of the non-agricultural sectors is not very high. The very definition of change has to be radically altered in this context. Again the pre-existence of a high proportion of agricultural labourers means that the way we study the process of rural proletarianisation must be altered. The latter would no longer be reducible to the process of depeasantisation alone—it would much more be reflected in the *qualitative* transformation of the relationships of these labourers with their employers.[11]

This last proposition cannot be fully understood, however, unless we have some conception of the nature of these relationships in the immediately pre-colonial period—which would provide an indication of the principal elements in which we would subsequently trace a qualitative transformation. What is immediately obvious here, even from a preliminary sifting of the available evidence, is the remarkable diversity these relationships show across different regions in India. The widely reported existence of *jajmani*-type relations from all over India does suggest a possible unifying framework for analysing these relations.[12] But beyond this unity their inter-regional variedness is undeniable. In any case there is hardly any detailed study of the relations between agricultural labourers and their employers in a single region or district in pre-colonial India. It should be obvious that without several such studies, any all-India generalisations regarding the nature of these relations could scarcely be considered credible.[13] The following account drawn from immediately pre-colonial and early colonial Chingleput is an attempt—doubtless still quite fragmentary—towards filling this lacuna.[14]

## THE KANIATCHI FORM OF PROPERTY

Control over land in Chingleput in this period was exercised collectively by a group of *kaniatchikars* (or holders of *kaniatchi* right), who were also known as *mirasidars* (or holders or *mirasi* right) since the advent of the Mughals.[15] These landholders, a large majority of whom were Vellalas and Brahmins, did not generally cultivate their lands on their own. They either leased them out to tenants or directly employed labourers to cultivate them. Our focus is on the latter relationship, to understand the character of which we need to get a picture of the nature of scope of the *kaniatchi* form of property as also the place and role of the *kaniatchikars* in village life.

The *mirasidars* derived their control over land, as also a position of overall pre-eminence in village affairs, through their collective ownership of the total number of principal shares (*pangus*) into which the village output was divided, once certain deductions had been made. The village output was regarded as a unit from which various shares were allocated to participants in the village economy in accordance with customary norms governing the allocation. Some deductions called *swatantram* were made before the gross produce was estimated: "Some are taken while the grain is in straw, some by computation and some by measurement: the same person receives different fees in as many different ways" (Letter from Place, Collector of the Jaghire to the Board of Revenue, October 6, 1795, para 33). While their number and value varied greatly across villages they were extremely important in assuring the subsistence of different participants in the agrarian system, given especially the collectivity of the property form. Place indicates this when he remarks:

> besides that they define the property of individuals, they have a further utility, in constituting the temporary subsistence of the inhabitants, till the final division of the crops takes place. First they are received whilst the grain is cutting; and, secondly, when it is beat out, and between these two stages of the harvest and the ultimate disposal of the crops, various inevitable delays occur, which would make the privation of these fees a real hardship. (Place's Final Report on the Jaghire, June 6, 1799, para 204.)

From the gross output itself several deductions were made which included the *calavasam* or the share of the agricultural labourers and different kinds of *murai* or customary payments made to the village artisans, the temples, for the maintenance of irrigation tanks and sometimes also to *kaniatchikars* and to certain chosen individuals favoured by the state. Once these deductions had been made, the state share or *mel-varam*[16] was set aside. The striking thing about Chingleput is that the overwhelming proportion of land-revenue was paid *collectively* by each village, in *kind* and as a *proportion* of the total output.[17] The remaining village output, the *kudi-varam* or *kil-varam*[18] was shared among the *mirasidars* and their tenants.[19]

The number of *mirasi* shares remained fixed even if the number of shareholders (*pangalis*) increased or decreased over time. Thus for example, Place found that the village of Poolatoor, divided into four shares, was in his time held by thirty shareholders, while in the village of Damerlah only 23 *mirasidars* held the 160 shares (Place's 1799 Report, op cit, para 69). The interesting thing is that the current shareholders would still be recorded to be holding a certain fraction of the fixed number of principal shares—the summation of their various holdings adding up to the original number of shares. Thus, as Place says of the village of Poolatoor:

> Ask any of the thirty, into how many shares his village is divided, he will say, four; ask him how much *mirasi*, or how much landed property, he has in the village, he will say a half, a quarter, or a sixteenth, or any other fractional part of a share (loc cit).[20]

The *mirasi* right was, of course, exceptionally secure. On the basis of a review of ancient legal texts, Ellis expresses the view that:

> *Mirasi* right is not forfeited by the discontinuance of cultivation for a single year, or any longer period, during the life of the *mirasidar*, his son, or his grandson; it would become forfeitable, that is, the claimant could not regain it, if it had passed into the possession of another, by the Hindu law after the third generation, or after the lapse of the *period of memory*, determined to be one hundred years (Replies from F W Ellis, op cit, Reply to the 3rd question).

*Mirasi* shares were inherited patrilineally and this was a potential source of inequality among *mirasidars*. Under such a system "a man's land shares like his personal property, were inherited equally by his sons, by a chosen daughter's son if he had no son, or by an adopted son if he had neither daughters or sons" (K Gough, 1981 p 209).[21] Thus, the larger the number of sons a *mirasidar* had, the smaller would be the size of each son's *mirasi* share. Whether or not inequality would have grown over time, of course, cannot be asserted *a priori*, depending as it would have on the differential rates of partitioning of different sized shareholders. The joint family system would in any case have acted as a check. Another potential source of inequality was the fact that *mirasi* shares could be bought and sold but again little can be said *a priori* without knowing more about the trends in direction of sale.

What is interesting however, is that a well-developed institutionalised mechanism existed in most villages which kept the growth of inequality among *mirasidars* greatly within limits. Cultivation in *pasancarei* or *samudayam*[22] villages took place collectively on the fields of the *mirasidars* who bore the joint responsibility of organising cultivation in the village. In most villages, however, cultivation generally took place on fields separately allocated to each *mirasidar* in proportion to his share, the fields themselves being subject to redistribution at regular intervals of 8, 12, 27 or 30 years (K M Gupta, 1933, pp 63-65). Such villages were known as *karaiyidu*.[23]

On the basis of a village-survey conducted in 1817 in a village in Chingleput district yet untouched by British rule, Hodgson (1830) provides a fascinating account of how this redistribution occurred in *karaiyidu* villages. According to Hodgson, this practice was common in villages where crops such as rice, which needed a lot of water, were important. In Hodgson's village there were four principal shares, each divided into 16 parts, making in all 64 shares. The distribution procedure is described thus:

> the names of each lot and each shareholder are written on pieces of the leaf of the palm tree, such as is used for village records, and the names of each division of land to be allotted are placed in a row. A child, selected for the purpose, draws by lot a leaf with the name of a principal shareholder, and places it under a number thus:
>
> | 1 | 2 | 3 | 4 |
> |---|---|---|---|
> | TANNAPPA | NINA | NARRAPPA | MALLIYAN |
>
> It is thus settled, by chance or lottery, that Tannappa and his under-shareholders, are entitled to cultivate the land of the principal share lotted under No 1. Tannappa next proceeds to settle in the same way each under-shareholder's portion included in his principal share; and so on till the 64 shareholders receive each his allotment.
>
> The lots are not drawn for all the land at once, but in sub-divisions according to quality; for instance, for the division nearest to the reservoir, as being less liable to the effects of drought, first; then for the next division, as being further removed from the reservoir; and then for the third, which perhaps receives an adequate supply of water one in two or three years only. It is thus apparent, that the object in drawing the lots for the annual or periodical occupation of the land, is to secure to each person interested a proportion of each description of land, *viz*, of the best, the good and the indifferent; in other words, of the best watered, second best, and so on. Each of these subdivisions has an appropriate name in the village register (J Hodgson, 1830, pp 80-81).

There were a few villages, however, where one could expect a greater tendency for inequality among *mirasidars* to grow over time. These were the so-called *arudi-carei or palabhogam*[24] villages. Here the land was *permanently* distributed among the *mirasidars* in proportion to their shares. However, even in these villages, "all other rights and privileges are held in common: in most of these also, land reclaimed from the waste since the *general division* is *samudayam* or common property" (Replies from F W Ellis, op cit). We do have some evidence on inequality among *mirasidars*. Place notes at one point that land held by *mirasidars* ranged roughly from 2.67 to 2,667 acres (Place's 1799 Report, op cit, para 344). Ellis' data on the value of *mirasi* shares from 11 villages covering nearly 200 *mirasidars* shows that the average range was in the ratio 1:3 (Replies from F W Ellis, op cit, Reply to the 8th question). The much more significant inequality, as I show in a moment, was, of course between the *mirasidars* as a whole and the rest of the village. This immediately came to the fore in the early colonial period following the introduction of the British *raiyatwari* system. Thus, the Lorenz ratio for inequality among landowners in Chingleput in 1853-54 was as high as 0.57 (M Shah, 1984b, p 48). This high figure for inequality *among landholders* had nothing to do with the classical differentiation process—on the contrary it was a reflection of the already existing inequality in rural Chingleput and resulted from a dual process—(a) the dominant *mirasidars* obtaining *pattas* for vast areas of land, and (b) the acquisition of small fragments of land by non-*mirasidars*. There was little rise in this already high figure in the rest of the colonial period (ibid, Ch 4).

In any case, whatever may have been the level of inequality among *mirasidars* in the pre-colonial period, we must crucially take note of the deep bonds of collectivity that knitted the *mirasidars* together and which provided a distinctive form to the dominance they exercised over the village. Thus, the privileges that each *mirasidar* enjoyed by virtue of his holding the *mirasi* right derived from his being a member of the collective *mirasi* body. Moreover, the entitlement to *mirasi* right was conditional upon the payment of the *mel-varam*. Sancaraya describes the mechanism by which a defaulting *mirasidar* could be divested of his right although he does add that this was a rare occurrence. In such an event the government "may call upon other shareholders of the village to pay the balance due by the defaulting *Mirasudar* and allow them to execute for his share a *Sabhacharya Sasanam*". (Sancaraya, op cit, Reply to the 3rd question). In a footnote here he adds: "In this case the whole of *Mirasudars* of the village assemble and execute a joint deed divesting the defaulter of his share in the *Mirasu*, and investing it, according to their several proportions, in themselves: It does not appear to be necessary for the person, whose share is thus transferred, to be party to the deed" (loc cit).

The collective sanctions to which the exercise of *mirasi* right was subject are also reflected in the strict and detailed specification in the Village Register of the use to which different parts of the village land were to be put. The total description of the village land was carefully recorded in the *Terapadicanacu* which was "the first part of the general Village Register recording the extent and description of the several kinds of land of which the whole is composed" (replies from F W Ellis, op cit, footnote 23). Thus, "on the *nattam* they must build their houses and nowhere else, they cannot cultivate it or appropriate it to any other purposes; in the *peramboke* they have no right to fill up tanks, stop water courses, or obstruct roads" and so on (Ibid, reply to the 2nd question). The *mirasidars* had no "inherent right" to make changes in the distribution of land specific in the Tarapadi accounts but such changes could be made in special cases with the consent of the "Circar". In all such cases the Tarapadi accounts had to be suitably altered incorporating the changed allocation. Again, the customary norms governing the distribution of the village output were noted in the second part of the Village Register:

> The *Pangumalei-Canacu*, which may be considered the second part of the general Village Register, states the number of *careis*, or fixed shares into which the whole *Mirasi* is divided; the proportions possessed by each *Mirasidar*; the lands held by *Ulcudis*; all mutations of these; and the actual distribution, in detail, of the culvitable lands, *Manyam* or *Varapet*,[25] for the current year, among every description of cultivator, *Mirasidar*, *Ulcudi* or *Paracudi* (Ibid, footnote 21).

The conditional and collective character of the *mirasi* right is also well illustrated by considering the question of its alienation (which was a distinctive feature of this right, distinguishing it, for example, for the occupancy right of the *ulkudis* which was not transferable). According to Ellis, the *mirasi* right could "only be transferred by written deed, accompanied by certain prescribed formalities, tending to give the act general publicity and with the consent of six stated descriptions of persons" (Ibid, reply to the 12th question, para 19)[26]. Additionally, "by the custom of the country the bill of sale must be drawn up by the *curnum* of the village; it must be witnessed by two or more creditable persons, and countersigned by all or at least the principal *mirasidars*" (loc cit). The last was essential because the *mirasidars* of a village were generally *mureicars*, possessing the rights of pre-emption with respect to eath other. Thus "the execution of a bill of sale by one only, though good against himself, could not bar the rest from assertion of this right" (Ibid, remarks appended to sale-deeds of slaves). The deed itself "must state the exact share transferred (or, when land and not right is sold, the boundaries towards the four cardinal points, sometimes also it shows the measurement and produce); it must contain a distinct date and the name of the persons of the transferer and the transferee must be clearly designated by the insertion of their father's name, their caste, tribe and place of residence; and the transfer must be regularly recorded by entry of the new *mirasidar's* name in the *Pangu-malei* register" (Ibid, reply to the 12th question para 19). Various kinds of transfer of *mirasi* right were possible. Broadly these could be sales, mortgages or gifts but within each of these three categories there were a number of variations.[27]

A distinctive feature of the villages of Chingleput in this period was the absence of a village headman which once again underlines the collectivity of the property form,. apart from showing the dominant position occupied by the *mirasidars* in village life. The duties of the village headman were discharged by the *grama pravarticam* or the village assembly. This assembly was responsible for the conduct of the internal and external affairs of the village. And the membership of this body was restricted to the *mirasidars*. Thus as Ellis says, "in this assembly every proprietor has a seat and a voice, each posessing a right to the management of the general business of the community, as to every other privilege, in proportion to his share in it" (Replies from F W Ellis, op cit, Appendix).[28]

Smalley, the Collector of Chingleput, in a letter to the Board of Revenue (4.11.1820) also brings out the role of the *kaniatchikars* in the maintenance of the *grama-silavu* or "a fund provided for the general concern and public convenience of the village" (Ibid, para 18). The fund was derived from the various fees and *maniams* received by the *kaniatchikars* "and whatever remains after defraying the whole village expenses is divided amongst the *mirasidars*. Should the charges exceed the income, the *mirasidars* must pay their portions of the deficiency" (loc cit). This fund is also referred to in Ellis' letter to the Board of Revenue (25.6.1817) where managing "the general purse of the village (*grama-shelevu*) according to custom" (op cit, reply to 3rd question) is mentioned as an aspect of the *kaniatchi* privilege. The *mirasidars* also took the lead on all important social occasions of the village, including festivals, as also at times when important dealings with state officials were involved.[29]

Quite apart from this general preeminence in village affairs, the *mirasidars* also held a disproportionately high share of the village output.[30] Thus, beyond their share in the *kudivaram*, they received a variety of fees from various sources. This included the *swatantram* they received before threshing, the *cuppattam* and *murai* they received after threshing as also the output from the *manyam* land held by them. Finally, they were entitled to receive the *tunduvaram*,[31] "a certain proportion of *cudivaram*, fixed by custom or agreement, rendered by the *payacaries* (tenants) from the produce of all lands cultivated by them to the *mirasudar*" and *swami-bhogam*, "rent paid for land held on farm from the *mirasudar* for a fixed period" (Sancaraya, op cit, footnote 6).

Even more important is the fact that holding a *kaniatchi* share meant far more than a mere share in output.

> If a village be divided into 16 shares and an individual hold half a share, he is entitled to 1/32nd part of the annual produce of the Caniyatchi-Manyams and Mereis; of the total productive Varapet lands, *he must provide for the cultivation of 1/32nd part* and participates to that extent in the total profits from them; 1/32nd part is his share, also, in all advantages derived from forests, wastes and water; and in fine, he has an interest equal to 1/32nd part in all profits belonging to the village, tangible or intangible (Replies from F W Ellis, op cit, reply to the 12th question, para 19).

According to Ellis, the right also extended to waste-land. The *seycal-carambu* or cultivable waste was as freely available to the *mirasidars* as a varapet for direct cultivation or leasing out to tenants. In the *anadicarambu* or immemorial waste, the *mirasidars* "possess the exclusive right of cutting firewood, working quarries, etc" (Ibid, Reply to 2nd question). The sample deed of sale presented in the Appendix provides a very good indication of the vast scope of the *mirasi* right.[32]

## THE KANIATCHI FORM OF LABOUR

Indeed, what is truly remarkable and directly pertinent for our purposes is that the *kaniatchi* right included in its purview, a claim to agricultural labour, the claim varying in proportion with one's share. The labourers, like the land, were collectively held by the *kaniatchi* body. Thus, whenever the *kaniatchi* right was transferred they went along with it. So like the *kaniatchi* right, *mirasidars* could sell, mortgage or gift labourers or rather in the context we are dealing with, the one generally implied the other.[33]. In the deed of sale I have appended to this paper, they are mentioned as many as *four* times: first, when the seller proclaims what he intends to sell, secondly, when he declares what he has sold, then, when he informs the buyer all that he will become proprietor of and finally when he informs the latter what he will be entitled to sell, mortgage or gift. The reference actually is to be *Paracheri* and *Tider Pareiyer*, which suggests that the Paraiyans and the places where they live are together being sold.

The Paraiyans were the overwhelmingly important caste of agricultural labourers generally called *adimai*. One of three most important castes of the district in numerical terms (the other two being Vellalas and Vanniyars), the Paraiyans could never become *mirasidars*. Caste sanctions strictly prohibited them from control over land. As Place wrote in 1799, the Paraiyans "can by no means acquire property in land, and I have not yet met with an instance of their having done so" (Place's 1799 Report, op cit, para 75). In fact, almost all members of this caste were employed as agricultural labourers. Thus, almost all Paraiyans were agricultural labourers and virtually all the agricultural labourers were Paraiyans.

As a caste, there were severe social sanctions arrayed against the Paraiyans. We have the following contemporary description of the wide range of social disabilities to which Paraiyans were subject:

> They are prohibited from drawing water from the wells of other castes, but have particular wells of their own near their habitations, round which they place the bones of animals, that they may be known and avoided. When an Indian of any other caste permits a Paraiya to speak to him, this unfortunate being is obliged to hold his hand before his mouth, lest the Indian may be contaminated with his breath; and if he is met on the highway he must turn on one side to let the other pass. If any Indian whatever by accident touches a Paraiya, he is obliged to purify himself in a bath. The Brahmans cannot behold them, and they are obliged to fly when they appear. Great care is taken not to eat anything dressed by a Paraiya, nor even drink out of vessel he has used; they dare not enter the house of an Indian of another caste; or if they are employed in any work, a door is purposely made for them; but they must work with their eyes on the ground; for if it is perceived that they have glanced at the kitchen, all the utensils must be broken (E Thurston, 1909, Vol 6, pp 78-79, citing Sonnerat's "Voyage to the East Indies 1774 and 1781").

Thurston adds that "a Brahman considers himself polluted by the touch, presence or shadow of a Paraiyan, and will not allow him to enter his house, or even the street in which he lives, if it is an agrahara" (Ibid, p 86). A striking illustration of the low social status of Paraiyans is provided in the local Tamil proverbs cited by Thurston. Most of them reflect a severe contempt for the Paraiyans: for their low social status—"If a Paraiya boils rice, will it not reach God?" (implying that God will notice all piety even that of a Paraiyan); for their morality—"The Palmyra palm has no shadow; the Paraiyan has no decency" or "When a Paraiyan woman eats betel, her ten fingers (will be daubed with) lime"; and for their alleged servility and lack of intelligence and initiative—"Though a Paraiyan woman's child be put to school it will still say Ayye" or "Though seventy years of age, a Paraiya will only do what he is compelled" or "Not even a Paraiyan will plough on a full moon day" (Ibid, pp 117-118).

Paraiyan labourers were subject to extensive control by their employers. This control extended to their families. The wife and children of a male labourer were expected to work for the *mirasidar*, undertaking a variety of agricultural and non-agricultural tasks. Again a female labourer was not at liberty to marry her daughter to anyone without her master's consent and all the children from such a marriage belonged to her master. When she got her son married, however, the son's children went to his wife's master, not to his own. Or as the Collector of Chingleput describes the situation from the male labourer's point of view, "in the event of his marrying with one of the females belonging to his master the children all became his (master's) property but should he marry with a female slave of another person the children of such marriage mostly became the property of the female's (master) though in some villages the custom is otherwise" (Letter to Board of Revenue, July 31, 1819). It was also noted that "the power was vested in them (masters) of inflicting very severe corporal punishment or confining them (labourers) for neglect of the duties assigned to them" (loc cit). E Thurston (1975, part 2 Ch 5) contains a vivid account of the gruesome forms of torture to which they were liable in such instances.

The control that the *mirasidars* wielded over their labourers is strikingly evident in the manner in which they sought to use them as an instrument in their resistance to the colonial state's incursions on their authority. In November 1785, in the middle of the growing season, Paraiyan farm labourers *withdrew* from cultivation demanding their usual *calavasam*. At Poonamallee they were all found to have gathered in one place and threatening violence unless their demands were met. The context for the "insurrection" (as it was described in contemporary British records) was a move by Richard Dighton, Superintendent of Jaghire, to curb Nattar privileges. A locally powerful Vellala *mirasidar* was discovered to have instigated the agitation. Letters written by him advocating the action, were found by the British. The time of the year when the labour of the Paraiyans was indispensable was chosen so as to most effectively threaten government revenues (E Irschick, 1982, pp 223-25).

The confrontation between the *mirasidars* of Chingleput and the colonial state came to an even greater head during the Collectorship of Lionel Place. In 1795, while making the annual revenue settlements in Tripassore and Poonamallee, Place found considerable resistance to his proposals from the *mirasidars*. His subsequent threat of sequestrating their *mirasi* right only made their resistance greater. Once again in February-March 1796, Paraiyan labourers went on a 'strike', refusing to harvest the crop, unless they were given a higher calavasam share. Place wrote:

> There are mamool places for beating out the grain in every village but owing to a general disregard of all prescribed rules of revenue management, the Paraiars either will not be confined to them or reject the regulation that these spots should be previously cleared of grass which is purposely allowed to grow in order that the greater quantity of grain may be concealed under it (Place to Board of Revenue, 1.3.1796).

The *mirasidars* had this time evolved a novel method of instigating the agitation. They had forged a letter supposed to have been written by Paraiyan caste-heads in Madras city to their caste-fellows in Karanguli urging them to come away to Madras or face the threat of being outcasted. Company servants later learnt from Paraiyans in Madras that two of the alleged signatories of the letter had been dead for more than a year. And one Paraiyan caste-head in Poonamallee told Place that "unless persuaded and allowed by their masters, the Paraiars would never have thought to assemble in the manner they did" (Place to Board of Revenue, 29.3.1976). Finally, a Vellala *mirasidar*, seeking to cultivate Place, revealed the names of the *mirasidars* who were behind the disturbance.

It would be quite incorrect to see in these instances, evidence of collective village solidarity against an external regime. The dealings of the Vellalas with the colonial state were (as the just mentioned instance of a 'loyalist' reveals) based on a complex strategy of manipulation, supplication and resistence. And though they may have sought their labourers' help in fighting some of their battles with the British, the *mirasidars* at the same time felt no hesitation in betraying them if it became necessary or if it could prove useful in their dealings with the Company. Thus Dighton acknowledged the favour done them by the supplicant Evalappah Mudali in revealing some of the methods which the Paraiyan labourers used in order to cheat the Company—methods which Evalappah himself probably urged them to deploy in the first place! Dighton describes the "taking away without measuring that part of the paddy that remains under the heap on the spot where it is beat out, a practice very prejudicial to government since it allows fraud which is very difficult to prevent *and which fraud Eevappah Moodelly was active in pointing out*" (Irschick, op cit, p 224, emphasis added).

We must also note that once all the facts of the 1796 case were revealed, the one's who suffered were the Paraiyans and not the Vellala master-minds. Despite Place's recommendation of exemplary punishment, the chief Vellala responsible was let off lightly. But the Paraiyans involved were chained and subject to forced labour in road-gangs in the lean season.

At the same time it is clear from all contemporary accounts that Paraiyan labourers were entitled to a range of customary privileges. While the actual share of the labourers in gross output came to a mere pittance (Place's estimate based on evidence from a survey of 898 villages in 1795 was 3-11 per cent), it was generally regarded incumbent upon the *mirasidars* to supplement this, especially in times of dire need. As Ellis says, "custom, however, allows them certain indulgences, which, if withheld would be *thought disgraceful to the master, and occasion inconvenient discontent*" (Replies from F W Ellis, op cit, Remarks appended to sale deeds of slaves). These included additional allowances of grain in particular seasons, gifts, mainly cloth, at the major festivals and family wedding expenses. According to Ramaswami Naidu, a contemporary writer, the last generally included the expense for the *kura*, or the cloth worn in nuptials and *tali*, the small gold plate tied around the bride's neck by the bridegroom (R Naidu, 1834, p 296). Indeed, the Collector of Chingleput found in 1819 that the labourers were given "a proportionate subsistence for each of their children or others of the family; they are housed and clothed and during the principal festivals certain other allowances are made to them both in money and articles requisite for their ceremonies and their marriages are also performed at the charge of their masters and when reduced by infirmity they are also supported by their proprietors" (Letter to Board of Revenue, July 31, 1819). Hodgson in his village-survey also made very similar observations. He states that labourers "are remunerated or supported by allowances of grain and donations of cloth for clothing: their families have the benefit of gleanings and of the sweepings of the treading floor . . . and have presents on marriages or births in their families or on the new year" (J Hodgson, 1830, p 81). In any case as already noted, collectively from the village output they received the *swantantram* fees which were paid before the gross produce was estimated.[34]

The Paraiyan labourers also possessed a set of customary rights which they were supposed to have enjoyed through generations. To begin with, there was the right to hereditary employment. Thus, as Ellis puts it, while these labourers could not "be sold separately from the Mirasi *nor can the Mirasi be sold separately* from them" (Replies from F W Ellis, op cit, Remarks appended to sale deeds of slaves). Place, provides a fascinating account of the ritual by which labourers entered employment and then "withdrew" at the end of each year, only to be re-employed by their *mirasidar*:

> The servant engages in the service of the cultivator at the beginning of the year, on the customary terms of the village to which he is conciliated and binds himself by the acceptance of betel . . . his servitude expires with the year during which it seldom happens that he is guilty of desertion if those terms are faithfully observed towards him . . . yet the ceremony of withdrawing themselves at the end of the year and recontracting themselves for their labours is invariably renewed; for the disposition of each party towards the other is so well understood, that this retirement is never further than the adjoining village and if under such disposition one should not allow reasonable time or the other refrain to offer a renewal of the contract within that time, the complaint would be equally heavy" (Place's 1795 letter, op cit, para 36).

In his 1799 Report, Place cites an example from Madhurantakam of hereditary servants claiming back their jobs even after a break in service for some length of time: "Maduranticum affords a very curious example of the preservation and assertion of this right. Previous to the repair of the tank—it is not known how long—the lands had been uncultivated, but so soon as this work was completed, the descendants of many families who had been the hereditary servants of the Brahmins, claimed, and were admitted to their inheritance, although, in the intermediate time they had taken up other occupations" (Place's 1799 Report, op cit, para 75).

The labourers could, of course, be transferred from one *mirasidar* to another but they remained entitled to all the customary privileges they had enjoyed previously. These included the *paracheri*, the part of the village where they built their huts, and the backyards attached to these huts. These were held rent-free and no taxes were levied on them. At times they were also allotted small plots of land by their *mirasidars* for cultivation on which the latter provided them seeds, cattle and implements, although most of the output from these plots went to the *mirasidars*. In addition, they hereditarily held the village offices of *Taliyari* or the village watchman who, among other things, guarded the heaps of harvested grain, and *Totty, Kumbokutti* or *Vettiyan* who performed the functions of watering the fields, measuring grain, delivery of messages and burning the dead.[35] Finally, we may note the existence of an annual ritual of status-reversal which could be considered yet another dimension of the customary rights of the Paraiyans. This ritual seems to have characterised their relations with their employers in Chingleput till as late as the advent of the British:

> At the close of the Tamil month *Auni*, with which the revenue year ends, and the cultivation of the ensuing year ought to commence, the whole of the slaves *strike work*, collect in bodies outside of the villages, and so remain until their masters, by promising to continue their privileges, by solicitations, presents of betel, and other gentle means, induce them to return. The slaves on these occasions, however well treated they may have been, complain of various grievances, real and imaginary, and threaten a general desertion; this threat however they never carry into execution, but after the usual time, everything *having been executed according to namul*, return quietly to their labours" (Replies from F W Ellis, op cit, Remarks Appended to Sale deeds of Slaves).

## REFLECTIONS ON THE FORM OF POWER

What I have been describing so far is clearly a relationship of power a relationship involving two social strata at opposite ends of the village hierarchy. On the one hand we have the *mirasidar* collective whose members, though performing no agricultural labour, controlled a disproportionate share of the village produce, indeed, exercised a remarkably comprehensive kind of proprietary right over village land (including a claim to labour services) and thereby dominated the conduct of village affairs. At the other end, there are the Paraiyans, a whole stratum of people held in general social contempt, subject to severely degrading kinds of social disability, including pollution by touch, sight, speech and shadow, and permanently restricted to earning their livelihood mainly through onerous forms of agrestic servitude-forms involving detailed control by the *mirasidars* over their lives and of their families, which included a say in such personal decisions as marriage. They were attached to the *mirasidars* collective through generations, had little say in the choice of their employer, could be bought, sold or mortgaged within the collective, and were liable to brutal physical punishment in case they neglected their assigned duties.

In trying to understand this *form* of power, however, at least two kinds of stumbling blocks can be imagined. For one thing, it is obvious how Eurocentric categories would prove utterly inadequate. It is, of course, quite conceivable for someone seeking to fit these forms into a feudal mould to onesidedly focus on the fact that labourers were inseparably attached to the soil. On the other hand, the fact that they were bought and sold, could suggest their being likened to the slaves of Classical Antiquity. Finally, the collective dimensions of their unfreedom recall to mind Marx's references to "the general slavery of the Orient" in the Grundrisse (K Marx, 1973, p 495). It should be fairly evident however, that any such partial view would be completely ahistorical for it would lose sight of the integral interconnection of these relations with the *kaniatchi* form of property. None of these three features can really be isolated for emphasis in this manner since each one of them is equally an inextricable element of the *kaniatchi* form of labour. In any case, unlike in feudal Europe, the attachment here is not to individual lords but to a collective. The contrast with feudal Europe is, of course, already evident in the overall agrarian structure itself, for in Chingleput, as almost throughout pre-colonial India, labourers existed as a third significant stratum distinct from the landlords and the tenants.[36] It may, perhaps, also be necessary to stress that the collective dimensions of the *kaniatchi* form of property and the practice of the periodical redistribution of land should not mislead one into construing this as some kind of a "primitive communist" society. For the crucial contrast with other parts of the world where such forms prevailed is that here the collectivity existed among *landlords*, not *peasants*. A deep social divide separated the *mirasidars* from and pitted them against the rest of the village. This was no peasant commune; in fact, this deeply unequal rural society is best described as a system of *collective landlordism*. One would actually be hard-pressed to identify who in the *kaniatchi* agrarian system could accurately be described as a peasant proprietor—landlords, tenants, labourers, yes, but peasant proprietors?[37]

Yet another kind of difficulty could arise for those who find it impossible to reconcile the existence of the customary rights and privileges of Paraiyans with a characterisation of this relationship as a form of power. In such conceptions the presence of these features either implies a denial of power itself or at least a mitigation of it. We can find these kinds of views being expressed in the discussion around the *jajmani* system both by those who regard *jajmani* relations as essentially characterised by harmony and reciprocity and by those who consider them relations of exploitation. Thus, Wiser, who could be regarded as the classic exponent of the former view, is able to sustain it only by one-sidedly focusing on these aspects of *jajmani* relations, while Beidelman who makes the most detailed argument in favour of the latter view, is at pains to show that *jajmani* is "an economic system" (T O Beidelman, 1959, p 81) or that it is "the economic aspect of caste" (ibid, p 15), as if the admittance of "non-economic features" would lead to a denial of exploitation. It should be evident that these views, by no means uncommon,[38] and normally considered to represent diametrically opposed positions on *jajmani* relations, actually *share* the same implicit conception of power.

The common operative idea seems to be that the more overt or perhaps more directly "economic" the forms of domination, the more exploitative they are, in some sense. This must, however, be regarded as too "bourgeois-centred" a view of power in the specific sense of considering "naked, economic bourgeois domination" as the most violent form possible.[39] A certain kind of overtness seems to get identified with brutality. On the contrary, it has been remarked about pre-capitalist societies that "it would be a mistake to see a contradiction in the fact that violence is here both more present and more hidden" (P Bourdieu, 1977, p 191). Without immediately presuming a hierarchy in the degree of violence in either epochal direction, one must acknowledge the strength of Bourdieu's argument that simply by appearing more hidden or subtle *to our eyes*, violence certainly does not become less present. These are, indeed, "forms of domination which may strike the modern observer as more brutal, more primitive, more barbarous, or at the same time, as gentler, more humane, more respectful of persons" (loc cit). Indeed, what these views fail to recognise is that in the social context one is examining, the relation of power had to necessarily involve such features which, moreover, in no way precluded the possibility of conflict or even tyranny. The fact is that the dominant discourse laid down the kind of attributes, in terms of which alone an *effective* relation of power could be constituted. To develop this crucial proposition we need to reflect awhile on the relationship between those who exercised control over land and the Brahmins in the Indian historical context.

It is by now fairly well-established that this relationship was extremely important in several parts of India both at the village and at the state level, once the ascendancy of Brahmins had been established in the sacredotal order.[40] A crucial element of this relationship was gift-giving, to Brahmins and Brahminical institutions. This practice has a long ancestry in South Indian history. Till around the late 7th century sacrifice remained the central defining feature of kingship, with royal *danas* being made within the constitutive framework of the royal sacrifice. However, through inscriptions from about the beginning of the 8th century AD, it becomes increasingly obvious that around this time sacrifice disappears and is replaced by divine origin and noble conduct, reflected essentially in munificent gift-giving, as the constitutive characteristics of kingship (N Dirks, 1976).

In the Pallava period the most important such royal activity was the setting up of *brahmadeyas*, revenue-free villages in which Brahmins exercised collective control over the land and where "brahminical learning and canonical ritual were supported" (B Stein, 1977, p 19). Stein (Ibid, pp 19-26) provides inscriptional evidence to show the importance of Pallava support to *brahmadeyas* as also the continuation by the Cholas of this tradition. Considerable support was also given to the construction and maintenance of temples (see B Stein, 1980, ch 7; also A Appadurai, 1977). While the role of medieval South Indian kings in this was crucial, the fact that dominant landed groups also played a crucial part has been emphasised by some writers (D Ludden, 1978, p 109: G Spencer, 1968: B Stein, 1977, pp 19-26). Stein's mapping of *brahmadeya* villages shows that of the four major clusters in which these settlements are found, central Tondaimandalam, in the basins of Palar and Cheyyar rivers is one (B Stein, 1980, Map IV-1 and p 67). Many of these villages survived till the point of colonial intervention, gradually undergoing a decline thereafter.

The process of analysing the form of power involved in the relations we are examining must, therefore, include an understanding of the relationship between land-controllers and Brahmins. Louis Dumont, in his profound work on the caste-system (*Homo Hierarchicus*), correctly poses this as the central question and criticises those who wish it away by positing "a high degree of coincidence between politico-economic rank and the ritual ranking of caste" (L Dumont, 1980, p 76, quoting F G Bailey). He is also right in speaking at the same time of "a solidarity between them which opposes them conjointly to the other social functions" (ibid, p 75). However, the manner in which he conceives of this relationship, this conjoint solidarity, and the notion of power and of the religious or ideological that this entails, seems seriously open to question.

For Dumont, the question is one of relationship between "hierarchy" and "power". Now hierarchy is "purely a matter of religious values . . . the opposition between the pure and the impure" (Ibid, p 66). while "territory, power, village dominance, result from the possession of the land" (Ibid, p 153). The caste-system, according to Dumont, "in its nature, is religious, or if one prefers, a matter of ultimate values" (Ibid, p 106). Thus, "by keeping to the level of power, one is prevented from understanding the essential characteristic of the Indian system. This characteristic is the subordination of power" (Ibid, p 76). "Dominants and dependents live under the sway of a system of ideas in which the 'power' aspect we have isolated is in fact encompassed" (Ibid, p 107). Power "is located in a framework of ideas and values, confined within the limits of this framework but distorting it to some extent" (Ibid, p 153). More precisely, it "is force made legitimate by being subordinated hierarchically to the brahman" (loc cit).

Now, the very attempt to ascertain even

if not necessarily pre-judge (Ibid, p 38) "essential and subordinate aspects" in this manner could be regarded as vulnerable to the sort of objections E P Thompson has raised in the opposite direction *vis-a-vis* the Marxist metaphor of base and superstructure.[41] Centrally problematic, however, are the implicit notions of power and ideology in this conception. Because for Dumont the ideological seems to have a purely non-power connotation, or to put it the other way around, power is restricted singularly to the politico-economic sphere. One may, however well ask whether "the plane of ideology" (loc cit) or of the religious is really as clear, as empty of power as Dumont makes it out to be. What, indeed, happens when a certain mode of religious discourse establishes its dominance over all others and thus *governs* what are regarded as "ultimate values" in that social situation? Or to express it the other way, how does the "framework of ideas and values" which Dumont emphasises centrally, get constituted, established and hold "sway" in any given social context? Does this not itself entail a relationship of power? Additionally, we must recognise that the effective existence and reproduction of any relationship of power presupposes the simultaneous operation of hegemonic discourse. This would suggest a rather different way of conceiving the nature of the relationship we are trying to understand from the one suggested by Dumont.

Thus, with Michel Foucault we must direct our attention to the implication/impregnation of truth in/with power. We must recognise that in any society, "relations of power cannot themselves be established, consolidated nor implemented without the production, accumulation, circulation and functioning of a discourse. There can be no possible exercise of power without a certain economy of discourses of truth which operates through and on the basis of this association. We are subjected to the production of truth through power and we cannot exercise power except through the production of truth" (M Foucault, 1980, p 93). Thus, "in the end, we are judged, condemned, classified, determined in our undertakings, destined to a certain mode of living or dying, as a function of the true discourses which are the bearers of the specific effects of power" (Ibid, p 94). And the process of the constitution of "true discourses", Foucault argues, is itself a process of *hierarchisation* and *struggle* and involves the *subjugation* of other discourses which are marginalised in the process (Ibid, pp 81-85).

Within the Marxist tradition, it is Gramsci's conception of hegemony which could help us grapple with our central question.[42] However, as Raymond Williams has argued, our account of the notion must be a complex one which "allows for its elements of real and constant change. We have to emphasise that hegemony is not singular; indeed that its own internal structures are highly complex, and have continually to be renewed, recreated and defended; and by the same token, that they can be continually challenged and in certain respects modified" (R Williams, 1973, pp 37-38).

Thus, when we examine Indian history we must see in the rise to dominance and sustained hegemony of Brahminical discourse, a process of continual contention with and suppression of alternative forms of discursive practice. One must not, however, conceive of suppression in the sense of pure elimination: much more accurately it is seen as a subtle process involving assimilation, incorporation and modification in the face of fresh challenges.[43] It needs also to be recognised that the features of the relation of power which we are seeking to understand, found their detailed codification precisely in the Brahminical law books of successive centuries, a virtually unbroken chain of hegemonic discourse. Thus, the disabilities to which the labourers were subject was a part of the definition of the overall social order that was to be found in these texts, which specified the social function and place of the various *varnas* and *jatis* within the social order. The ritual aversion of the "higher" *varnas* to defiling manual labour was part of the same codification. At the same time, Brahminical texts indicated the kind of attributes and practices which would be regarded as edifying for those in a position of power. As Nandi has argued,

> the avowed purpose of the performance of medieval *dana* rites was to acquire religious merit *(punya)* which would instantly purify the *jajmana* of the different types of pollution and help him to retain, consolidate and even improve the degree of his ritual purity and his corresponding social status . . . these practices enabled him to circumvent many an impure situation and thereby avoid loss of a pure status, and consequently of caste. The loss of caste particularly for those who occupied eminently 'pure' positions in society amounted to a denial of benefits and privileges ordinarily available to persons belonging to the concerned group or caste" (R N Nandi, op cit, p 93).

Ludden (1978, p 109), Spencer (1968) and Stein (1977, pp 19-26) who provide evidence of the support given to *brahmadeyas* and temples by landlords in medieval South India also stress the "religious merit" derived by the latter in the process. But the munificence of the landlords was expected to extend not only to the Brahmins but also to their subordinates. In terms of the dominant discourse, it was obligatory on their part to assure certain customary benefits to their labourers. If they were not to be "disgraced", if they were to retain a certain position of "honour" , to be recognised as "worthy" holders of power, the maintenance of what has been termed a "clientile" was absolutely vital for the dominant castes. And to sustain an *effective* "patron-client" relation, to engender the loyalty of one's clientile, necessitated the existence of these kinds of features in the relationship.[44]

It would, therefore, be a serious error to place the features of these relations on a balance sheet as it were, and attempt, through an arithmo-morphic netting procedure, to gauge the "magnitude" of power involved in these relations. For the crucial fact that must be recognised is that all these features put together *simultaneously constitute* the form of power we are dealing with. The customary privileges of Paraiyans, far from implying, a denial or an alleviation of power, on the contrary, constitute precisely the conditions of possibility of the latter. In terms of the governing discourse one could not exist without the other. The *jajmani* character of the relations is as integrally tied to Brahminism as is the social ostracisation of the Paraiyans. They simultaneously constitute the language of power and truth in the social context we are examining. Thus, we may say as Bourdieu does in his context that "it is as false to identify this essentially *dual* economy with its official reality (generosity, mutual aid, etc), i e, the form exploitation has to adopt in order to take place, as it is to reduce it to its objective reality, seeing mutual aid as a corvee, the *khammes* as a sort of slave" (ibid, p 192).[45] It is imperative in other words that "the analysis holds together what holds together in practice, the *double reality* of intrinsically *equivocal, ambiguous* conduct" (Ibid, p 179).

Possibly the most evocative illustration of Bourdieu's argument is provided by the annual custom of status-reversal I described earlier. First of all we need to recognise that the ritual does not imply an alleviation or negation of power—it is rather, integrally constitutive of it imbuing it with a distinctive form. Its annual repitition is a necessary dimension of the reproduction of the relationship of power. At the same time, however, the situation must not be shorn of its essential ambiguity in the near-functionalist interpretation of these rituals as necessarily some kind of "safety-valve devices". For the "successful" completion of a ritual of status-reversal cannot always be taken for granted. Its outcome depends crucially upon a variety of contingent factors which constitute its setting-factors governing, broadly, the degree of social tension within which the ritual occurs. Indeed in the very necessity of its annual repetition lies the indication of the enduring possibility of the relationship being challenged, even overthrown. Thus, to be true to its intrinsic "double reality", we must acknowledge that a ritual of status-reversal in a hierarchical social context, which may generally operate as a mechanism for the reproduction of the relations of power, could also, on occasion, become the site for their overthrow.[46]

### CONCLUSION

The point of departure for this paper was the discussion on the mode of production in Indian agriculture. Its main concern was to suggest that owing to the adoption of a fairly crude Eurocentric model, the debate seems to have got bogged down in a series of false problematics, with a number of extremely important questions getting neglected in the process. The paper has attempted to chart only a bit of the way in bringing to the fore just one such question. I argued at the beginning that the study of the qualitative transformation in the nature of the relationship between agricultural labourers and their employers, following capitalist penetration in India, is an important task as yet largely unattempted. Such a study, however, requires as its basis an understanding of the nature of this relationship in the pre-colonial era. I have tried in this paper to move towards such an understanding in a small area in pre-colonial and early colonial India.

Let us, then, attempt a summary of the key features of *kaniatchi* form of labour that emerge from the account given in the paper. To begin with, let us note that the relationship was generally always between male Vellala, Brahmin or some other "high"-caste landlords (who themselves never laboured on land) and Paraiyan labourers. These landlords formed a collective which governed the village and controlled the village land through its ownership of the *mirasi* shares. The collectivity was extensively evident in the collective holding of the *kaniatchi* right, in the periodic redistribution of land, in the collective management of the affairs of the village by the *mirasidars* (the absence of a village headman) and in the collective obligation to pay land-revenue. It could also be discerned in the way the Village Register specified the precise allocation of village land to different uses and the share of each participant in the village output—neither of these being alterable without collective sanction. Again the transfer of the *kaniatchi* right could occur only under stringent, collectively specified conditions. Finally, the power of the collective shows in the process through which a defaulting *mirasidar* could be divested of his right by the body of shareholders.

The scope of the *mirasi* right extended to a right over the labour of the Paraiyans in proportion to the extent of one's share. Paraiyan labourers were attached to these shares through generations and were bought, sold and mortgaged as and when the share was. The *mirasidars* exercised an extremely comprehensive control over the life and labour of the Paraiyans and their families. In a sense, the *mirasidars* represented for their labourers a nodal point for several dimensions of their relations with the rest of the world. The remarkably unmediated, detailed, personal, even corporeal relationship of the *mirasidars* to their labourers served as the vital mediation for the relationship of the latter with the outside world. The *mirasidars'* presence was felt everywhere at work, in providing subsistence, at the most important social occasions in the life of the labourers' families, at the time of major disputes or in any larger matter concerning the village as a whole—an omnipresence which makes their being designated *swami* by their labourers fairly suggestive. The involvement of the labourers was also wide-ranging: in general, the entire family would share in duties for the *mirasidars'* households, duties spanning every activity considered ritually admissible. Thus, for both the labourers and the *mirasidars* the relationship spanned several vistas beyond the agricultural labour-process which suggests that it would be an error to regard it merely as a "landowner-labourer" relationship.

One must, finally, note the connection of the form of power involved in this relationship with the dominant Brahminical discourse. This is evident in the existence of this relationship within the moral framework of the *jajmani* system which meant the assurance of certain customary, hereditary rights for the labourers, most importantly subsistence and employment. It is also reflected in the range of social disabilities to which the Paraiyans were subject as a consequence of their occupving the lowest rung of the caste hierarchy.

The descriptions of this paper have, of course, been limited to a very small region, while these relations showed a great diversity of forms across regions in India which still await detailed study. This emphasis on variations within the country should not, however, be construed to imply a kind of empircism which ultimately degenerates into saying that every village was different. Most certainly one can conceive of a process of typological synthesis taking off from these variations.[47] The richness of this synthesising movement, however, would depend crucially on the availability of detailed region-wise studies, unblinkered by dogmatic adherence to inappropriate unifiers and sensitive to the specificities of the situation being examined. Chingleput and *kaniatchi* should hopefully become, and are best seen as, elements in this synthesising effort.

## Appendix

### DEED OF SALE OF KANIATCHI RIGHT

In the year Sarvari of the cycle of sixth, following the year 1642 of the era of Salivahana (AD 1720), on Sunday the 21st of A'ni, under the lunar constellation Barani, on the day this *Sasanam* was written: Arjuna Mudeli, the son of Rakiyappa Mudeli, one of the Mudelis of Tandeiyarpet, and his parceners, in the Nayeru Nadu, the Puzhel *Cotam*, in Tondamandalam acquired by conquest, in the Kingdom of Chandragiri pronounces Om! Having proclaimed aloud in public auction—"Are there any who will purchase one-third of my *Caniyatchi*, being one of the ten shares of the village of Tondeiyarpet, including *Manei,*[a], *Nilam,*[b], *Pulam,*[c] *Nir,*[d] *Collei,*[e] *Topu,*[f] *Turavu,*[g] *Kinaru,*[h] *Cani-peru,*[i] *Cani-manyam,*[j] *Checcu-mutteri,*[k] *Tarei-cadamei,*[l] *Para-cheri,*[m] and *Tider Pareiyar,*[n] *Pizhacadei,*[o] and all other privileges whatsover?"—The words thus proclaimed were heard by Surappen, the son of Tiruvellapillei Malayappa Mudeliyar of Connur of the *Nadu* of Ambattur, of this *Cotam* and *Mandalam*, who answered, saying aloud "—I will purchase. "—I, Arjunen, the proclaimer, the son of Rakiyappa Mudeliyar of the Gotram of Mayilakizhan, and the answerer Surappen, the son of Maleiyappa Mudeliyar, having agreed between ourselves and settled to our mutual satisfaction, in the presence of rulers of the land and householders of Tondeiyarpet, sold one-third of my one share out of the ten, with the grounds, lands, fields, homestead, water, plantations, large wells, small wells, the rights of inheritance and rent-free lands thereto belonging, dues from oil presses, and *the Pareiyar of the suburbs and the plains*, backyards and all other privileges whatsoever, thereto appertaining for 50 new Pagodas of Madras, and received the full amount of this the settled price; for the second time, and the third time, this is the price, this is the established price, so it has been fixed, and I have decidedly received the full amount. The one-third of my share, it is ground, land, fields, waters, homestead, plantations, large and small wells, the rights of inheritance and rent free lands, dues from oil presses, and looms, *the Pareiyer of the suburbs and plains*, backyards, and all privileges appertaining thereunto, you are to enjoy, you and your descendants lineally, as long as the sun and moon endure. There is no claim to the one-third of my share: if it be thought that there is any, I will stand forth and bring it to a decision. You are entitled to sell, transfer, mortgage, and to bestow as a gift, or in charity, the ground, fields, waters, homestead, plantations, large and small wells, the rights of inheritance, and the rent free lands thereto belonging, the dues from oil presses and looms, the *Pareiyer of the suburbs and the plains* and backyards, and all privileges appertaining thereunto—Thus with my free consent I have executed this deed of sale. Arjunen, the son of Rakiyappa Mudeli, and his parceners, agreeing with Surappen, the son of Maleiyappa Mudeli, pronounced Om:- All blunders in this deed arising from the quality of the *cadjan*; errors in writing, mistakes in words, and interlineations, and from its being cut, split, or worm-eaten, from erasements, or breaks are not to be regarded.

Witnesses: PU'D'UR PREYA CATCHIYAPPA MUDELIYA'R, CANNU'R

NAMASIVAYA MUDELIA'R NAIYINIYAPPA MUDELIYA'R, POYA'D VIRARA GAVA MUDELIYA'R

With the knowledge of these the integrity of this writing is attested by the signature of Pudaven, the son of Guruva Pillei, the Village Accountant.

(Signed) Varadappen, the son of Rakiyappa Mudeliyar, Tiya' Gappen, the son of Toppei Mudeli, Tiya' Gappen, the son of Culla Mudeli, Nallen, the son of Shinnanna Mudeliyar, Periya Muttiyappen, Periya Mudeli, Periya Tambi, Arjunen, Tiya' Gappen, the son of Shinna-tambi Mudeliyar[p]

### Ellis' Notes to the Deed

a *Manei* means here ground as divided or divisible into lots for building, or small enclosures, or the ground forming the site of the *Nattam*, contradistinguished from the rest of the village.

b *Nilam*, land in general; the whole soil of the village, or that part under tillage in particular years. This word means that which is fixed, permanent, durable.

c *Pulam*, a field of corn.

d *Nir*, waters in general, tanks, large and small watercourses, and c, or, as here used, a share in all public water.

e *Collei* which may be rendered *homestead*, is any small enclosure near the house, the difference between this term and *Pizhacadei, backyard*, is that the latter immediately adjoins the dwelling, whereas the *collei* may be at some distance from it.

f *Topu*, groves, orchards and plantations.

g *Turavu*, large wells.

h *Kinaru*, small wells either of brick or earthen rings burnt in the kiln, commonly called *pot-wells*.

i *Cani-peru*, consequence or dignity derived from the possession of hereditary landed property.

j *Cani-manyam*, rent-free lands held jointly by the Caniyatchicars as a type of their proprietary right.

k, l *Checcu-muttei*, and *Tarei-cademei*, the first of these terms (*Checcu-muttei*) is derived from *checcu*, an oil press, and *muttei* an egg, and signifies the quantity of an egg-shell full of oil; the second from lit, a *weaver's reed*, but used for the whole and *Cademei*, tax, due, fee. The first of these dues is always paid in kind, while the second is paid in money.

m, n *Paracheri and Tider Pareiyer; tider* signifies *an open barren space*, and the whole sentence, therefore, means the *Pareiyer* who reside in the regular *Paracheri* or suburb set apart for them, and those whose habitations are scattered over the wastes. These terms are intended to comprehend generally the whole of the Pareiyer slaves attached to the soil of the village, and to express especially that right to a participation in their labour inherently attached to the one-third share of *Caniyatchi* transferred.

o *Pizhacadei*, the back-yard immediately adjoining the houses.

p In this deed the exordium eulogising the Vijayanagar kings with which all such deeds begin, has been omitted.

## Notes

[This paper is drawn from the first three chapters of a PhD dissertation "Capitalist Development and the Transformation of Agrarian Relations in Chingleput District, c 1780-1983" written at the Centre for Development Studies, Trivandrum (M Shah, 1984b).]

1 Comprehensive surveys of this discussion are found in J Harriss (1980) and A Thorner (1982).

2 It may also be pointed out that the model of the differentiation process being used is a highly simplistic one, overlooking as it does the significance of the specificities of the agricultural sphere of production: in particular the implications of the unique use-value characteristics of land which make peasant differentiation a far more complicated process than is usually imagined. I have argued this in detail in a separate paper (M Shah, 1984a) and partly also in M Shah (1984b, Ch 4).

3 The presumed identity of starting-points between Europe and India appears to derive at least partly from the proposition that according to Marx, all human societies were destined to pass through the same succession of stages from Primitive Communism to Slavery to Feudalism to Capitalism. In actual fact, Marx criticised attempts to "metamorphose my historical sketch of the genesis of capitalism in Western Europe into an historico-philosophic theory of the general path every people is fated to tread, whatever the historical circumstances in which it finds itself" (K Marx, 1877, in K Marx and F Engels, 1979, pp 272-273). For a severe Marxist criticism of attempts at "transposition of the standard P-S-F-C pattern to every society without exception", see I Habib (1974). In any case Marx's strong opposition to characterising Mughal India as feudal is well-known (See L Krader, 1975, pp 343-412 for Marx's critique of Kovalevsky's attempts in this direction). Marx struggled almost throughout his intellectual life to grapple with the specificities of Asian history. That his conception of the Asiatic Mode of Production has several weaknesses (I Habib, 1974) and that he appears, as Said argues, almost despite himself, to have remained trapped in the hegemonic structure of 'Orientalist discourse', is, of course, yet another matter (see E Said, 1978, pp 153-156).

4 It is fairly ironical that at times these criteria are sought to be derived on the basis of something called the "Kautsky-Lenin laws of capitalist development in agriculture". Neither Kautsky nor Lenin claim to have developed such laws. What we find in their work are concrete studies of the process within the specific historical contexts they were examining. Indeed Kautsky appears to warn against precisely such rigid conceptions when he says: "the marxist theory of capitalist production does not reduce the development of capitalist production to the simple formula: 'disappearance of the small holding before the big', as if such a formula were a key to the understanding of modern economy. To study the agrarian question according to Marx's method, we should not confine ourselves to the question of the future of small scale farming; on the contrary we should look for all the changes which agriculture experiences under the domination of capitalist production. We should ask: *is capital, and in what ways is capital, taking hold of agriculture, revolutionising it, smashing the old forms of production and poverty and establishing the new forms which must succeed*" (K Kautsky, 1899, pp 2-3). For Lenin also the specificity of the historical context carried paramount importance and he emphasised the possibility that the process may take fairly diverse forms: "The essence of the problem of 'the destiny of capitalism in Russia' is often presented as though prime importance attaches to the question: how fast? (i e, how fast is capitalism developing?). Actually, however, far greater importance attaches to the question: *how exactly*? and to the question: *where from*? (i e, what was the nature of the pre-capitalist economic system in Russia?)" (V I Lenin, 1899, p 385).

5 This is an essential corrective to studies of the so-called "dependency theorists" which while correctly rejecting transplantation of European teleologies to other historical contexts, tend generally to ignore the concrete specificities of the latter, and their resistance to capitalist penetration.

6 The argument being made here is not against a comparative-historical approach *per se*. It only insists on the specificities of each element in the comparison being recognised in their fullness, so as to prevent the obliteration of the uniqueness of one historical experience by the imposition upon it of another.

7 To cite only *one* example, as many as 52 per cent of farm workers in England lived in tied-cottages, even as recently as 1972. The proportion had indeed gone up from the 34 per cent figure in 1954 (H Newby, 1977, p 180).

8 Equally problematic, therefore, also is the teleological recourse to models of formal and real subsumption of labour under capital, for understanding non-European experiences, as for example, in M Shah (1980). This is particularly so because the continued significance of land as an element in the production process even in advanced capitalist agriculture implies that the transformations in the agricultural labour-process resist schematisation into the formal-real subsumption frame. In agriculture, unlike in industry, it is virtually impossible to identify a *specifically capitalist* form of the labour-process. These arguments are developed in some detail in M Shah (1984a).

9 It could be argued that the way I am proceeding would leave untackled the question of a precise definition of the prevailing

mode of production. Briefly my response would be to say that modes of production can only be identified through an understanding of their dynamics. This point is well argued in J Banaji (1977). For this, the kind of studies I am suggesting would be essential. It would be useful here to reflect a little on the way Marx "defined" anything, to heed Engels' warning not to "look in Marx for fixed, cut-and-dried definitions that are valid for all time" (Preface to Vol 3 of Capital, K Marx, 1979, p 103), to recognise the connection between Marx's use of language and his view of the world. For a thoughtful discussion on this difficult question, see B Ollman (1971, Part I). At any rate, one needs to be wary of the facile notions of "precise definition" implicit in the mode of production discussion. The initial chapters of N Georgescu Roegen (1970) greatly helped me to understand this but, of course, little could be better than a careful reading of L Wittgenstein (1968). For one view of the relationship between Marx and Wittgenstein, see D Rubinstein (1981).

10 The process through which these castes came to occupy this place as well as the rough ancestry of the process in both North and South India is outlined in M Shah (1984b, Ch 2).

11 A substantiation of these propositions is provided in M Shah (1984b, Ch 4, 5 and 6).

12 I Habib (1983, p 50), T Raychaudhari (1984, p 9), L Dumont (1980, p 102) and B H Baden-Pawell (1892, Vol I, pp 149-151)—widely different writers, all attest to the veritable universality of *jajmani* relationships in immediately pre-colonial rural India.

13 This, however, is not the only sense in which I regard a district-level study relevant. Indeed, one of the major conclusions of my Chingleput study is that a limited regional analysis contains the possibility of throwing up new questions which could have significance far beyond its own geographical purview—and that some of these questions could have been brought to light only through such a micro-study.

14 Chingleput is a district on the east coast of South India which surrounds the city of Madras. It corresponds to the area known as the Jaghire which was under the Nawab of Arcot's rule in the mid-18th century and which came under *direct* British rule in 1782. (For details see M Shah, 1984b, p 106). The information on which this paper is based has been collated from historical manuscripts, inscriptions and field-survey reports, some pertaining to the Madras Collectorate also. Many of these were collected and conducted by British administrations in the area during this period. Lionel Place (Collector of Chingleput, 1794-1798), F W Ellis (Collector of Madras 1810-1819) and Colin Mackenzie (Surveyor-General of Madras in the early 19th century) are particularly worthy of mention. Appreciations of Ellis are found in B Hjejle (1967, p 77) and J D M Derrett (1968, pp 258-259), of Place in C S Crole (1879, pp 240-73) and of Mackenzie in T V Mahalingam (ed) (1972, Vol I, pp i-xxii). A comprehensive account of Mackenzie's work is found in the Journal of the Royal Asiatic Society (1834, Vol I, pp 333-364). Even so I have sought to move with an awareness of the problems underlying an uncritical reliance on what may be described as "Orientalist discourse" (See E Said, 1978).

15 *Kaniatchi*, from the Tamil, '*kani*' (or property, possession, right of possession, hereditary right) and '*atchi*' (or power, domination) (B A Saletore, 1934, Vol II, p 446). As Ludden says, '*kani*' "a basic Tamil word for resource control in production also means 'land' a measure of land, and a 'hereditary right' in general, to land, office or position of control over resources" (D E Ludden, 1978, p 172) See also A Appadorai (1936, Vol I, pp 120-21), for an explanation of the term. *Mirasi* from the Arabic, '*miras*' (hereditary right, property, inheritance).

16 From the Tamil '*mel*' (or upper) and '*varam*' (share). According to Stein, "the particle *mel* means not only 'higher', 'upper', or 'major' but also 'superior' in the sense of priority of entitlement and 'first' in the sense of that which is taken first" (B Stein, 1980, p 169).

17 This was the case right upto the advent of the British revenue systems, except for a brief period between 1770 and 1780, in a few villages on the south, south-west border, where money assessment on dry fields was introduced by the Nawab of Arcot. What is most remarkable is that even when a money assessment became generalised on all the lands in the Tuluva and Carnatic Provinces of the Vijayanagar empire, this did not happen in Tondaimandalam (an ancient territorial division which includes the modern districts of Chingleput and North Arcot and parts of South Arcot, Nellore and Chittoor), except to some extent in its southern part (which appears to have largely excluded Chingleput) (Replies from F W Ellis, Collector of Madras to the Mirasi Questions, 30th May, 1816, Appendix, footnote 27).

18 *Kudivaram* or share of the 'resident' (or 'cultivator' in this context). '*Kil*' (Tamil-lower), hence 'lower share' (*kilvaram*).

19 These were mainly *ulkudis* (occupancy tenants) or *parakudis* who moved from village to village, their right to cultivate generally being annually renewable.

20 In a footnote, Place adds, "the division could only be made according to the fractions recognised in Tamil arithmetic such as 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, etc, etc. Fractions not forming multiples of one of these could not be *mirasi* shares, and were called *kandams*, or detached pieces which carried no *mirasi* privileges" (loc cit). Place also found that villages of equal area were sometimes divided into an unequal number of shares. He tries to account for both this and the fact of fixed shares by suggesting that the number of shares in each village was fixed at the time of its original settlement and that it varied across villages "according to the number of original settlers, or of labouring servants that they brought with them" (loc cit).

21 This meant of course, that women could never become *mirasidars*. "Women had rights only to maintenance from the land. Unmarried girls lived under the guardianship of their fathers; married women, of their husbands and fathers; and widows of their sons, or if there were no sons, their husbands' closest *dayadis*, or patrilineal kin" (Ibid, p 208). Gough's account relates to the *kaniatchi* system in Thanjavur.

22 From the Tamil '*pasan*' (fair), '*carei*' (shares); and '*samudayam*' (undivided or common).

23 Literally in Tamil, 'field-division'. While Gupta bases himself on inscriptional evidence, Sancaraya, the Sheristadar to the Collector of Madras, describes the intervals as 7, 10 or 12 years, from his first-hand experience (Translation of Answers to the Questions enclosed in Secretary Hill's letter to the Board of Revenue, 2nd August 1814 by B Sancaraya, late Sheristadar to the Collector of Madras, Reply to the 12th Question).

24 Tamil, *Arudi-carei* ('final or decisive division'), *palabhogham ('divided enjoyment').*

25 Tamil, *Manyam* or revenue-fee land and *Varapet* or land paying revenue in kind, shares of output. Of course, the *mirasidars* could and did misuse their position to tamper with the village records. Place cites examples of this in both his 1795 Letter and 1799 Report. See M Shah (1984b, p 7).

26 In a footnote Ellis describes how the ceremony would commence with the delivery of gold, the delivery of water, the consent of townsmen, of kindered, of neighbours, of heirs and of the king or of his resident officer (loc cit).

27 A large number of deeds of sales, gifts and mortgages of *mirasi* pertaining to the Chingleput area in the 18th century were collected, translated and catalogued under Ellis' supervision. A careful examination of these reveals the remarkable intricacies involved in the question of the alienation of *mirasi* right, the wide variety of conditions under which so many different kinds of transfers occurred. For details, see M Shah (1984b, pp 74-80). A sample deed of *sale* of a portion of a *mirasi* share (with Ellis' footnotes) is presented in the Appendix to this paper.

28 Several inscriptions dating from the late 8th century A D onwards provide details of various collective bodies responsible for all important affairs of the village in different parts of South India (K A Nilakanta Sastri, 1932, Ch 3-6; A Appadorai, 1936, Vol I, pp 135-152; B Stein, 1980, Ch 4). Some of the most famous of these inscriptions come from Uttaramerur in Chingleput district (Nilakanta Sastri, op cit, p 100). On the basis of these, Appadorai demonstrates the close connection between the collective form of property and the existence of these committees and shows that a major qualification for their membership was the holding of a *kaniatchi* share in the village (op cit, pp 151-152). The inscriptions indicate the wide range of functions performed by these committees. It may also be noted that Stein in his survey of "locality governance" across the "Chola macro region" finds that "in the central portion of the Kaveri basin and

Tondaimandalam the *nattar* seemed to operate as an assembly without a single, local, executive chief" (B Stein, 1980, p 110). (Elsewhere *nadu* chieftainships prevailed). The *nattar* generally comprised the dominant Vellala landed strata of the *nadu*. They "classified and registered lands within the locality and took prime responsibility for effecting changes in the distribution of income from cultivated land" (loc cit). They were the ones who received and executed royal orders.

29 "Whatever estate a man may possess in money in countries above mentioned, the holding of *Mirasu* is always considered as more honourable by the people. The *Mirasudar* looks on himself as entitled to direct the affairs of the village, to stand forward on all occasions when the affairs of the *Sircar* are in discussion, and to receive any *Tasrif* given by it, and the pre-eminence thus claimed is allowed him by others" (Sancaraya, op cit, Reply to the 15th Question). Sancaraya explains the term Tasrif as "honorary presents at the time of forming annual settlements" (loc cit).

30 I have made an attempt, albeit somewhat approximate, to estimate the share of the state and the distribution of the remaining village produce among different participants in the village economy (M Shah, 1984b, pp 65-66) which supports this claim quantitatively.

31 Tamil, '*Tundu*' a piece cut off, a bit, portion.

32 "The eight incident of ownership in land are stated in the following Sanscrit verse—*(1) Nidhi (2) Nikshipa (3) Pashanam (4) Siddha (5) Sadhya (6) Jalamvitam (7) akshiny (8) agame samiyuktam ashta-bhoga samamvitam*. (1) treasure trove (2) property deposited in land not claimed by another (3) mountains, rocks, and their contents, mines, minerals, etc (4) all land, etc, yielding produce (5) all produce from each land, etc (6) rivers, tanks, wells and all other waters (7) all privileges actually enjoyed (8) all privileges which may be conferred; these are expressed by the general term *ashtabhogam*, the eight rights enjoyed by the owner of land" (Ibid, Reply to the 12th Question, footnote).

33 Althought somewhat less common, there were some labourers who were held by *mirasidars* independently of the *kaniatchi* share. These labourers who mainly did agricultural work could be bought and sold independently of the share. The most common form of this kind of transfer traditionally seems to have been of whole families of labourers called *cottu-adumai* (R Naidu, 1834). It is, however, very difficult to say what proportion either form of labour constituted or whether any other form was also important.

34 This suggests the existence of a "subsistence ethic" or the notion of "subsistence as the fundamental right", a feature the *kaniatchi* agrarian system appears to have shared with several other pre-capitalist societies all over the world (J Scott, 1976, p 176). The existence of this ethic in the context of the caste-system, however, imbues the *kaniatchi* relations with a certain specificity. This argument is developed below.

35 Indeed, a Paraiyan's knowledge of village boundaries is said to have been highly regarded. There was apparently a custom "of making a Paraiyan walk the boundaries of a field with a pot of water on his head, when there is any dispute about their exact position" (E Thurston, 1909, Vol 6, p 86).

36 Ultimately, however, the point is not merely that in terms of a number of elements Europe was different from India. Much more crucially we must recognise (a) that even societies which at a certain moment in history exhibit somewhat similar characteristics could be involved in essentially different dynamics and trajectories and (b) that even very similar elements could add up to very different systems in different historical contexts.

37 Possibly the *ulkudis*, who were tenants holding occupancy rights, would come closest to such a description. The several problems in so describing them should, however, be apparent. It is only after the British introduced the *raiyatwari* system in this area that one can really speak of peasant proprietorship.

38 See, e g, H Orenstein (1962) for a more moderate revision of Wiser's position (in terms of mitigation rather than negation of power). Such notions of mitigation/alleviation of power are found even in the writings of those who otherwise appear to have a fairly subtle appreciation of the nature of *jajmani* relations (J Breman, 1974, p 20 and K Gough, 1960, pp 90-91).

39 Not that bourgeois domination in any actual situation is ever purely "economic" or so blatantly expressed either. It is often overlooked that there is a very specific system of values, "a moral order" so to speak, that characterises relationships even in a capitalist society, and that it is an order that is as *historically limited* as capitalism itself. Once this is recognised, i e, once a conception of "human nature" as an eternal given is rejected, domination associated with non-bourgeois ideologies should not occasion too much wonder or invocations of irrational behaviour. On the contrary, one could perhaps say that capitalist domination should itself become an object evoking a somewhat greater degree of astonishment than it usually does!

40 The discussion here concentrates on South India. For the North, R S Sharma (1980a) and others have brought out the significance of the phenomenon of land-grants to Brahmins. All over India this was a major mechanism for drawing tribal groups into the ambit of caste-society (see especially R S Sharma, 1980b, Appendix II and B Stein, 1980, p 84). R N Nandi (1979-80) describes the growth in significance of *dana* rites in rural North India from around the 6th century A D, which were performed by Brahmins who were supported by the dominant landowners.

41 See footnote 42 below, although one must recognise that Dumont's is not a model of determination.

42 A series of suggestive remarks on the notion can be found in Gramsci's Prison Notebooks (see A Gramsci, 1971, especially "Notes on Italian History", "The Modern Prince" and "State and Civil Society"). I have relied heavily on the interpretation in R Williams (1973). One of Williams' major aims here and in several other writings (see especially R Williams, 1977, pp 75-82) is to argue that adherence to the 'base-superstructure metaphor' is a serious problem in Marxist approaches to culture and ideology. At the same time he stresses the need for any materialist approach to culture to recognise the *materiality* of the process of cultural production. The strongest Marxist critique of the use of this metaphor is however, found in the work of E P Thompson. As Thompson says, "this metaphor from constructional engineering ... must in any case be inadequate to describe the flux of conflict, the dialectic of a changing social process" (E P Thompson, 1965, p 79). More fundamentally, he questions "the notion that it is possible to describe a mode of production in "economic" terms, leaving aside as secondary (less "real") the norms, the culture, the critical concepts around which this mode of production is organised ... No agrarain system could be continued for a day without complex concepts of rights of use and access and ownership: where are we to put such concepts—in a "basis" or a "superstructure"? Where are we to put customs of inheritance—patrilinear or matrilinear, partible or impartible—which are tenaciously transmitted in non-"economic" ways and yet which profoundly influence agrarian history? Where are we to put the customary rhythms of work and of leisure (or festival) of traditional societies, rhythms intrinsic to the very act of production and yet which are often ritualised, whether in Hindu or Catholic societies, by religious institutions and according to religious beliefs? There is no way in which I find it possible to describe the puritan or Methodist work-discipline as an element of the "superstructure" and then put work itself in a "basis" somewhere else" (E P Thompson, 1977, pp 261-62). In the Indian context, the problems posed for the metaphor by the caste system are brought out in M Shah (1984b).

43 An account of this process is, of course, way beyond the scope of this paper. The breaking down of this hegemonic position of Brahminical discourse has been a major thrust of the non-Brahmin movements of the last hundred years or so. It is encouraging to note that Talal Asad in his recent writings has proposed an approach to religion which comes very close to the one being suggested here (see T Asad, 1983a and 1983b).

44 Lest any misunderstanding may arise, I would like to clarify that what I have said so far does not amount to an explanation for the existence of certain features in these relationships, i e, I am not arguing, for instance, that "this was the form of power because Brahminism was dominant"? For this would obviously beg such questions as "Why was Brahminism dominant?", "Why did post-tribal Indian society taken on a caste character?" , etc. All I have attemp-

ted is a demonstration of the connection between the dominance of Brahminical discourse and certain features of these relationships. Indeed, I really wonder what kinds of answers can be proposed to such questions. Beyond stating what may be called their "negative determinants" or conditions which set the limits to the range of possible outcomes, I think one can only try to the extent possible, to describe how these processes occurred. A materialist interpretation of history could usefully take off from the proposition that "the *ultimately* determining element in history is the production and reproduction of real life" (Engels to Bloch, September 1890), while recognising that "the human essence is no abstraction inherent in each single individual. In its reality it is the ensemble of the social relations" (Marx's 6th thesis on Feuerbach, in K Marx, 1975, p 423). One would then study the conditions of reproduction of the various existing social relations, their breakdown and transformation, always remembering that any relation of power involves a process of struggle. But I doubt very much if any general law asserting the primacy of "economic" factors can be sustained. For a fascinating account of Marx's concept of determination, see D Elson (1979).

45 Bourdieu is here describing the relationship between masters and *khammes* (sharecroppers) in rural Algeria in the 1950s, a major difference between which and caste society is the much more rigidly hierarchical character of the latter. Even so many of his observations carry force in our context too. It may be noted that Bourdieu's use of 'dual economy' is to be sharply distinguished from its use in development economics literature.

46 This is a rather compressed account of a much more elaborate argument in M Shah (1984b, pp 97-101) where I bring out the significance of *liminality* in understanding such rituals, drawing upon van Gennep (1977), V Turner (1969), N Z Davis (1975) and H G Gadamer (1975) among others. R Guha (1983, pp 30-36) contains an interesting review of evidence on these rituals from various parts of the world.

47 For instance, we have evidence for the existence of the *kaniatchi* form of property from Thanjavur, Tirunelveli, Tiruchirapalli, Ramnad, Salem and North and South Arcot (B Hjejle, op cit, pp 86-87 and B J Murton, 1973, pp 169-70). The *bhaiachara* villages of North-West Provinces and Punjab (B H Baden Powell, 1892, Book III, Part I, Ch 2 and Part IV, Ch 2), and the *narva* or *bhagdari* villages of Gujarat (Ibid, Book IV, Part II, Ch 2) exhibit strikingly similar features. In any case the *jajmani* system is an extremely suggestive, partially unifying framework.

## Asea

ASEA has received its first contract from NTPC for high voltage direct current (HVDC) equipment. This is the first such project in the country for the construction of a complete back-to-back convertor station. It is scheduled to enter into service at the beginning of 1988. According to Mantosh Sondhi, Chairman, the 500 MW convertor station is intended to interconnect, without any transmission, the 400 KV grids of the northern and western regions. The convertor station will be built in the Vindhyachal, close to the border between UP and MP. Although in the first contract the role which the company has to play is somewhat limited, it is bound to grow in the future in an area which is technologically most advanced. The company is also actively engaged in formulating several plans for expansion and diversification. Of these, the decision to manufacture medium voltage SF6 and vacuum breakers in the Switchgear Division at Nasik will help it to maintain its market share in the power industry. Circuit breakers and other apparatus for extra high voltage upto 420 KV will be taken up for manufacture in the next phase of expansion at Nasik. The company has also been receiving several interesting enquiries for the supply of induction melting furnaces and suitable arrangements have been made to fabricate these furnaces locally with active assistance of ASEA, Sweden, with whom a revised formal collaboration agreement has been proposed and is pending with the government for approval. Consolidation and expansion of the Electronic Division's activity at Bangalore is also being actively pursued. Besides, active steps are being taken to develop the necessary engineering and project management capabilities within the area of power transmission technology, a field which will receive increased importance in the next five-year plan.

# Food Consumption and Size of People

## Some Indian Evidence

### A Vaidyanathan

*The arguments and evidence presented in this paper suggest that size of human beings being one of the major indicators of nutritional status merits closer attention; that differences in size are to some degree, perhaps to an important degree, a reflection of differences in sustained food intake; that differences in mean food intake as between households/groups do not affect the size of all age-sex categories uniformly; and that intra-family distribution may be systematically related to the overall supply of food per capita but in ways considerably more complex than the hypothesis of purely sex-based discrimination would suggest. In all these respects, the evidence is sufficiently suggestive to warrant more detailed analysis.*

THE significance of the level and quality of food intake of a population as indices of its health and well-being has been the subject of a lively debate in recent years. One major focus of the discussion is the question raised by Sukhatme (1978, 1981, 1982) about the possibility of defining objectively the quantum of calories, protein and other nutrients necessary for people of specified age, sex and activity levels to maintain normal health. He argued that apart from the variation in food requirement between individuals falling within the same age-sex activity category (which has been well recognised), there are self-regulatory mechanisms for adjusting energy expenditure to intake which enable a given individual to maintain a normal level of activity without any significant change in body weight or loss of health despite day-to-day and week-to-week variation in the level of food intake or, to be more precise, calorie intake. Sukhatme has also cited some evidence to show that intra-individual differences are much more important than inter-individual variations. On this basis he questioned the use of *average* nutritional norms as the basis for judging the incidence of poverty and under-nourishment, and for deciding the policy intervention appropriate to alleviating these conditions. While the existence of intra-individual variation is now generally accepted, the factors responsible for them and, even more so, their implication for the use of average nutritional norms for measuring poverty and under-nourishment continue to be matters of controversy. (See, for example, Dandekar, 1981; Krishnaji, 1981; Srinivasan 1977; and Gopalan, 1983.)

Specifically, there is some question whether the claim about intra-individual variation being more important than variations between individuals is valid for a group which does not normally get enough to eat. Mechanisms by which individuals can maintain weight, health and normal activity in the face of day-to-day variations cannot be independent of the long term mean level of intake. In any case, as Sukhatme himself recognises, the importance of intra-individual variations falls as the period over which intake observations are taken increases till eventually we are left only with variations between individuals. It has of course been suggested that biological adaptation arising from inter-actions between genetic and environmental factors can take place even over the long-run, i e, in the face of changes in the sustained level of food intake by individuals. "If nutrient constraints are encountered at a given rate of growth, the rate is slowed down to bring the nutrient demand into equilibrium with nutrient supply. By thus regulating the speed of the internal physiological 'clock' short-run equilibrium is established and the ultimate size and shape of the adult may be moulded to its environment" (Seckler 1979:5). Low levels of sustained intake may on this reasoning result in a population of smaller physical stature which may nevertheless show no greater signs of ill health or clinical malnutrition than a better fed population. But clearly this is a long term process and one which has definite limits. Whether indeed sustained low levels of intake or significant reductions in the sustained level of intake leads to mere adaptation in size without impairing health or activity is an important question of fact but one which has not been adequately explored and certainly not conclusively.[1]

This paper examines, on the basis of some Indian survey data, the relation between sustained mean food intake of population in different regions and their mean size and health status. We recognise that these relations are inherently complex and the relevant information of the requisite quality necessary to unravel them empirically is also difficult to get. Nevertheless some information is available, and the question of how sustained low intakes and significant reduction in mean intakes affects people is particularly important in our context because a very high proportion of the population live close to the margin of subsistence and the per capita food grain production (the major component of food) has shown a declining trend in as many as eight major states during the last two decades.[2]

### THE AVAILABLE DATA

The National Institute of Nutrition (NIN) has conducted several detailed field surveys of food intake, nutritional status and anthropometric measurements in different parts of India over the last 2-3 decades. Some of these enquiries are of limited scope being confined to particular towns/villages or sections of the population. But the Institute has also carried out two large-scale sample surveys which give anthropometric data for a number of states at two points of time. This body of data provides a basis for studying the size-intake relation and, with heavy qualification, changes in size over time.

The first of these surveys, covering 11 states, was done between 1956 and 1965, different states being covered in different years. Its scope was limited to collecting data (based on actual measurement by trained investigators) relating to height, weight and a few other anthropometric indices for children aged 1 to 21 years. While the survey did not collect any data on food intake, it did classify the children by socio-economic background (in terms of religion, caste and broadly defined per capita income class) of their families. A detailed report of its findings giving the mean values and standard deviations of anthropometric measurements by sex and age for each state and tabulations to bring out the differences in height, weight, etc, of children from different socio-economic classes for the pooled sample have been published (ICMR, NIN, 1972). The major limitation of this set of surveys, apart from the lack of data on food intake, is that the procedure for selection of children raises questions about the representativeness of the sample.[3]

Unlike in the earlier survey, those conducted by the National Nutrition Monitoring Bureau (NNMB) pertains to a sample of households in rural and urban areas of different states selected on the basis of a well defined procedure.[4] It ascertains by weighment and, for a small fraction of the sample, by oral enquiry, the actual food intake of the family for one day. Anthropometric measurements (including height and weight) are taken for all members of the household who are also screened clinically for signs of nutritional deficiency according to a certain number of explicitly stated indicators. For eight states these surveys have been done every year since 1974; two more have been added to the list in 1977 and 1978. Published reports giving summary results of the surveys by state are available upto 1980 (ICMR, NIN, 1980). Our analysis is necessarily limited to these published tabulations which give only mean value of height, weight and intake for the rural sample by states. The number of sample households in each year being too small to permit analysis of individual age categories, we have used the pooled estiamtes for five years (1974-79).

A major difficulty in using the NIN data is the inadequacy of information on food intake. The first round of surveys (1956-65) did not collect any data on this aspect. The more recent surveys collected intake data for each household (and for a portion of the sample by individuals) but only for a single day. If the daily food intake of each family were reasonably stable, or if the sample were large and the enquiry properly designed to capture seasonal variations in consumption, this would give a pretty good idea of the normal average annual intake of the population. But in fact there are wide variations in the food intake of families and of individuals from day-to-day and season to season. There is no indication that NIN surveys used any systematic procedure for getting at the mean sustained intake of the population. Indeed it is not even clear that the surveys were designed with this end in view.

These problems do not arise in the case of the National Sample Survey (NSS) which is explicitly designed to measure the level, pattern and distribution of consumer expenditure by state and by rural and urban areas. The NSS collects data on consumption for a 30-day period from each household and the survey is so arranged as to capture seasonal variation. Its estimates therefore give a better idea of the mean annual intake at the state level than the NNMB. There are of course several questions about the accuracy of NSS data on food consumption and in particular on the nature and extent of non-sampling errors therein (Vaidyanathan, 1983). Nevertheless, on the assumption that the magnitude and direction of errors (especially non-sampling) are not systematically related to the level of consumption—and this does not seem unreasonable—we could use the NSS to define the *relative position* of the states in respect of sustained mean intake. We have state-wise estimates of per capita calorie intake for rural and urban areas separately in respect of 1961-62 and the early seventies.

Even this procedure raises two difficulties in the case of the first NIN survey: Since it was conducted at different times in different states spread over a 10-year period there is the problem of deciding which round of the NSS is to be used for ranking. In any case such ranking is possible from published data only for one year, namely 1961-62. There is also the problem that the NIN tabulation relates to a sample which includes both rural and urban areas, the coverage of the latter being disproportionately large. While these difficulties do not pose a problem in the case of NNMB surveys, there are, for reasons cited, doubts about the reliability of their estimate of intake as a measure of the sustained mean intake for the households or for the population. Therefore, we have taken the simple average of per capita calorie intake in rural areas of each state as estimated by the NSS for three years (1971-72, 1972-73 and 1973-74) as the basis for ranking.[5]

State-wise data on mortality by sex and age is available for the late sixties from studies under the Sample Registration Surveys conducted by the office of the Registrar General. Fairly detailed data, state-wise with rural-urban breakdown, or morbidity (measured in terms of 'incidence' and 'prevalence' of illness) by age and sex is available from the 28th round of the NSS. The Rural Labour Enquiry gives information on the number of days for which male and female workers remained unemployed due to illness—but this may not be sufficiently reliable for our purpose.

Given the errors in the data, the high level of aggregation at which the relation between food intake and size/health is being examined and the fact that the estimated mean intakes and size are derived from different sources relating to two different points of time, the results of our efforts to explore the size-intake relations cannot but be tentative. Nevertheless they are sufficiently interesting to merit reporting.

## FOOD INTAKE AND SIZE OF PEOPLE

In the Indian context, given the low levels of intake, our expectation is that for a given age-sex category (and controlling for climate, activity, genetic differences and health environments) higher levels of intake will be associated with larger size both in terms of height and weight. It is not possible with available information to control for factors other than food intake which affect size. However, if genetic differences and variation in the health environment were dominant, and are not related to the level of intake, then we would find that there is no strong relation between food intake *per se* and size. It is, however, possible that size could be maintained in the face of low intake by working less and/or working less diligently. There is no way of verifying how important the latter adjustments in fact are.

For the purposes of the present study 'food intake' will be measured by per capita calorie consumption and height, weight and weight for height will be used as the indices of size. Since size is a function of age and sex, the focus will be on differences in mean height and weight between people of the same age and sex categories.

Ideally the analysis of the food intake-size relation requires data on food consumed individually by people in each age-sex category. However, such information, as is well-known, is very difficult to get. Typically the basic unit for food consumption/nutrition surveys is the household which consists of persons of different age, sex and activity status. It is not possible to infer from the household level information the consumption of individual members.[6] Under these circumstances, the only course open is to relate the size of particular age-sex categories to the average per capita consumption of

their families, classes or regions as the case may be. This necessarily involves some hypothesis (or assumption) on intra-family distribution of food.

The simplest assumption would be that the intake of individual members of different households varies in the same proportion as their respective mean intakes per capita. This does not imply equal distribution within the family, though variation in the age-sex activity composition of families makes it difficult to give it precise meaning. More important, it is widely believed that there is systematic discrimination in intra-family distribution particularly against females.[7] Such discrimination is generally ascribed to culturally ingrained prejudices: It is widely believed for instance that there exists a marked bias in favour of males in allocating food within the Indian family. One can also think of other reasons: Thus it seems only reasonable that when there is inadequate food in a family, the needs of working members (usually males), on whose earnings the others depend, will have the first claim on the supply leaving the remainder to be shared among the rest. Whatever the reason, it seems but plausible that such discrimination has something to do with the overall supply of food to the family: The more abundant the supply relative to the requirements of healthy living, the less is likely to be the intra-family inequality.

To the extent that the long term mean consumption of individuals is proportional to the mean per capita intake of their families, one would expect the mean size (height and weight) of individuals of each age-sex category to be positively correlated with the mean per capita intake of the family. But insofar as intra-family distribution is itself systematically related to its mean per capita intake, the relation between the mean per capita intake of the population and the mean size of its members should be more pronounced in some category of members than others. We will concentrate on the discrimination between the sexes which is generally believed to be the most widespread. And since, for reasons cited, the prospect of such discrimination would seem to be greater in a situation of low overall mean intake per head compared to a high level of intake, the expectation would be that the differences in height and weight of females relative to mean per capita intake would be greater than in the case of males which is equivalent to saying that the ratio of male to female height (and weight) will fall as the mean per capita intake rises.

The published tabulations of the first NIN survey do not permit a study of intake-size relation across states. However, it does give a tabulation of the pooled data of mean height and weight by age and sex classified by range of per capita income PCY which is a good proxy for ranking groups according to mean level of food intake per caput. These data (Table 1) show that (a) mean height and weight for both sexes increases with per capita income; (b) the difference in height between the ages of 4 and 19 (especially for males) tends to be larger in the poor groups than in the rich; and (c) the difference in weight between 4 and 19 years is generally an increasing function of per capita income. The usefulness of these associations is, however, limited by the fact that they are derived from pooled data in which systematic differences in mean consumption, environment and perhaps genetic characteristics across regions and between rural and urban areas are confounded with the effect of intake *per se*. A more disaggregated analysis by individual states and occupational/caste groups, which should be possible by retabulation of the primary data, can mitigate some of these limitations.

For the more recent NNMB surveys, published tabulations permit comparisons of mean size and mean intake across states but only for rural areas. (Tabulations of both size and intake for urban areas and of size by income-activity categories are not yet available.) The available information of mean height and weight by sex and selected age[8] groups (representing the average for 1974-79) for 10 states ranked according to per capita calorie intake during 1971-73 are presented in Tables 2 and 3. From a comparison of the extremes of the spectrum of food intake, it is seen that people of a given sex and age are invariably taller and heavier in states which rank highest in terms of food intake compared to those at the bottom, the difference in weight being much more marked than in height. If higher intake always resulted in larger size and size were not influenced by any factor other than intake, there should be very high correlation between intake and size.[9] However, in fact, observed size is influenced by factors other than food intake and the data are always subject to error. Therefore the association between intake and size estimated from survey data is likely to be muted.

Table 4 gives the correlation coefficients between mean per capita calorie intake on the one hand and different indicators of size (namely mean height, mean weight and mean weight per unit height) for selected age-sex categories.[10] In general mean size is seen to be positively associated with mean calorie intake. However, the strength of the association differs between age and sex categories, with the suggestion of a pattern. Thus association between intake and height is very weak at age 4 for either sex; there seems to a stronger (though not statistically significant) positive association between the two at all other ages. Among females, unlike males, the strength of this association seems to rise with age. The weight-intake association in early childhood and late middle-age is much stronger among females than males. But in other age groups the association is generally stronger for males. This is specially so in the age groups 19 and 20-24 years (where the coefficients are also significant). The coefficients for weight per unit height

bring out the contrasting patterns more sharply.

Further the magnitude of weight differences as between regions with different levels of per capita calorie intake is generally greater among males than among females. Variation in mean intake seems to make a striking difference to 19-year old males and progressively less at higher ages; among females, weight differences associated with mean intake seems to get more pronounced with age. The differences in weight between 4 and 19-year olds is not only generally higher among males, but its magnitude also tends to be larger in better fed populations. Between 19 and 20-24 years males in relatively poorly-fed regions gain more weight than in state with high average calorie intake; while in late middle-age (40-44 to 55-59), when people generally seem to lose weight, the reduction tends to rise with mean per capita intake. Among females, no clear relation is seen between weight gain (loss) and mean food intake of the population. These associations it should be noted, relate the indices of size for particular age-sex categories in each state with the mean intake for the entire population of that state. Differences observed between age-sex groups are most likely a reflection of differences in the way the available food is allocated between age-sex categories. This leads us to an examination of the relation between mean intake and distribution of food consumption by particular age-sex groups.

## INTRA-FAMILY DISTRIBUTION OF FOOD: SEX DISCRIMINATION?

We are concerned with two questions: First, is there a general discrimination of the basis of sex in the distribution of available food in India? And second, whether this discrimination tends to be more acute when the total supply available per head is relatively low. One way of testing the existence of discrimination would be to compare, as Sen (1983) has recently done, the actual height and weight of males and females of specified ages with the values expected of a well-fed, healthy population of the same genetic stock. Table 5 gives such a comparison of weight for children from 1 to 18 years, using the Harvard standard (HS) as the norm. Actual weights (and heights) in all cases are below HS. If there were discrimination against females, the difference between actual and the corresponding HS values for them should be higher than for males. This seems to be the case in early childhood (see also Sen, 1983). During later childhood the data do not show any sustained or marked difference between the sexes in this respect: in fact during adolescence the deviation relative to HS is generally less among females. If the HS can be taken as a valid generalisation of the relative profiles of the growth curves of the human male and female, the data point to a general discrimination against females in early but not later childhood. In the absence of any generalised height and weight standards for adults, it is not possible to say whether discrimination against females is a general phenomenon during later stages of life.

The data however provide some basis to examine whether the sex-discrimination in intra-family distribution of food is systematically related to the mean level of food intake: If it is true that the food needs of males get first priority in intra-family allocation of food one would expect the difference between male and female intake to be relatively large when per capita intake is low and small at high levels of intake. Insofar as intake affects size, these differences should also be reflected in the relative size of males and females.[11]

The correlation (based on data for 10 states) between mean per capita calorie intake on the one hand and male to female ratio in respect of (a) weight and (b) weight for height were given in Table 4. While none of the coefficients is statistically significant, it is interesting that both the direction and strength of the association varies with age and apparently systematically. As mean intake rises there seems to be some tendency (*albiet* weak) among four-year olds for the male to female ratio in both weight and weight for height to fall. But among 19-year olds the male-female disparity in respect of both indices tends to increase as one moves from states with low level of intake to those with relatively high levels. In the adult age groups the distance between male and female size generally declines as mean intake increases, the tendency being most marked in the weight for height in the 20-24 group and weight in the 55-59 years group.[12]

The above data suggest that discrimination against females in intra-family food allocation may not be as universal as is generally supposed nor does it always get accentuated when the family's food supply relative to population is low and inadequate. Discrimination against females in early childhood and late middle-age seems to be general, but may weaken as mean intake rises. The fact that male-female disparities both in absolute weight and in weight differences between the ages of 4 and 19 years increase with mean intake would seem to suggest that there is no sex discrimination in late childhood and adolescence. If size difference in particular age-sex categories were mostly due to differences in food intake, the fact that weight of males is generally more sensitive to changes in mean intake than that of females of same age would imply that as the family food supply changes the amount allocated to males is varied much more than females but in differing degrees at different ages, most strikingly in adolescence and early adulthood.

The observed relation between relative size and overall mean intake is a reflection not only of differences in intra-family distribution, but also of systematic variation in other determinants of size with reference to overall mean intake: Thus the kind of activity which females of different ages perform in a

TABLE 6: FOOD INTAKE AND MORBIDITY IN SELECTED STATES

| State | Calorie Per Cent | Incidence Rate | | | Prevalence Rate | | |

relatively poor region may differ systematically compared to those in the more prosperous areas; and it is possible that people in the low intake regions have adapted either by more efficient use of food or by lowering thier activity level and/or work output per unit time. Given that changes in food intake could lead to adjustments on dimensions other than size a more disaggregated study controlling for nature of activity, genetic factors and health environment is necessary for a better understanding of the age-sex differences in size-intake relation and their significance.

It would be even more interesting to map changes in the size of people in different regions experiencing different rates and/or direction of change in mean food intake. The NIN and the NNMB surveys provide mean values of anthropometric measurements for children and adolescents (0-19 years) in a few states at two points of time spanning 2-3 decades. Published tabulations for six states show that in practially all age-sex categories the mean height and weight of children in the latest NNMB surveys is less than in the earlier NIN surveys. Unfortunately, comparable data on intakes for the relevant years is not always available; there are also serious questions concerning the comparability of coverage, sampling and enquiry procedures in the two sets of surveys. However, by suitable retabulation of the primary data it may be possible to get more insights into the changes in size of selected socio-economic groups. Of particular interest would be the scheduled castes and agricultural labourers, who comprise the poorest segments of the rural population and whose per capita real income, by all accounts, may well have fallen in the last 2-3 decades. Over the longer term it would seem worthwhile to attempt anthropometric measurements alongwith enquiries about employment, incomes and consumption once every 10 years for at least a segment of the sample covered by the NSS.

### FOOD INTAKE AND MORBIDITY

Morbidity (or illness) is a function of several factors besides food intake, including environmental hygiene and the extent to which mass communicable diseases have been controlled. Nevertheless, there is little doubt that the level of food intake is one of the factors in as much as sustained low level of intake relative to requirements of normal activity increases the propensity to illness by reducing the body's capacity to resist infections. This, and the incidence of ailments directly arising from nutritional deficiency, are apt to be more important in poorly fed populations. The NSS data on 'incidence' and 'prevalence' of disease, though subject to limitations arising from the difficulty of defining and identifying morbidity are of interest in this context (see Table 6). It is noteworthy that by both indices of morbidity, relative to population, across states show a negative association with their respective mean food intakes per capita. Kerala which has the lowest calorie per capita has the highest morbidity rate, while those at the top end of the intake scale show generally lower incidence of disease. Overall the correlation between calorie intake and morbidity rate for the population is negative and significant (at 10 per cent level).

### CONCLUSION

Bieng basically an exploratory effort and given the limited amount of empirical data with which we had to work, this paper has no definite conclusions to offer. Hopefully, however, the arguments and evidence marshalled above are sufficient to show that size of human beings being one of the major indicators of nutritional status merits closer attention; that differences in size are to some degree, perhaps to an important degree, a reflection of differences in sustained food intake; that the differences in the mean food intake as between households/groups do not affect the size of all age-sex categories uniformly, and that the intra-family distribution may be systematically related to the overall supply of food per capita but in ways considerably more complex than the hypothesis of purely sex-based discrimination would suggest. In all these respects, the evidence, gross as it is, seems sufficiently suggestive to warrant more detailed analysis. The data from the nutrition surveys conducted by the NIN permit far more detailed examination of these questions, and also the question of whether there has been any systematic tendency for the mean size of people to fall especially in regions and classes which have experienced a declining trend in per capita food intake on the past two decades. The purpose of this paper would be amply served if it helps stimulate such detailed work.

## Notes

[I have benefited from discussions with Chandan Mukherjee, Chiranjib Sen, Ashok Nag and especially C R Soman who helped me to understand the effect of variations in food intake on size. I am grateful to T N Srinivasan and N Krishnaji for detailed and critical comments on an earlier draft. Needless to say, none of them are implicated in any defects which may remain.]

1 The evidence marshalled by Sukhatme in support of this thesis consists of (i) a close and continuous monitoring of activity and energy expenditure of some 54 males of roughly the same height and weight engaged in farming; and (ii) data on body weight and food intake of a group of women workers in a community kitchen with roughly the same level of productivity. The evidence suggests that the relative efficiency of energy utilisation (measured by average work output per unit calorie intake) is inversely related to the level of intake (Sukhatme, 1980: 2013). See also Sukhatme (1982:2011, 13)

2 According to one recent estimate, the average annual growth in foodgrain production during the period 1953-1978 was below two per cent in four states. According to another estimate (Sawant: 1983) it was less than two per cent in eight states between 1968-69 and 1980-81.

3 During the earlier survey, a total of 127,100 children were surveyed, about one-third of them in rural areas (ICMR, 1972:11). The primary sampling unit for this study was "eligible infant or child" defined as "an apparently normal infant or child aged one through 21 years who was resident in the area in the sense that it had spent the major part of its life there". Certain children (those bed-ridden for 15 days or more, those with deformities and chronic systemic disease) were excluded. Each survey unit (there were seven of them, roughly one for each major state) was expected to survey 20,000 children distributed in the ratio of 5:3 between urban and rural areas. There was a different sampling procedure for rural and urban areas. In rural areas there were three stages of selection, namely, districts, villages and households. Roughly one out of 200 villages in the selected zones was surveyed, with villages being classified into two strata according to size. "All eligible children in the selected village were included in the sample. Children were asked to assemble in the village school or some essential place in the village for clinical examination and body measurement" (ICMR: 1977:4).

Urban areas were stratified by size and a designated number choosen from each. "The sampling frame for children going to school was a list of shcools in the town/city. A systematic sample of schools was selected and from each school a random sample was chosen. Pre-school and non-school going children were also included and examined in their homes" (ibid). The exact procedure for selecting the last category is not quite clear from the report; nor is it clear whether the 5-15 age group is confined to school going children.

4 In more recent surveys, about 400 households were sampled annually from rural areas of each state. The actual number varied somewhat from state to state. Thus in 1979 a total of 3,533 HHs were surveyed for diet and nutrition in 10 states. The number of households surveyed in individual states ranged from 140 in Bengal to over 500 in Karnataka. The total population of the surveyed HHs was close to 25,000 giving an average HH size of 7. In any given year the number of observations in particular age-sex categories is very small—rarely exceeding 50 and in several cases as small as 10 or less. This is the reason why we decided to use the pooled data for five years.

In the NNMB surveys (see ICMR, NIN:1975) the sampling for rural areas is done in three stages: namely districts, villages and households. All districts in each state are classified into four groups according to the level of development and one from each selected randomly. Within each district villages are grouped into three categories according to size. The number of sample villages in each category is determined on the basis of their relative shares in rural population of the district and the number of households to be surveyed. The villages are selected randomly from each stratum. "On the selection of households in each village, proper representation must be given to the different segments of the population (Harijans, low income groups, middle income groups and high income groups) so that the pooled estimation based on all the households surveyed gives us reliable information regarding the dietary status of the village as a whole. The selection of the households will be done by the team on the spot by random sampling after consultation with the village head" (ibid: 12).

5 These estimates are available for 1971-72, 1972-73 and 1973-74 from Dasgupta (1982). The next survey of consumption was done only in 1978-79, the tabulations of which are not yet available. This difference in the base years for ranking the two sets of variables is thus dictated by the availability of data Insofar as the relative rankings of state by calorie intake are reasonably stable over time—and it is interesting that the ranking based on 1961-62 data is broadly similar to the one for 1971-73—it seems that rankings based on 1971-73 averages are a reasonable approximation of relative positions in terms of mean long term intake.

6 The surveys conducted by the National Nutritional Monitoring Bureau did attempt to collect, by oral enquiry, data on the quantum of various foods consumed by individual members for a single day. Considering the well-known difficulties of getting even the family's total intake by weighment, there is good reason to be skeptical of the information on individual intake obtained by interviewing the family members.

7 For example in a recent article Sen and Sengupta conclude on the basis of detailed data for two Bengal villages that there is a systematic sex bias "reflected in higher rates of deprivation of girls *vis-a-vis* boys. The sex bias is reflected both in the greater prevalence of under-nourishment of various degrees among girls than among boys and also (b) the lower growth dynamics of girls *vis-a-vis* boy" (Sen and Sengupta 1983:855). This study is limited to children below four years of age and uses the deviation of actual from "normal" growth defined by ICMR as the index of malnutrition. It does not give any data on the food intakes of the villages or the sample families.

8 Determining the age of each individual accurately is well-known to be a major problem in such enquiries. The NIN surveys are quite conscious of this and the instructions to investigators emphasise the need for care in getting this information and also gives some hints for the purpose. While errors in age estimates are inevitable, so long as their incidence is random the survey data can be used to study the size-intake relation at different ages.

9 Strictly speaking it could be argued that height and weight of an individual at a given point are not only a function of his food intake level at that time but is a reflection, and the cumulative result, of the level and quality of intake over his entire life. However, this seems much more relevant for height than weight. The latter, and even more so weight per unit height, would seem much more sensitive to the current level of intake. The need for more refined models of the nutrition-size relation is obvious enough though there are serious doubts whether the data necessary to test them are currently available.

10 Since the distribution around the mean is skewed and the extent of skewness varies between states, mean size (especially weight, and weight for height) will be influenced by not only the mean intake but also the extent of skewness in the distribution around the mean. Dasgupta (1982) estimated the gini coefficient of calorie intake to range from .1765 in West Bengal to .2650 in Kerala. We have however not taken this factor into account.

11 Inequality between sexes in food distribution would also affect the coefficient of variation (CV). If females are discriminated against, the CV of female weight should be greater than CV for males; and if the extent of discrimination is inversely related to mean intake, the coefficient of variation of females relative to that of males should fall as intake rises. We find that while the CV in weight and height is in most regions and age categories higher for females, the relative CVs (which we compared only for weight) show no clear pattern except in the 40-44 age group where it declines as mean intake rises. However since the CV estimated from the sample data is affected by pooling of data over several ages in some cases and over five years (there are year-to-year variations and errors on account of sample size in individual years) and since they are also affected by the extent of inequality in distribution across families (which varies), it may not be possible to be definitive on this aspect from the present data.

12 Srinivasan, commenting on an earlier draft, pointed out that comparisons at different levels of food intake could be vitiated by 'survival bias' which would arise if (a) those who die are systematically weaker and smaller members of the group to which they belong; and (b) the mortality rates of the sexes in the relevant age groups are different. However this bias would tend to narrow the size disparities between sexes as mean food intake increases only if the mortality rate of females is higher than that of males in the relevant age groups and if the differential in mortality is positively associated with mean intake. As a matter of fact, as can be seen from Table A, there is little difference in the mortality rates of males and females during infancy and early childhood. Nor does the differential show any systematic tendency to increase with mean intake. However, both these tendencies are manifest in the adult age groups, especially among young adults. This means that the inverse correlation between relative size of males to females in the young adult group and mean food intake across states could be in part a reflection of the survival bias.

TABLE A: AGE-SPECIFIC MORTALITY RATES OF FEMALES RELATING TO MALES, INDIA 1968-1969

| | Age-group | | | | | |
|---|---|---|---|---|---|---|
| | Infants | 0-4 | 5-14 | 15-19 | 20-24 | 55-59 |
| Kerala | 0.79 | 0.94 | 1.23 | 0.72 | 0.79 | 0.58 |
| Maharashtra | 1.15 | 1.03 | 1.08 | 1.09 | 1.19 | 0.63 |
| Tamil Nadu | 0.95 | 1.03 | 1.04 | 1.15 | 1.35 | 0.92 |
| Gujarat | 1.06 | 1.09 | 1.00 | 1.18 | 1.73 | 0.71 |
| Andhra Pradesh | 0.91 | 0.94 | 1.07 | 1.01 | 1.46 | 0.78 |
| Uttar Pradesh | 1.18 | 1.39 | 1.32 | 1.32 | 1.88 | 0.81 |
| Karnataka | 0.93 | 0.94 | 0.97 | 1.37 | 2.09 | 1.03 |

## Grover Leasing

GROVER LEASING, an existing dividend paying company, is entering the capital market on July 31 with an issue of 12 lakh equity shares of Rs 10 each at par. The issue is being jointly managed by Grindlays Bank and Punjab National Bank. The objects of the issue are to augment the long-term resources of the company for its leasing and hire-purchase operations and to seek listing of shares on the Bombay and Delhi Stock Exchanges. The company has been promoted by Kashmir Vanaspati and Grover Tankers, both controlled by Charanjit Grover, who is the Managing Director. According to him, the leasing company commenced operations last year and already owns gross leased assets and hire-purchase stocks of around Rs 2.30 crore. These are expected to almost double by the end of 1985. The company's gross income for 1984 was Rs 22 lakh and it declared a maiden dividend of 10 per cent. In the current year the company has firmed up several lease and hire purchase contracts at attractive rates. It has already earned about Rs 27 lakh as gross income in the first five months and the total income for this year is estimated at Rs 90 lakh. Encouraged by its success and to cater to the growing needs for leasing and hire purchase finance in southern India, the company is establishing a branch office in Madras.

# Problems of Adjustment and Growth in the World Economy

**Jayati Ghosh**

*Discussing some of the principal features of the present international economy, this paper highlights the effects of economic interdependence on the potential for growth or stagnation in the developed capitalist economies. The author's concern is with the fiscal, monetary and trade policies of the major developed economies and their actual and potential impact on world economic activity. The basic presumption underlying the discussion is that the behaviour of these economies is crucially important for possibilities for adjustments and growth in developing economies as well.*

*In the first section of the paper the nature of the current economic recovery and the problem that still remain are analysed. Subsequent sections consider briefly some of the major issues that emerge: the implications of the US budget and trade deficits, exchange rate and interest rate behaviour and possibilities of expansion elsewhere in the developed world. The final section touches on some of the implications for developing countries.*

THIS paper discusses some of the principal features of the present international economy, and highlights the effects of economic interdependence on the potential for growth or stagnation in developed capitalist economies. The concern is with the fiscal, monetary and trade policies of the major developed economies and their actual and potential impact on world economic activity. The basic presumption underlying the discussion is that the behaviour of these economies is crucially important for possibilities for adjustment and growth in developing economies as well. In the first section, the nature of the current economic recovery and the problems that still remain are analysed. The subsequent sections consider briefly some of the major issues that emerge: the implications of the US budget and trade deficits, exchange rate and interest rate behaviour and possibilities of expansion elsewhere in the developed world. The final section touches on some of the implications for developing countries.

## I

## Nature of Current Recovery

Although in the past year world economic indicators have shown an upturn, certain fundamental problems are still to be resolved. Thus, in spite of the high rates of growth of output and trade witnessed in the past year in some developed countries in particular, there are reasons to worry about whether such growth can be sustained and spread to the rest of the world, and whether it can rectify some of the imbalances in the system.

The current boom, unlike any other post-war recovery, is based on a fundamental imbalance created by the very high US budget and trade deficits, which have themselves served as major engines of growth. The most dynamic economy today is simultaneously also the one which is most susceptible to instability and possible crashes. At the same time, the recovery has not brought under control the main macro-economic problems in developed countries, especially high rates of unemployment. Nor have the basic difficulties of the developing world, including LDC debt and the consequent need for debtor countries to generate continued trade surpluses, or the need to control fluctuations in primary commodity prices and to reform the world monetary system, been addressed.

A main weakness of the present situation lies in the fact that while national economies have become more interdependent, there has not been a corresponding growth in the co-ordination of policies between countries. An asymmetry has also developed whereby powerful countries such as the US can pursue policies largely unmindful of their international impact, while others have to adjust to the changing international environment.

A basic feature of the world economy is the high and growing degree of interdependence of national economies. This is the result not only of vastly increased trade flows, but also, and more importantly, the free mobility of private capital flows. The trade dependence of developed countries has increased markedly over the last 30 years. The share of exports in GNP has doubled in many OECD countries, including the US. On average, developed capitalist countries now export about 30 per cent of the value of their GNP, but there are wide differences between countries (from 12 per cent in the US to 60 per cent in Belgium: OECD, 1983b). Nevertheless, it is now estimated that only around 5 per cent of international financial transactions are related to trade in goods and services. The rest are capital flows of one variety or another, prominently speculative flows of short-term capital (IMF, 1985). In the last two decades, Eurocurrency markets, for example, have grown by 30 per cent a year, twice as fast as world trade and three times as fast as the OECD's nominal GNP. Around one-sixth of total commercial bank claims in developed countries are now on non-residents (OECD, 1983b). The highly integrated nature of financial markets the world over and the trading of currencies as commodities have meant that within each national economy monetary and fiscal policies no longer have the autonomy to respond to purely domestic pressures. The resulting policy interdependence has several aspects (see Stewart, 1983): (1) Policy actions and other developments in foreign countries have more impact on domestic economic variables than they would otherwise have had. (2) Domestic policy instruments in turn have less effect on domestic target variables and more effect on foreign economies. (3) Foreign responses to these effects once again affect variables in the home country—and so on.

It has been pointed out by a number of observers (Stewart, 1984; Holland, ed, 1983; FERE, 1983) that such interdependence has also implied a deflationary bias in the world economic system. Thus, it is relatively easy for a country to deflate on its own (perhaps out of a desire to achieve a balanced government budget); this transmits deflationary impulses to other economies through the behaviour of trade balances, exchange rates and capital flows. Conversely, expansionary policies of a single economy are likely to come up against balance of payments constraints and the consequent reactions of international financial markets of restrain the financing of these deficits. This would inhibit both its own expansion and the transmission of a reflationary stimulus to other economies.[1]

The present boom in the world economy began in mid-1982, reversing the negative output trends experienced by most of the capitalist world since the second oil shock of 1979. The recovery was initiated and led by substantial fiscal expansion in the US, which has remained the strongest and most dynamic economy thereafter. In the past year, which was clearly the peak of the cycle, in the US output grew by nearly seven per cent (its fastest pace for more than 30 years), 3 m new jobs were created and the dollar rose to unprecedented heights in spite of a huge and growing trade deficit.

The growing budget deficit in the US, which has been instrumental in the boom, was in marked contrast to the contractionary fiscal policies evident in most of the other major developed countries. Governments in Western Europe and Japan have followed contractionary fiscal policies, aimed at reducing deficits. Tables 1 and 2 provide evidence of the growth rates and the components of the changes in real GNP in the recent past, while Table 3 indicates the nature of the divergent fiscal policies in the major economies, Several important features emerge from these Tables. Firstly, the recovery has been heavily concentrated in the US, which has experienced both the highest growth rates and the largest increase in employment. Secondly, the US demand expansion has included a major role for imports (which have risen more than in any previous recovery). This reflects the loss of international competitiveness by the US in certain industrial and agricultural sectors, resulting from the overvalued dollar. The major increase in imports as a per cent of US GNP is shown in Table 2 to have been counterbalanced by the expansion of exports in the GNP of Japan and West Germany. Within the US, a major role in the expansion has been played by non-residential private investment, which in 1984 amounted to nearly 20 per cent of GNP. Outside the US and Japan, unemployment rates in the developed world remain high, while inflation rates everywhere have shown significant declines.

An aspect of the developed capitalist world that has become very marked in recent times is the growing distinction between 'saver' economies—those with structural trade surpluses such as Japan and Germany—and 'spender' economies—most obviously the US. To some extent this is clearly related to varying macro-policies: tight fiscal policy with relatively loose monetary control allows private capital flows from the saver economies to move to the locus of the high-interest-rate boom created by the combination of tight money and loose, almost prodigal, fiscal stance in the US. But it also has to do with varying national propensities to save and consume, and the degree to which these are encouraged by official policy. Peterson (1984) has pointed out that the number and facility of savings institutions, the pattern of pension payments and the rather limited access to consumer credit in Japan all play a role in encouraging a high aggregate savings rate, whereas in the US institutional incentives work in the opposite direction. The difficulty is that such a division of labour is not really sustainable for a prolonged period, as large and continuing trade surpluses give impetus to protectionist calls in trade-deficit countries, which find their own gaps increasingly hard to finance.

The boom in the US has been vigorous, but it has not resulted in a commensurate expansion in world trade or in economic activity elsewhere in the world. The volume index of total world exports remained constant between 1980 and 1983, while that of world commoditiy output increased by three per cent. GATT (1984) estimates that the international transmission of the recovery has been the weakest in post-war economic history. This is in spite of the unusually large increase in US imports, and the GATT report attributes this to a lack of trade-related investment as well as increased protectionism which has inhibited the growth of aggregate trade volumes. It is true that in 1984 the volume of world trade grew at nine per cent, substantially above the previous year's rate (two per cent) and the rate of growth of world output (3.5 per cent). However, most of this was taken up by intra-OECD trade particularly between the US on the one hand, and Japan, Germany and Canada on the other. The trade stimulus to other economies still remains weak.

A notable feature of the current recovery has been the low rate of price increase, indeed the relative disinflation, in the major economies (see Table 1). It is often claimed that tight monetary policies have been instrumental in controlling inflation. However, Backerman (1985) has shown that a large role in the battle against inflation has been played by the decline in primary commodity prices, and thus import prices for the developed world as a whole. This decline itself is not exogenous, but is related to demand and thus to the level of economic activity. By this account, the US price level has been held back both because the limited nature of the recovery in the rest of the world has meant that commodity prices did not increase rapidly, and because the high dollar operated to keep all import prices low in dollar terms, and thus also exercised a downward pressure on domestic price levels.

A factor creating greater international interdependence is the nature of technological change which is resulting in a changed pattern of industrial demand and trade. Services are playing an increasingly important role, especially the overlap between manufacturing industry and financial/technical services. The most evident example is information technology—the convergence of computers and telecommunications—which is the most rapidly expanding sector. Last year the world information technology market was estimated to be worth around $ 300 bn, and since it is growing at approximately 15 per

cent per year, by 1990 it is estimated to be the world's largest manufacturing industry.[2] This growth further integrates various aspects of production structures around the world. The main areas of industrial restructuring, besides information and communication, include the capital goods sector which is being transformed by robotics and computerisation, and the consumer durables sector in which 'white', 'brown' and leisure goods are playing increasingly important roles.[3]

The new products and processes created by technological change are also significant because of the employment implications of new investment which relies heavily on incorporating this technology. It is difficult to estimate the ultimate effects on employment of the new technology: jobs created in the long-term may more than compensate for present job losses.[4] But the tendency of the present innovating investment is to render large parts of existing physical and human capital obsolete. There is some evidence of a labour-saving trend (each additional unit of output being produced with relatively more capital and less labour) which in the long-run may create problems of capital shortage and structural unemployment (OECD, 1985). In any case technological innovation calls for the development of new skills in the labour market. One major implication is that simple demand-expansionary fiscal policies may not be sufficient to alleviate the problems of unemployment significantly.

Technological change has also affected the sectoral distribution of the recovery of investment and output. The most dynamic sectors, with very high rates of growth, are all products making use of electronic applications and chemical products, such as organic chemicals, plastics, synthetic fibres, fertilisers and pharmaceuticals. By contrast, the worst-hit sectors are precisely those which tended to lead previous booms, such as traditional and general engineering, machine tools, iron and steel and non-ferrous metals.[5] This is related to the new qualitative pattern of investment: there has been an increase in the proportion of 'non-productive' investment directed to improving worker safety and safeguarding the environment (due to the impact of trade unions and pressure groups) as well as an increase in the share of new machinery as compared with buildings and construction. While the new technology and associated products have meant an OECD trade surplus with the rest of the world in these sectors, on balance the OECD trade deficit has grown because of enhanced manufactured goods exports by the rest of the world.

Within this highly integrated economic structure, national governments continue to pursue uncoordinated and often contradictory policies. A major example is the divergence of macro-policies. Another is the growth of trade protectionism—by OECD countries individually against each other and as a bloc against newly-industrialising countries, many of whom are also net debtors to the international capital market. GATT (1984) has described the substantial increase in discriminatory trade practices in the recent past, predominantly in the form of bilaterally-imposed quantitative restrictions. The last year has seen only cosmetic changes to these protectionist barriers. Indeed, some may have increased recently. A major increase in protectionism has taken the form of non-tariff barriers. In 1983, the degree of such protection by industrial countries together amounted to 10.5 per cent of all imports from industrial countries, 19.8 per cent of imports from developing countries and 21.9 per cent of imports from the major debtor countries (IBRD, 1985). The persistence of large trade deficits in economies such as the US alongside persistent trade surpluses of Japan, Germany and many NICs can only exacerbate such tendencies.

The protectionist forces also have an impact on what remains a major potential crisis point in the world economy—the debt of a number of developed countries. While debt-servicing ability is related to a number of factors, notably interest rates and internal adjustment measures, the generation of continued positive trade balances and the associated need to expand exports remain crucial to any eventual solution of the problem. IBRD (1985, p 38) has estimated the cost of such protection by industrial countries for the debtor countries, and suggests that an increase in protectionism sufficient to produce a 10 per cent fall in Latin American terms of trade, for example, would have an impact equal to the present real interest cost of the entire existing external debt of the region. Studies such as those of Cline (1984) indicate that a sustained high level of exports may be more important for the ability to service debt, than a decline in interest rates of 2-3 per cent. However, the export performance of major debtor countries (including Brazil, Argentina, South Korea) in the first quarter of 1985 has been

below both the peak levels of last year and the projections made by almost all the major forecasters. The recent decline in LIBOR rates may have helped to prevent a repeat of the 1982 situation of *de facto* defaults in some countries, but has not altered the basic problem significantly nor changed the need for debtor countries to generate trade surpluses. Export strength of such countries can come only from sustained growth in the developed world, accompanied by the ability and willingness of developed countries to bear counterpart trade deficits. In this context the future behaviour of the oil and primary commodity markets is also of significance.

These features of the international economy have shaped the nature of the recovery, as well as the fact that it has been both short-lived and limited. The following sections consider particular aspects of this situation.

## II

## Implications of US Deficits

The fiscal expansion in the US has resulted from a combination of massive increase in military expenditure by the Reagan government (defence spending has amounted to more than a quarter of total government outlay in the 1980s and has been increasing by 10-15 per cent annually)[6] and substantial tax cuts for both business and private individuals. At present the federal budget deficit is estimated to be more than $ 200 bn, although it may be reduced slightly by small cuts the US Congress wishes to impose. Simultaneously the Federal Reserve has pursued a policy of tight monetary control and high interest rates, relaxed slightly only in April 1985. This combination encouraged the capital inflows which financed the enormous deficits generated by such an expansion.

Two differences in the nature of this US boom as compared with earlier booms are, firstly, the major roles played by residential construction growth and import demand, and secondly, a substantial rise in business fixed investment in spite of high interest rates. It is remarkable that even in the face of the highest historical real rates of interest, new capital investment continued to grow until very recently. Several reasons have been advanced for this, of which the following may be the most important. There was a strong growth in domestic final demand even with a deteriorating trade balance, and this must have fuelled businessmen's expectations of future sales and profits. The new tax depreciation guidelines of the US government were especially favourable to cash-flow transactions, which further favoured current expansion.[7] In many industries which faced severe international competition because of the overvalued dollar, there was a perceived need to replace the old and outmoded technologies through the installation of new capital equipment. Associated with this, and perhaps most importantly, the advent of new computer-based technologies meant the need to expand a whole new range of products and processes. Not only were certain products (e g, personal computers) part of an altogether novel market, but the technologies they embodied held the promise of providing improvements in industrial productivity even for exsiting production areas. At the same time, increases in unit labour costs have also been modest.[8]

These factors may help to explain the rise in real terms in 1984 of US exports, which grew by nearly five per cent. Much of this is attributable to the export of commodities in the production of which the US has a technical advantage, such as certain capital goods. BIS (1985) suggests further factors such as the role played by trade within US-owned multinational firms with production sites abroad, especially in the automobiles, electronics and textiles sectors. The efforts by US exporters to maintain market shares, especially in Europe, even at the expense of lower profit margins, has also been significant.

However, the increase in exports has been overshadowed by the massive expansion of US imports, which has led to the export-led boom in some other developed countries and provided the main market for the increase in exports of the major debtor developed countries. In fact the recovery in Western Europe and Japan has been based largely on such US demand. This has been the only stimulus to growth in the world economy apart from the impetus to particular sectors determined by technological innovation.

The danger for Western Europe, and indeed for the rest of the world, is that a sufficiently strong demand stimulus to increase growth and reduce unemployment significantly may not materialise at all in the current recovery. For the boom in the US shows every sign of having come to an end already. Industrial production has been declining for the last few months, and since January 220,000 jobs have been lost in the manufacturing sector. Even in the services sector the rate of growth of job creation so far this year has been a fraction of last year's rate. The rate of growth of real business fixed investment has fallen from 16 per cent to 3.4 per cent in the quarter of 1985 (in the first quarter of 1984 the figure was 21 per cent). New orders for capital goods have been falling sharply from March 1985 onwards. There is also every sign of an incipient profit squeeze as the rate of growth of after-tax corporate profits is estimated to have fallen from an annual rate of 20 per cent last year to five per cent so far this year.

The recovery has thus been of much shorter duration than most predictions. One major cause is the current account deficit, which is beginning to act as a drag on the economy, and the preponderance of imports which has adversely affected domestic manufacturing industry. Also, the rapid growth phase of investment is over, partly because of some of the new constructions are complete and partly because of a slowdown in final sales and output. Nor is the short-term situation likely to improve. Stephen Marris has estimated that with the dollar appromixately at its current level, in 1989 the US current account deficit would amount to $ 250 bn, equal to five per cent of GNP and 50 per cent of exports. The external debt of the US would be more than $ one trillion, and interest payments would swallow up more than 20 per cent of export receipts.[9]

This deceleration will have its obvious impact on the rest of the world economy. Already it is estimated that the rate of growth of US output will decline from nearly seven per cent in 1984 to 3.25 per cent in 1985 and 2.75 per cent in 1986, while for the OECD countries as a whole the growth rate will decline from five per cent to 3.25 per cent to 2.5 per cent (OECD, 1985b). World trade growth is expected to slowdown from nine per cent in 1984 to five per cent in 1985 and 4.5 per cent in 1986, with the slowdown heavily concentrated in the US (NIER,

1985). The effect wil be particularly marked for those economies which have benefited from US expansion. Thus the increase in exports to the US accounted for 75 per cent of all export growth in Japan in the last year, and was also a major source of export growth for the rest of the Pacific region. As a result, the impact of the drop in US demand was felt in the low growth of the Japanese economy (0.4 per cent at an annual rate) in the first quarter of this year. Not only does the deceleration of growth in the US economy raise the problem of finding new markets for the world's exporters, but it also suggests the possibility of even greater strains on the world's trading and financial system. The difficulties resulting from allowing these trends to work themselves out are discussed below.

The most potent threat to world economic stability in the immediate future comes not from developing country debtors or oil producers, but from the reversal of the growth process in the largest and most powerful economy, the US. The instability resulting from the dependence of world growth on impetus from a single country means that a slowdown in US expansion has two implications.

The first is the possibility of domestic financial collapses and problems associated with over-extended foreign debt. (It is noteworthy that thus far the banks and savings institutions in the US which have faced serious problems or collapse have all been oriented to the domestic market—usually in the agricultural or export sectors—rather than the international market.) Although the problem has not been studied in depth, there are no grounds for great optimism regarding the ability of the US economy to service its external debt in the medium-term, given productivity levels and the prevailing patterns of world trade. A run on the dollar which lowers the real value of dollar-denominated debt would also create severe international financial pressures and would not alleviate the basic problem. It would dampen internal pressures to improve competitiveness within US industry and would definitely give rise to severe inflationary pressures in the US. At the same time, the Fed would probably be forced to maintain a policy resulting in high interest rates in order to keep attracting capital flows to finance the still-large budget and trade deficits. This could have a further negative impact on business investment in the US and lead to a recession in spite of the dollar devaluation. Also, a drastic decline in the value of the dollar could cause a severe financial crisis in the US, which would quickly become international in scope because of the highly integrated nature of financial markets.

The second implication is that with no alternative source of growth to take up the economic slack, there is every prospect of more worldwide stagnation or recession. The major developed economies other than the US which have benefited from the latest boom have been operating on export-led growth, which by definition requires a growing market willing to absorb trade deficits somewhere in the world economy.

If these major difficulties are met with relative inaction and a continued lack of coordination of national macro policies, the short-term and medium-term prognosis may be dire. Not only will there be relative stagnation and continued (or increasing) high rates of unemployment in most developed countries, but the problem of developing country debt could explode and primary commodity producers could face a major crisis. There is a likelihood of increased trade protectionism.[10] Furthermore, these problems will leave little or no room for manoeuvre in terms of the reform of the international monetary and trading system.

These rather grim predictions seem to be shared by most forecasts. The OECD INTERLINK model, the US Federal Reserve Multi-country model and the Japanese EPA model all suggest the following as the most likely scenario: There will be a decline in US GNP growth, which will be associated with a slower rate of increase in the price level in developed countries as a whole (including energy and commodity prices) as well as a drop in US interest rates. However, the fall in US interest rates cannot be too drastic for two reasons: a dramatic fall in the dollar would threaten inflation and the Fed may try to keep interest rates high to combat this; also, given that the budget deficit will remain large for some time, there is a corresponding need to attract funds to finance it. In any case, the dollar will fall relative to other currencies. The growth of economic activity in the rest of the world will decelerate not only because of the declining impetus from US import demand, but also because the lower dollar will increase the international competitiveness of US exports. The endogenous fall in interest rates outside the US will be of some help to industry, but will be insufficient *in themselves* to offset the negative impact of the decline in the US demand stimulus if monetary and fiscal policies are unchanged. At the same time, the US current account balance will improve somewhat, but will remain substantial for some years to come.

The FERE model which makes projections on the basis of alternative policy measures, also predicts that with present policies unchanged, the rate of growth of the world economy is likely to be around 2.5 per cent per annum upto 1990, with near zero per capita growth for most of the developing world apart from the newly-industrialising countries of South-east Africa. With a deflation in the US and a corresponding decline in the trade deficit to $20 bn, a sharp contraction in US activity is projected to spread recession to other areas—particularly Latin America and South-east Asia, but also Europe. The model projects a one per cent rate of growth of output in Western Europe within a few years, with an associated unemployment rate of 20 per cent of the labour force. This will affect not only the developed countries but also the developing countries, of which all the blocs are projected to suffer declines in per capita incomes. The sharpest

fall would be felt in the Middle East: a corollary of the substantial decline in oil prices. Only the Latin American countries would have a trade surplus (an assumption built into the projections rather than resulting from it; see Appendix B) in 1990, but at the cost of steep falls in real income and drastic import compression. The details of this projection are presented in Table 7, while Appendix B contains a description of the basic model used in making the FERE projections.[11] The IMF (1985) "worst policies" (i e, largely maintaining present policies) scenario also suggests both more stagnation and greater instability on the world economy.

A recent study by Morgan Guaranty[12] has estimated the likely effects of a number of alternative policies. With an unchanged value of the dollar and unchanged policies, the US trade deficit is predicted to increase to $180 bn, the current account deficit to $250 bn and the net foreign debt to $943 bn by 1989. These would be associated with a three per cent rate of growth of both domestic demand and foreign real GNP, and rates of interest higher than 10 per cent on average. A reduction in the trade deficit brought about by a gradual devaluation of the dollar (by around 10-12 per cent per annum) would leave a positive trade balance of $7 bn in 1989 and a current account deficit of only $ 26 bn. The net foreign debt would amount to $419 bn. Domestic demand is projected to increase in such a scenario by 2.6 per cent and GNP growth by 3.6 per cent. The unemployment rate would also decline to 5.4 per cent but manufactured goods prices would increase by around seven per cent per annum while interest rates would be similar to those in the previous scenario. Interestingly, a reduction of the US trade deficit by trade protectionism *via* an import surcharge would have less beneficial effects even for the US economy. The trade balance would still be $62 bn in deficit in 1989, and while domestic demand would grow at nearly three per cent, the unemployment rate would be near eight per cent. The rate of increase of manufactures prices would increase at the higher rate of eight per cent in the middle of the decade but would eventually decelerate, while foreign real GNP would grow at a slower pace of around two per cent.

*Notes:* * 1975 US $.
+ 1975 US $ bn.
** In terms of the price of manufactures.

The worst scenario is that of the US recession, which actually appears the most likely given present economic tendencies. Although the US trade deficit and current account deficit would decline to $34 bn and $27 bn respectively, the net foreign debt would remain sizeable at nearly $400 bn, and US GNP and domestic demand would actually decline from 1986 onwards. The result would be an unemployment rate of nearly 20 per cent in the US. While manufactures prices would fall by the end of the decade, interest rates would remain relatively high at nearly six per cent. This projection describes foreign real GNP growing at three per cent per annum, but this may be an optimistic estimate given the heavy reliance of the major developed countries on US growth at present.

The main argument of relevance in this context is that the US budget and trade deficits are likely to remain substantial for some time, at the very least until the end of the decade. This means that US interest rates must be maintained at fairly high levels in order to attract inflows of foreign capital necessary to finance the deficit, especially if the confidence of financial markets becomes eroded over time. All the scenarios described above project US interest rates at no lower than six per cent.[13] Under certain assumptions, US interest rates could be as high as 10-12 per cent by the end of the decade. The dire implications for industrial country growth as well as for developing country debtors are clear. The burden of high interest rates is likely to remain in the foreseeable future, even in the situation in which US growth slows down so that it no longer provides an expanding market for third world exports.

One of the fundamental issues, therefore, is that of creating a stimulus for growth to counteract the effects of the US deceleration. Present policies, with each of the major developed economies seemingly determined to avoid trade deficits resulting from domestic expansionary stimuli, seem unlikely to contribute to another source of growth.

## III

## Exchange Rates and Interest Rates

A major feature of the world economy at present is the increasing instability of exchange rates. In the last year the more rapid and voluminous capital flows have created sharper fluctuations in exchange rates than have ever been known before. They have also implied the possibility of prolonged overshooting or misalignment of particular currencies—especially the dollar which is at present estimated to be overvalued to the tune of 15-40 per cent. While the misalignments themselves have created particular trading patterns, the inherent volatility of their movements implies the possibility of even greater eventual swings in the opposite direction. The dangers of a dramatic fall in the dollar have been reiterated by almost all concerned parties.

The capital flows which have created exchange rate instability have also resulted in a moving together of interest rates across the developed capitalist world. These real interest rates have also reached historically high levels in the past few years, and only recently show signs of coming down somewhat.[14] The high real rates are associated with the mix of fiscal and monetary policies pursued by the major economies. It should be noted that there is still substantial divergence of national real long-term rates of interest, as Table 5 makes clear. However, the differential has been narrowing over 1984. In spite of this divergence, it can be argued that most countries face a lack of autonomy in setting domestic interest rates, unless they can afford completely to disregard the behaviour of exchange rates.

The US dollar has been overvalued now for more than three years, belying the predictions of economists and policy-makers alike. Not only is the dollar inexplicably high in relation to the huge American trade deficit, but it seems to be unaffected in its climb by interest rate variations as well. It is interesting that the dollar appreciated *vis-a-vis* other currencies in 1984 even though interest rates moved against it. Thus, despite its recent reverses in the exchange markets, in early June of this year the dollar was 30 per cent higher (*vis-a-vis* the Deutsche-Mark) than it was in early 1983, even though in 1984 interest rate differentials have moved against the dollar.[15] From Table 5 it appears that from the start of this year, the opposite trends have been evidence: the dollar has been falling in value relative to the yen and the Deutshe-Mark even while relaxed monetary policies in Japan and Germany have resulted in interest rate differentials moving slightly in the dollar's favour.

The official US government explanation is that the dollar is not 'overvalued' at all, but is high relative to other currencies because of the underlying strength of the American economy. This prompts the inflow of long-term capital into the US and promotes speculation in holding dollars by those playing the exchange markets. The validity of this reasoning appears to be extremely limited. The US boom has been strong, but the enormous and growing trade deficit creates the seeds of the boom's collapse—indeed, it needs only a shift in speculative expectations to make the collapse an instantaneous one: a crash landing for the dollar rather than a carefully-engineered soft fall.

Thus the large-scale holding of dollars requires some other explanation. In this context it is worth noting that the capital account surpluses which have financed the huge current account deficits are due only in part to the US attracting savings from the rest of the world. It is true that net inflows of long-term capital increased from $ 12 bn in 1981 to $ 40 bn in 1984, much of this from Japan and other structural savers like West Germany (see Table 3). But by far the greatest change in the US capital account has been the virtual drying up of outflows, which have fallen from $ 65 bn in 1981 to under $ 10 bn in 1984. Most of these were short-term outflows which are now remaining within the US. Although there has been a decline in US overseas aid, most of this change reflects a fall in private flows, primarily by private banks. The LDC debt crisis and consequent insecurity regarding lending abroad have combined with the new profits to be had from financial deregulation in the US, so that net lending overseas by US banks has declined from $ 111 bn in 1982 to a net *borrowing* position of $ 6 bn.[16]

The most plausible (and widely-accepted) explanation of the dollar's rise is in terms of the divergence of US monetary and fiscal policies *vis-a-vis* other economies. As Dornbusch (1984) has pointed out, the link between fiscal policy and exchange rates (which are ultimately determined in asset markets) has three aspects: (1) International differences in the direction and extent of fiscal expansion affect both short-term and long-term capital movements. (2) The measurement of fiscal policy by changes in 'full employment budgets' affects investor confidence. (3) Investors also need to pay attention to anticipated future changes in fiscal policy. The same forces which create the overvalued dollar are also seen to create the high real rates of interest (e g, Blanchard and Summers, 1985) so that it is argued that smaller US federal deficits will bring down interest rates as well as the dollar.

However, even this argument appears insufficient to explain completely the recent behaviour of exchange markets. After all, in the recent past US monetary policy has been relaxed[17] and this combined with recent signs of economic weakness has meant that interest rates have been falling sharply. Thus in early June a Treasury 11.25 per cent bond maturing in 2015 offered little more than 10 per cent, and rates continue to fall even now. Since last year interest rate differentials have moved against the dollar and still the widely

predicted tumble of this currency has not materialised. Therefore, some importance must be given to 'market irrationality', i e, psychological and speculative forces. It has been argued that *passive* speculation (rather than active intervention to gain dollars) is the key: "For many Treasury managers it now requires a *positive* decision to convert surplus dollars (from export receipts) into another currency . . . paradoxically, staying in dollars has come to appear increasingly risk-averse, the more the dollar has risen and the more the dangers of an ultimate collapse have grown."[18] Thus beyond a certain level speculation must play a part in explaining the behaviour of currency markets.

While the high dollar has helped to finance the boom (expressing the capital inflows) and to sustain it by lowering import prices and thus costs, it has also meant a sharp loss of international competitiveness of the US economy.[19] In fact it is remarkable that this has not already had a more defined impact on the economy, but it is clearly being felt in the agriculture and primary goods sectors, as well as by manufactured goods exporters. It also implies that the voice of the protectionist lobby is heard with greater vehemence both inside and outside the US Congress.

A group of countries together may wish to take some action to restrict capital flows, but this does not seem either feasible or likely to be very effective at present. Control in this area is susceptible to circumvention, or may result in imbalances elsewhere in the system. As far as international monetary reform is concerned, it does not appear that this can be feasibly on the agenda until national economic policies are more co-ordinated. Thus, a system of fixed exchange rates would be no better than the present system if national macro-policies continue to diverge, capital flows continue to be massive and uncontrolled, and given the 'initial condition' of an overvalued dollar. While these issues are pressing and important, action on these fronts is dependent on prior action to co-ordinate economic strategies internationally among the major developed capitalist nations.

## IV

## Growth in Western Europe and Japan

The relative stagnation of other developed economies, especially those in Western Europe, requires further investigation. The weak response of Western European economies in particular to the strong export stimulus created by the growing US domestic demand, stems in large part from the restrictive macro-policies pursued in these economies. Table 3 shows the behaviour of recent and projected government financial balances. It is evident that while the US deficit is large and expected to grow in the near future, in the other major developed economies the trend is to reduce the budget balance as far as possible, often aiming at a deficit of one per cent of nominal GNP (as in Germany) or even lower. Attempts to have a tighter control over the money supply in some countries may be at least partly a result of fears that the high US dollar will 'export inflation' to the US' main trading partners. The tight fiscal stance however requires more explanation. The desire to achieve a balanced budget appears to have the status almost of an orthodoxy in current policy literature.[20] Very recently there have been some calls for 'cautious reflation' by European governments in response to a significant cut in the US budget deficit (OECD, 1985b). But these do not represent a major departure from the dominant trend. In all developed capitalist countries bar the US, attempts are being made to minimise both the level of government current expenditure and the size of the budget deficit relative to GNP. Concern about interest payments arising from previous bond-financed government deficits and the large share of interest payments in current expenditure have meant not only that there are attempts to make the deficits smaller, but also that such deficits are inherently less expansionary. In retreat of the state from the realm of economic activity in most economies excepting the US and Japan (which notably are the most buoyant) has implied the decline of a major source of demand and an associated lower level of economic activity.

There are other reasons for the sluggish growth in Western Europe. The dominant portion of private investment has been taken up by rationalisation and the installation of new techniques and production processes in existing plant, rather than capacity expansion. This has meant that construction and related demand have remained feeble, and also that unemployment rates have continued to be high (see Table 1). Furthermore, the investment outlook has been uncertain even while real rates of interest remain high. There are uncertainties with respect to the effects of technological change, the US current account and the dollar, the likely evolution of and possible competition from non-OECD areas (in particular the newly-industrialising countries) and the behaviour of the world oil market. A rigidly controlled

set of macro-policies may provide some areas of uncertainty for capitalists, but they do not operate to restore confidence in a higher future volume of demand and sales. This has meant that expected profitability is still not high enough to overcome the increased risk premia and high costs of borrowing.

It is sometimes argued that recovery in Europe has been retarded by 'structural rigidities', primarily in the labour market, which inhibit the expansion of investment and therefore employment.[21] Institutionalised wage-setting and real wage resistance organised by trade unions, high minimum wages and unemployment benefits, are all seen as culprits in this regard. Thus policy proposals have focused on supply-side action, some ingredients of which are the following: In the labour market, so-called barriers to adjustment in the form of, for example, high minimum wages and unemployment benefits and regulations protecting workers against job loss, should be reduced. Cuts in national insurance contributions by employers and similar costs would lower the costs of hiring labour. These measures are supposed to make the hiring and firing of labour more flexible and responsive to demand pressures. The reduction in wage costs is intended to make output prices more competitive in export markets and prevent a squeeze on profits. For the industrial sector generally, subsidies should be reduced and all regulation that restricts competition should be done away with. This is usually meant to include all support for "declining" industries which would need some kind of subsidy structure to continue in production. Some of these proposals fail to take account of the long-run impact of the economy of the freeing of all industries to direct competition. Often a cut in marginal tax rates is also prescribed. This measure is directed towards demand stimulation as well as costs.

Several of these measures have already been implemented in a number of European economies, without notable success in terms of output or employment. Thus in several economies the so-called 'imperfections' in the labour markets have been reduced, resulting in greater job insecurity, falls in the real value of unemployment benefits, greater use of part-time employment and circumvention of minimum wage laws. In France, Germany and a number of smaller economies, industrial subsidies have been greatly reduced and there are plans for further cuts.[22] In the UK there are proposals for wide-ranging reforms of social security which would do away with many state transfers that entered the average wage basket and unemployed real income. Changes in social organisation which have weakened trade union power and may result in changes in income distribution and an increase in the share of profits in value-added. As OECD (1985b) points out, real wage rigidity has significantly loosened for some years, through de-indexation, reform of state payments and subsidies which affected the wage-basket, etc. These have occurred in a number of countries without noticeable effects on employment. An examination of the wage-productivity relationship reveals that the gap between the wage rate and productivity has increased in the US in the past two years, unlike in Western Europe. Marjolin (1985) has argued that apart from the last two years which are acknowledged to be unusual, Europe has been doing as well or better than the US in terms of production, investment and productivity (IMF, 1985). In any case, it is not clear what effect supply measures will have given an overall stagnation in effective demand. The basic point is that supply-side considerations, such as the removal of 'imperfections' and the rigidities in labour, product and capital markets, are not enough to generate output and investment growth without some demand stimulus, whether from the government, exports or domestic sources. Without a growth in the markets of these economies, increasing the facility and reducing the costs of borrowing finance and hiring labour will not bring about substantial growth of capitalist investment or output. Some reflationary policies would therefore appear to be essential if there is to be growth. The calls for such measures range from the somewhat conservative demands for 'less deflation' made by the UK Charter for Jobs (1985) to proposals for European-wide and OECD-wide reflation (e g, Holland, ed, 1983, FERE, 1984).

It is generally agreed that reflation by a single European economy would not have much effect on the world but would bring the economy concerned to a possible balance of payments crisis. FERE (1984) has estimated the effects of a $ one bn reflation in a typical individual European country, using estimated values of import propensities, export market shares, domestic multipliers and fiscal drag for Western Europe. The projection is of a resulting government budget deficit of $ 450m and a current account deficit of $ 550m. Clearly such a unilateral expansion would be unsustainable. An OECD study has also pointed to the constraints on individual economic performance posed by the balance of payments. Consider an economy with imports equal to 20 per

cent of GNP (which is the OECD average on a weighted basis) and a typical elasticity of import volume growth with respect to GNP of 1.5 to 2. Then, if a country initially in current account balance were to have an increase in the growth of domestic demand of three per cent than its trading partners, it would move into a current account deficit amounting to one per cent of GNP. The same result would occur if the growth of demand in the major partners were to slow down by three per cent relative to the concerned country (OECD, 1983b).

The second possibility is of reflation by those economies with structural trade surpluses, who could not face a balance of payments constraint. Even the normally conservative OECD has suggested (1985b) that Japan and West Germany, who both have record trade surpluses and low rates of inflation, should undertake 'cautious reflation' in the event of a decline in US demand. It is a moot point why such reflation has not been on the cards. Export-led growth based on undervalued currencies is not sustainable in the long-run, and Germany is also burdened with an unemployment rate of 9.5 per cent which must add to social tensions. In Germany, however, the fear of inflation which may result from expansion, including the possibility of another rise in energy and primary commodity prices, is clearly a strong psychological barrier which restrains policy and colours the judgment of Bundesbank reports. In both economies there is also a fear of losing the momentum of export-led growth. Policy-makers in both countries point out that the government debt burden is already very high, and the 'unproductive' portion of public expenditure is likely to rise in future due to projected pension payments to be made to an ageing population. Furthermore, the political orientiation of the present government in Germany is directed to reducing the role of the state in the economy, rather than expanding its importance.

For Japan there are other considerations. The state has always played an important, indeed crucial, role in directing and stimulating the economy. But Japan's growth is very much export-oriented, and it is difficult to imagine this pattern being altered in the near future. Projections were done for this study on the FERE model of the world economy of the effects of Japanese reflation in a context of US deflation. The results are summarised in Table 9. The assumption is of a Japanese expansion sufficient to reduce its trade balance to $ 20 bn in 1988-90, i e, to around half of its previous level. This is associated with an annual growth rate of per capita income of 5.4 per cent for the rest of the decade—more than double the rate experienced in the last decade. However, even such an expansion would not make much of a dent of the rest of the world economy, which would still grow at less than one per cent per annum until 1990 (in per capita income terms). The developing country blocs of Latin America, Africa and the Middle East would experience negative rates of growth of per capita income while per capita income in Asia would remain stagnant. Even the US and Western Europe would not be affected significantly in terms of either output growth or trade balance.

The reasons for this are to be found in the pattern of Japanese growth and trade. Throughout the 1980s Japan has had a substantial trade surplus with other industrial countries, a smaller surplus with non-oil developing countries and a deficit with oil exporters. Imports from oil-exporting countries have accounted for between 30-40 per cent of the value of total imports.[23] The problem is that even though oil and primary commodities are dominant in Japan's total imports, they are simply not large enough in terms of world imports to be able to affect world prices. Thus, Japanese expansion as described in Table 8 would not prevent a fall in the world price of oil and would only marginally raise the world price of raw material. At the same time, there would not be a sufficient demand impetus from Japan to shore up export markets in developed country manufacturing sectors. The competititve and cost-effective nature of the Japanese manufacturing sector, as well as its use of new technology, means that a manufactured goods trade surplus would not be likely to be wiped out with simple expansion of the Japanese economy. Thus calls for unilateral expansion of Japan may result in increased incomes within Japan, but would not go very far towards either providing an important demand stimulus for the rest of the world, or solving the basic problems of the world economy that were discussed in earlier sections.

For this reason, several other domestic policies have been advocated for Japan. These include increasing imports through incentives schemes and the dismantling of non-tariff trade barriers, improving the attractiveness of yen-denominated assets to encourage capital inflow and improving the speed of and access to consumer credit so as to raise the marginal propensity to consume. It has been pointed out, however, that even these measures may have only limited impact.[24] In the end capital flows will be affected also by the behaviour of interest rates, so that Japanese action would be limited in effect. And even completely unrestricted import access would have only minor impact in terms of volume or value, given the pattern of internal demand in Japan. Since at present raw material imports account for 60 per cent of total imports,[25] growth in manufacturing imports is not likely to keep pace with economic growth. Complete liberalisation of agricultural imports is estimated to boost such imports to the tune of less than $ 2 bn, making only a small dent in Japan's current account surplus. Thus it appears that the world may have to live with Japanese trade surpluses for some time to come, and that policies for Japanese expansion must be part of a more general programme of expansion, in order to deal with present economic problems.

A West European expansion would clearly have more impact, not only on the growth rates of the developed capitalist world as a whole but also of developed economies, especially the major debtors. The FERE model estimates that growth in the combined West European economies of 4.5 per cent p a until 1990, achieved through expanding public expenditure, would not only cut the unemployment rate to half of its present level, but also imply a moderate growth rate of per capita income of 2.5 per cent p a for the world as a whole. However, sustaining such growth would be difficult given the problem of financing the increased public borrowing it would entail and the predictable behaviour of the financial markets given the fears of inflationary pressure and growing current account deficits. Ultimately, the fear of inflation may play a crucial role, for logically, public debt to GNP ratios will stabilise as long as post-tax interest rates are not greater than an effect on policies regarding public debt in many of these countries, is whether inflation the rate of growth of GNP. The real question that will have can be kept under control without high rates of interest, especially if energy and commodity prices are ultimately regarded as endogenous.

## V

## Suggestions for Policy Co-ordination

It is evident that the most effective means of achieving both a higher and a more stable growth rate in the world economy is through concerted policy actions for expansion by the major economies together, rather than by a single economy or regional group. Even if, for example, the seven major OECD partners (US, Canada, Japan, Germany, UK, France, Italy) undertook a systematic and co-ordinated reflation, the effect on world growth rates and trade balances of particular developed economies would be dramatic. Table 9 presents projections carried out for this study, of just such an optimistic scenario, based on the FERE model. (It is assumed in these projections that the US will undergo some deflation and reduction of its trade deficit.) World per capita income would grow at 2.6 per cent p a for the rest of the decade, but the effect on developing countries is particularly marked, with annual growth rates of per capita income rising to 3.9 per cent in Africa and 4.8 per cent in Asia.[26] This would also ease the problems of the major debtors, especially if such growth were unaccompanied by increased protectionism. It is evident from the projections in Table 9 that such growth could result in a shift in the international terms of trade, because of a substantial rise in the prices of oil and primary commodities relative to the price of manufactures. Effects of an oil price rise may be partly compensated for by investment in energy conservation, as discussed below; commodity price increases will benefit many primary producing countries who have been badly hit by the recent recession. Nevertheless it should be accepted that there are some inflationary tendencies in such a programme of expansion.

The fiscal expansion would have a direct affect on unemployment levels in most OECD countries, since the argument here is that unemployment has been high because output has been low relative to potential.[27] The fear of high budget deficits in Europe and Japan leading to strains on the financial sectors of these countries appears to be largely unfounded, since the ratio of public debt to income in the 1980s is much lower than it has been in the past three decades.

This scenario of OECD expansion could be based on the following policy programme for the major developed countires, which takes into account both the requirements of the new technology and the need to deal with the problem of unemployment. The programme puts a lot of emphasis on the role of government policy not only in generating the expansion but also in directing private investment and promoting international transfers. Because of the changed industrial structure which technological change is bringing in its wake, a simple fiscal expansion may not be sufficient to help an economy to adjust to new circumstances or reduce unemployment to any marked degree. Therefore, the needs of the new technological structure have to be incorporated into the pattern and composition of fiscal expansion.

One major area of such fiscal expansion would be public investment in social infrastructure. The specific sectors would include transport and communication, as well as new housing.[28] Another major area is the promotion of investment in energy conservation. This could be either directly public or private with government incentives and subsidies, and would have the crucial effects not only of long-run environmental advantages but also short-run reductions in costs and improved productivity ratios. This is likely to be crucial to the generation of a sustained growth pattern in most developed countries.

Public policy would also have a major role to play in the incorporation of new technology and the consequent economic adjustments required. Direct state investment may be crucial in the development of new products and the use of new technology in existing industries. One example is the spread of cable networks for the application of information technology and distribution networks. Also, it is important for governments to foster new industries through subsidies and financial support or credit availability for radical or risky innovations.[29] This may be especially relevant in times of recession when private enterprise may be unwilling to undertake such investment on its own. There is much scope for the state-assisted restructuring of industries—along the lines of MITI in Japan—so that fears of job losses through such technical innovations do not lead to domestic pressures for more protection.

Associated with this there are several labour market strategies which require state involvement. First of all, there is the need for more and varied education and training systems which would create a labour force with the requisite skills to cope with the new technology. The upgrading of existing skills is also relevant. Secondly, the state could promote greater geographical and occupational mobility of labour through subsidies and incentives, and also through investment in social infrastructure. Labour market information systems would facilitate occupational shifts and also reduce frictional or 'search' unemployment, as well as provide greater flexibility to employers. Finally, income maintenance through some kind of unemployment insurance is necessary not only on welfare grounds, but also to promote the acceptance by the labour force of technological and industrial changes.

Even with such an overall OECD expansion, however, there are severe limitations on developing country growth. The rise in energy prices consequent upon such an expansion is only one such constraint. However, if such an expansion is not implemented (which appears to be the most likely at present given the prevailing political climate and anti-inflation—or anti-Keynesian—bias of policy-makers in developed countries) than developing countries as a group will face severe problems given the high degree of trade and aid dependence on the developed capitalist bloc. This means that the growth of intra-LDC (or South-South) trade as well as the importance of developing markets outside the US-Western Europe-Japan bloc may become of fundamental importance in future growth.

## Appendix

## Description of the FERE Model

The projections in Tables 6-9 were carried out by Terry Ward of the Department of Applied Economics, Cambridge University, using the FERE Model of the World Economy developed in Cambridge.

The model regards the world economy as a group of inter-dependent blocs. World real income is equal to output which is equal to aggregate spending. The exports of any one bloc are the imports of some other bloc and *vice versa*. The trade balance of the world as a whole is always and necessarily zero.

In this model the dynamic of the world economy derives from the interaction of the following main processes: (1) adjustments of real spending in response to changes in income and to political and financial pressures influencing governments; (2) reactions of supply sectors and of world market prices to adjustments of real spending, mainly volume adjustments in manufacturing, and price and volume adjustments in energy and raw materials; (3) trade balances of the different blocs, reflecting the joint effect of changes in spending, supply and world prices, influencing financial flows and thence feeding back into the processes determining real spending.

The data used in the model are all derived from UN sources, assembled as time-series covering the period 1961-83. In principle they are intended to cover the whole world; the major omission is the absence of data on China, for which a purely notional calculation has been made. All inconsistencies and discrepancies of measurement have been resolved by preliminary adjustment so that the identities of the model hold without error.

All variables are measured in 'real' terms—adjusted for inflation—and are denominated in 1975 US dollars. The following identities hold for all blocs in the model:

(i) real income Y derives from real spending H plus trade B

$$Y = H + B$$

(ii) output is equal to real spending H plus "volumes" of net exports of fuels (BE/PE), raw materials (BA/PA) and manufactures BM

$$Q = H + BE/PE + BA/PE + BM$$

(iii) the trade balance B is the sum of the balances on fuels, raw materials and manufactures

$$B = BE + BA + BM$$

The demand side of the model is shown by equations linking changes in real spending H in each bloc to changes in real income Y and (with a one-year lag) to the strength or weakness of the trade balance:

$$H - H(-1) = \text{const} + 0.6 \langle Y - Y(-1) \rangle + 1.0\,B(-1)$$

The numerical coefficients shown are those assumed for the majority of blocs. Slightly different values are assumed for Western Europe (higher sensitivity to the trade balance) and the Middle East and Centrally Planned economies (lower sensitivity to income and the trade balance).

The supply side of the model is shown by equations predicting trade flows generated by any given pattern of demand.

(i) *Trade in manufactures*

Imports of manufactures M are assumed to respond to real spending H with an elasticity which varies slightly from bloc to bloc. Trend terms are fitted separately to the historical data for each bloc.

$$\log M = \text{const} + \text{trend} + 2.0 * \log H$$

Slightly higher import elasticities are assum-

TABLE A

**(Table 6) Unchanged Policies**

| Trade balance | 1986 | 1987 | 1988 | 1989 | 1990 |
|---|---|---|---|---|---|
| US |  | −65 | −70 | −70 | −70 |
| Latin America |  | 15 | 20 | 23 | 25 |

**(Table 7) US Deflation**

| Trade balance | 1986 | 1987 | 1988 | 1989 | 1990 |
|---|---|---|---|---|---|
| US | −65 | −55 | −40 | −30 | −20 |
| Latin America | 15 | 20 | 23 | 25 | 25 |

**(Table 8) US Deflation/Japanese Reflation**

| Trade balance | 1986 | 1987 | 1988 | 1989 | 1990 |
|---|---|---|---|---|---|
| US | −65 | −55 | −40 | −30 | −20 |
| Japan | 30 | 25 | 20 | 20 | 20 |
| Latin America | 15 | 20 | 23 | 25 | 25 |

ed for Western Europe and Other Countries, and lower elasticities for Japan, Latin America, Asia and the Middle East.

Exports of manufactures by each bloc are determined as shares of import markets into that bloc and all other blocs.

$$Xi = \text{Sum}\ (Sij\ Mj) \text{ summed over all blocs } j$$

(ii) *Trade in fuels*

The influence of the real world price of oil PE on energy demand and supply within each bloc is assumed to be a slow and gradual one. To represent this, lagged variables PELS and PELD are constructed with lags denoting the influence of the oil price on supply and demand respectively.

$$PELS = 0.1*\log PE + 0.9*PELS\ (-1)$$

$$PELD = 0.1*\log PE + 0.9*PELD\ (-1)$$

Energy demand ED (measured in physical units of oil equivalent) is assumed to depend on the general level of spending H as well as on the lagged real oil price.

$$\log ED = \text{const} + \text{trend} + \log H - 0.2*PELD$$

Energy supply ES depends on exogenous factors (including long-run expectations of governments, oil companies, etc) as well as on the lagged real price of oil.

$$\log ES = \text{const} + \text{trend} + 0.5*PELS$$

In the case of major oil-exporting countries of the Third World the short-run world market situation may also exert a substantial influence on the volume of energy production. This is represented in the model by adding a short-run price effect.

$$\log ES = \text{const} + \text{trend} + 0.5*PELS + 2.0*\log PE$$

(iii) *Trade in raw materials*

The model defines a lagged price of raw materials

$$PAL = 0.3*\log PA + 0.7*PAL\ (-1)$$

The supply of raw materials in each bloc is assumed to respond to this lagged price as well as to exogenous trend factors.

$$\log AA = \text{const} + \text{trend} + 1.0*PAL$$

The demand for raw materials in each bloc is assumed to depend partly on population N ($ 100 per capita) and partly on total real spending (5 per cent of spending). The real world price of raw materials is solved numerically so as to balance world supply and demand.

The alternative projections that have been generated and reported in Tables 6-9 are based on differing policies regarding reflation or deflation. These are summarised in terms of target changes in the trade balance of particular blocs. The particular assumptions for the alternative projections are as shown in Table A.

ULKA·GB·PR·9·83

The Latin American trade balance is a constant assumption in these projections because of the need for the main debtor countries of Latin America to generate trade surpluses to meet their debt obligations. It is assumed that even with stagnant exports they would meet their obligations by suppressing imports. This assumption may not be realistic: it is made in order to clarify the other main mechanisms in the world economy.

## Notes

[This paper incorporates some material used in a study for the Commonwealth Secretariat, London. I am grateful to S K Rao for many useful and constructive comments, and to Terry Ward for carrying out some of the projections on the FERE model of the world economy for the study.]

1 The US, in its capacity as the largest economy and holder of the world's reserve currency, is the important exception. More on this below.

2 Study quoted in *Sunday Times*, June 9, 1985.

3 See OECD (1983). 'White' goods are household consumer durables such as refrigerators, washing machines, etc, while 'brown' goods include audio, hifi and video equipment.

4 OECD (1983) estimates that the new technology may be essentially neutral in its impact on job levels.

5 See OECD (1983).

6 Federal Reserve, US Annual Statistical Digests.

7 See University of Michigan (1984).

8 In Table 1 the per cent change in hourly earnings in the manufacturing sector gives some indication of the lower growth of wage costs in the US as compared with other major industrial countries.

9 Quoted in Peterson (1984).

10 It should be noted however, that protectionism will lower the level of world trade only if it increases imports from those countries without balance of payments constraints at the expense of countries which are so constrained, (see, Cripps, 1978). Protectionism operating only against economies with structural trade surpluses may actually increase the level of world trade; however, if some of these countries are also major debtors, it may have other destabilising effects.

11 Table 6 presents FERE projections for 'unchanged policies'—i e, a large US trade deficit. These also imply a low rate of growth of 0.9 per cent for the world economy as a whole.

12 Morgan Guaranty: World Financial Markets, March/April, 1985.

13 LIBOR rates tend to be higher by about one per cent, although the differential has narrowed recently.

14 By mid-June, nominal six-month LIBOR rates had dropped to an average of around 8-8.5 per cent from 12.5 per cent at the start of the year.

15 *Financial Times*, June 6, 1985.

16 Citicorp estimates. See also BIS (1985, pp 94-95).

17 Henry Kaufman of Salomon Bros has argued that since November 1984 US monetary policy has focused much more on monetary reflation and much less on aggressive methods to combat inflation. Quoted in *Financial Times*, May 23, 1985.

18 Anatole Kaletsky, *Financial Times*, June 6, 1985.

19 An estimate by Roger Brinner quoted in the *Sunday Times*, April 29, 1985, suggests that whether measured by relative costs, market shares or productivity levels, the US is far less competitive today than at any time in the post-war period.

20 See OECD (1985), IMF (1985), Bank of England (1985), Bundesbank (1985), etc.

21 Recently Bruno and Sachs (1985) have attributed stagflation to supply-side shocks, primarily from oil price behaviour and real wage demands.

22 *Financial Times*, June 6, 1985.

23 IFS Direction of Trade Statistics.

24 See *Journal of Japanese Trade and Industry*, January/February, 1985.

25 The proportion has fallen slightly from 63 per cent to 59 per cent in 1984, as manufactured goods imports have grown in volume.

26 These results are obviously sensitive to the size of the projected expansion in the developed world; the above figures are given to suggest some orders of magnitude given the assumed growth rates of OECD countries as listed in Table 9.

27 See Dornbusch (1985) for an affirmation of this argument in the context of the UK economy.

28 For example in Japan it is acknowledged that public investment on housing is both desperately needed and long overdue.

29 See OECD (1985a).

### Tata Electric Companies

**TATA ELECTRIC COMPANIES in association with Tata Projects have recetly secured a prestigious assignment for carrying out an Orientation-cum-Training Course for the personnel of the National Electricity Board (NEB), Malaysia. The training which will be in two batches, spanning over 10 weeks at Tata's Trombay Thermal Power Station, covers 22 operation personnel of Port Klang Power Station, Malaysia. The training would be on the modern 500 MW training simulator, attached to the Training Centre. This sophisticated and versatile simulator has been installed at Trombay for training not only Tata engineers but also to train technical personnel from State Electricity Boards in India and from utilities of other developing countries. The simulator, which is an exact replica of the highly sophisticated computerised control room of the 500 MW unit, was designed and developed indigenously by Tata Consulting Engineers, and Tata Electric Companies, who were jointly awarded the Assoication of Indian Engineering Industry (AIEI) Award, 1984, for Technical Training and Education.**

## Education and Elites in India

**Krishna Kumar**

*This paper reviews the function of education in the circulation of elite roles in Indian society which is seen as an important aspect of the path of egalitarian social change outlined in the Constitution.*

*The paper is divided into three sections. The first section discusses a basic dialectic that governs the relationship between education and social mobility in general and mobility to elite positions in particular. Section two examines the distribution of opportunities for elite status in the case of one elite role, namely, the administrative service. This section also discusses the limits within which education has contributed to social mobility. Section three considers some recent developments that point towards a crisis in the elite's identity. The paper ends with a discussion of the implications of this crisis for education.*

THIS paper reviews the function of education in the circulation of elite roles in Indian society. Although the term 'elite' is used throughout the paper, this use does not imply that the paper is based on the perspective or ideology embedded in theories of elitism.[1] Rather, 'circulation of elite roles' is seen as an important aspect of the Indian path of egalitarian social change outlined in the Constitution. In the context of education, this path is described in the Constitution in terms of equality of opportunity, a term which implies the opportunity to rise higher in a stratified society (Bottomore, 1964). The concept of equality of educational opportunity is also consistent with the economic individualism accepted in India's liberal democratic set-up to the extent that competition is permitted and encouraged as a legitimate strategy for the betterment of one's fortune. Indeed, competitiveness is a salient feature of Indian education, and one way to measure the success of the competitive ethic in education is to apply it in the context of elite roles.

The paper is divided into three sections. The first section discusses a basic dialectic that governs the relationship between education and social mobility in general and mobility to elite positions in particular. The dialectic is identified in terms of 'early selection' and 'mass examination'. Section two examines the distribution of opportunities for elite status in the case of one elite role, namely the administrative service. This section also discusses the limits within which education has contributed to social mobility. Section three considers some recent developments that point towards a crisis in the elite's identity. The paper ends with a discussion of the implications of this crisis for education.

### I
### Key Dialectic

'Early selection' and 'mass examination' are two important features of the Indian education system. These two features form a dialectic that helps us understand the relationship between education and society, particularly the potential of education to bring about changes in the distribution of power in society through the circulation of elite roles.

By 'early selection' is meant the placing of children when they are very young in different types of institutions. According to Turner (1961), early selection is a major characteristic of systems that permit ascent through 'sponsored' as opposed to 'contest' mobility. Those selected out of the rest of the children are placed in separate institutions and are prepared—in terms of skills, behavioural norms, and values—specifically for elite status in their later life. This process accurately reflects the functioning of a large and rapidly growing elite sector of education in India.

Foremost among the schools that distinguish their clientele early from the rest of children are the so-called 'public' schools. Strictly speaking, the term applies to the 55 members of the All-India Public Schools Conference.[2] These schools draw their distinctiveness from the spirit of the British public schools which they imitate and whose historical origins they share. Like their British counterparts, the Indian public schools breathe the spirit of a bygone era of history and continue to uphold an unmistakable aura of imperial days. Tawney's commentary on the British public schools applies just as well to their Indian counterparts:

> The better among them owed much, and added much, to the practical energy, the admirable moral seriousness, the respect for the hard grind of the intellect, without fancies or frills, of Victorian England. All of them, including the best, were impoverished by the feebleness of the social spirit of the same England. All of them were the victims of its precipitous class divisions, its dreary cult of gentility, its inability to conceive of education as the symbol and spirit of a spiritual unity transcending differences of birth and wealth (Twaney, 1964; p 55).

These features would broadly fit a large number of other institutions that are not 'public schools' in the strict sense of the term, but which follow the public school model in matters like early selection, emphasis on a moral code, and the use of English for peer-interaction. The majority of these quasi-public schools are run by private organisations. As the Table shows, 44 per cent of all primary schools and 60 per cent of all secondary schools in India are private. They are run by a variety of interests, ranging from business concerns to religious and ethnic bodies. The Inter-State Board for Anglo-Indian Education and Saraswati Shiksha Parishad are two among the several ethnic organisations whose member schools operate on the basis of religio-cultural norms along with early selection.

Both aided and unaided private schools practise exclusiveness to different degrees. At one level is the exclusiveness that comes from charging tuition fee. It significantly curbs the number of potential clients for the education offered by a school. In their study of private schooling in Delhi, Bhatia and Seth (1975) found that different types of private schools could be grouped in terms of the income of the pupils' fathers. Bhatia and Seth concluded that "economic status of parent is a significant determinant of school selection", and this was true of both aided and unaided private schools. Another type of exclusiveness comes from meritocratic selection of children aged from three and a half to six. At this age, 'merit' is judged in terms of etiquette and certain types of skills such as drawing a sketch, piecing together a puzzle. Private pre-schools have mushroomed in all metropolitan towns, and they claim to impart such skills along with fluency in English specifically to facilitate children's success in meritocratic admission tests. Clearly, the items of merit whereby schools test applicants for admission mirror parental inputs and socio-economic class. Thus, selection by merit becomes indistinct from selection according to socio-economic back-gound.

Private schools are not the only avenue

TABLE: PRIVATE SCHOOLING IN INDIA

| | Primary | Secondary/ Higher Secondary |
|---|---|---|
| Aided private schools | 201982 (42.5) | 26991 (57.3) |
| Unaided private schools | 7558 ( 1.6) | 1672 ( 3.5) |

*Note:* Figures in brackets show the proportion in percentage out of the total number of schools at each level.

*Source:* Fourth All-India Educational Survey (National Council of Educational Research and Training), 1982.

fed by early selection strategies. Within the government's own school system, there are schools that cater to specific groups of parents. 'Sainik' schools, meant for children of military personnel, are members of the All-India Public Schools Conference. 'Central' schools are meant for children of the Central government's civil servants. These schools carry prestige and they operate with far superior resources than are available to the schools run by the state government in the same town. Central schools also follow a different curriculam and examination pattern. Then there are schools for the 'gifted' among the children of government employees, such as the Navyug School run by the New Delhi Municipal Committee.[3] Yet another category of selection-based schools within the government sector is that of 'model' schools which are intended to act as pace-setting institutions.

All these different types of exclusive schools offer routes of 'sponsored mobility' to elite jobs. The routes pass through elite institutions at the higher education level, institutions such as the Indian Institutes of Technology, Institutes of Management, Central universities, famous city colleges, and so on. Each of these routes includes screening on the basis of merit, and, with predictable regularity, the products of the private sector of schooling, along with the products of elite schools in the government sector, far outnumber the products of common schools. The National Science Talent Search Examination conducted by the National Council of Educational Research and Training (NCERT) every year throughout the country ends up selecting students of private schools for the majority of the scholarships available.[4]

The private sector is neither an aberration nor a relic of the past. It is accepted as a legitimate means of expanding and improving education. Its meritocratic ideology has answered the common demand that talent should be spotted early and harnessed with whatever means available. The private sector fits nicely in the contradiction that has characterised Indian educational thought and policy on the question of equality *versus* merit. With rare exceptions, writings and debates on the development of education have always emphasised the need to keep the door for competitive enterprise in education open. The dominant concern has been the maintenance of quality defined in terms of rigour in instruction and the availability of resources. Even the Education Commission (1964-66), which was more egalitarian than any other previous or subsequent body in its outlook, supported the need to develop in the government sector certain 'quality schools' and at least "one good college in each district" on a meritocratic basis. That the 'good college' would be monopolised by the products of private schools did not concern the Commission. The only way to protect the 'good college' from the monopoly of the better off sections of society that the Commisssion could offer was the provision of scholarships for the deserving poor. How they would make it to the college level, competing with the beneficiaries of the sponsored mobility offered by elite schools through early selection, was not discussed.

The main mechanism operating in the education system to counterbalance the strong emphasis on early selection is that of mass examination. Schools of all different types share this feature; they are all obliged to take part in either state-level or nationwide examinations. True, a student of an exclusive 'public' school, another from a Central school, and a third one from a government school do not compete with each other at the same examination at the end of the higher secondary classes. The first student may take the Indian School Certificate examination, the second the All-India Higher Secondary Examination, and the third the provincial Board's examination. However, all three examinations are mass events, and they share certain core features such as the secrecy of the paper-setters and the evaluators, strict invigilation at the time when examinees write their answers, and delayed declaration of results.

These features of the ritual of mass examination carry a symbolic message—that all individuals have an equal chance. Thus, while emphasis on early selection ensures special treatment to the children of those who can afford to make extra inputs, mass examination promises total parity among all candidates. Early selection and mass examination are two conflicting characteristics that together endorse the ligitimacy of the education system. While private schools, featuring early selection, ensure that the elite sections of society have a means to provide privileged treatment to their children, mass examination, featuring strict secrecy and parity among examinees, keep the confidence and aspirations of the masses alive.

Historically, the system of mass examination has played an important role in the development of modern education. During the latter half of the nineteenth century, when the old education system—characterised by a loosely structured network of locally-governed schools—died and the new system, with its centralised control, took over, the institutionalisation of examination acted as a major factor in the transformation. As Shukla (1978) points out, the new system depended on written examination to evolve a bureaucratic governance of education. The function of the written, impersonal examination in the emerging education system was to keep the curriculam stable and confined to the prescribed syllabus and textbooks. Mass examination provided to the nascent Indian middle class a sense of hope and belief in the fairness of the colonial order. In practical terms, the examination system required students to rehearse endlessly the skills required to enter the newly introduced channels of secure jobs in the service of the colonial government. The ultimate test of these skills was the Indian Civil Service examination, now known as the Indian Administrative Service.

We can view the transformation of education brought about by the institutionalisation of mass examination in terms of the aims of education. The model developed by Weber (1951) on the basis of his study of the ancient Chinese literati helps us understand the change that has taken place in India during the last one hundred years in the perception of the aim of education. Weber says:

> Historically, the two polar opposites in the field of educational ends are: to awaken charisma, that is, heroic qualities or magical gifts: and, to impart specialised expert training. The first type corresponds to the charismatic structure of domination, the latter type corresponds to the rational and the bureaucratic (modern) structure of domination (Weber, 1951; p 119).

Centralised examination not only helped to bring education under bureaucratic control, it also reshaped the perception in society of the purpose of education and the image of the educated man. Formerly, the purpose of education was commonly accepted in terms of character-building and spiritual awakening. In the new situation, education began to be perceived as a process of acquiring status and skills. Given the narrow sphere of civil service within which colonial education could lead to employment, education became associated with the specific skills that civil service required. And the highest image of the educated man became that of the administrator. As administration was the only elite role to which education could be expected to lead, all examinations became preparatory to and therefore similar, in terms of requirements, to the competitive examination for civil service jobs.

Thus, the examination system has played an important role in the linking of education with competition for achievement of status and power. Whereas the strategy of early selection practised by the private education system continues to offer safe routes towards status professions to the children of the elite, mass examination offers to the rest of society the assurance that status can also be achieved through competition. Thus, while early selection is a 'reproductionist'[5] force in Indian education, mass examination is a symbol of the possibility of change. Since the mass examination system is historically so closely linked with the civil service, an appropriate context to assess its effectiveness as a means of change—in the sense of change in the composition of an elite role—is the civil service itself. Such an assessment is made in the following section as a starting point to review the relationship between education and social mobility, particularly the mobility to elite roles.

## II

## Mobility and Limits of Education

The recruitment for the highest civil service in the country, namely the Indian Administrative Service (IAS), is a convenient case to study the rate at which circulation of elite positions is taking place. It also offers a useful though limited sphere to assess the impact that competitive, mass examinations have had on circulation of elite positions in particular and social mobility in general during the recent past.

The studies[6] made by Subramaniam (1971) and Gopalakrishnan and Joshi (1973) show that IAS recruitment process is to a considerable extent a reproductive one. Both studies show that sons of those already in the civil service form the single largest component of the IAS recruits, and this has consistently been the case year after year. Subramaniam's study showed that the proportion of recruits whose fathers were in the higher civil services was from one-fourth to nearly one-third during the sixteen years since independence. If we combine the recruits whose fathers were in the higher civil services with others whose fathers were in other ranks, the proportion of this combined category (which Gopalakrishnan and Joshi's study identifies as 'government service parents') comes to 55.9 per cent of the total recruits in 1972. Compared to the 1961 figure of 43.6 per cent, this more recent figure shows that the already large share of recruits from parents in government service (including the IAS itself) had been increasing. One can conclude that the highest civil service circulates to a considerable extent within the families in which fathers are already doing government service. In the Indian Foreign Service, this circulation has been even more well-established. Subramaniam's study showed that 45.9 per cent of the recruits during 1947-56 and 42.1 per cent of the recruits during 1956-63 had fathers working in the 'higher civil services'.

We arrive at a similar conclusion if we look at the data concerning some other aspects of the recruits' background. Gopalakrishnan and Joshi found that the percentage of 'public' school products has usually been around 10. In the 1972 batch, 15 per cent of the recruits had attended 'public' schools throughout their educational careers and another 10 per cent had completed part of their education there. Thus, no less than one-fourth of the country's highest civil service consisted of products of 42 'public' schools (1974 figure). If one adds to this proportion the number of those produced by other types of exclusive schools, such as convents, unaided private schools, and so on, we should expect to find a much higher proportion. The studies mentioned here did not use such a combined category. However, while analysing the college-level background of recruits, Subramaniam found that 56 per cent of the total recruited during 1947-56, and 58 per cent of the ones recruited between 1957-63 were educated in about a dozen famous city colleges such as St Stephen's, Presidency College (of Madras), St Xavier's and Elphinstone College of Bombay. These data show that the supply of elite civil servants is a 'reproductive' process inasmuch as a few educational institutions account for sizeable proportions of the total numbers recruited. There is little reason to suspect that the situation has changed much since the two studies reported here were made.

These studies also show that the single major means of entry to the elite service through which the downtrodden sections of society have been able to send their sons has been the reservation system which applies to the Scheduled Castes and the Scheduled Tribes. It is mainly through this route that some recruits from a rural or agricultural background have been entering the IAS. Their inclusion in the service cannot be seen as an evidence of the success of the open competition strategy. 'Success' of the strategy would mean that it has been able to break the monopoly of those holding a higher status in society. The only signs that indicate the beginnings of such a process can be spotted if one takes into account the caste background of the recruits. A trend towards the slow erosion of the monopoly of the traditionally dominant Brahmin castes was observed by Subramaniam, especially in states such as Tamil Nadu, Maharashtra, West Bengal, and Uttar Pradesh as a result of the ascendence of landowning middle castes into positions of political dominance.

The rise of 'middle caste' leadership is now widely recognised as a major phenomenon in Indian politics and society. It is often cited as an evidence of change in social stratification. In states such as Maharashtra, Karnataka, and Uttar Pradesh, the middle castes have emerged as the new rural powers who are acting as a major pressure group in the political and economic affairs of their regions, and to a certain extent, of the country. Kamat's (1978) study of Maharashtra shows how the middle castes had advanced their political and economic interests by using available educational opportunities and by creating new opportunities for themselves. "In the old days", Kamat says, "education, particularly beyond mere literacy, was mostly confined to the advanced castes—e g, the Brahmins, the Kayasthas, etc—to whom therefore the village population naturally looked up as its leaders and spokesmen. Now the situation is entirely different. The rural elite consists primarily of the educated youth of the middle castes and landowning communities" (p 259). The rural elites of modern Maharashtra have opened private institutions on the 'public' school model and professional colleges for medical and engineering education on a capitation fee basis. The study made by Sivakumar (1982) records a similar phenomenon of the ascendence of middle castes, especially the Vokkaliga and the Lingayat, in Karnataka. These castes have used higher education facilities to advance their interests in the social structure, in particular in the political system.

The success of education in providing opportunities for social mobility, then, is largely confined to the middle castes of the rural society, castes that have gained political dominance under the adult franchise system and which got economically stronger by using the facilities provided by the government to increase the productivity of landowners (Desai, 1984). These middle castes are among the ones recognised as 'backward' in several states; in other states they are grouping together to be recognised as backward. As Beteille (1981) says: "the prospects of material advancement through job reservations has led to a kind of competition for backwardness among castes at the middle levels of the hierarchy. This kind of competition creates a vested interest in backwardness, and it combines the worst features of a hierarchical and a free-market society" (p 48). The middle castes now have a politically vocal elite to represent the interests of their largely poor and educationally deprived following. Whether the language of 'backwardness', 'caste', and 'reservation' will prove effective in the struggle to win a better deal for this following is yet to be seen.

The urge for special treatment that we see in different parts of the country among the middle castes is a symptom of the crisis that the vision of a meritocracy faces. It would be quite wrong to attribute this crisis to the Scheduled Castes and the Scheduled Tribes to whom the Constitution had awarded a distinct status. The educational progress of the Scheduled Castes and Tribes has been miserably slow despite the modicum of 'sponsored mobility' that they have been offered.[7] If the middle castes were to learn about the advantages of sponsored mobility through reservation from the Scheduled Castes and Tribes, it would have been a long and usually uninspiring lesson indeed.[8] A far more effective lesson was available from the urban elite who never abandoned their right to exclusive schooling for their children while promising all the time an egalitarian social order.

By maintaining a separate system of schooling on the basis of early selection, the urban elite pre-empted the development of a truly mass education system. The system of holding mass examinations did act as a symbolic corrective to a certain extent, but it could not prove sufficiently effective in upholding the myth of open competition and equal opportunity. Early selection impeded the erosion of ascription-based differentiation and also the emergence of an achievement-based differentiation in school and society. The situation described by Parsons (1959) in which the school—as a social institution—differentiates pupils strictly according to achievement never fully emerged in India because the contest among pupils was curbed by the pooling of pupils in different types of institutions according to their socio-economic background.

## III

## Revivalism or Progress?

The strains we see in the social order today are related to the decay of the vision of society that sustained the educated elite during the freedom struggle of the earlier half of this century and the first two decades after independence. The vision was based on certain value-choices, particularly equality and secularism. I have discussed how equality as a value-choice was rendered hollow by the elite themselves by the maintenance of early selection as a strategy for nurturing the meritorious. By choosing to stick to this strategy, the elite forfeited the opportunity to use education as a means to draw upon the talent and resources of the overwhelming majority of the population. Whether the elite were capable of such an achievement or not is beside the point; what is important is to notice that the elite eschewed the path they had themselves charted in the Constitution—that of mobilising the resources and talents of all sections of society.

Secularism was another value-choice enshrined in the Constitution, and as the following discussion will show, the chances of a secular attitude to flourish were closely linked to the fate of the first value-choice, namely equality. Secularism can be understood, according to Khundmiri (1968), as:

> . . . that attitude of mind . . . which refuses to accept the division of humanity into religious or races or historical classes as final . . . It is incompatible with any extreme anti-scientific, anti-intellectual and dogmatic standpoints so far as they affect the solutions of human problems on this earth. It believes that man has a duty to prove his own condition and make the human situation the ultimate arbiter in matters exclusively human (p 90).

Writings on social change in India during the last one hundred and fifty years are replete with references to the impact of such secular ideas on the Indian elite. Education is customarily described as the means whereby certain sections of Indian society came under the influence of secular ideas during the later colonial period. It is a very widely held assumption that the educated, westernised elite were destined to steer Indian society away from its mythopoeic consciousness towards a secular worldview. Education was the chief instrument with which such steering was to be accomplished. That the elite could use education for this purpose was assumed despite the realisation that there was "a certain amount of continuity between the traditional elite and the new or westernised elite" (Srinivas, 1966).

Faith in the instrumentality of education for the development of a secular society has received a serious jolt since the beginning of this decade. The jolt has come from the expression of a demand for the orientation of education in the direction of 'Indian' values.[9] More specifically, the demand is that "sooner rather than later we must recognise the need of duly adjusting our education to our past" (Sen, 1983). The demand, which applies both to the school and higher level of education, has not been made by a fringe section of professional educators or sectarian politicians. It has been voiced by the topmost offices of the system of education, such as the Ministry of Education and the University Grants Commission. Also, the current demand needs to be distinguished from previous demands which were voiced in similar terms. Whereas the earlier expressions of the need for value-orientation of education and the inculcation of religiosity referred to purely educational aims, the present expression of the demand for value-orientation refers to the aim of stopping the moral decay of the whole society itself. The slogan of moral education that one hears today has a distinct political flavour. It represents a fresh regrouping of lobbies within the educated elite strata. Moreover, the regrouping cuts across conventional party lines in politics.

The changed situation of today clearly shows that earlier assumptions regarding the contribution of education, during colonial and post-colonial periods, towards the formation of an elite holding secular and egalitarian values were simplistic and erroneous. To a certain extent, the error can be attributed to the fact that historians and other social scientists who wrote about education ignored the internal processes of education, such as the curriculum, the norms and content of pedagogy, and the culture of educational institutions. Had they not relied solely on the sentiments expressed by a few among the educated elite, they might have noticed that education in India has never been particularly secular or secularising. Observation and inquiry, which are directly related to a this-worldly, secular attitude, have been a low priority in the pedagogy of Indian schools and colleges. Also, patterns of authority and daily rituals observed in schools have prevented the growth of a secular culture of education.

The current expression of the revivalist viewpoint on education is linked with the deepening of economic inequalities and the desperation of the elite to project a radiant identity in the midst of crisis. The aggravation of rural inequality in the decade following the Green Revolution, large-scale migration of the landless villagers to cities, the slow growth of employment opportunities and the urge among the urban rich to live at par with their counterparts in the West are among the factors that have sharpened the conflict of interests in society. In this climate, revivalism has gained new grounds. Its adherents argue that India cannot go any further with borrowed identities such as 'secularism' and 'rationalism', and since inequalities and poverty are here to stay, these should not cloud the emergence of a strong, self-confident identity for the nation as a whole. Such arguments, and the hidden assumptions on which the arguments are based, have a great appeal not only for the urban rich but also for the urban middle class and the dominant, landowning sections of the middle castes in the rural society. Moreover, the rise of fundamentalism in other countries facing problems similar to India's has found a resonance among the Indian elite across their ideological range. Reference to the ancient glory of India and the promise that it can be resurrected have obvious political value in the present situation. Education, more than any other sphere of cultural activity, is being looked upon as an agency for this resurrection.

Revivalist orientation of education will undoubtedly strengthen the 'reproductionist' tendency of the system and will weaken the energy for change. It is likely that the strategy of early selection will continue to be applied increasingly widely as a means to identify potential merit at an early age. On the other hand, 'value-orientation' will make the harnessing of merit in the chosen student indistinct from indoctrination into a mythologised value-system related to ancient India. Thus, education will further aggravate the malady it is supposed to cure. The only real solution is to orient education—both in terms of the structures of selection and the structures of knowledge—to the value-choices enshrined in the Constitution. Pedagogy that is consistent with secularism, such as learning by inquiry and reasoning, cannot develop within the framework pieced together by the propagandists of 'value-orientation'. On the other hand, the overall merit-pool of society, already stagnant and highly inbred, cannot be enlarged and revitalised unless early selection in all forms is outlawed and fought when it is practised illegally.

## Notes

1 Most well known among theorists of elitism are G Mosca and V Pareto. Two major commentaries on Indian society and its recent history from the viewpoint of elite formation are B B Misra's "The Indian Middle Classes" (London: OUP, 1961) and B M Bhatia's "History and Social Development" (New Delhi: Vikas, 1974). For a competent summary and commentary on elite theorists, see Bottomore (1964). For recent Indian developments in the context of elites, see *Seminar* (No 299, July 1984).

2 Despite their crucial role in the formation of elites, the Indian public schools are a neglected area of social and educational research. Among the few studies that have been made are A De Souza's "Indian Public

Schools" (New Delhi: Sterling, 1974) and R P Singh's "The Indian Public School (New Delhi: Sterling, 1972).

3 For a commentary on the understanding of society and progress involved in the opening of Navyug School, see my "Raj, Samaj Aur Shiksha" (State, Society and Education) (New Delhi: Macmillan, 1978).

4 According to the data given by M Karlekar in her essay 'Education and Inequality' (in "Equality and Inequality, Theory and Practice", ed by A Beteille; New Delhi: OUP, 1983), 172 or over 70 per cent of the candidates who were successful at the National Science Talent Search examination in 1976 were from private (including 'public') schools. Out of the 2,176 students of government schools who appeared in the examination, only 17 were successful.

5 The point that education usually reproduces the prevailing social and economic order is not new, yet the term 'reproduction' is currently associated with the research and theorisation provided by P Bourdieu and J Passeron in their "Reproduction in Education, Society and Culture" (London: Sage, 1977).

6 It is unfortunate that there are no more recent studies than the two discussed here. However, the trends they identify many not have changed much.

7 For a review of research on the question, see my 'Educational Experience of the Scheduled Castes and Tribes', in *Economic and Political Weekly* (18, No 36/37, September 3-10, 1983; pp 1566-1572).

8 Jealousy of the few individuals of Scheduled Caste background who moved up with the help of reservations is a different matter.

9 Most important among the documents expressing the demand for value-orientation is Report of the Working Group to Review Teacher Training Programme (in the Light of the Need for Value-Orientation) (New Delhi: Ministry of Education, 1983). For a collection of commentaries on the demand for value-orientation, see *Seminar* (No 297, May 1984).

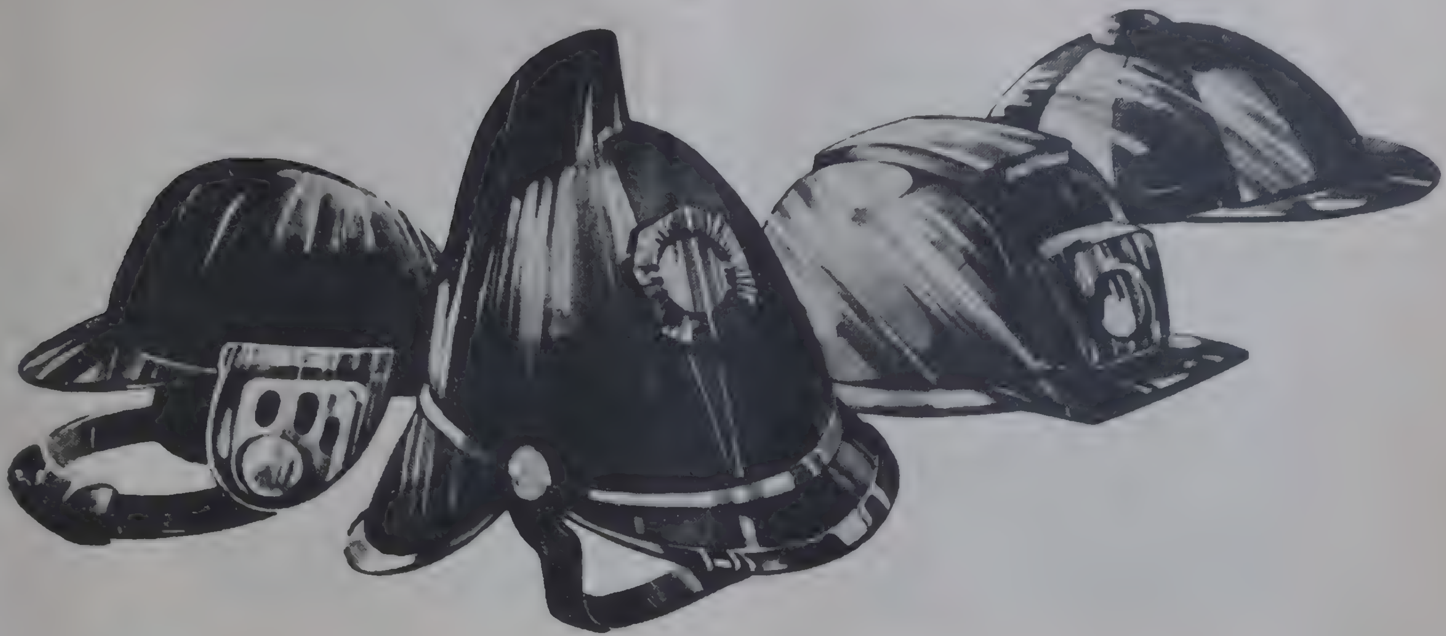
## Escorts

ESCORTS has planned a programme for investment of Rs 180 crore for expansion and diversification of its activities in the next 5 years. It is in the process of completing the first phase of a Rs 32 crore project for the manufacture of 1.50 lakh 100/50 CC Yamaha motorcycle in technical collaboration with Yamaha Motor Company of Japan at Surajpur, a backward area of UP. The first motorcycle is scheduled to roll out by October 1985. The company also proposes to manufacture a wide range of bi-wheelers, according to market demand, under the existing and future Yamaha production programmes with minimal additional capital investment. The company would also take up, under the government's broadbanding policies, the manufacture of self-propelled harvestor combines, baling and agricultural waste collectors in collaboration with CLAAS of West Germany, one of the world's largest manufacturers of such agricultural equipment. The company also proposes to produce a broader range of tractors and prime movers for rural roads and cross-country transport, specially needed by the rural commuters. The company's expansion programmes for one million pistons and piston pins at Patiala and 1.5 million shock absorbers at Faridabad have been approved by the government. The company has also received approvals for capacity expansions and letters of intent and government approvals for new projects such as PABX electronic exchanges in technical collaboration with Jeumont-Schneider of France, gas pressure shock absorbers in technical collaboration with August Bilstein of West Germany, above 39 ton mobile cranes in technical collaboration with FAUN of West Germany and front-fork and shock absorbers in collaboration with Kayaba of Japan for application in bi-wheelers manufactured in the country under Japanese technology. A part of the funds for investment during 1985-86 on capital account are proposed to be raised by issue of convertible debentures/equity linked debenture issue of around Rs 30 crore. Meanwhile, to augment its long term working capital resources, the company is issuing 20 lakh 15 per cent secured non-convertible redeemable debentures of Rs 100 each at par. The subscription list opened on July 1 and will close on August 9. The debentures are being offered, in the first instance, on 'rights' basis to Indian resident equity shareholders of the company and the debentures remaining unsubscribed will be disposed of by the board by allotment to its employees, business associates, deposit holders, preference shareholders and others on private placement basis. The debenture issue is managed by Grindlays Bank's Merchant Banking Division and CIFCO. Amrit Lal Bajaj and Company is acting as a consultant to the issue.

According to H P Nanda, Chairman and Managing Director, the company has performed exceptionally well in the last two decades and has established an excellent track record of compounded growth in sales, profits, consistent dividends, regular bonus issues, besides continuous expansion and diversification. Since 1974, the turnover of the company has increased from Rs 62 crore to Rs 328 crore in 1984. The gross block rose from Rs 14.45 crore to Rs 125.28 crore in this period and reserves from Rs 4.4 crore to Rs 42.9 crore after bonus issues of 1:2, 3:5 and 3:5 in 1974, 1977 and 1979, respectively. The present book value of Rs 10 per equity share of the company is over Rs 42. Since 1964, the company has made seven bonus issues. The present equity capital of Rs 13.38 crore includes bonus issues of Rs 11.41 crore. On 100 equity shares held in 1961, the members have so far received 2029 bonus equity shares and 251 right equity shares, besides handsome dividends. A sum of Rs 1,000 invested in 1960 would be worth nearly Rs 2 lakh at the market value today.

Secure... in the protection of General Insurance



For 'Normal' or 'Heavy' risks, the new **PERSONAL ACCIDENT POLICY** offers better financial relief, in simplified form at reduced premiums.

**Job categories reduced to two–**
The 'Normal Risk' category that spans a wide range of professions/occupations from accountants, lawyers and builders to motor mechanics, machine operators and drivers of heavy vehicles. And the 'Heavy Risk' category which covers more dangerous professions/occupations – from miners, jockeys, circus personnel and mountaineers to electricians working on high tension lines.

| TABLE | NORMAL RISK Per thousand Rs. | HEAVY RISK Per thousand Rs. |
|---|---|---|
| I Death only | 0.60 | 0.90 |
| II Death, and Permanent disablement (total/partial) | 1.25 | 1.90 |
| III Death, Permanent disablement (total/partial) and temporary total disablement | 2.00 | 3.00 |

**The Policy also pays–**
Medical expenses, arising out of an accident up to 10% of the capital sum insured or 25% of the admissible claim amount, whichever is lower. And the Family Package Cover has been designed to provide benefits to you, your wife and children at a discount of 5% on the overall premium. So cover yourself with Personal Accident Insurance. It takes care of you when you need it most.

# Change is permanent

**Change is the essence of growth, an edict of management.**

**And, in today's world, the choice before an organisation is not between 'change' and 'no change', but between managing the change and being managed by events.**

**Change, when consciously imposed from within, opens up new opportunities, new avenues of growth. Paradoxically, the process of change is, and has to be, permanent.**

**This is the philosophy behind the changing role of MMTC — from a mere canalising agency to an international trading house.**

Change, to MMTC, has meant putting its expertise in bulk buying and selling to larger purposes of national growth.

Like opening up global markets for India's small scale entrepreneurs. Adopting new strategies like Third country trading, Three-way trade, Joint ventures both in India and abroad, Equity participation abroad in sources of raw materials as well as in basic inputs.

Entering the arena of non-canalised items — ranging from importing PVC resins and mercury to exporting diamonds and graphite electrodes.

Improving customer service by decentralising operations, streamlining the distribution system and setting up Customer Service cells.

Reorienting the organisation to meet new challenges — through long-range planning, computerisation, systems reappraisal and organisation restructuring.

And this change already reflects in MMTC's performance. Non-canalised exports registered a fourfold increase in the first half of 1984-85, while the year's turnover is poised for a threefold rise. A record quantity of fertilisers was imported, at the right time, resulting in an all-time high foodgrain production and substantial savings in foreign exchange. Long-term contracts worth millions of dollars have been concluded for iron ores exports. For the first time, a counter-trade deal has been finalised with Zimbabwe for importing Asbestos against the export of engineering goods — an important step towards diversification and growth.

All this has led to increased employment opportunities which now exceed half a million and generated a new industrial and economic prosperity.

Yes, change is permanent. A philosophy chiselled in the minds of everyone at MMTC, the cornerstone of its success.

Consumer products helped make Hindustan Lever a household word. Today the Company is moving in a new direction, from the home to the heart of India's core sector.

**Directions for growth**

Today's emphasis is clearly in **technology-intensive** areas of national priority. Over 60% of the total investment in fixed assets today represents core-sector projects or sophisticated technology.

**Using science with sensitivity**

The Company's **Research & Development** has always been attuned to India's needs. Significant R & D successes have been achieved in import-substitution of edible oils and energy conservation. A third major breakthrough is the development of a plant-growth nutrient which boosts crop yields at low cost.

**Products made in India — for the world**

Quality products and widespread distribution are Company strengths that have contributed to an impressive export success story. An increase in turnover by 70 times — from Rs. 10 million in 1971 to Rs. 700 million in 1983.

**A Company of people**

This is a Company of people, not just employees. People committed to excellence who have made us what we are — a Company meeting the challenge of change.

# The 'Nuclear Option'

IT is ironic that when people all over the world are recalling the holocaust of Hiroshima and Nagasaki forty years ago, voices in this country urging the government to 'make the bomb' are becoming ever more shrill. The bomb lobby here got its most recent shot in the arm from the disclosure last month by ABC, the American television company, that Pakistan had successfully tested in non-nuclear explosions a US-made electronic trigger device which could be used to set off nuclear bombs. Irrespective of the accuracy, and significance, of this particular revelation, there is no reason at all to doubt that Pakistan has been engaged in building up the capability for making nuclear weapons. Above all, there can be no other explanation for all the expense and trouble it has gone to in order to set up the natural uranium enrichment facility at Kahuta near Islamabad.

What has been noteworthy, however, is the response of the Government of India and of public opinion in this country to the unmistakable evidence of Pakistan's pursuit of a nuclear weapon development programme. This response has consisted in, first, seeking to persuade Pakistan to give up its nuclear bomb programme on the strength of our assurance that we are committed not to make the bomb and that the aims of our admittedly far larger and more advanced nuclear research and development programme are entirely non-military and peaceful; secondly, trying to persuade the United States to pressurise Pakistan, by using the levers of US economic and military aid to that country, to abandon its nuclear bomb programme; and, finally, threatening that if Pakistan persists in its efforts to make the bomb India would be forced to review its commitment to use nuclear energy solely for peaceful purposes. The fact is that none of this amounts to a convincing or effective enough policy for dealing with something as serious as the nuclear arms race between India and Pakistan.

First of all, the Government of India's assurances about the purely peaceful objectives of its nuclear programme cannot honestly be expected to convince anybody, least of all the rulers and people of Pakistan. If it is true, as it of course is, that the facilities for enrichment of natural uranium set up by Pakistan make sense only in terms of a nuclear weapons programme, the same is the case with our clearly politically directed and long ongoing efforts to produce and stockpile plutonium. And whatever else Pakistan may have achieved in its efforts to build the bomb, it has not yet managed to actually carry out a test nuclear explosion as we did as far back as in 1974 at Pokhran. Secondly, while the United States will go to considerable lengths to stop as yet non-nuclear countries, including Pakistan, from acquiring nuclear weapons, it will do so only within the limits imposed its overall political-military strategic requirements. This is illustrated, in Pakistan's case, by the US decision to revoke the cuts earlier imposed in US military and economic assistance to that country as a mark of US displeasure at the establishment of the Kahuta uranium enrichment plant in 1976 after the entry of Soviet troops into Afghanistan in 1981. US intervention and arm-twisting, which Rajiv Gandhi so fervently sought during his recent visit to that country, cannot therefore be a dependable guarantee against Pakistan pursuing its nuclear weapons programme and for that reason against India and Pakistan plunging into a nuclear arms race with disastrous consequences for the people of both countries. Finally, the periodic statements, made with increasing explicitness in the last few weeks, that India will have to reconsider its commitment to peaceful use of nuclear energy if Pakistan does not desist from its efforts to make the bomb are clearly counter-productive. They provide the Government of Pakistan with added justification for its efforts and strengthen its case against the restraints sought to be imposed on its nuclear programme by countries such as the US.

All this underscores the fact that the Government of India, despite its oft-repeated commitment to the peaceful use of atomic energy, has never seriously tried to evolve policies to stop a potential nuclear arms race with Pakistan. Not only has it made no contribution to the few specific proposals in this regard which have emerged, but it has tended to dismiss them in an offhanded fashion. One such proposal is that to declare South Asia as a nuclear weapons free zone which has won the support of all the countries of the region with the exception of India. We have opposed the proposal on the ground that a nuclear weapons free zone comprising the countries of South Asia will be meaningless in view of the presence in the region of sea-borne nuclear weapons of the superpowers as well as the existence in the vicinity of China as a nuclear power. The argument is specious because a commitment by the countries of the region—which in effect means by India and Pakistan—to abjure the development of national nuclear weapons cannot in any manner come in the way of an eventual more comprehensive de-nuclearisation of this part of the world. The other proposal—for mutual inspection by India and Pakistan of nuclear installations in the two countries—we have rejected on the plea that such inspection cannot be foolproof and cannot therefore be an effective guarantee against clandestine development of the bomb by Pakistan. This argument again can hardly be expected to carry conviction in objective quarters since the imperfections of whatever inspection procedures are devised initially will apply to both sides and, further, given seriousness of purpose on the two sides these procedures can be progressively improved and tightened.

In the light of these positions of the Government of India, it is high time the question was raised quite bluntly: what is the Indian government's policy on development of nuclear weapons? In its official pronouncements the government continues to link India's policy to the possible, indeed likely, development of nuclear weapons by Pakistan. But from non-official and even semi-official quarters a different approach to a nuclear weapons policy for the country has begun to be advocated. It is beginning to be openly argued that possession of the bomb is essential for the full realisation of India's potential as the 'dominant regional power'; that if only India had actually made the bomb when it is supposed to have first acquired the capacity to do so "neither China would have attacked us in 1962, nor Pakistan in 1965", as a protagonist of the bomb has put it recently.

The issue is of the utmost importance. The Government of India has so far led the country and the people to believe that it is firmly committed not to make the bomb, that if it was ever compelled to review this commitment, it would be because of Pakistan's efforts to develop nuclear weapons. However, if the actual position is quite different and the 'nuclear option' is being considered, more or less independently of Pakistan's actions and intentions, as a possible 'input', to use currently fashionable jargon, in the pursuit of the government's external policy objectives, then, surely, the political consequences, including domestic ones for the people of the country, the economic costs and the morality of such a course need to be examined more carefully and impartially than the government and the non-official and semi-official protagonists of the bomb appear to consider necessary (at a 'let's make the bomb' conference in Delhi in May it was even suggested that the government should proceed to develop nuclear weapons secretly without any need for public discussion of the pros and cons of such a course)?

## *Supreme Court*

### Blow to Workers' Rights

THE recent majority judgment of the Supreme Court bench which has armed the executive with powers to dismiss "government servants who are inefficient, dishonest or corrupt or have become a security risk" without holding prior inquiry or giving the concerned employees an opportunity to be heard is a serious blow not only to the government servants' security of employment but also to the overall democratic culture of the nation in general and the trade union movement of the government employees in particular.

A well known journalist specialising in legal/constitutional questions and generally known for his support of civil liberties has, however, come out on this issue with an apologia that "viewed in totality the majority judgment makes sense and does not appear to be unduly harsh to civil servants". The main argument in support of this contention is that "before a government servant is denied his right to be heard, the seriousness of the offence must be determined and when it has been found that his conduct merits dismissal or demotion, the authority concerned may (really must) dispense with an inquiry". Also mentioned in this connection is the great emphasis laid by the Supreme Court bench on the need for maintaining discipline in the armed and para-military forces.

These arguments, however, can be easily faulted. First of all, an *ex parte* determination by bureaucrats (or their political bosses) about the culpability of the implicated employees, generally under all circumstances and specifically in the existing socio-political set-up in India which is not particularly noted for its respect for democratic norms or for uprightness, is highly suspect. Secondly, the legal armoury already built up in the country suffers from no dearth of laws and regulations for dealing with, *under due process of law*, any of the contingencies listed above or for maintaining discipline in the armed or para-military forces.

More importantly, the specific case which served as the occasion for the Supreme Court judgment in question arose out of the dismissal and removal from service without any inquiry of some railway workers for taking part in all-India railway strikes. As such, the use of the extraordinary powers was made on grounds neither of 'inefficiency', nor of 'dishonesty', nor of 'corruption', nor even of 'security risk', but of trade union activities.

Since the government is the largest employer in the country accounting for, as it does, more than two-thirds of the total employment in the organised sector, the judgment in question is likely to deal a very serious blow to the trade union movement in the country by building up a climate of intimidation. There is already a widespread sense of nervousness among the Central government employees about their job security created by the overhanging threat of computerisation. The present judgment will surely tend to increase this nervousness.

In this context, the rather low key reaction of the Left parties, their MPs, trade unionists and so on to the situation created by the Supreme Court judgment is somewhat inexplicable, particularly so by contrast to the vocal criticism of the judgment by some Congress(I) people, including a member of the Union cabinet. The situation really demands concerted steps in the legal, parliamentary and other public forums for redressing the harm caused by the judgment.

## *The Dollar*

### Taking a Tumble?

THE dollar has continued to lose value against all major currencies in recent weeks. It fell below DM 2.90 for the first time in ten months and the pound sterling at $ 1.3858 is at its highest for more than a year. The question is: has the dollar, whose strength has confounded many and has had a profound impact on the trade balance of the United States and on the debt position of many developing countires, begun its descent?

There had been many conflicting explanations offered for the apparently paradoxical strength of the dollar in the face of the very large fiscal and trade deficits of the US. The American Administration had for some time claimed that the high value of the dollar was a reflection of the greater confidence in their economy—that it was growing vigorously, unimpeded by the structural problems evident in west Europe and the rest of the world. Others had argued that it was due to the expanding fiscal deficits, which in the face of a tight monetary policy, had driven up interest rates in the US, making it attractive to hold dollars *vis-a-vis-* other currencies. There is no doubt that capital movements across national frontiers in search of higher yields dominate over trade-related flows at present. It is estimated that the former may be in the range of $ 20,000 to 30,000 billion, compared to trade-related flows of some $ 2,000 billion—that is, some ten to fifteen times the trade-related flows. Interest rate differentials, therefore, are of importance. It has been argued, however, that interest rate differentials should be large enough to out-weigh expectations regarding exchange rate movements and, as the fundamental circumstances of the dollar are far from sound, this should have worked against a strengthening of the dollar. Moreover, it has been argued, interest rate differentials have narrowed against the dollar in the last one year.

The latest Annual Report of the Bank for International Settlements, that central bank of the central banks of industrial countries, which was released in early June, finds that while real interest differentials have narrowed, they still favour the dollar and argues that "the persistence of substantial, although varying, international interest rate differentials in favour of the dollar is surely part of the explanation; indeed, it is difficult to imagine that, in the absence of these differentials, capital flows to the United States in recent years could have been as large as they in fact were". In favour of this hypothesis, it finds that "US balance of payments statistics reveal the predominant share of banking and other highly interest-sensitive financial flows in US capital imports". It does agree, however, that the continued strength of the dollar may have resulted in self-fulfilling speculative capital movements towards the later stages.

The importance of the interest factor, and the predominance of interest-sensitive capital flows of a short-term nature, suggests that the dollar is very vulnerable. Will interest rates fall in the US? Will the confidence in the dollar take a tumble? There is some evidence that US interest rates have been looking down in recent months in spite of the undiminished fiscal deficit. This may be due to the fact that private sector demand for credit may have declined as the US economy is slowing down. There is not much evidence that the stance of US monetary policy has changed in any fundamental way, but the other countries are taking the opportunity to bring down the interest countries. This is an opportunity they have been long waiting for. As a result, real interest rate differentials may not decline by as much. Indeed, the view is widely held that the strengthening of the pound sterling in the recent weeks is explained by the fact that British interest rates have remained high.

While the US Administration, conscious of the damage the high value dollar has done to the country's trade, is earnestly hoping for a depreciation of its value, it is also worried about too precipitate a fall for two reasons: first, it is worried about the impact on the domestic price level; second, in view of the continuing large fiscal deficits which cannot be financed by domestic private savings, it would need to continue to attract capital inflows from abroad. It is estimated that about half of the US fiscal deficit is financed by inflows from abroad. Some analysts believe that in order to prevent a rapid erosion in the value of the dollar, the Federal Reserve might pursue a tight policy, keeping interest rates high; this might explain the jump in the Federal fund rate noticed in the second week of July.

The future course of the dollar, however, will be of crucial importance in many respects: to US trade performance, to the degree of freedom which other industrial countries have in cutting interest rates, and so on. It is also of great significance to the developing countries whose debt is predominantly held in dollar terms; with a strong dollar, dollar prices of their exports tended to suffer, whereas their debt service obligations are in dollars.

## *West Bengal*

### Curious Coming Together

THE coming together of the nine central trade unions in West Bengal in calling for concerted action virtually amounting to a Bangla bandh in furtherance of certain working class clauses is indeed an important development. Although there have been some rare occasions in the past when the Left-controlled trade unions and the Congress(I)-led INTUC had joined hands, such co-operation was designed for less comprehensive actions on narrower issues. By contrast, the INTUC and the Left-controlled trade unions have given on the present occasion a joint call for essentially a Bangla bandh (i e, a statewide general strike) on September 12 in support of a 12-point charter covering both economic and political demands, critically impinging on both the Congress(I) Union government and the Left Front state government. The Union government has been specifically criticised for its actions in downgrading the public sector and liberalising imports as well as foreign investment. The Left Front government, in its turn, has been taken to task for mooting proposals for transferring to the private sector industrial units already nationalised or otherwise taken over by the state government.

In this joint deal, the two major Left trade unions, the AITUC and the CITU, did not have to go really beyond their usual grooves. Indeed, the CPI's AITUC spokesmen had earlier opposed talks about the state government giving up the industrial units, nationalised or otherwise taken over. The CITU, controlled by the CPI(M), is not directly affected by the critical edge of this particular demand as the proposal for 'denationalisation' actually emanated from a Forward Bloc minister in the state government, in charge of the Industry department.

The real wonder is that Subrata Mukherjee, the chief whip of the Congress(I) party in the state assembly and the general secretary of the state INTUC, has publicly ventured so far in opposing the Union government's policies and actions. The most charitable explanation is that the Congress(I) has been compelled into this move by its commitments made to the working class during its campaign for the last Lok Sabha elections. More sceptically inclined observers may, however, tend to explain the INTUC's radical posturings as moves in the factional struggles within the Congress(I), specifically meant to weaken the position of the group led by the Union Law minister Ashok Sen. Only the future will reveal what is actually what, while the immediate impact of the joint call in terms of a revival of the militant tendency in the West Bengal trade union movement cannot be underestimated.

## *Electronics*

### Learning from Mexico

*A Correspondent writes:*

IT will be of interest to us in India that IBM, the computer giant of the United States, has at last been allowed by Mexico to set up a plant to manufacture personal computers through a wholly-owned subsidiary. Initially IBM had been refused permission; the Mexican government had insisted on joint ownership of the plant. Other computer firms like Hewlett-Packard and Apple had been able to set up their plants in Mexico only by ceding majority control of their Mexican personal computer operations.

On the face of it, therefore, the Mexican government has caved in to the pressures IBM brought to bear upon it. The US government too seems to have played its part. US criticism of the Mexican decision to reject the IBM's proposition in 1984 had been strong and vocal, going by the comments aired through US newspapers. It is also not beyond the US government to have tried to diplomatically twist Mexico's arms. Given the current weaknesses of the Mexican economy the US government has enough levers in its hands.

Still, and this is what we in India ought to note in particular, IBM has not got away with everything. Originally, the company had planned to invest less than $ 7 million on the expansion of its existing facilities where the System 36 mini-computer was already being made. Now it will put in as much as $ 90 million. Part of this $ 90 million will be the outlay on a semiconductor development centre which will "provide a base for Mexico's electronic industry to develop customised chips". The centre will be set up and probably run by IBM, but the Government of Mexico hopes to have control over its working to ensure that it is run as a national technology centre.

IBM has also agreed to establish a software distribution centre which will (a) provide and distribute programmes to Spanish-speaking countries, (b) establish programmes to train students in computer science, and (c) create a local dealers' network.

Above all, IBM is committed to exporting 90 per cent of the computers it manufactures in Mexico. It will, at the same time, "purchase a variety of high technology components from Mexican companies". The new facility that IBM is setting up in Mexico will thus come within the Indian definition of a 100 per cent exporting unit which in India would be altogether exempt from any constraints with regard to either the extent of foreign ownership or the purchase of components within India. So, at least by Indian standards, the bargain Mexico has struck with IBM is not at all bad just on these two scores. But Mexico seems to have done even better, for IBM has been made to agree to the establishment of semiconductor technology development and software distribution centres in Mexico.

Since IBM is known to be negotiating a possible re-entry into the Indian market—the proposal initially seems to be to start only a software development unit which will, presumably, be almost altogether export-oriented—the Indian government might well profit from an exchange with the Mexican authorities on the subject.

**SUBSCRIPTION RATES**

**Inland**

| | | |
|---|---|---|
| Institutions | One year | Rs 250 |
| | Two years | Rs 475 |
| | Three years | Rs 700 |

# Tonic for the Few, Poison for the Many?

UNTIL not many months ago, the cotton mill industry complained about being "in the grip of a deep crisis" and being "caught between two stools of surging cost escalations and diminishng textile market". In his annual speech last September the then Chairman of the Indian Cotton Mills' Federation Arvind N Lalbhai had stated that "the immediate future for the majority of the mills seems quite bleak" and that the "outlook for the [cotton] season 1984-85 appears to be even more grim". The leading spokesmen of of the industry must be feeling greatly embarrassed by the profound change in the textile scene. For, currently, the industry is enjoying the benefit of abundant supply of raw cotton—the 1984-85 crop is placed at well above 92 lakh bales—at prices substantially below last year's levels and a ready market for its products at prices higher than those prevailing last year. Statistics relating to yarn and cloth output and stocks, mill closures and wholesale price indices of raw cotton, cotton yarn and cloth suggest that the organised sector of the industry has seldom had it so good.

Yarn output during the first six months of the current year (January-June) is provisionally placed at an all-time record of 713.31 million kg, 7.5 per cent up over the previous year's corresponding figure of 663.64 million kg. Cloth output also is higher, though only marginally—1,707.40 million metres against 1,705.99 million metres. Cloth stocks with mills which stood at 350.1 million metres at the end of December 1984 and 362.7 million metres at the end of February declined to 258 million metres by the end of June. Yarn stocks have been maintained at the 39/40 million kg level. The index for raw cotton prices which had touched at high of 296 in September 1984 declined to a low of 227.9 in February and stood at 242.4 at the end of May. The average for the first five months of 1985 works out to 237.4 against the 1984 average of 262.6. Indices for cotton yarn and cotton fabrics have ruled a little higher than in 1984.

The favourable turn in its declining fortunes has brought considerable cheer to the industry. But if the cotton mill industry which had all along been using the language of crisis has now begun to exude optimism it is mainly because the new textile policy is designed essentially to ensure the healthy growth of the organised sector of the industry by nursing the sick but potentially viable units back to health and liquidating the irretrievably sick units. The ICMF chief Kantikumar R Podar's assessment that the new policy should enable the industry to "enter the dawn of a new era" contrasts sharply with the ICMF's past statements prophesying doom.

The new textile policy, which has been accorded an unqualified welcome by the champions of the millowners' cause, has come in for scathing criticism from all sections of Lok Sabha, including the ruling party members. The policy has been dubbed as "poison for handlooms and tonic for mills" and it has been criticised for giving raw deal to workers. Many organisations representing the decentralised sector powerlooms, handlooms and hand processors have sent representations to the Union minister for textiles Chandra Shekhar Singh pointing out the likely adverse implications of the policy guidelines and emphasising the need for appropriate modifications to ensure the growth of the entire textile industry on healthy lines.

In his welcome address at the convention on "the impact of the new textile policy on the decentralised powerloom sector" K B Awade, former Maharashtra minister of state for industries, criticised the policy for attempting to equate mills with powerlooms. He said that unlike the composite mills which produced their own yarn, wove their own grey cloth, processed it and marketed it through their countrywide network, decentralised powerlooms had to buy yarn from merchants incurring additional costs on account of their profit margins, spinning mills' profits, sales tax, octroi, transport cost, middleman's commission, packing charges, etc. This gave mills a cost advantage of about 20 per cent over powerlooms. Even after allowing for the advantage to the tune of about 11 per cent which the powerlooms enjoyed in respect of lower wages, the powerlooms still suffered a net handicap of about eight per cent *vis-a-vis* mills. Awade has urged the Maharashtra government—75 per cent of the total powerlooms in the country are located in the rural areas of Maharashtra—to move the Centre to restore the duty differential between composite mills and powerlooms and refrain from further burdening the powerloom units under the garb of 'rehabilitation fund', 'controlled cloth subsidy' and 'textile modernisation fund'. The state minister for industries and revenue Sudhakar Naik has assured his government's firm support to the powerloom industry in its bid to represent its problems to the Central government. The unorganised sector is said to be particularly vulnerable because of its weak working capital resources and hurdles in obtaining sufficient timely bank funds. The spokesmen of the mill sector, however, have a very different story to tell. They have always contended that powerlooms enjoy a distinct cost advantage and that the price difference between mill and powerloom cloth is of the order of about 25 per cent. The divergent views expressed by powerlooms and mills call for an in-depth study to establish the correct position.

The Andhra Pradesh chief minister N T Rama Rao has expressed the view that the existing subsidy of Rs two per square metre is not adequate to fully meet the cost disability suffered by handlooms which have been entrusted with the entire production of controlled cloth. He wants the growth of powerlooms to be closely regulated in consultation with state governments to ensure that handlooms are not adversely hit. He considers it necessary that the Centre should devise a mechanism by which the mill sector and the powerloom sector are made to pay a levy every year which could be used to help the handloom sector.

The textile hand processing units have also represented to the Union minister for textiles that if the present policy of protection to the entire cotton textile hand processing industry is restricted only to units with fixed daily clearance of 15,000 square metres, at least half of the capacity in the industry will be rendered idle throwing nearly 2.5 lakh workers out of employment. It is contended that the removal of excise difference (12 per cent) between hand processing and power processing will spell disaster for the hand processing industry and lead to monopolistic condition in favour of organised independent processors.

With almost all the demands put up by the organised sector from time to time having been met and encouraged by the prompt follow-up measures pertaining to simplification and rationalisation of controls and fuller fibre flexibility, ICMF has forwarded several suggestions to the Union minister for textiles to facilitate implementation of the new policy. These suggestions relate to progressive reduction in fiscal levies on manmade fibres and modernisation plans. Considerable significance attaches to the meeting of the central advisory council on the textile industry scheduled for August 11 to discuss in detail various policy implications of sickness and modernisation where interests of workers are intimately associated. Effective implementation of the policy guidelines is bound to pose many formidable challenges as the issues involved are really very complex. Leaving aside the question of identifying the type of machinery to be modernised and arranging requisite resources it can be argued that selective modernisation by the more enterprising managements will intensify inter-firm competition which might well drive marginal units to the sick category. The new textile policy places emphasis on the need to infuse confidence in fresh investment, initiative and enterprise but the process of reorganisation of the industry could well prove to be quite painful.

## *Industrial Finance*

### Made Softer

THE Industrial Development Bank of India (IDBI) has announced substantial liberalisation in its refinance schemes for expansion and modernisation effective from July 1, 1985. A new scheme known as 'equipment refinance scheme' has also been added to the existing schemes with a view to facilitating faster modernisation of industrial units with even imported equipment wherever necessary.

Under the revised policy, the bank will offer bill rediscounting facilities for unlimited amounts on machinery purchases, thus removing the earlier ceiling of annual purchase-wise limit of Rs 3 crore. Moreover, the facilities under this scheme would now be available even for machinery imported by a company under open general licence (OGL). In such cases, the importers of machinery will have to ensure that the bill in question is drawn by the local agent of foreign suppliers and the purchaser. The purchaser will have to be an industrial concern and the actual user. The only restriction is that the facility will not be available for setting up new projects.

The liberalised measures also include a substantial hike in the annual ceiling for loan assistance under the Technical Development Fund (TDF) scheme to Rs 1.25 crore from the earlier level of Rs 70 lakh. This scheme is for the import of small value equipment, technical or process know-how, foreign consultancy services, drawings, etc. The interest on these loans has also been reduced to 12.5 per cent. Loans under these schemes would normally be secured by way of hypothication of assets.

Assistance under IDBI's soft loan scheme will now be available for replacement of plant and equipment which have been in use for even less than 10 years especially in the cases where the rate of technological obsolescence is high. Expansion of capacities and diversification into related products with upgradation of existing equipment would also be allowed under this scheme if such action was incidental to modernisation and had the requisite government clearances.

The relaxation of the condition regarding the minimum life of equipment to be replaced is intended to provide a boost to technological upgradation. In the context of the present government's concern for expediting the induction of modern technologies in Indian industry, and the slow pace of technological upgradation so far, this appears a sensible policy refinement.

The IDBI notification says that the liberalisation with regard to soft loan scheme for modernisation would also be applicable to such assistance from the Industrial Finance Corporation of India (IFCI) and the Industrial Credit and Investment Corporation of India (ICICI). According to the notification, multi-division companies having units in different locations and/or producing diverse products would be eligible for separate division-wise limits of concessional assistance for modernisation.

In addition to these liberalisations, the IDBI has now introduced a new scheme, namely, the Equipment Refinance Scheme. This is intended to provide quick assistance under a simplified procedure for acquisition of indigenous and imported capital goods by the existing healthy concerns subject to a ceiling of Rs 2 crore. The assistance under this scheme would be routed through the State Financial Corporations and the State Industrial Development Corporations by way of refinance.

The soft loan scheme was first introduced by the IDBI in November 1976. Initially, it was restricted to only five industries, namely, cotton textiles, jute, sugar, cement and engineering to enable them to overcome the backlog of modernisation/renovation/replacement of plant and equipment in order to improve their productivity and competitiveness. In 1981 the scheme was extended to other industries also. Over 500 units had taken advantage of this scheme till 1983-84 and the total assistance provided to them amounted to Rs 490.8 crore. Yet, this formed no more than four per cent of the total lendings of the IDBI. The changes now introduced should hopefully accelerate the pace of sanctions under the soft loan scheme.

## *Textiles*

### For the Rich

THE data presented in the "Highlights of Consumer Purchases of Textiles 1982" published by the Textile Committee, Ministry of Commerce, provides aggregative insights into the country's largest industry. The data, whose collection was first initiated in 1969, is based on a survey of 7,450 households in 58 urban and 100 rural centres carried out in that year.

The study views 1982 as a watershed for the industry since the demand for textiles revived in that year, after consistent decline during 1979-81. The demand in 1982 moved up by 10 per cent over the previous year's figure. In the Textiles Committee's view this spurt in demand meant an end to consumer resistance experienced in the earlier years, mainly due to rising prices of textile goods. Such a conclusion though is not borne out by other data included in the publication. First, the price of textiles did go up substantially during the year, by an average of 12 per cent. Second, 1982 witnessed a low overall economic growth, including a setback in agricultural production due to an inadequate kharif harvest. So the purchasing power of the consumers could not have generally become better. Both these factors would have served to reinforce, and not reduce, consumer resistance.

The explanation for the jump in demand has therefore to be tentatively sought elsewhere. The increase in consumption occurred mostly in the rural markets, where it went up by 11 per cent during the year. The rise in the urban areas surveyed was about half that level. The rise in consumption of textiles in the rural areas may well have been largely the outcome of the opening up of new sales outlets and aggressive marketing. The prolonged near-stagnation in urban demand would have compelled the industry to lay emphasis on expanding its market in the rural areas.

However, it is not the industry as a whole which benefited from the increase in demand in the rural areas. While the demand for cotton fabrics rose by a mere five per cent in 1982 in the country as a whole, that for non-cotton and mixed blended fabrics jumped up by 21 and 31 per cent respectively. Further analysis of this data reveals the sharp upturn in demand for non-cotton and blended fabrics in the rural areas: 39 and 42 per cent respectively, more than thrice the increase in the case of the urban markets. Similarly, the rise in the value of consumption of non-cotton and blended fabrics in the rural areas in that year, at 54 and 52 per cent respectively, is thrice that of the urban areas. These figures imply a pronounced swing in taste in the rural areas from cheap to more expensive fabrics during 1982, probably triggered off by the manufacturers of non-cotton and blended fabrics in their search for new markets. A similar shift in consumption pattern took place in the urban markets some years ago. In this context it may be worth mentioning that the manufacturers of high value fabrics are more dynamic than the traditional ones dealing in cotton textiles.

The Textile Committee's study seems to imply that the spurt in consumption of higher valued fabrics was evenly spread amongst all income groups since these fabrics are more durable and easily washable and hence more attractive to buyers. However, here again there is data elsewhere in the study itself that contradicts such an interpretation. The consumption of textiles by rural households earning less than Rs 6,000 per annum actually declined during the year, contrary to the overall trend. On the other hand there was a 56 per cent increase in consumption by the highest income group covered in the survey, i e, of households earning more than Rs 40,000 per year.

# Bhopal and the Sodium Thiosulphate Controversy

THERE are extremely powerful forces ranged against the use of Sodium Thiosulphate (NaTS) in Bhopal. There are at least about 90,000 gas victims who are still suffering from the effect of the gas exposure of December 3, 1984 and who need medical relief. The whole issue of medical relief through NaTS, messy as it was, took an ominous turn on June 25 when workers of voluntary groups, including doctors, were arrested in Bhopal by police for using NaTS.

In the light of this development, D R Varma's views on use of NaTS in Bhopal (*EPW*, May 11) assume a special significance. On the face of it, D R Varma seems to extend his expert support to the powerful anti-NaTS lobby in Bhopal. However, his views should not be mistaken to belong to the anti-people forces in Bhopal, for Varma's concern for the welfare of gas victims and his anger against UCIL and the medical establishment in Bhopal is unambiguous. It is, therefore, strange and surprising that Varma has not given deeper thought and consideration to his arguments than he has. He offers two arguments against NaTS.

(a) According to him, the double blind clinical trial (DBCT) conducted by the ICMR has no value. Therefore, the alleged benefits of NaTS therapy to the gas victims are of no consequence.

(b) The use of NaTS has proven value only in cases of acute cyanide poisoning, and there may be a possibility of it being of some value in detoxicating MIC. According to him, there is no question of acute cyanide poisoning occurring after months of the gas leak. As to continuing exposure to MIC, it is irrelevant in Bhopal since continuing exposure to MIC is impossible.

Varma's arguments look simple and straightforward enough but in their actual effect they are subtle and complicated. There are two connected but still distinct issues involved here: (1) Does NaTS really give symptomatic relief to gas victims weeks or months after the massive exposure to MIC? (2) Are the gas victims suffering from acute cyanide poisoning or continuing MIC poisoning?

The second question is clearly answered in the negative in Varma's argument (b) and from there he proceeds to answer the first question in the negative which is his argument (a). Varma is naturally relying here on the existing and established knowledge of the cyanide metabolism in the body, MIC toxicity and mechanism and mode of action of NaTS. Unfortunately this is not enough. One should always remember that the situation in Bhopal is extraordinary. It is an uncharted territory full of the most unexpected problems and riddles. The limits and boundaries of existing knowledge should not be imposed on it uncritically and dogmatically. The situation in Bhopal is challenging and should be allowed to challenge well-entrenched existing theories.

The answer to question (1) implied in Varma's argument (a) is of critical importance for people like us who believe in the usefulness of NaTS. Reading carefully his argument (a), one immediately realises that he offers no substantial arguments against the DBCT conducted by the ICMR on the validity of which rests the rationale of NaTS therapy in Bhopal. He is aggrieved that the details of the trial are treated as closely guarded secrets by the ICMR. We share his grievance fully. In a report on the health status of gas victims of Bhopal prepared by Medico Friend Circle this secretiveness of the ICMR and the harm it has done to the cause of the gas victims has been discussed at length. But surely this cannot be the decisive argument against NaTS when the stakes are so high and the claims made by ICMR are so decisive and so clear-cut. The ICMR in its update of March 10 has given some relevant details of the trial and shown that of those who received NaTS, 55 per cent had distinct improvement as against only seven per cent of those who received glucose as placebo. One cannot discard the value of NaTS just because the ICMR does not release details of the trial. Scientists and the public have a right to know the details of the trial. They should force the ICMR to release it. This is not merely a scientific study undertaken by an individual scientist or a private group of scientists whose findings may be rejected with some justification since they have failed to provide the necessary details. Where is the justification for rejection of NaTS therapy in Bhopal where such major public interest is at stake?

Varma's second point against the trial is even weaker than the first. "Why subject the victims to NaTS in the first place?" he asks. This is a strange argument. How does it matter why NaTS was chosen in the first place as long as it can be shown by rigorous methods like the DBCT that it relieves the symptoms? And in any case, in Bhopal the use of NaTS is not accidental. It has been well documented that on the very night of the disaster, H Chandra of the Medico Legal Institute of the Gandhi Medical College of Bhopal had suspected cyanide poisoning in the gas victims and in the following days he and other doctors, according to him, including those who are opposing the use of NaTS, had used this drug themselves to obtain relief from similar symptoms.

Varma is a pharmacologist. He should know more than anyone else that pharmacology is full of therapeutic agents whose usefulness is based only on empirical evidence, i e, there is no known theory or mechanism of their action, but their usefulness has been established, very often by less rigorous trials than DBCT.

Even if we accept Varma's argument (b)—there are reasons for not accepting even this argument but it is not necessary to advance them to defend the use of NaTS—argument (a) does not stand because, as we have tried to show above, he offeres no substantial arguments against the DBCT-ICMR.

Available evidence—the ICMR trial, half published—still supports the use of NaTS on the gas victims in Bhopal. Unless more powerful arguments against NaTS are advanced, any move against the use of NaTS on the gas victims must be regarded as motivated, unscientific and anti-poor people. Such moves must be resisted at all costs.

## Sabotaging Relief for Bhopal Victims

WE hope your editorial ('Sabotaging Relief for Bhopal Victims', July 6) will prick at the conscience of the political and intellectual community and bring help to our endeavour to resume detoxification treatment of the Bhopal gas victims suffering from cyanide poisoning. As a senior member of the medical profession I have taken part in numerous medical relief programmes but the occurrence in Bhopal—arrest of doctors and health workers and confiscation of the clinic—is a unique experience.

Every one must know that we started the people's health clinic in Bhopal with the approval and help of the peculiar government of Madhya Pradesh. Peculiar because the government supplied us with the specific drug Sodium Thiosulphate (NaTS) and disposable syringes (these are not available commercially) and this very government attacked us and liquidated our clinic for undisclosed reasons. Subsequently, we again approached the government for the drug and syringes without any result. Without the drug we are helpless and cannot do anything to alleviate the suffering of victims who are, now in huge numbers, seeking NaTS therapy. NaTS is a low-cost drug and can be manufactured easily by any middle grade pharmaceutical house. The Government of MP acquired a large quantity of the drug from abroad as gift and the rest was manufactured by the IDPL on requisition. From where can we get help now?

The Drug Action Forum, West Bengal, sought help from the Left Front government of West Bengal which can easily get NaTS manufactured in any one of the state-run drug factories. The Health Services Association, West Bengal, the organisation of state-employed doctors, requested the government to arrange for special leave for members who offered their volunteer services for Bhopal. To all these requests the Left Front government has not cared to respond for inexplicable reasons. We have now sent requests to the Union Health Ministry, international voluntary relief organisations, WHO, Health Action International, etc, for help and await their response.

Is there no way for us to obtain the drug and syringes? Do the victims of cyanide poisoning have no right to self-preservation? Or is it that there is someone who may incur a loss if the scientific evidence of cyanide poisoning is documented, authenticated and published?

DR SURJIT K DAS

Drug Action Forum,
Calcutta.

# Sauce for MGR Is Not Sauce for Nazir Sab

### A G Noorani

THAT there should be some norms for ministers' trips abroad no one can deny. As far as the Central ministers are concerned, the Prime Minister's authority as head of the Council of Ministers is patent. What is the legal basis for his authority over ministers in the states? Under Section 9 of the Foreign Contribution (Regulation) Act, 1976, "No member of a legislature, office-bearer of a political party, government servant or employee of any corporation shall, while visiting any country or territory outside India, accept, except with the prior permission of the Central government, any foreign hospitality"—except, the proviso says, for "emergent medical aid".

Note that permission is needed for acceptance of 'foreign hospitality' not for a visit without receiving such hospitality. Section 2(1)(d) defines 'foreign hospitality' to mean any offer by a 'foreign source'—whether government, trade union, society or even a foreign citizen—of costs of travel, free board, lodging, transport or medical treatment.

Thus if an MLA is invited by his brother who has settled down in, say, Nepal to visit him and spend a week with the family, he will need the 'prior permission' of New Delhi before he leaves the country. Unless he wishes to say in a hotel and not with the brother!

The *Indian Express* reported on July 24, that the Prime Minister, Rajiv Gandhi, had cleared the visit of the Chief Minister of Tamil Nadu, M G Ramachandran, to Japan for the twin purposes of medical check-up and purchase of a ship for the state-owned shipping corporation. The correspondent added: "The Prime Minister's clearance is a 'must' for all VIPs going abroad and this practice introduced by Mrs Indira Gandhi is strictly followed even now." It is a novel practice devoid of legal sanction. It is open to the Centre to condemn as void and improper any dealing by a state with a foreign government which impinges on foreign relations as distinct from a purely commercial dealing like any other citizen. But the PM's licence for trips is another matter.

MGR's entourage consisted of 14 persons. *The Stateman*'s Madras correspondent reported in the issue of July 26:

> The Chief Minister's sudden decision to go to Japan cancelling his earlier programme to take two weeks' rest at the Nandi Hills in Karnataka, viewed in the light of past history of the state government's attempts to buy ships from foreign yards overlooking the facilities available within the country, has made many eyebrows rise both in the opposition and ruling party circles here.
>
> Mr K Veeramani, leader of the Dravida Kazhagam, openly questioned the necessity of Mr Ramachandran's journey to Tokyo with such a large contingent just to take delivery of a ship, unheard of in the annals of other state-owned shipping corporations.
>
> Because of his frail health and loss of speech faculty suffered over nine months ago, most pressing problems of the state have been allowed to drag on. The Cauvery waters dispute and the differences between Karnataka and Andhra Pradesh in conveying 15 TMCFT of water from the Krishna to augment Madras city's drinking water supply call for immediate attention of Mr Ramachandran. Brushing aside these problems and unmindful of his delicate health following a kidney transplant, for which the people of Tamil Nadu had generously contributed about Rs 1 crore to defray the expenses, he is undertaking the arduous journey to Japan, which most people consider is quite unnecessary.

Contrast this with another news report concerning a minister in Karnataka government, Abdul Nazir Sab, a genuine man of the masses with a deservedly high reputation for dedication to rural welfare. The *Deccan Herald* of July 12 published this report:

> The Union government declined to clear Rural Development Minister Abdul Nazir Sab's name for an unofficial Indian delegation's visit to China, it was alleged here today.
>
> According to State India-China Friendship Association President M Chandrasekhar, MLA, the Centre's decision was political.
>
> He was speaking at a function here on July 11 to felicitate an eight-member delegation of the State Association which would leave for China on July 20 on a 15-day visit.
>
> Mr Chandrasekhar said the Centre did not clear Mr Nazir Sab's name for inclusion in the all-India delegation which left for China on July 7 because he was a Minister.
>
> The visit, sponsored by the India-China Friendship Association, was at the invitation of its Chinese counterpart.
>
> Mr Nazir Sab, who was the chief guest, said the eight-member team should study the efficacy of bio-gas and gobar-gas plants in China to improve the working of the plants in Karnataka.
>
> He said China was the only country in Asia to have adapted and greatly improved upon its indigenous technology.

The contrast in the unequal treatment of the two cases is too glaring for words. In one case, colossal waste is scandalously sanctioned to a political ally. In the other a very reasonable trip is refused sanction for political reasons, as M Chandrasekhar rightly alleged. Does New Delhi realise that it would have been perfectly proper for Nazir Sab to file a writ petition challenging the refusal of permission under Section 9 of the Act of 1976? It is a cardinal principle of law that exercise of discretion conferred on authority by the law must be reasonable. It must not be capricious or *mala fide*. Had Nazir Sab filed the petition New Delhi would have been compelled to state on oath in an affidavit the reasons for refusal. It could not have acted on Sir Humphrey Appleby's advice in "Yes, Minister" and pleaded 'security' as a ground for withholding the reasons.

Take another case. What if a group of public men in India or a state government defrays the costs of a trip by a Chief Minister or state minister and he chooses to go without depending on 'foreign hospitality'? The practice invented by the former Prime Minister has no statutory sanction.

In any event, even a statute cannot prevail over the citizen's right to travel abroad which the Supreme Court has repeatedly ruled is a part of the fundamental right to 'personal liberty' embodied in Article 21 of the Constitution of India.

NOTICE

1. It is hereby notified for the information of the public that Reliance Industries Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval for the establishment of a new undertaking for the production, supply, distribution or control of 66,000 Tonnes of Chlorine and associated by-products In the first instance with an estimated annual turnover of Rs 300 Million Other particulars of the proposed new undertaking are as under -

A) Name of the proposed undertaking The proposed undertaking will be a unit of Reliance Industries Limited.

B) Name(s) of person(s) or authority/authorities proposing to establish the new undertaking Where it is a body corporate furnish details of its management structure together with those of proposed undertaking Reliance Industries Ltd, a body corporate managed by the board of Directors consisting of a) Shri Dhirubhai H Ambani—*Chairman & Managing Director* b) Shri Ramniklal H Ambani—*Joint Managing Director* c) Shri K. Gopal Rao d) Shri Jayantilal R. Shah e) Shri Mansingh L. Bhakta f) Shri R V Madhava Rao—*Nominee Director of G I C.* g) Shri Ramesh U Pai h) Shri Natvarlal H Ambani—*Executive Director* i) Shri Rasiklal L. Meswani—*Executive Director* j) Shri Mukesh D Ambani—*Executive Director* k) Shri Anil D Ambani—*Executive Director* The proposed undertaking will be a unit of the applicant body corporate and will be managed by the same

C) Capital Structure of the applicant person or authority and of the proposed undertaking as on 31st December, 1984: a) Authorised Capital—Rs 850 Million. b) Issued and Subscribed Capital—Rs 519 7 Million The proposed undertaking will be a unit of the applicant body corporate and therefore will not have a separate capital structure

D) Proposed Location of the Undertaking. In Gujarat.

E) Brief outline of the cost of Project, i.e scheme and source of finance The Project Cost of the new undertaking is estimated at Rs 487 Million, including the cost of land, civil works, plant, machinery equipments etc. This is proposed to be financed through own resources/loans/issue of Debentures Shares etc

2. Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi within 14 days from the date of publication of this notice, intimating his view of the proposal and indicating the nature of his interest therein

# An American Nightmare

### GPD

> In some, madness must come in with breath, mill through the blood and be breathed out again. In some it goes up to the mind. Some take the madness and stop it with discipline. Madness is locked beneath. It goes into tissues, is swallowed by the cells. The cells go mad . . .

THAT is Normal Mailer in the epilogue of his famous novel "The American Dream". Unfortunately in real life we are nowhere near the epilogue of the American dream. The edition of the novel that we read was dated 1965 (a British edition; Book Club choice and all that). That was the year Mailer's countrymen began pounding Vietnam with about twice as much bombing as Europe took during two world wars together. We had thought then that the novel which features Jack Kennedy on its opening pages and talks of cells going mad in its epilogue was a remarkably contemporary novel although, one must hasten to add, it is not at all a political novel.

It is, indeed, frightening that good twenty years after the novel was written the cells continue to go mad. Indeed the dream has turned into a nightmare. How else does one describe the latest interview that Nixon has given to the *Time* magazine. The former President has held forth there on the nuclear factor in international relations. He has cited four examples of how and where the Americans thought of using nuclear devices. In two cases, i e, Korea and the Middle East, the nuclear threat was actually used successfully. According to Nixon, Eisenhower used the threat to bring an early end to the Korean war. Nixon himself had put the US nuclear forces on the alert during the Arab-Israeli war in 1973. It would have been small wonder if the Americans had not thought in nuclear terms when they were "waist deep in big muddy"—Vietnam. The third case was the 1971 conflict between us and Pakistan.

In exactly two decades (1953 was the year of the Korean ceasefire and 1973 was the year of the Arab-Israeli war) the American President had thought of using nuclear weapons four times. It is a frightening, nightmarish thought that the American President can coolly 'consider' the use of nuclear weapon (or nuclear blackmail) to bring about a desired change in a given situation. Want to go in for a political-economic system which the Americans do not like? Well, be prepared for the bomb then. It is extraordinary that such thinking does not earn odium these days as it once did when Hitler thought of and executed the plan of exterminating the 'unwanted' Jews.

The fourth case of the 'thinking' is curiouser still. It relates to the possibility that the Soviets were thinking in terms of pre-emptive bombing of Chinese nuclear sites. While it is nice to know that in the corridors of powers in big capitals some 'thinking' is always going on, it is frightening that the thinking relates to nuclear blackmail. There was lot of talk about a Sino-Soviet war towards the end of the sixties. (Who has not read Harrison Salisbury's "Coming War between Russia and China"?) What is new is the fact that Nixon was considering a nuclear intervention in the war which never occurred. The Americans just cannot get over their school-boy like fascination for the policeman's role. Or is it the case that in its degeneration late-capitalism tends to become an oppressive system dominated by silly people?

To be fair to Nixon, in none of the four cases was the nuclear weapon actually used. Thank god and the Statue of Liberty for it! In two cases the nuclear threat was actually employed. In our own case the conditions under which the weapon was supposed to have been used were the most unlikely conditions. The weapon would have been used if both the Chinese and the Soviets would have intervened in South Asia following the 1971 war between India and Pakistan. It's amazing that the Americans were so naive as actually to imagine that the Chinese could intervene even if they wanted to. It's a mystery why, as Nixon has put, the Americans "did not learn till later that they [the Chinese] did not have that kind of conventional capability". Although our professional China-baiters drew rather grim pictures, it is reasonable to presume that Indira Gandhi and her men knew that the Chinese did not have either the capability or the intention to intervene in the 1971 conflict. The Chinese never really pull anybody else's chestnuts out of the fire. And, indeed, why should they?

Nixon is probably again in a typical school-boyish manner talking big, and, of course, irresponsibly. But that's precisely where the danger lies. It would put god's fear in anybody's heart that the most powerful state in the world is run by people who do not distinguish between reason and unreason, defence and all-round destruction, power and arrogance. The Nixon interview is a signal reminder that these weapons are in the hands of nearly insane people. The cells have gone mad! Mailer's hero was a murderer after all. He could not have been anybody else.

GLOBAL ECONOMIC DEVELOPMENT
FINANCE & INVESTMENT
— A Survey of Socio-Economic and Legal Aspects
By ATTAR CHAND
Forewords by: VISHWANATH PRATAP SINGH
PRANAB MUKHERJEE
Dr. MANMOHAN SINGH
1985/Pp.550/Price Deluxe Edition Rs. 300/-

Global economic development, finance and investment are important topics to be studied in-depth. They are complicated subjects also. Documentary description and analysis of complex features especially of the fiscal structure should, therefore, be helpful to all persons concerned with the effects of taxation, whatever their views on public policy may be. It is for this reason that the learned author has engaged in study of monetary and fiscal policies, investment and economic development. The book presents a wealth of useful reading material and gives the reader a better understanding of the subjects, for further investigation and research on these timely topics. This book is a very good first step towards Documentation in the legal and economic areas and as such one of the few books which provide excellent guidance. Researchers and Legislators alike will depend on this book and Economists will welcome it. Government officials and tax experts will depend on it for the wealth of knowledge and its informed opinions. The book will serve every educational institution and industrial house. The book provides a useful source of information and, as such, is a welcome addition to the literature on the subject.

# Adding Another Dimension

**Hansavivek**

*GWALIOR RAYON SILK MANUFACTURING (WEAVING) COMPANY* proposes to further diversify into the fertiliser industry. It is seeking an industrial licence for setting up a gas based fertiliser plant for the manufacture of 4.5 lakh tonnes of ammonia and 7.5 lakh tonnes of urea per annum in UP. Meanwhile, the company has received offers from foreign technology suppliers for the sponge iron project. Further progress of the project depends on the clearance of matters of allocation and pricing of gas which are pending with the government. The construction work on the second cement unit for another half a million tonnes per annum is in progress and the erection work is expected to be completed by the first quarter of 1986. The clinkerisation plant of the first unit of half a million tonnes cement capacity was commissioned during 1984-85 in a record period of 18 months and about 3,000 tonnes of clinker was produced. The company has turned in good results for the year ended March 1985. It has earned a gross profit of Rs 28.41 crore on a turnover of Rs 380.57 crore against a profit of Rs 22.74 crore on turnover of Rs 318.27 crore in the previous year. These figures reflect increased gross margins. With provisions for depreciation claiming Rs 23.14 crore (Rs 12.65 crore) and tax liability Rs 55 lakh (nil), net profit has been halved to Rs 4.72 crore (Rs 10.09 crore). Equity dividend has been raised by 2 points to 22 per cent, which is slightly short earned as against an earnings cover of 2.25 times for the previous year's distribution. Sales of the viscose fibre divisions were 94,600 tonnes against 76,800 tonnes in the previous year. The offtake of Grasilene fibre was affected due to unrestricted imports and high incidence of excise duty. Production was only 4,960 tonnes i e, half the installed capacity. Production of pulp was also lower at 78,400 tonnes against 87,800 tonnes previously. The pulp plants at Mavoor and Harihar continue to face a serious shortage of pulp wood on account of non-fulfilment of their commitments by the state governments of Kerala and Karnataka. The Karnataka government has finally agreed to a joint afforestation venture. A joint sector company along with Karnataka Forest Plantation Corporation has been formed for the purpose of raising plantations of suitable pulp wood species. In addition, a farm forestry project has also been taken up in that state with the assistance of NABARD in an area of about 730 hectares. The farmers have already planted fast growing trees during monsoon of 1984. To assist these projects, the company has set up a Grasim Forest Research Institute at Kumarapatnam (Harihar) for developing nursery techniques and optimising the yield of wood. The directors point out that while the wood based industries in these states are facing serious raw material crisis, royalty on wood is being indiscriminately increased from time to time, the last one being made effective from April last. The incidence of royalties on pulp wood is perhaps the highest in the world.

The production of caustic soda in the chemical division was 80,600 tonnes against 74,960 tonnes in the previous year. The company is in the process of setting up a 50 tonnes per day capacity caustic soda fusion plant which is expected to be commissioned in the first quarter of 1986. The company has also received a letter of intent for the manufacture of stable bleaching powder with an annual capacity of 10,000 tonnes. This project will be implemented in two phases of 5,000 tonnes per annum each, the first phase of which is expected to go on stream also in the first quarter of 1986. With a view to popularising the use of viscose fibre as also to establish its own viscose fibre spinning capacity in the Eastern Zone, the company entered into a 'leave and licence' arrangement with the Eastern Spinning Mills and Industries, Calcutta, for running its spinning unit having an installed capacity of about 25,000 spindles for a period of three years from July 27, 1984. The engineering and development division has designed and manufactured, for the first time in India, sophisticated energy-efficient equipment which would enable it to achieve an appreciable saving in steam consumption. During the year, the company issued non-convertible debentures series II of the face value of Rs 15 crore for augmenting long-term working capital resources, which were fully subscribed. A further sum of Rs 25 crore is proposed to be raised by issue of such debentures, for which the company is securing approval of the shareholders. The company's foreign ventures *viz* viscose fibre joint ventures in Thailand and Indonesia, the carbon black project in Thailand and the textile plant at Philippines continued to operate satisfactorily. The joint-sector caustic soda project of Bihar Caustic and Chemicals was successfully commissioned. Due to the sluggish market for caustic soda, however, the market prices were not remune-

rative. Tamil Nadu Flourine and Allied Chemicals, another joint-sector project, commenced commercial production in March last.

*DHARAMSI MORARJI CHEMICAL COMPANY* has chalked out plans for expansion and diversification of its activities. It has secured letters of intent for annual manufacture of 33,000 tonnes of sulphuric acid and 66,000 tonnes of single superphosphate at Amreli in Gujarat and 10,000 tonnes of synthetic detergents and active detergent sulphonates at Roha in Maharashtra. The company's applications for increase in the licensed capacities of single superphosphate at Ambernath near Bombay from 2 lakh tonnes to 3 lak tonnes per annum, of single superphosphate at Kumhari in MP from 1.61 lakh tonnes to 2,13,700 tonnes per annum and of sulphuric acid also at Kumhari from 66,000 tonnes to 1,01,900 tonnes per annum have been approved. The management will take steps to implement these new projects in a couple of years. The company has also renewed the lease arrangement with Tolue-Chem Industries for its factory at Baroda for a further period of six years. The borrowing powers of the board have been enlarged to Rs 30 crore from Rs 2 crore sanctioned way back in 1968. The company has shown a fair improvement in its working results for 1984 with gross profit rising from previous year's Rs 3.91 crore to Rs 4.50 crore following an increase in turnover from Rs 53.85 crore to Rs 62.75 crore. These figures show a modest decline in profit margins. Net profit is Rs 2.63 crore (Rs 1.81 crore). Equity dividend, stepped up by 2 points to 20 per cent, finds a better earnings cover of 2.05 times against 1.56 times previously. These results have followed record high production of two of the company's main products in its 65-year career. The output of single superphosphate was 4,12,247 tonnes and of sulphuric acid 2,59,688 tonnes against 3,76,079 tonnes and 2,22,260 tonnes, respectively, in the previous year. The capacity utilisation in the case of the former was 114 per cent and in the latter 91 per cent. The company incurred capital expenditure of Rs 1.80 crore during the year and raised Rs 4.80 crore by offering 15 per cent secured non-convertible debentures of Rs 100 each to the shareholders. These debentures were allotted in February last.

*MAY AND BAKER (INDIA)* expects to commence commercial production at its new pharmaceutical factory under construction at Paithan, a backward area in Aurangabad district of Maharashtra, towards the end of 1985. When completed, this will be one of the most modern pharmaceutical formulation manufacturing units in the country conforming to the highest standards of good manufacturing practices. So far the company has been selling chemicals only for black and white photochemistry. It has now set up a new modern facility for manufacturing colour chemicals, since there has been a colour explosion in India in the last couple of years. The company has turned in good results for 1984. It has shown a higher gross profit of Rs 4.46 crore against Rs 3.89 crore in the previous year despite lower sales of Rs 37.53 crore against Rs 40.87 crore. The 1984 sales does not include the agrochemicals trading business which was taken over by the subsidiary, Rhone-Poulenc Agrochemicals (India). Net profit is Rs 133 lakh (Rs 119 lakh). The unchanged dividend of 15 per cent payable this time on all the 45 lakh equity shares requires disbursal of a higher amount and is covered 1.99 times by earnings as against 2.12 times previously. Sales of pharmaceuticals showed an impressive increase. In fact, they could have been still higher but for shortage of vital raw materials like codeine and alcohol which affected supply of certain popular drugs of the company. The directors say that a number of applications are pending with the government for price increases. Due to considerable increase in the cost of inputs beyond the company's control, the margins on products are constantly under pressure.

*INDIAN DUPLICATOR COMPANY*, an associate of Gestetner Holdings of London and which pioneered the duplicating machine industry in India half a century ago, is embarking on a multi-pronged diversification programme. It is entering the field of sophisticated plain paper copiers in technical collaboration with Copyer Company of Japan, a subsidiary of Canon. It has also received a letter of intent to manufacture electronic stencil cutting machines at its factory at Nasik in Maharashtra. The company's R and D department has developed a guillotine machine, which has just been introduced in the market. It has also developed a shredding machine, the production of which has commenced at the Nasik factory; and will be marketed next month. The company has also applied for a letter of intent for the manufacture of word processors at its Hyderabad factory. It will also introduce two models of electronic typewriters of TOWA, Japan, as OEM items and this will be followed by marketing of computers at a later date. According to D N Sarkar, Chairman and Managing Director, the copier project is estimated to cost around Rs 4 crore including Rs 2.45 crore as capital cost which is intended to be financed by loans from banks and financial institutions. The balance amount of Rs 50 lakh will be funded from internal resources. The working capital needs will be met by issue of non-convertible debentures of Rs 150 lakh on a private placement basis. The consent of the Controller of Capital issues has already been obtained in this respect. The copier project factory is almost ready at Hyderabad and the company hopes to commence production by May 1986. The electronic typewriters are expected to be launched by September 1985. Production of electronic stencil cutting machines is expected to commence by the end of 1985. Meanwhile the company has replaced the hand operated duplicator model 105 with an advanced manual duplicator model 145. It has also plans to manufacture electronic duplicators, for which it has already received a letter of consent for the supply of designs and drawings from Gestetner Manufacturing Company, UK. With the implementation of this programme, the company's turnover is expected to jump by 200 per cent and profit before tax by 250 per cent in the next 5 years. For the year ending October 1985, the company hopes to achieve a sales turnover of Rs 13.5 crore and profit before tax of around Rs 80 lakh.

*STEEL STRIPS*, an existing dividend-paying company engaged in the manufacture of various types of cold rolled strips, is to enter the market with a public issue of one lakh 15 per cent convertible debentures of Rs 200 each at par. Out of this, 42,000 debentures are being offered on a preferential basis to the existing equity shareholders, fixed deposit holders, employees and business associates and 58,000 debentures to the general public for subscription. The debentures will be fully converted into equity shares of Rs 10 each at a premium of Rs 10 per share after one year from the date of allotment. The issue is opening for public subscription on August 12. As part of its diversification programme, the company is setting up a Rs 7.65 crore scrap based mini-steel plant for the manufacture of carbon alloy and special steel and stainless steel billets with an installed capacity of 20,000 tonnes per annum. The project is being set up at village Rampur Bangaran in the 'no-industry' district of Sirmour in Himachal Pradesh. The company has already got a modern cold rolling mill complex at village Jitwal Kalan in Sangrur district, a notified backward area in Punjab which went into commercial production in 1980. In 1982, the company implemented a Rs 2.80 crore diversification-cum-expansion scheme to manufacture cold rolled stainless steel strips. Today the company operating from three cold rolling mills has an installed capacity to produce 24,000 tonnes per annum of cold rolled strips of mild, medium and high carbon and alloy strips. According to R K Garg, Managing Director, the company has achieved an impressive performance during the last three years. Its turnover increased from 11.55 crore during 1982 to Rs 15.36 crore during 1983 and to Rs 19.82 crore during 1984. It paid a dividend of 10 per cent for 1983 and 18 per cent for 1984. The issue is being managed by Merchant Banking Division of Canara Bank. Mehta Financial Consultants and Management Services is Advisor to the issue and Amrit Lal Bajaj and Company is Principal Broker.

*TATA BURROUGHS*, established in 1977 as a joint venture between Tata Sons and the internationally renowned Burroughs Corporation of USA, is going public at a time when the computer industry is poised for massive growth. At present the equity capital of Rs 250 lakh is equally held by the two partners. It is offering a linked issue of 6.26 lakh equity shares of Rs 10 each at a premium of Rs 15 per share and 2,50,400 secured redeemable non-convertible debentures of Rs 100 each carrying interest at 12 per cent per annum. An applicant has to apply for a minimum of 100 equity shares and 40 debentures and thereafter in multiples of 50 equity shares and 20 debentures. The subscription list will open on August 21. The issue aims at reducing the foreign equity holding to less than 40 per cent and augmenting the long-term working capital resources of the company. The debentures will be redeemed at par at the end of 12 years, but the company has the option to redeem them at any time after seven years. The company markets, installs and supports the entire range of Burroughs products in India and undertakes software development on a large scale. It manufactures computer peripherals at SEEPZ solely for export purposes. The company also renders computer consultancy services in overseas markets and employs over 600 highly trained professionals. According to M H Mody, a director, the company has firmly established its presence in 22 countries of the industrialised West. It has secured a letter of intent for the manufacture of the Magnetic Ink Character Recognition (MICR) document processing system. This will help bring rapid cheque clearance and improved customer service in Indian Banks. The project is estimated to cost Rs 224 lakh and is being set up at Mapusa in Goa, a backward area. It will be financed entirely from internal resources and Burroughs will provide the technical know-how. The company is also in the process of developing a software centre at New Delhi to cater to the Indian market as well as to further expand its overseas operations. The company has an impressive track record. Its export turnover has increased by 1,000 per cent. Profit after taxes has jumped from Rs 63 lakh in 1980 to Rs 245 lakh in 1984. The issue is managed by J M Financial & Investment Consultancy Services. Tata Consultancy Services' financial services division is consultant and advisor to the issue.

*BANK OF RAJASTHAN LIMITED* has achieved good progress on all fronts during 1984. Its advances to the priority sectors rose by 39.9 per cent to reach Rs 65.74 crore. Deposits recorded a growth of 23.6 per cent from the previous year's Rs 263.46 crore to Rs 325.65 crore in 1984. This is much more than the growth rate of deposits in the banking industry. The bank has again topped the list of the private sector banks in the country. The credit-deposit ratio of the bank as at end of 1984 was 55.75 per cent. During 1984, 11 new branches were opened bringing the total to 251. The bank intensified its efforts at increased financing to the weaker sections and the greater part of financing to priority sectors flowed to the weaker sections. During the year, such advances increased from Rs 5.97 crore to Rs 8.61 crore in 33,843 accounts. The total advances to the agriculture sector amounted to Rs 20.65 crore, showing an increase of 36.2 per cent over the previous year. Direct agricultural finance amounted to Rs 16.19 crore. The share of direct agricultural advances to the total priority sector advances reached the level of 24.63 per cent. The bank's advances under the IRDP increased from Rs 2.33 crore to Rs 3.04 crore and the benefit of this financial assistance was extended to 5,000 additional persons, increasing the number of beneficiaries to 18,555. Under the DRI scheme, the bank covered an additional 1,800 persons and the total advances increased to Rs 1.10 crore. The bank's advances under the 20-point programme rose from Rs 8.78 crore to Rs 18.31 crore, while the number of beneficiaries increased from 27,536 to 34,598. Similarly, the total number of beneficiaries belonging to scheduled castes and tribes was 22,012 at the end of 1984 and the quantum of finance provided to them rose to Rs 5.89 crore. Under the scheme for employment to educated unemployed youth, the bank exceeded its targets during the years ended March 1984 and March 1985, when it sanctioned financial assistance amounting to Rs 2.29 crore and Rs 3.24 crore to 1,359 and 1,607 persons, respectively, against the targets of 1,100 and 1,598 persons. The bank's operations resulted in a net profit of Rs 45 lakh and the directors have recommended a dividend of 15 per cent, subject to approval by RBI. The Chairman, J N Pathak, is highly optimistic about a favourable climate for the bank's functioning. His optimism is based on the "exemplary team spirit" in which the management and the staff of the bank are operating,

*GUJARAT STATE FINANCIAL CORPORATION (GSFC)* crossed the landmark of sanctions of Rs 500 crore during 1984-85, its silver jubilee year. During the year, the Corporation sanctioned loans of Rs 65.42 crore, which was the highest amount sanctioned in any single year in its career. Some 1,680 small scale units were sanctioned loans of Rs 51.71 crore, accounting for 97 per cent of the total number of units assisted and 79 per cent of the total amount sanctioned. Loans amounting to Rs 1.73 crore were given to 60 entrepreneurs under the liberalised 'New Entrepreneurs Scheme'. Loans of Rs 1.20 crore were sanctioned to 223 SC/ST entrepreneurs showing a rise of 37 per cent over the amount sanctioned during the previous year. Some 157 entrepreneurs were sanctioned loans of Rs 1.68 crore in 13 centres under the 'Door Step Programme'. According to R D Shah, Chairman, the Corporation's total assistance in backward areas amounted to Rs 245 crore to over 9,800 units. The share of assistance in the five 'advanced' districts of Ahmedabad, Baroda, Surat, Rajkot and Jamnagar, which was more than 66 per cent of the total assistance at the end of the decade of the 60s, was reduced to 36 per cent at the end of 1984-85. The Corporation has started implementing the IDBI's soft loan scheme for modernisation of industries. It organised a workshop-cum-guidance programme to create awareness for modernisation amongst industrialists. The Corporation expects to develop in-house computer facility before the end of the current year. The Chairman has welcomed the recent changes in the policies of the Central government which are expected to accelerate investment in industry. He feels that the ceiling of financial accommodation which the Corporation can provide under the SFCs Act will go up in view of the Bill introduced in the Parliament recently for amendment of the Act. This would enable the Corporation to expand its business in the medium scale sector of the industry.

*SUDERSHAN PLYWOOD INDUSTRIES*, a well-established dividend paying company is entering the capital market on August 5 with a public issue of 9 lakh equity shares of Rs 10 each at par to raise a part of the finance required for its Rs one crore project to modernise its plant and to manufacture 'Compreg Plywood' which is a special quality of plywood used by the railways and by the textile, jute and chemical industries. The company originally started manufacturing commercial grades of plywood like black boards and flush doors and over the years branched off to make varous technical grade speciality plywoods which find wide applications in several industries. It enjoys a wide consumer base and a strong brand image and has emerged as a market leader in plywood industry. Its products are marketed under the brand name 'Swastik'. It has 14 sales offices spread all over the country. The latest export-import policy of the government envisages liberal imports of timber and veneer. This will improve the profitability of the plywood industry, as imports are cheaper. The company has in hand substantial orders. According to S P Goenka, Chairman, the company has consistently earned profits since its incorporation. For 1984, it made a profit before interest and depreciation of Rs 112 lakh on a turnover of Rs 767 lakh. The outlook for the current year is even better and the company is confident of declaring a minimum dividend of 15 per cent for 1985. The shares of the company will be listed in Gauhati, Calcutta, Delhi and Bombay stock exchanges. The issue is being managed by the Standard Chartered Bank's Merchant Banking Division.

**PUNJAB**

# A Document of Good Intent

**Amrita Abraham**

SOLUTIONS to complicated problems always seem so simple and obvious after they have been found. This is so of the Punjab accord of July 24. The 11-point accord is not the 'solution to the Punjab problem' that many people, more in relief than through conviction, have called it. Even a cursory examination of the 11 points shows how loosely worded it is, how much has been left out of it, how any one or all of them could become the basis of another *dharma yudh* morcha. But the accord is certainly a way out of the *cul de sac* for the moderate Akali Dal leadership and particularly H S Longowal. All that the accord is is a document of good intent on both sides.

In Amritsar soon after Operation Bluestar Akalis and others said that only a long spell in jail would restore Longowal's credibility. When he emerged in April he still stood head and shoulders above the other Akali leaders as the man with whom the Centre could negotiate but quite soon again Longowal became enmeshed in extremist rhetoric and gesture as with the ceremonies for Beant Singh and Satwant Singh. If he was expected to demonstrate that the majority of Sikhs in Punjab was behind him and was eager for a restoration of the *status quo ante* through talks with Delhi or other means, he was unable to do so. Evidence that Sikhs by and large had not been mobilised to either moderate or extremist cause came from Punjab's rural heartland where they had ploughed and sown and reaped record quantities of wheat, rice and sugarcane as though the state's most politically turbulent year had passed them by.

In April it was clear that Governor Arjun Singh did not subscribe to the widespread romantic notion (at least outside Punjab) that some kind of new able Sikh leadership would rise from the ashes. The new administration accepted that Punjab would have to do the best it could with the very same Akalis, tainted, contentious and limited men. It is only more recently that Baba Joginder Singh's United Akali Dal and the AISSF have shown that they cannot throw the Akalis into complete disarray. But during these last four months their mere existence and rhetoric were enough to produce the kind of nervous reflexes from the moderate Akalis which Bhindranwale produced during 1982 and 1983: the fear that extremists would seize advantage from any sign of softening towards Delhi. Once again the list of outstanding issues grew as it had between 1981 and 1984 and every partial concession from the Centre provoked deeper suspicion. In early May Balwant Singh, former Akali finance minister, and one of the triumvirate that met Rajiv Gandhi in July at the accord, explained the Centre's then tentative moves to 'restore normalcy' in Punjab as efforts to "finish our leadership and downgrade the popularity of the Akalis" and to "dictate terms".

According to him it was no use trying to discuss the pre-Operation Bluestar agenda over which the Centre had shown such intransigence (he said there had been four meetings between the Akalis and the former prime minister, seven or eight with her emissary, Swaran Singh, five or six rounds with a cabinet sub-committee in Chandigarh as well as tripartite talks with the opposition until June 1984). Before negotiations on those outstanding issues could take place the Centre must demonstrate its "sincerity" by acceding to Akali demands—an enquriy into the November riots in Delhi, the release of Sikhs and AISSF members still in jail, withdrawing the special courts, reinstating jawans, referring the Anandpur Sahib resolution to the Sarkaria Commission. All this, he said, would remove some of the Sikh sense of grievance and he implied that it would allow the Akalis to negotiate on the older issues without appearing as 'traitors'.

To demonstrate how the July accord is not an agenda for future action but only an earnest of good intent: when Balwant Singh spoke of an enquiry into the November killings, the Centre had already finally conceded such an enquiry but Balwant Singh said Sikhs were still suspicious because no judge had been named or terms of reference set out. When this was done, the Akalis demanded that the enquiry should be enlarged to cover other cities. The July accord enlarges the enquiry to include Bokaro and Kanpur leaving out, for instance, Madhya Pradesh cities. This compromise from the Akalis is met on Rajiv Gandhi's side by him dropping the proposal he once made to include 'riots in all of Punjab' in the enquiry.

There is similar compromise from the Akalis on jawans who are not to be reinstated but "rehabilitated and given gainful employment". Special courts are not abolished outright as the Akalis demanded but will try only those charged with sedition (waging war) and hijacking; other cases will go to ordinary courts (where one assumes hearings will not be in camera, where bail will be possible and where witnesses can be cross-examined by the defence). Even this proposal had been aired by Delhi through the press in April and May and been dismissed of hand by the Akalis. All these points in the accord and the first one on ex-gratia payment and compensation to "innocents" killed in agitation or any action after August 1, 1982, are a preamble so to speak, to the rest of the accord.

It is on points 5, 7 and 9 that the Centre's chickens will come home to roost. The All-India Gurudwaras Act is what the SGPC wants for obvious reasons: it already controls enormous funds because of its control of gurudwaras in Punjab and would vastly extend its powers and finances if gurudwaras outside Punjab came under its control. In the last four years the morcha has been limited to Punjab largely because the Akalis and SGPC did not have control of scores of gurudwaras in other parts of the country and the chief priests of Nanded and Patnasaheb had taken independent lines on several matters or remained passive. Sikhs outside Punjab are unlikely to support such an Act.

On the other hand, Indira Gandhi had intended to amend the Gurudwaras Act following the appalling record of the SGPC in order to empower the government to intervene in certain situations, e g, to prevent gurudwaras providing sanctuary to terrorists. It was met with outrage by Sikhs everywhere and especially the SGPC and Akalis. Just now point 5 on the accord is vaguely worded and both the Centre and the SGPC are left to believe they will get what they want out of the Bill.

Territorial claims are mentioned in the accord in the same ambiguous fashion. Indira Gandhi insisted at all talks that Chandigarh and Abohar and Fazilka were one package, according to the 1970 award. Harkishan Singh Surjeet, the CPI(M) leader, said in an article last year that after Asiad when talks were resumed with the Akalis, the government had announced acceptance of the Akalis religious demands, the opposition had persuaded the Akalis to drop the Anandpur Sahib resolution from the agenda and settle for an examination of Centre-State relations, agreement had been reached on the river waters dispute as well. "Only one major problem remained". This was the territorial disputes and agreement broke down because Indira Gandhi insisted on the 1970 award. When she did finally accept the opposition consensus on this question—that Chandigarh would go to Punjab and certain Hindi-speaking areas would go to Haryana together with finance for a new capital city—it was over a year later during her June 2, 1984 radio broadcast and by then Operation Bluestar had begun.

The July accord says much the same leaving the same scope for dispute over how the principles of contiguity, linguistic affinity and the village as a unit for determining Hindi-speaking areas will be determined. (Boundary questions will go to a separate Commission.) The Lok Dal, BJP and Bhajan Lal have all expressed themselves on these principles to suggest that the outcome would be Abohar and Fazilka. At this stage Rajiv Gandhi is leaning on the Hindus to make concessions just as his mother leaned on the Sikhs throughout 1982 and 1983. The sudden enquiry announced into charges of corruption against Bhajan Lal may be calculated to quell him for the time being. If Bhajan Lal doesn't try to scuttle the accord the Lok Dal and BJP are trying hard to.

On river waters there is even more reason to believe that Rajiv Gandhi is hoping that with his massive Congress(I) majorities in the Centre and in the concerned states he will be able to manage the resentment and disaffection. Rajasthan clearly stands to lose a great deal of future water if the Commission, as the accord requires, decides on the basis of quantum of water used as on July 1, 1985. Since the Rajasthan canal has not been completed the state uses far less than the 8 MAF it was awarded in the 1955 inter-state conference. Quite how Rajiv Gandhi explained away this problem to Harideo Joshi is not known but the chief minister was certainly clear that he would not be able to sell the idea to his partymen and the Rajasthan Assembly was adjourned *sine die* immediately after the opposition no confidence motion was defeated.

It should be obvious then that the accord is a hornets' nest. The trick is not to disturb it until normalcy is restored in Punjab. Theoretically there is a lot of time (perhaps two years) for Rajiv Gandhi, confident of his vast majorities in the Hindu states, to go on leaning on Haryana and Rajasthan. But some of the deadlines in the accord (the transfer of Chandigarh by January 26 next tied to the commission on the *quid pro quo* for Chandigarh giving its award by December 31, 1985 which will be binding on both sides) suggest the Centre is hoping to carry through the current process in Punjab to an election before October 6 when President's rule must end. Contention and disaffection in Punjab when it comes to the fine details of river waters or the Gurudwaras Act or anything else can be postponed or spread out over months and years under an elected government as is democratic practice in the country and the link between unsatisfied religious, political and economic demands and the Akali-SGPC religio-politico mobilising machine will have snapped. This appears to be the thinking just now. But it presupposes an elected Akali government.

It is interesting also to see how Rajiv Gandhi has turned somersaults over what wer were told during the elections was the bottom line. The Anandpur Sahib resolution in toto was seditious. After the elections it turned out that only parts of it were seditious. When the Akalis failed to respond to this nudging the Congress tried one of its standard ploys. In Delhi in April there suddenly sprang up a Sikh Youth Forum, a child nobody would acknowledge as theirs but there it was on a dharna outside the offices of the Sarkaria Commission demanding that the Anandpur Saheb resolution on Centre-State relations should be referred to the Sarkaria Commission. The dharna was lifted when a government spokesman said the demand would be considered. Reliable sources said this was the Congress(I)'s face saving way of telling the Akalis that even the Anandpur Saheb resolution or parts of it could go back on to the agenda!

Just as the hawks and fundamentalists at one end of the Akali Dal spectrum (Tohra, Talwandi and even Bhindranwale) became crucial counters in the Congress(I)'s Punjab game, in this season of compromise it is others, the go-betweens, men with one leg in each camp, who become key players. Such a man is Balwant Singh who spent most of the last four years cultivating his large business enterprises in Punjab, who was never taken seriously as a spokesman of the Akali position on any question and whose credibility with the people and rank and file was rated very low because he was once a Congressman and had kept his connections alive. But Balwant Singh turns out at this twist on the road to be the man trusted by the Governor Arjun Singh and the moderate Akali chief Longowal.

The July accord shows the disposition of forces in Punjab since this April was such that Longowal was unable on his own to mobilise clear-cut support. He now has a platform to do so. But though he can present the accord as a victory for the Akalis and his leadership, his colleagues, Badal and Tohra (with the AISSF and Joginder Singh in waiting), have the potential to turn it into a defeat through the now normal procedures of recruiting religious leaders, congregations of Sikhs, etc. The course on which Longowal and Rajiv Gandhi have embarked requires logically and soon that Longowal and his supporters should win an election. Will Rajiv Gandhi let that happen? Can he rein in the divided Congress(I) in Punjab and allow them only just so much of a role as to split the Hindu vote between the BJP and themselves?

# The Karamchedu Killings

## The Essence of the NTR Phenomenon

**KB**

"HE who sets his heart on Lord Krishna and thinks of him steadfastly gets as much benefit as from an *Aswametha Yajna*; he who does *pranam* to Lord Krishna verily gets ten times the benefit . . . ". Thus, a honeyed brahmin's voice blaring from the loudspeaker fitted to the top of a two storeyed building in the village of Karamchedu. Just beneath the loudspeaker is a painted board which says that the top storey of the building—or a part of it—houses a *Lakshmimandiram*; and the picture rises before your mind's eye of devout housewives of caste-Hindu landed families sitting cross-legged on the floor nodding their heads in appreciation as the brahmin goes on to say that "one should hear the secrets of the Gita from a man born to noble *samskaras*, and one understands the message according the *samskaras* of one's birth".

The day is Monday, July 22, 1985. Just five days earlier, a 3,000-strong mob of caste-Hindu (Kamma, to be precise) landholders of the village had assaulted the madigas (chamars) *en masse* and killed six men and raped three girls. As the Gita *pathan* goes on in the *Lakshmimandiram*, barely 20 of the 300 madiga families are in the village. The others have fled the village, to look after the injured in the hospitals at Chirala or Guntur; or to seek refuge in a Church compound in Chirala. The walls of the Church say "Come unto Me" in bold letters; they came unto Him (in part because most of the madigas are Christians, and in part because He is in possession of the most durable structure in Chirala), but He has given them no better shelter than the shade of a couple of mango trees, which can keep neither the sun nor the rain out.

Karamchedu is a big and prosperous village of Prakasam district in coastal Andhra. The coastal villages of this district are major cultivators of cotton and tobacco, and Karamchedu is one of them. The attendant prosperity is evident in the well-built (and no longer shoddy as of yore but quite slick-looking) buildings with TV antennae sticking out from the top, and the substantial number of scooters, motor cycles, tractors, and even an odd car that slush through the muddy streets.

Most of this wealth is concentrated in the hands of a few Kamma landlord families; one of them, Daggupati Chenchuramaiah, being none less than the father of NTR's son-in-law and leader of Telugu Desam's youth wing, Venkateswara Rao. Among the others are well known film-producers, not to mention lesser operators of the film business. While not all the Kammas in the village are rich, the fact that their community is about 6,000 strong in a village of 10,000 people has given the dominant sections of the community tremendous power. And they appear to have put it to good use. The stronghold they have over this prosperous and 'developed' looking village is remarkable. The madigas and malas (the two major harijan castes of Andhra) of the village, numbering about 450 households, live in conditions reminiscent of the helotage of ancient India. Most of them own no land (just 16 of the 300 madiga families possess land, and that too just about half an acre), and depend entirely upon leasing in or labouring upon the land of the peasants or landlords. Those who lease in land are forced to perform chores in the landlord's fields or house, in addition to paying the rent. The annual farm-servant (*paleru*) is paid about Rs 2,000; if he is unable to complete the full year's work for which he has contracted, he is forced to quit without being paid a single paisa. Absenting himself for one day would entail being beaten and manhandled. In the words of Tella Judson, a madiga of the village, "a *paleru* who has worked all the year cannot be sure of getting his payment until the last month is through, and the crop is harvested and deposited in the landlord's granary". The payment for daily wage-labour is also surprisingly low by coastal Andhra standards. The men are paid about Rs 10 to 12 and the women Rs 6 to 8.

The harijans do not appear to have received much help in resisting this domination. The Left in coastal Andhra has generally been more popular among the propertied classes (especially in the villages), leaving the harijans to the Christian missionaries, and the politics of patronage perfected by the Congress. Indeed, caste-wise it is Kamma gentry and peasantry that has shown a general preference for the Left, especially the CPI(M); the fact that one important reason for this partiality is the very patronage that the Congress has afforded the harijans is a shameful commentary on Left politics, but is nevertheless an undeniable truth. The other important factor is that in the choice of leadership the Congress has shown a general aversion towards giving the leading role to coherent and well organised landed communities settled in prosperous and fertile regions, and has preferred to give a disproportionate importance to decrepit and unorganised sections of the gentry, or economically powerful sections of the backward communities. This was the only viable policy for holding the immensely varied sections of this country's propertied classes together; for if the political lead had been allowed to economically powerful communities, that would have resulted in what our newspaper editors call 'fissiparous tendencies", to the fatal detriment of the unity of the ruling classes so essential for their survival. Indira Gandhi—perhaps more than her father—was an expert in handling this stratagem. But the incongruity inherent in such a tactic was not in line with the party's green revolution economics which gave more and more prosperity to precisely those who felt they were being denied their fair share of political power. And their ranks were strengthened by the rise of new sections and a new generation enriched by the green revolution and all that it has entailed, and who have little loyalty and lots of impatience with the structure of the past. The Congress Party's ambition to technologically modernise the country without altering the political structure suitably has now caught up with it, and it is paying for its folly all over the country at the cost of considerable bloodshed. With the rise of Telugu Desam party, this incongruous distance of the prosperous sections of the gentry and their new-rich fellow-travellers from the seats of political power has been bridged; it implies, of course, short-sighted self-assertion which is inimical to what Rajiv Gandhi and his late mother like to call 'national integrity' (which is properly understood as the unity and integrity of the propertied classes) but that is not our concern right now.

What is of moment is that it implies more violence on the rural poor. It is a matter of historical accident (for these forces of arrogant self-assertion are present as much within the Congress as outside of it) that the violence takes the form of electoral conflict, with the landed classes backing the Telugu Desam and its allies (CPI, CPI(M), BJP, etc) and the harijans, the Congress(I). Small wonder then that the national opposition parties (we call them 'friendly opposition parties' in Andhra) have been maintaining a shamefaced inactivity in the face of these assaults, while the Congress(I) is extracting maximum propaganda mileage as the blood flows. Karamchedu is only the last of a series of incidents. The very first elections that brought the Telugu Desam to power in 1983 saw the burning of harijans at Padirikuppam in Chittoor district. Four persons were killed and about 80 houses gutted; property worth Rs 6 lakh was destroyed. In this year's Assembly elections the assaults became more widespread, though less fatal. According to press reports, assaults took place on harijans at Muthukur, Veerareddypalem, Brahmanatangel and Vadamalpet in Chittoor district; Dharur, Chilapur and Alampalli in Rangareddy district; and Venkatakrishnapuram and Chimalamarri in Guntur district. As at Padirikuppam, the attacks took the form of house-burning. Harijan houses burn easily, especially if it is the summer months. Thirty houses were burnt and 71 persons hospitalised, but mercifully no one died. Oddly enough, while we do not know how many of the landed classes were arrested, 60 harijans were taken into custody for rioting. And just in case somebody thinks it is only the Kamma gentry that has gained moral strength from the accession of NTR to power, let it be recorded that at Padirikuppam the arsonists were Naidus, and in the Rangareddy villages they were Reddys—which happen to be the dominant landed castes of the respective areas.

Now it is Karamchedu, and with an unprecedented degree of brutality. There was trouble in the village during the recent Assembly elections, with the harijans defying the landlords and voting for the Congress(I). That conflict merely added some more heat to the cauldron. On July 16 there took place an incident that set off the explosion. There are two drinking water tanks in the village, one for the harijans and one for the caste-Hindus. At about 4 o'clock in the evening of July 16 a Kamma youth by name Srinivasa Rao was feeding bran to his buffalo near the harijans' tank. Some of the bran dribbled down into the tank. A madiga woman by name Suvarta, who had come to fetch water, objected to it, and there was an altercation. Srinivasa Rao took out the thickly plaited rope used for beating buffaloes, and beat Suvarta with it. The girl is said to have grabbed at the rope and beaten him in turn. Some more people joined issue on both sides but the quarrel was soon settled. That night the Kamma youth came to Suvarta's house and dragged her out. But the neighbouring women interceded and sent away the youth. The harijans thought the issue was closed, and therefore did not anticipate what happened the next day.

That night the Kamma youth gathered at a brandy shop in the village and took a decision to attack the madigas (the other harijan caste, the malas, were deliberately spared). Their fellow-castemen from neighbouring villages were mobilised through openly communal and provocative slogans. ("If you are born to a Kamma you come out, if you are born to a madiga, then don't.) A mob of 2,000 to 3,000 then gathered in tractors and motor cycles and surrounded the madiga houses from all sides. The surprised madigas ran for life. Some ran into houses, some hid under haystacks, and some ran into the fields. But the pursuers were unrelenting. They ransacked houses and hacked at the doors and walls with axes. Duddu Vandanam and Duddu Ramesh were caught running out of their houses, and were attacked with axes. Vandanam died immediately and Ramesh four days later in hospital. Those who ran into the fields were chased and murdered in the fields. Tella Yevasu, Moshe and Muthaiah were killed thus. The way the 70-year old Moshe was killed is illustrative of the massacre that took place that day. He first begged with them to spare him, for he was an old man. When they started beating him, he ran into the fields. They caught up with him, hacked him with an axe, and as he fell down on his back, they dug a spear into his groin and twisted it. Muthaiah and Yevasu were also beaten with sticks, axed and speared to death in a similar fashion. Duddu Yesu was another person who was axed and died five days later in hospital, taking the death toll to six. About 20 others were hospitalised with severe injuries on the head and limbs.

The women were treated equally brutally. They were dragged out of the houses, stripped and molested. Three young girls, Mariamma (11), Victoria (13) and Sulochana were raped; after raping them a stick was dug into the private parts and twisted. Sulochana, who was married and pregnant, aborted in hospital. It is not certain the girls will survive.

It is only to be expected that politicians would make capital out of this brutality, especially considering that the chief minister's own people are probably involved in it. But in AP the Congress(I) is the only party that can make such capital, for the other opposition parties are too much beholden to NTR for the measly seats they have in the Assembly or Parliament. They have therefore been content with making condemnatory statements. The Congress(I) appears to be on the road to making a big issue of it. Legend has it that when a similar massacre took place in Belchi during Janata Party's rule, Indira Gandhi rode into the village on an elephant to comfort the bereaved. Vengala Rao, the Congress(I) chief over here, was either unable to procure an elephant or realised that the heavy beast would find it difficult to navigate the muddy black soil of the cotton tracts in these monsoon months, and so chose a more modern mode of transport. Neither he nor his party is doing anything to help the refugees who have camped in the church at Chirala, but they are out to pull down the state government if they can.

A more realistic question is whether the guilty will be punished. For the estimated 3,000 assailants, a mere 11 have been arrested till now. Most of those whom the victims have identified by name have vanished from the village. "They might even have gone to London, for they are rich people", says the equanimous Superintendent of Police of the district. Though 3,000 people could not have found themselves armed with axes and spears spontaneously and simultaneously, he refuses to consider the possibility of a criminal conspiracy. If you press him further for stringent action, he says virtuously: "What do you want me to do, gather all the thousands of Kammas at the police station and beat them up?". We do not, indeed, but we do know what would have happened if it had been the other way around and the labourers had attacked the landlords and killed half this number. One shudders to think of what would have happened then.

# The Choice Ahead

### Lawrence Lifschultz

GENEVA: The fourth round of UN sponsored talks on Afghanistan ended in Geneva on June 25 with muted voices expressing the hope that diplomacy might yet outpace the runners of war. For those on the outside looking in it was difficult to unravel the sonorous and solemn phrases spoken at the end of the session by various diplomats

Diego Cordovez, the mediator at the centre of the UN effort spoke carefully and positively about the end of the 'deadlock' which had prevailed since 1983. What Cordovez indicated was that an important advance had been made in drafting the document which could become the basis of a comprehensive settlement, if more powerful factors permit.

In fact, three out of the four principal sections of the draft agreement have for all intents and purposes been settled between the negotiating parties. This is at the core of the advance which was achieved in Geneva during the latest round of proximity talks between Afghanistan and Pakistan. The three diplomatic 'instruments' as they are called *which have been resolved* concern the principles of 'non-interference', international guarantees, and the return of Afghan refugees.

It is the fourth 'instrument' which still remains unsettled. Its substance is best summarised by the phrase which, is at its centre; it is the instrument of 'interrelationships'. It is the final act of the agreement and is the binding element which links all other parts of the document into a form which will secure the unity of the settlement in what negotiators have termed an 'implementable' form.

Thus, it is this fourth instrument, which remains the nut to be cracked. The 'interrelationships' within the fourth instrument are the *pivot* on which the entire negotiations hinge, and the outcome will be crucial in shaping the contours of Southwest Asia's politics in the decades ahead.

What is involved in this final protocol is the relationship between the withdrawal of Soviet forces and Pakistan's agreement to restrain insurgent activity originating within its borders. Its terms are designed to allow both the withdrawal of Soviet forces and the repatriation of refugees under as near peaceful conditions as possible.

The differences which exist between the two sides on this question are the subject of profoundly complicated forms of elocution by the respective negotiating sides. Each wishes to explain the terribly complex and involved nature of the problem and the burdensome tasks involved in the diplomatic effort to resolve the question. Elegant phrases are turned, an intellectual architecture is arranged, and the mystification of the diplomatic world is invoked. The public is left blinking to grasp an understanding of what actually is going on. However, despite this organised lack of clarity the outstanding problem has precise features.

The remaining difference between the two sides is in fact quite straightforward. The Pakistan side has stated that the Soviets will not withdraw their forces unless and until external interference has ended. Pakistan on its part will not give guarantees that it will restrain cross-border operations until it is confident that the Soviets will withdraw their forces. If this type of posturing is maintained on both sides, the negotiations can go around in circles for quite a long time with various personalities with long experience in the field of foreign affairs enjoying periodic trips to Geneva.

The only distraction, of course, will be the mounting civilian dead as ideologically motivated fighters pursue the war which their various patrons have already declared cannot be militarily won, even if it can yet be substantially escalated on both sides.

## DIFFERENCE NOT PROFOUND

In spite of what some quarters would like believed, the diplomatic difference between the two respective positions with regard to the fourth instrument is not very profound or complex. It is, in fact, paper thin. Mediators have already indicated to both sides that the form of wording for the fourth 'instrument' of the text can be arrived at which will satisfy the specific concerns of each side. It remains as always a question of political will in both camps whether this shall be done.

The Afghan and allied Soviet position has insisted that the fourth instrument should be formulated in a 'consecutive' framework. The condition of 'non-interference' and guarantees regarding the end of cross-border operations are to be given primacy, and then the withdrawal of forces is to be linked in a 'consecutive sequence' to this understanding. The Pakistan side has argued for the two principles of 'non-interference' and 'withdrawal' to be simultaneously linked with the guarantees on the cessation of cross-border operations becoming effective once the time-frame for a withdrawal has been established.

Although they have repeatedly stated that they will commit themselves to a specific schedule of withdrawal once all provisions of a settlement are satisfactorily resolved, the Soviets on their part are reluctant to commit themselves publicly to an exact time-frame for withdrawal unless they are confident that as they withdraw cross-border operations will not be escalated. They fear that certain American quarters obsessed with new Cold War 'roll back' conceptions would not be wholly averse to such a development. However, the Soviets are not prepared to undertake a withdrawal that is paralleled by a stepping up of covert operations based from Pakistan. This is the basis of their insistence on the 'primacy' of 'non-interference' over 'withdrawal', and that the Pakistan government's guarantees be more than pro-forma ones.

Although both positions have elements of narrow substance grounded in distrust, they each also possess the quality simply of diplomatic 'postures' and negotiating 'stances'. Whether the ultimate form is 'consecutive', 'simultaneous', or another variation in diction, the essence of the only agreement which could ever be arrived at must encompass secure commitments on both features—the staged withdrawal of Soviet forces and the cessation of cross-border operations based from Pakistan. UN negotiators have made clear that the language of agreement can be found to resolve all existing problems including the possible deployment of a UN border enforcement force. But, first a co-ordinated commitment from both sides for a solution must be exercised. Simply put, if there is a will there can be a way.

### POWERFUL VESTED INTERESTS

If the talks collapse over the formulation of this point, it will not only be absurd, it will be due to the fact that more powerful influences have been brought to bear by forces which perceive much greater gains deriving from a failure.

There now exist real material interests which have little to gain from a comprehensive peace settlement. Certain sections of the military and intelligence bureaucracies both in the US and the USSR, to speak nothing of sister agencies in Pakistan and Afghanistan, have acquired huge budgetary allocations premised on current trends in the Afghan war and preparations for wider wars yet to take shape in the region. *The Washington Post* last January reported that the budgeted increase in the CIA's secret aid to the Afghan insurgent forces would rise to $ 250 million over the next year, making it the largest covert programme since the Vietnam war. According to the *Post* the programme was designed to support an estimated 200,000 to 300,000 insurgents or roughly half the size of the Pakistan army. A Geneva settlement would not be welcomed in some quarters since it would place in fundamental jeopardy existing plans of military development and deployment by removing the underlying rationale for their expansion.

However, developments on the Afghan front are dwarfed by comparison with plans for wider regional military alliances. On Jaunary 1, 1983 the United States Central Command (USCENTCOM) was officially activated as a regional military formation with a command area of 19 countries along an arch stretching from Kenya and Somalia, across the Middle East and ending in Pakistan. Originally termed the Rapid Deployment Force (RDF), the USCENTCOM has 300,000 troops at its disposal for deployment in the countries surrounding the Gulf region. Bewteen 1984-88 the sum of $ 13.6 billion is budgeted to be expended on development of the command and its supporting structures in the region. This will be the largest single infusion of military expenditure ever made in a co-ordinated manner among the various states in the region under US aegis.

Originally conceived as a response to the deterioration in the US regional position in the aftermath of the Iranian revolution and the Shah's demise as the principal pivot in American strategic planning for the Gulf, US military planners perceived the need of a force which would be the basis for projecting US military power quickly into the area. Pakistan is an important component in the strategic coalition US planners are projecting for the entire Gulf region involving several levels of military integration and deployment. In testimony before the US Senate Foreign Relations Committee during the original hearings on aid to Pakistan, former Under Secretary of State James Buckley, described Pakistan's position within US strategic planning as "an essential anchor of the entire Southwest Asian region".

The contours of American policy have developed along lines similar to recommendations which were first set out in the 1980 Rand Corporation study on Pakistan's security. The Rand report stated, "The United States is currently building a rapid deployment force to protect Western access to oil . . . Pakistan could serve as an extremely important entrepot for an RDF moving into the . . . Gulf from the East, i e, from Diego Garcia or the Philippines . . . Furthermore, there is the possibility that the Pakistan army could serve as a proxy force fighting in the Gulf." The Rand study concluded that Pakistan's generals would only "be induced to co-operate in an American scheme for defence of the . . . Gulf, provided once again that the United States undertakes to protect Pakistan from the consequences of such a decision".

### 'FORWARD POLICIES'

Both the Americans and the Soviets are moving ahead with 'forward policies' which will bring their massive military establishments into closer proximity and possibly direct confrontation in a region where for decades 'great power' conflicts had been mediated by buffer states, and where local military forces had never been called upon to engage in the serious risks of 'front line' confrontations on behalf of distant benefactors. The stakes across the region are growing perilously. But, for those committed to the further structural development of deepening military alliances, no profit will be derived from a successful resolution of the current Afghan negotiations.

The Soviets on their side have already suggested that if the coming phase of the negotiations do not advance towards a settlement then they will extend their own violent 'forward' policy in Afghanistan with a possible five-fold increase in their forces deployed against the insurgency. The symmetry is remarkable on both sides. Elements in each are convinced that a further escalation on their part will yield favourable results for their cause.

This 'see-saw' escalation on both sides of the Durand Line once begun in earnest will be difficult to draw back from and will permanently alter the options which still exist (if only just) for the societies on both sides of the boundary. If the region's present conflicts widen, it remains an open question whether the Pakistani state, as it is presently constituted, will be able to internally sustain the political strains placed upon it by the strategic demands that will inevitably be required of it.

The key point which requires understanding is that the only possible basis on which the Afghan negotiations can reach a successful conclusion is if the prevailing momentum towards militarisation, the fostering of garrison states, and the extension of covert warfare is halted. There can be no settlement unless and until there is a genuine stepping back from existing policies of esclation on the part of both the United States and the Soviet Union. In short, unless there is a sharp interruption in the entire trend of the past five years, a settlement will not be secured.

The statement by Diego Cordovez, the UN mediator, made to this correspondent in a detailed interview published in May (*The Muslim*, May 16, 1985) was not one of casual understatement, when he claimed no solution was possible without 'broad political support' from the superpowers. Without a genuine co-ordinated commitment to back a diplomatic settlement, the text of which virtually exists, there will be no agreement and the formal diplomacy displayed at Geneva will in retrospect be proved to have been an illusion. But, that stage has not yet been reached. Indeed, what is crucial about the present moment is that the possibility of achieving a solution does exist, but if it is to succeed then restraint must now be imposed on those who possess a vested interest in the collapse of the negotiations. The 'intra' and 'inter' bureaucratic battles are now underway, not merely in Islamabad and Kabul, but also in Washington and Moscow.

### OUT OF THE SHADOWS

The formal meeting in Washington between US Assistant Secretary for Near East and South Asian Affairs, Richard Murphy, and the Chief of the Middle Eastern Department of the Soviet Foreign Ministry, Yuli Alekseyev, in the two days preceding the opening of the Geneva-IV round was a modest gesture on both sides signifying positive support for the UN process. The United States has now publicly shifted from a policy of 'active benign neglect' in its attitude toward the UN effort to one of benign support. But one could hardly regard the shift yet as having taken on a dimension of a creative dynamic diplomatic effort behind the UN draft agreement.

Nevertheless, senior State Department officials have recently begun briefing journalists in a style meant to dispel the cloud which had gathered around the April-June 1983 round of talks, when American diplomacy appeared distinctly uninterested in essentially the same terms which two years later are again on offer in Geneva. State Department officials have denied allegations that the US was either interested in 'fighting the Russians to the last Afghan' or of 'bleeding' the Soviets in a protracted and indeterminate conflict.

The Soviets have also come slightly out of the shadows. During the Geneva discussion a senior Soviet emissary, Nikolai Koserev, with special responsibility for Afghanistan was present throughout the talks and remained available for consultation to the Afghan delegation. Despite Soviet/Afghan insistence on a 'consecutive' formulation to the fourth instrument of the text, the Soviets through the presence of Koserev appeared to regard the Geneva talks as a serious venue.

However, the Soviets must face up to some hard questions if the reported remarks Gorbachev made to Rajiv Gandhi about Soviet willingness to accept a 'neutral, non-aligned Afghanistan' is to be realised. The outstanding issue still remains the composition of the regime or national coalition that would emerge in Kabul, if a settlement were to occur.

It is more than slightly ironic that Vasily Safronchuk, the senior and most powerful Soviet emissary in Kabul, as far back as 1979 used to openly discuss with his American colleague, Bruce Amstutz, the need of the Kabul regime to broaden its political base. American Embassy documents from the period quote Safronchuk as saying to Amstutz in June 1979, "They [DRA/Democratic Republic of Afghanistan] will neither allow any opposition, nor do they wish to share power . . . They are stubborn people."

Six months prior to the Soviet intervention, Safronchuk told Amstutz that it would be unwise for the Soviet Union to bring in Soviet forces to support the regime in Kabul. The Soviet emissary quoted Lenin to the American diplomat saying, "Every revolution must defend itself".

According to Amstutz's cable (June 25, 1979), Safronchuk "said that were the Soviets to bring in troops, this would have bad repercussions internationally. He [Safronchuk] explained, "It would harm SALT and the position of the Soviet Union in the world." He then added, "Quite aside from international considerations, it would be bad policy in terms of internal Afghan affairs. I [Amstutz] observed that Soviet troops would have a difficult time in this rugged, mountainous country. He [Safronchuk] nodded his head vigorously."

A great deal of water has since gone over that particular dam and flowed down river into a variety of tributaries, but some of the issues no doubt remain. A negotiated settlement implies that the regime in Kabul would be reconstituted involving a much 'broader political base'. It has been implicitly assumed throughout the Geneva negotiations that a process of political accommodation would occur in phases—before, during and after—the disengagement period which would bring non-PDPA elements into a national coalition.

### MAJOR CHANGES NEEDED IN KABUL

Between the next Geneva round which is scheduled for August 27 and the convening of a final session—perhaps in next February—where a text would be signed, it is expected that certain concrete measures would be taken in Kabul which would clearly point in the direction of a government of national reconciliation, reflecting movement towards a 'neutral, non-aligned Afghanistan'. The complicated and difficult compromises required to achieve such a goal are not to be underestimated.

It would require an important shift in policy within Babrak Karmal's People's Democratic Party of Afghanistan (PDPA). The irony for Karmal is that the establishment of a broad multi-class 'national democratic' coalition of forces is precisely the point of dispute on which he was purged from the party and sent into exile in August 1978 by the late Hafizullah Amin. He had argued that unless such an approach were adopted from the start the regime would falter disastrously. To now attempt to recreate such a coalition of forces after at least five years of bitter civil war will be no easy task. But without doing so the entire PDPA apparatus can expect only to survive behind a Soviet military shield exercising increased levels of violence. Thus, only after the country is further decimated and perhaps hundreds of thousands more are turned into war refugees would the PDPA achieve relative security. If a settlement is not achieved, this is a distinct possibility which even certain elements within the PDPA do not particularly relish for the future.

The PDPA never conceived of itself as coming to power in the manner it has, and it has found itself in the classic dilemma of a radical force having prematurely secured state power without a highly developed or mobilised social movement as its political basis. The severity of its own internal sectarianism reflected that it was not a sufficiently mature entity to undertake the tasks of social transformation which it faced. Its internal sectarian disputes were only resolved by Soviet military intervention, but this 'resolution' became the very basis on which the civil war took off in earnest.

On July 11 *The Times* quoting a Radio Kabul report noted that Babrak Karmal had left for a 'complete medical check-up' in the Soviet Union. Coming two weeks after the conclusion of the Geneva-IV round the coincidence was perhaps a telling one. The real question is whether anyone in Washington and Islamabad is prepared to respond with sufficient intelligence and political will to test whether the signals being offered contain substance.

Preliminary reports on Yaqub Khan's July visit to Washington have not been remarkably encouraging. According to a reliable Washington source, most of the Pakistan Foreign Minister's time in the American capital involved sewing up a wide range of military and economic aid agreements committing the United States to financially sustaining Pakistan's position over the next five years. During ninety minutes of discussions between Secretary of State, George Schultz and the Pakistan Foreign Minister, Yaqub Khan, more than two-thirds of the session is reported to have exclusively concerned the dimensions of the US economic and military aid programme. Afghanistan appeared as a minor corollary to these discussions. For Pakistan's policy-makers Afghanistan has proved a highly functional 'sideshow' to the more central political objective of securing an unparalleled inflow of financial resources.

Nevertheless, during a meeting with invited journalists on July 16 in Washington, Yaqub Khan stated that the Soviet Union's declared intent to withdraw should be tested. He added the familiar point that there was no way to physically force the Soviets out of Afghanistan.

### THE NEXT ROUND

In spite of such remarks, a well placed diplomatic source close to the negotiations stated to this correspondent in late July following the Yaqub/Schultz meeting in Washington, "The Soviets have said they are prepared to be tested on the principle of the withdrawal of their forces from Afghanistan within the framework developed in the UN's draft agreement. Perhaps, this claim is true; perhaps, it is not. But, it has yet to be tested." Despite public statements to the contrary, Pakistan and the United States still have not demonstrated their willingness to actually test the terms of a settlement. Unless this is done, there will be no agreement. If the Soviets are tested on the terms of the draft agreement and they fail to initiate the features of the "fourth instrument", that is a schedule of force withdrawals, then the onus for the collapse of a negotiated solution will rest squarely with the Soviet Union. As matters stand now, the onus for prospective failure appears to rest elsewhere.

According to these diplomatic sources, without the actual willingness to test what has been virtually agreed, the negotiations will stall, deadlock again, and in all likelihood either collapse or straggle on indefinitely, similar to the Geneva arms talks or the Contadora 'process'. If this occurs, it is possible that the UN will suspend the negotiations indefinitely.

The next round in Geneva which convenes on August 27 will indicate whether the opportunity to advance towards a settlement is seized by both sides, or whether the protagonists of a longer and more bitter war will have maintained the upper hand on the conflict.

## WEST EUROPE

# New Dimension in Franco-German Ties

### Ramesh Jaura

THE post-war co-operation between Federal Republic of Germany and France promises to assume significant new dimensions—be it for the purpose of leading EEC to a European Union or in respect of French nuclear deterrent protecting not only France but also West Germany.

Interestingly enough, this development comes within less than eight weeks of the Bonn economic summit of seven major western industrialised countries. The conference had ended in some 'misunderstandings' in Franco-West German relations, giving rise to speculations about the future course of ties considered crucial for the European pillar of the transatlantic alliance NATO.

The 'misunderstandings' were sought to be removed at a meeting between Chancellor Helmut Kohl and President Francois Mitterand in Constance, in southern West Germany. While debate persisted on the outcome of the meet, both Bonn and Paris sprang a near surprise by announcing that they would table a joint draft treaty for European Union. And this they did at the EEC Milan summit on June 28-29.

West Germany and France evidently intend to retain the role of pace-setters in order to take the EEC further. This determination has been reiterated by none lesser than Chancellor Helmut Kohl while presenting his assessment of the Milan meet. Chancellor Kohl was addressing the German and international press corps in Bonn on July 4, two days after the House of Commons debated British Prime Minister Margaret Thatcher's evaluation of the EEC summit.

On July 3 the European Commission headed by Jacques Delors, a former minister in President Mitterand's cabinet, had launched a two-pronged move in attempts to salvage the EEC. At the Milan summit, UK, Denmark and Greece found themselves pitted against the six founder-members and Ireland on the issue of European Union.

The EEC Commission was, on the one hand, engaged in an attempt to placate the three who are apparently against changes in the Treaty of Rome which established the Community and provides the legal basis for its functioning. At the same time, the Commission is working out new proposals on the running of the EEC which go further than those it had advocated in the past and have already been cold-shouldered by UK, Denmark and Greece.

It was against the wishes of the three that the Commission decided to convene an intergovernmental conference, with a view to considering amendments to the Treaty of Rome that could involve restrictions on the use of national veto, new powers for the Commission and the European Parliament, and a separate foreign and security policy treaty.

Despite initial strong reactions, Prime Minister Margaret Thatcher's statement in the House of Commons sounded a generally conciliatory note, stressing the degree to which decisions taken at the Milan summit reflected British thinking. In line with British thinking, she said, were the decisions to give priority to removal of physical and technical barriers to trade and to a free market in transport and financial services, to free capital movements and give freedom of establishment for the professions.

Besides, the decision on political co-operation reflected both British proposals "and a Franco-German text which was very similar". The Milan conference had been a temporary setback "to a new momentum" for Europe, which, she hoped, would be repaired at the Luxembourg summit in December.

Whatever happens in Luxembourg, Chancellor Kohl, as he told newsmen, intends to continue to fight for closer political integration in the European Community even at the risk of a major split among members. He said that Bonn refused to accept the idea of the EEC as merely an economic grouping and added that members had to sacrifice some of their sovereignty to achieve European Union.

Asked if this would risk splitting the European Community, Chancellor Kohl replied: "This danger exists, but we are not frightened by it. If we do not make changes the only thing we have left to discuss in the future is the distribution of olive harvests." The West German leader criticised in particular the Greek Prime Minister Andreas Papandreou for saying that he would accept no changes affecting his country's sovereignty.

In reply to a question, Kohl rejected suggestions of hypocrisy on Bonn's part in using its veto to block a cut in EEC grain prices and in the next breath advocating greater use of majority voting to reach decisions. He maintained that West Germany had merely once made use of the same rights as Britain claimed for itself.

Together with France, West Germany was "ready to work closely with Britain, too, in this field" and "exchanges of criticism across the Channel" were not very helpful. However, Chancellor Kohl sought to smooth over differences with Britain. He said, almost repeating Margaret Thatcher's remarks in the House of Commons, that the basic positions of the two countries were not divergent, particularly over strengthening co-operation in the field of foreign and security policy.

Furthermore, said the West German leader, the decision in respect of strengthening co-operation in research and technology was a sign of hope for the readiness of the Community to accept the challenge in a field crucial for EEC competitiveness. Kohl welcomed, in particular, the Milan summit decision to give approval to the Eureka project. Bonn favoured a flexible approach so that Eureka remained open to countries outside the EEC.

According to reports, France has invited 16 European countries to the Paris ministerial meeting scheduled for July 17. The French wish the meeting to discuss five sets of high technology projects. These are outlined in a document produced by the state-sponsored technology centre Cesta and titled "The Technological Renaissance of Europe".

The projects group together proposals for joint efforts in information technology, robotics, communication, biotechnology and new materials sectors. They are studded with names such as Euromatique, Eurobot, Eurocom and Euromat.

Reports quoted French officials saying that specific funding of Eureka projects was unlikely to be decided at the Paris meeting. Finance, from a mixture of government, company and banking sources, they said, would be set on a case by case basis. This view appeared to be shared by Chancellor Kohl in Bonn.

A strong advocate of German-French co-operation, Kohl however declined a comment on the decision of President Mitterand's Socialist Party modifying its defence doctrine and asserting that French nuclear deterrent should be used to defend both West Germany as well as France. Observers believe that the decision reflects the less clearly spelt out shift in French government policy.

## Padmatex Engineering

PADMATEX ENGINEERING is making a 'rights' issue of new equity shares on a three-for-five basis to raise Rs 120 lakh to finance its new project for the manufacture of highly sophisticated spinning preparatory machines. During the last year, the company diversified its production base by starting production of highly sophisticated draw frames and speed frames of Zinser (W Germany) design. The company is now planning to manufacture an automatic open end spinning machine 'Auto Coro' which is a very prestigious and renowned product being manufactured by its collaborator, W Schlafhorst and Company, W Germany. The company is seeking approval of the government to the terms of collaboration. According to V G Rajadhayaksha, Chairman, the international market for this kind of machine is dominated by Schlafhorst products.

## CHAIRMAN'S STATEMENT

At the 46th Annual General Meeting.

**Shri Hari Shankar Singhania**

Ladies & Gentlemen,

I have great pleasure in welcoming you all to the 46th Annual General Meeting of your Company. The Directors' Report and the Audited Accounts of the Company for the year ended December 31, 1984 have been in your hands for some time and before I deal with them, I must place on record the major event of the year which saddened every Indian beyond words. The former Prime Minister, Shrimati Indira Gandhi, who steered the nation and held it together despite serious challenges from within and outside for nearly sixteen years laid down her life for the sake of India's unity and integrity. The best homage we can pay to her would be to do all that we can to make India strong and prosperous as well as to preserve the unity of the country.

It is a happy augury for democracy that the new leader was chosen swiftly and smoothly. The massive mandate that the ruling party received during the recent elections has brought to the helm, young and dynamic Prime Minister, Shri Rajiv Gandhi. In a very short span of time, he has succeeded in creating a new sense of confidence in the nation. He has tackled promptly and firmly many difficult domestic and international issues. A new direction has been given to the country with emphasis on efficiency, modernisation and technology, so that India may enter the twenty-first century with a firm base and competitive strength. Number of policy changes have been made to reduce control & red tape and simplify procedures. The Union Budget for 1985-86 has attempted to give a thrust to the country's economy through a series of bold and innovative steps. There is an endeavour to make Indian industry competitive and cost effective. The attitude towards foreign investment and technology is more open and liberal. All this has generated a new enthusiasm and confidence in India and abroad. This has also put responsibility on industry and trade to respond positively. Your Company will do all it can to play its constructive role and seize the opportunities that unfold themselves. A number of new areas of investment are already under our active consideration.

The Sixth Five-Year Plan has just ended with substantial achievements. We have been able to achieve average annual growth of 5.2 per cent per annum as targeted and sustain foodgrains production of nearly 150 million tonnes for the last few years. The rate of growth of industrial production however has been lower than the target. The Seventh Five-Year Plan envisages a growth of 5 per cent per annum of GNP and 6.7 per cent in industrial sector. A greater responsibility has been envisaged for the private sector. It is possible for the corporate sector to achieve a growth rate of 10 per cent per annum provided certain constraints are effectively tackled. The major problem is of financial resources. The issues of higher debt equity ratio, lower promoter's contribution and removal of convertibility clause need re-consideration in order to stimulate higher investment. Minority foreign investment in some traditional industries could be permitted to raise additional resources.

Problems of infrastructure like power, coal, transport and communication continue to be the weak spots and the Government has to accomplish breakthrough in these sectors to ensure targeted growth. It is not enough to achieve physical targets, it is equally essential to improve the quality performance. Poor quality of coal, frequent interruptions in power supply, wide voltage fluctuations and unreliable communication are not only frustrating and affect production but seriously damage machinery and adversely affect costs.

Labour productivity and discipline is yet another area which needs urgent attention. Trade Union movement will also have to positively respond to the changing economic imperatives.

What is now needed in India is not only new investment but better utilisation of the existing capacities through improved management, consolidation and technology upgradation. We have become a high cost economy and we have to get out of this rut both from the domestic as well as international angle. If India is to achieve higher economic growth so important for the well-being of its masses, it has to earn foreign exchange needed for its development by becoming competitive exporter in many fields, particularly manufactures. To my mind, this basic approach should pervade our decision-making.

For political stability and social harmony, it is essential that there should be price stability and generation of massive new employment opportunities. We will have to search for areas which generate large number of jobs in the short run. To my mind, two areas which can provide the answer are: (i) massive road building; and (ii) extensive house construction. We already have the required basic inputs–steel, cement and other materials. Creation of large scale employment by these activities would also generate additional purchasing power in the hands of rural masses. It has been the experience of Indian economy that the growth of many industries has been stunted because of inadeqate demand due to lack of purchasing power. Moreover, there has also been the problem of increasing migration to urban areas in search of jobs and opportunities, which in turn have given rise to new problems. These activities therefore would have a multiplicity of benefits. The enormous political, social and economic advantages which would accrue from such programmes lead me to suggest that we should not hesitate to resort to even unconventional methods of raising resources for these purposes.

## COMPANY PERFORMANCE

Coming to the Company's performance during 1984, I am happy to state that there has been an all round improvement in production, turnover and profits of the Company. The Cement Division achieved a capacity utilisation of 96 per cent with a production of 4.81 lac tonnes. The Paper and Board production at 65,848 tonnes was also higher as compared to last year. Sales and other income of the Company increased to Rs. 106.09 crores against Rs. 87.84 crores in the previous year. Profit before interest and depreciation was higher at Rs. 16.99 crores compared to Rs. 12.98 crores in 1983, showing an increase of 31 per cent.

The modernisation and renovation scheme of Paper Mills in Orissa with an investment cost of Rs. 23 crores is expected to be completed in phases in 1986 and 1987.

As you are aware, your Company has promoted Orissa Synthetics Limited (OSL) jointly with Industrial Promotion and Investment Corporation of Orissa Limited to manufacture 15,000 tonnes per annum of polyester staple fibre at Dhenkanal, a backward area of Orissa with an investment of Rs. 73 crores. I am happy to state that the plant is expected to go in production well within the targeted date during 1986. OSL will be entering capital market to raise equity capital in the next few months.

## PAPER

Last year, I had pointed out to the gradually deteriorating capacity utilisation in the Paper Industry which had come down from nearly 75 per cent in 1981 to less than 59 per cent in 1983. I am sorry to state that this has declined even further to 56 per cent in 1984. Such a low capacity utilisation is a gross waste of capital resources which our country can ill-afford. The bulk of this unutilised capacity is in the medium and small scale sector which accounts for nearly half of the overall installed capacity in the industry. The basic reason of this is that most of these plants are unviable and have obsolete second-hand machinery. Despite heavy excise concessions and no obligation to produce controlled variety of White Printing Paper, these units are unable to stand on their own because of the inherent weaknesses. In my view, such uneconomic capacity should not be allowed to be created any further and the existing plants should be enabled to become economic by expansion and technical upgradation.

As far as large integrated mills are concerned, the infrastructural constraints, inadequate returns and lack of modernisation are the key problems. The obligation on the integrated mills to produce and supply White Printing Paper at prices which are grossly below cost of production continue to affect the returns. It is unfortunate that the price revisions to compensate even the increase in cost of production are too late and are far from adequate. The last price revision was done more than a year ago in May 1984. Here I would like to suggest that the concept of requiring a particular industry to bear the entire social cost of subsidising supplies to certain sections of society or for important social causes needs reconsideration. For instance, the cost of subsidising paper for the Education Sector has to be entirely borne by the paper industry and that too only by a segment of the industry having less than half of the installed capacity. The burden on the industry should not be beyond its capacity to bear and should not jeopardise its health.

In this context, it might be mentioned that according to an Expert Committee, during the last ten years, the cost of production of the Paper Industry in general increased by 186 per cent whereas the sales realisation increased only by 129 per cent. This points to the continued decline in the rate of return in the Paper Industry over the years.

Modernisation of the existing Paper Mills to economic size requires huge investment. It has been estimated by the Working Group on Paper & Paper Board Industry set up by the Planning Commission that a sum of Rs. 690 crores is required for modernisation during Seventh Plan period. In order to encourage rapid moderisation, it is necessary to ease the norms of lending and the rate of interest.

Availability of raw materials has been one of the key problems facing the Paper Industry for quite some time. The basic raw material in India so far has been bamboo of which very few untapped areas are now available. Recognising this problem, the Government has permitted the import of wood chips, wood pulp and waste paper without any import duty. This is a welcome relief. However, the long term solution lies in replantation. In this direction also, the State Governments have recently shown some interest and I sincerely hope that concrete steps will follow.

## CEMENT

Cement Industry has made unprecedented progress as a result of assurance of 12 per cent post-tax return made in 1979 which was reiterated again in early 1982 at the time of partial decontrol. As a result, massive investment has been made in the industry and the installed capacity has increased from 24 million tonnes in 1979 to 43 million tonnes in 1984-85. The industry is expected to continue the pace of this growth during the Seventh Plan when capacity is expected to go up to 60 million tonnes. This will however require Government to take necessary steps, as in the past, to keep investment in Cement attractive.

Unfortunately continuous increase in cost of production, inadequate increase in price of levy cement and steep fall in the prices of non-levy cement have made the working of existing new cement plants unremunerative. These new plants set up at high investment cost are hardly able to meet the interest charges leave alone depreciation and the promised 12 per cent post-tax return. I would earnestly appeal to the Government to grant excise duty rebate of 50 per cent and other remedies requested by Cement Manufacturers' Association to the new plants established in 1982 and onwards without loss of time to mitigate at least part of their financial problem. It is not out of place to mention that the new cement plants constitute nearly half of the present installed capacity.

There was an assurance from the Government that there will be regular review of the levy cement price in order to compensate for increase in cost of inputs. The cost of production, because of steep increases in cost of inputs like coal, power, transport, labour etc., all beyond the control of the industry has been increasing continuously since partial decontrol was introduced in February 1982. The Government made the first price revision after a lapse of more than two years with effect from 18th July 1984 and that too by inadequate amount of Rs. 40 per tonne besides 5 per cent reduction in levy quota. Since then there has been further increase in the cost of production besides rise in the railway freight. It is unfortunate that the Government has decided against granting any increase in levy cement prices and has reduced levy quota by mere 5 per cent with effect from 4th June 1985. This will hardly provide any relief to the industry which is forced to sell levy cement much below cost. There is an urgent need to revise the levy cement prices to compensate for the increase in cost of inputs and such a revision should be made every quarter.

Cement is an energy intensive industry. Therefore level of production and cost of production is dependent on continuous and adequate availability of power. Power situation has been really bad in large number of States where cement plants are situated, particularly in Rajasthan, where your plant is located. Apart from heavy power cuts for long periods, the industry is subjected to frequent power interruptions and very wide voltage fluctuations. To maintain production, your Company, like many other cement units, has installed 15 MW standby diesel generating sets at a huge cost of Rs. 6 crores. Due to serious power situation, these diesel sets are no more standby but have to be operated almost continuously. The cost of power from DG sets is nearly three times the cost of power supplied by the Electricity Boards, apart from high expenditure that has to be incurred in maintaining these Sets. Hence, it is absolutely necessary to continue the DG Relief Formula in one form or the other to compensate for the extra cost incurred to produce the cement from captive diesel generation.

Coal, the conventional fuel used for manufacture of cement, is a source of great worry due to constraints of rail transport. The industry, has to work at very low levels of stocks of coal and is compelled to move coal by road raising the cost of production substantially. In order to optimise production and to minimise the cost, high priority should be given to the cement industry in allocation of power and wagons for movement of coal.

Before I conclude, I would like to place on record my appreciation to the management team, the workers and the staff at all levels for their dedication and hardwork to improve production and productivity. I would also like to thank the Governments of Madhya Pradesh, Orissa and Rajasthan and the Financial Institutions and Banks for their continued support and co-operation.

Thank you.

*This does not purport to be a record of the proceedings of the Annual General Meeting*

# In the Mirror of National Accounts

VVD

**National Accounts Information System** by Uma Datta Roychoudhary and Moni Mukherjee; Macmillan India, 1984; pp 296, Rs 80.

BOTH the authors are eminently qualified to write a book which has its focus on India's national accounts. Both have worked long years in India in this field, and have contributed a lot to the development of a system of national accounts for India, including the development of the information system relevant to estimation of macro-aggregates used in the system.

During the last thirty-five years or so, the national accounting framework has developed and become more and more complex. Starting with the estimation of GDP, investment, saving, consumption, expenditure, etc, economic macro-aggregates, the system has grown into an articulated set of accounts and standard tables as recommended in the UN's System of National Accounts (SNA), 1968. The SNA, 1968 has completely replaced the earlier SNA, 1953. Efforts of all countries, developed and developing, are directed at conforming to the SNA standards and reaching the level of excellence and sophistication envisaged in the SNA. India is no exception. CSO regularly publishes its annual 'National Accounts Statistics' (NAS) which contains Consolidated Accounts of the Nation more or less on the lines recommended by the SNA, and also a number of other tables bringing into focus disaggregated accounts classified by sectors, by kind of activity, by organisation, etc, categories and cross-classified categories.

The book under review is concerned with such macro-aggregates. The first seven chapters are generally all devoted to the technical aspects of national accounting work. Chapter 1 deals with the questions 'why national income and what it attempts to measure'. Historical notes are found in chapter 5. One who is familiar with the SNA and CSO's publication Sources and Methods (April 1980) may find these chapters easy reading. No doubt, technical aspects are also discussed in the remaining three chapters but they are more subject-specific discussions like those on poverty and its measurement; the factor inputs in the GDP growth process; and the national accounting framework in plan formulation and evaluation and in short-term forecasting of GDP and other macro-variables. Chapter 3 is also in a way subject-specific, concerning inter-regional or inter-country comparisons of GDP.

The authors have done well to make it quite clear that it is difficult to quantify the margins of errors for the estimates of various macro-aggregates. Not all data are so collected that standard errors of the estimates can be worked out. Even where sample survey methods are used to collect relevant data, final estimates contain several other data or assumptions regarding allocations, ratios and proportions used with the result that calculation of standard errors becomes meaningless. Even the sample survey data may contain unknown non-sampling errors. Previous efforts at quantifying errors were at best 'informed opinions' or 'expert guesses'. Ultimately, the best insurance against inaccurate or widely-off-the-mark estimates is to improve the quality of primary data and develop cross-checks to obtain an idea about the reliability of the estimates. Secondly, one can observe "the extent to which the estimates for a given year undergo revisions as a result of the use of fresh and more recent data". "Finally, one could consider the measures of 'statistical discrepancy' which appears in the consolidated accounts of the nation or the extent of the difference between the alternative estimates of the same aggregate to obtain an overall idea of the reliability of the estimates."

Having said this on the technical aspects, one may raise a few questions or expressions of doubts or make differing points. First, the term 'net output' which is used interchangeably with 'net product' appears alien to national accounts terminology. Neither SNA nor CSO's Sources and Methods recommend 'net output'. Secondly, on page 25, the authors define national income as "domestic product minus that part of domestic product which accrues to foreigners plus *the net output* of enterprises owned by the nationals but located in foreign countries" (emphasis added). It is not clear why the entire net output (as defined in the book) created in foreign land has to be added. Only the factor incomes flowing into the country from this activity has to be added. Thus national income is net domestic product plus *net* factor income accruing to residents. This, therefore, requires elucidation, maybe correction. Thirdly, the authors suggest that where the double-deflation method cannot be used for want of the detailed data it needs, or because factorisation between price and quantity is not possible (e g, for services), value added at base period prices are computed using procedure in which *base period cost ratio* is applied on deflated value of output. For manufacturing industry groups, for want of detailed data value added is deflated, but then it is by deflating the current price cost ratio and current price value of output (or what is the same thing, current price value added) that the constant price value added is obtained.

The authors state (page 5) that "an area with large per capita income be regarded as rich while another with low per capita income as poor". However, for a country like India with considerable pressure of population on agricultural lands making marginal labour productivity zero or near zero, it has been shown that it is only those states which have relatively high per capita income and high density of population that are really rich, and states which have low per capita income and low density of population that are really poor. States with the status of high per capita income and low density of population or low per capita income and low density of population cannot be ranked without considering other relevant factors.

## INDIAN ECONOMY: OVERALL PERFORMANCE

So much about the technical aspects. In chapters 8 to 11 the authors take us on a journey through data-land in a time and space frame and show us the various facets of the Indian economy. In chapter 8 this is done in terms of (i) overall performance as revealed by national income and per capita income levels and their growth rates, etc, (ii) analysis of structural shifts in production, distribution of the products and the income generated therefrom, and (iii) utilisation of the product by different institutional sectors of the economy. While the economy has advanced during the period 1950-51 to 1980-81, it has charted the growth course at its own sweet will. The real NNP increased at an annual rate of 3.6 per cent and per capita income at the rate of 1.4 per annum (Table 8.3). The increase has neither been smooth nor as planned by the authorities. Three times in thirty years the total income and 10 times out of 30 years (Table 8.1) per capita incomes have shown decline over their previous years' respective figures. Only six times annual per capita income growth has been above five per cent. It is ironical that the plan holiday period 1966-67 to 1968-69 showed the highest growth rate of 4.1 per cent in total NNP. Since then the fifth plan period 1974-79 has a growth rate of 5.2 per cent per annum for total income and 2.9 per cent for per capita income. In recent years the amplitudes for annual growth rate fluctuations seem to be widening.

The sectoral growth rates (Table 8.7) show that for any given decade in the Table and for the entire overall period 1951-81, the annual growth rates for the primary sector are the lowest among the sectors and that for each successive decade they have shown a decline. So much for the green revolution. The secondary sector also shows similar declines but at a higher level of growth of over five per cent. The annual growth rate for the entire period was 4.68 per cent. This is a sad commentary on the planned economy. The authors add: "Table 8.7 does not indicate any pattern of growth or acceleration in growth rate in secondary sectors."

This is putting it mildly.

As regards the price trends, the indices of implicit prices (1970-71 = 100) show that the index for all sectors combined (Table 8.2) has risen four-fold and more during these 30 years. Prices seemed to be changing in favour of the primary sector (mainly agriculture) after 1964-65 but after 1975-76 the trend was reversed and prices have risen faster in the secondary and tertiary sectors than in the primary sector. The price advantage accruing to farmers during the decade 1965-66 to 1974-75 has thus subsequently greatly eroded. During the initial period 1951-72, i e, 21 years, the annual rise in overall implicit price index exceeded the double digit mark only once in 1966-67, but in the subsequent nine years of 1972-73 to 1980-81, the price index showed five such annual increases, the highest annual increase being 19.2 per cent in 1973-74. In three consecutive years 1972-73 to 1974-75 prices increased by almost 55 per cent, and again for 1979-80 and 1980-81 the aggregate increase was 26 per cent. Table 8.4 gives 'annual average change' in prices by sectors. However, the figures seem to be very high. The annual average change for the entire 30-year period (line 1) is 10.57 per cent for the overall series, whereas the compound growth rate per annum comes to 4.88 per cent. This is because the authors take an arithmetic average of the difference between the values of two end years and divided by the value at the beginning year. The average annual change is thus $\frac{220.7 - 52.9}{52.9} \times \frac{1}{30}$ (Table 8.1) which is .1057 or 10.57 per cent. The above expression is equivalent to $\frac{1}{n}(Y_t/Y_{t-n} - 1)$, where n is the time span, and $y_i$ represents the price index for the year i $(i = t - n, t - n + 1, \ldots t)$, $Y_t/Y_{t-n}$ is again the product of successive years' ratios, i e, $Y_t/Y_{t-1} \times Y_{t-1}/Y_{t-2} \times \ldots \times Y_{t-n+1}/Y_{t-n}$. When such products are taken, one does not generally choose arithmetic average but geometric average as the n th root of $Y_t/Y_{t-1}$. This then leads to the compound annual average. The method followed by the authors will not probably affect the relative picture of changes in price rise but surely creates an impression of higher annual changes. Table 8.4 supports what has been said earlier about the sectoral price changes.

The authors make a valid point that since factorisation into price and quantity cannot be made in the case of the services sector, indicators have been used to work out 'real' incomes in this sector. For the 'revised' series and the 'conventional' series of earlier years different indicators have been used. They warn about the use of price deflators for the initial part of the 30-year period in respect of the services sector.

### SECTORAL AND REGIONAL SHIFTS

There has been a distinct shift in the pattern of production in favour of the non-primary products. The share of primary products has declined from over 61 per cent in 1950-51 to around 42 per cent in 1980-81. The fall seems more marked since 1975-76. Notwithstanding the decline in the share and the low growth rates of the primary sector, its contribution to the total growth is still the highest, although fluctuating a great deal from year to year (Table 8.8).

Organisationally, the public sector's share in GDP has almost doubled during the 20-year period 1960-61 to 1980-81. The private sector, however, still has a dominating share of about 80 per cent in GDP. Within the private sector, it is the unorganised sector which claims about 65 per cent and the organised private sector 15 per cent. The primary sector has hardly yielded much ground within the unorganised sector since its share under this sector was 94.5 per cent in 1960-61 and 91.1 per cent in 1979-80. There is some marked shift towards public sector from 1.4 per cent in 1960-61 to 5.7 per cent in 1979-80. The secondary sector on the other hand shows a decline in share of NDP both in the organised and unorganised private sectors during this period, the share of public sector going up from 6.7 per cent in 1960-61 to 19 per cent in 1979-80 (Table 8.11). The authors make the point: "It is important to remember that the growth in public sector is not always because of establishment of new enterprises but is also due to nationalisation which has spread over several activities from mining, manufacturing and electricity generation to transport services and financial establishments." It may however, be added that the real advance of the public sector's dominance cannot be judged by these figures but by the kind of activities it commands—the types of institutions and industries, trade, transport and finance over which it has acquired ownership by nationalisation or by starting new ventures.

A number of geographical or area patterns can be envisaged in order to study regional disparities through the use of macro-economic aggregates. Obviously, the most useful of these are the States as one such pattern and rural-urban divisions, either at national level or, if data so permit, at State level as another pattern. Politically also, States and rural-urban areas deserve to be specially studied. This is what the authors do. They study the economy through per capita State Domestic Product (SDP) in respect of States and rural and urban per capita incomes for the rural-urban areas. The reason for using SDP and not net State income (income accruing approach) is that net factor incomes across the State boundaries cannot be determined and hence income originating approach imbedded in SDP has to be necessarily used. As the authors explain, SDP estimates can be used to study overall performance of the State economy as also structural shifts, etc, for each State.

The difficulty in studying regional incomes arises because we have two sets of figures. One set is the SDP figures prepared by State Statistical Bureaus (SSBs) and the other set prepared by the CSO, which they call 'comparable' estimates. These are required by the Planning Commission and other bodies like the Finance Commission whenever they come into existence. It is a pity that with all the deliberations over all these years the 'comparable' estimates continue to be computed. The 'comparable' estimates use the same concepts, definitions and standards and a common methodology for all States. Since the methods are inextricably dependent on the data-base, it follows that common methodology would mean using the methods suited to some particular State for which the data-base is the weakest. In the process, States in which more refined methods are in use because of better data-base suffer. One can understand the need for uniformity in concepts, definitions, standards, etc, but to insist on the methods applicable to the State with the weakest data-base cannot really be appreciated. Why cannot the Planning Commission insist on uniformity only of concepts, etc, and not on a common method, and why cannot the CSO, a technical organisation whose views should be heard with respect and authority, persuade these other commissions, etc, to give up a false stance? But then, as things are two sets persist. The authors use the comparable series SDP figures for analysis.

The authors also state that "since these estimates are comparable between States on all counts, *viz*, concepts, definitions and coverage of sectors and are prepared taking care that maximum use is made of all data available *at the State level* the picture of disparity in development between States brought out by the estimates may be taken to reflect the real situation" (emphasis added). But it is doubtful if State level data can be put to maximum use for computing comparable series. They also give justification for two series when they say, "the two sets of estimates are relevant for studies of different aspects of the economics of the States. Thus for inter-State comparison it would be desirable to use the comparable series only and this would be true for most of the policy requirements at the national level where the comparative levels of economic development need to be studied for all simultaneously. For inter-temporal study of development and structural change within individual States, on the other hand, the estimates prepared and released by the State governments would be equally appropriate." They also relax the requirement of adjusting comparable series for differences in purchasing power parities by saying that State-to-State differences in this matter are not likely to be very large.

It is a novel argument to hear that two series may be needed for the same macro-aggregates, say SDP or per capita SDP, or SDP by industrial origin for sectoral analysis, for two or more different purposes.

However, one may go through the set of Tables 8.13 to 8.15 for the interesting set of data and the features they focus on. Table 8.13 gives a ranking of the States according to per capita SDP for 1975-76. These figures differ for some States considerably from those given in the CSO's latest publication: "Estimates of State Domestic Product, 1960-61 to 1982-83", June 1984, which gives State series figures. Table 8.14 brings out inter-State differences in compound annual rates of growth of per capita SDP. Each State's progress towards development of primary, secondary and other sectors can be seen in Table 8.15. It also gives structural differentials in terms of share of each sector in SDP. It is, for example, of considerable interest to learn that "the share of the primary sector is as low as 31 per cent in Maharashtra in 1977-78 declining from 41.8 per cent in 1960-61. The proportion is also low (33.6 per cent) in Tamil Nadu which had in 1977-78 a sharper fall (from 52.0 per cent in 1960-61) than Maharashtra". Gujarat also depicts a lower share than the national share. West Bengal presents a stagnant structure with very little change in the sectoral shares over the 1960-61 to 1970-71 period. Tamil Nadu on the other hand presents a dynamic change in favour of advance of non-primary sectors (except services). Punjab has the highest per capita SDP even though the share of the primary sector is as high as 55 per cent.

Rural-urban inter-State comparisons are also made by the authors but it is doubtful if these have much validity, particularly when one talks of changes over time. While the definition of rural-urban areas can be uniformly followed for all the years it is the allocation of the total NDP to these two divisions that creates difficulties. No standard procedures exist and the results used by the authors are those worked out by various research scholars or institutions. For example, by and large agricultural and allied industries belong largely to the rural area but to assign the entire such income to the rural area would not be correct. Similarly, all income originating in manufacturing cannot be considered urban. The problem of allocating transport, trade and infrastructure tertiary incomes is even more difficult and would therefore involve more arbitrariness in different hands. CSO itself has done a study for 1970-71 NDP. The analysis of change should be read and imbibed with some reservation.

Reviewing the latest CSO publication (referred to earlier) on State incomes, S P Gothoskar (*EPW*, November 3, 1984) has brought out the differences between the CSO's comparable SDP series and the State series for 1975-76. V K R V Rao also treats the subject of regional or State incomes in his book "India's National Income 1950-1980: An Analysis of Economic Growth and Change". The data used here are based on RBI publications, which means State-compiled series and not the comparable series. He has analysed the figures in great depth. Readers may like to consult this book. His book also deals with rural-urban differentials in per capita SDP, State-wise. Such analysis is not undertaken in the book under review.

### FACTOR INCOME DISTRIBUTION

Net Product gets distributed to different factors of production in terms of compensation of employees (or wages and salaries), interest, rent, profit and dividends and mixed income of self-employed. The last item is typical of developing economies and belongs to the 'unorganised' sector where the labour and profits of the self-employed cannot be segregated. These various factor incomes are analysed by the authors for productive enterprises classified according to character of output, type of organisation (organised and unorganised sectors) and type of ownership (public and private sectors). Ownership classification is applied to organised sector only, the unorganised sector being fully private sector. The shares of these incomes are then analysed. The analysis does not cover, for instance, differentials in per worker compensation of employees, or per worker mixed incomes of self-employed, by industry of origin, or by public and private sector classifications, as may be relevant. Perhaps this is because figures of numbers of workers by these classifications are not easily available. The period covered is 1960-61 to 1979-80.

The overall position (Table 8.18) shows the dominance of mixed income, although over the years it has somewhat declined (42.0 per cent in 1979-80 from 51.2 in 1960-61), followed by compensation of employees whose share has gone up from 33.7 per cent in 1960-61 to 40.1 per cent in 1979-80. Share of property income (i e, interest, rent and profits and dividends) has also increased from about 15 per cent to 18 per cent. The dominance of mixed incomes is however wholly confined to the unorganised sector and it claimed 68.8 per cent of income generated in this sector in 1960-61 and about 65 per cent in 1979-80 (Table 8.19). Compensation of employees increased its share from about 22 per cent to 25 per cent during the period. Within the unorganised sector, the agriculture and allied industries group showed a much higher level of dominance of mixed incomes and even showed slight increase over the years from 69.7 per cent in 1960-61 to 71.4 per cent in 1979-80. But the share of compensation of employees was also, surprisingly, more than for other unorganised industries (Table 8.21) for 1960-61 and 1965-66. Rent also appears to be an important factor for the residual section (i e, other than agriculture and allied industries) of the unorganised sector.

For the organised sector, compensation of employees is the most important factor income, both for the public and the private sectors. But, for the public sector, its share is more than in the case of the private sector for any given year. Over the years both sectors show slight declines in these shares. Interest has shown increase in its share particularly in the private sector, but level-wise, the share in public sector is much higher. As is to be expected share of profits and dividend income for public sector is much lower than for the private sector and has shown some deterioration over the years. There is also a decline in the share of this factor for the private sector, particularly after 1966-67.

These factor incomes ultimately flow to sectors where they are utilised. However, the data are not sufficient to show how much belongs to these different sectors. Thus, employees' compensation and mixed incomes of self-employed belong to the household sector, but the rest of the incomes—interest, rent and profit and dividends—is also shared by the households, the incorporated companies and government (by way of direct taxation). In fact, even from the household incomes, government will have a claim in terms of direct taxes paid by households.

### UTILISATION OF NATIONAL PRODUCT

Among the various components of expenditure on GDP, private final consumption expenditure (PFCE) and gross domestic fixed capital formation (GDFCF) are the most important. Between them, they accounted for 93.23 per cent of GDP in 1950-51 and 87.26 per cent in 1979-80. Of these, PFCE was 79.76 per cent and 70.16 per cent in these two years, respectively. While PFCE declined over these years, GDFCF increased its share. Government final consumption expenditure increased its share from 5.10 per cent in 1950-51 to 12.58 per cent in 1979-80. Why the authors call this substantial increase "a marginal increase in the share of public consumption expenditure" is not quite clear. The picture is more or less the same when figures are given at constant or current prices. The authors compare levels of per capita household disposable income (HDI) with the levels of per capita PFCF (Table 8.25) and find the ratio of HDI to PFCF rising from 1.06 in 1960-61 to 1.16 in 1979-80. These are at current prices. The authors feel that "disposable income and savings at constant prices are not meaningful concepts and the real per capita consumption can only be compared against per capita national product". One knows that it may not be possible to compute saving at constant prices, but why HDI and saving at constant prices are not meaningful concepts requires further elucidation. The estimates of consumption expenditure by 'objects' (Table 8.27) show that expenditure on food at constant price has shown a decline from 67.6 per cent in 1950-51 to 56.5 per cent in 1979-80. It just shows that we have yet to go a long way to reduce this percentage to about one-third the total consumption expenditure, which percentage is achieved generally by prosperous countries. Percentages have gone up for clothing and footwear, medical care, furniture and furnishings, etc, group transport and education. We are moving in the right direction although at snail's pace.

Gross Domestic Capital Formation (GDCF) has increased from 10.0 per cent of GDP in 1950-51 to 24.2 per cent in 1980-81 at current prices. Since the prices of capital goods have shown a higher rate than the overall implicit deflator for GDP, the rates at constant prices are somewhat lower in more recent years. This has been observed by the Raj Committee on Capital Formation and Savings. However, there is also some reason to believe that the method of estimation in vogue leads to overstatement of capital formation as estimated and hence the real situation may be that rates will be still lower. The growth rates in GDP are still low around 3.6 per cent although rates of capital formation are high. There is much debate going on on this question.

Several breakdowns of capital formation are given by the authors and they reveal interesting patterns. Briefly the position is as follows: the share of the public sector in GDCF has increased from about 23 per cent in 1950-51 to 43 per cent in 1980-81. The net domestic capital formation (NDCF) in the private sector is shared by private corporate sector and the household sector. In 1960-61 the share of the household sector was 45.8 per cent and of the private corporate sector 54.2 per cent. In 1980-81, the share of the household sector had gone up to 80.7 per cent. This is presumably because of considerable increase in industrial, trade and transport activities in the unorganised sector. The three components of capital formation are construction, machinery and equipment and change in inventories. The first two constitute fixed capital formation. The last named is a very small part of the GDCF or NDCF. The index of growth (Table 8.34) shows that fixed capital formation in machinery and equipment has advanced at a much more rapid pace than in construction. The latter increased by less than three times in the last 29 years whereas the former increased by over five times. The pace was much more in public sector than in the private sector for both the components, but more so in the case of machinery and equipment. Table 8.37 shows massive investment in manufacturing, electricity, gas and water supply as also mining and quarrying activities.

Capital formation needs finance which must primarily come from the savings of the government or the public sector, the private corporate sector and the households. Partly, the country can borrow from abroad or otherwise earn foreign exchange in current activities to bring in finance from abroad. But as the figures show, the public sector and the private corporate sector need more funds than they internally save; i e, they are deficit sectors. It is only the household sector which is on the whole a surplus sector with less spending on capital account than its saving (Table 8.33). Thus savings are diverted from the household sector to the other investing sectors through the banks and other financial institutions including government post offices and small saving organisations. In the process, households hold claims on the institutions to whom they lend their savings and they come to possess a wide variety of financial instruments. They can also directly invest, say, in the corporate sector in terms of shares, fixed deposits, debentures and other instruments. This is the net picture. In a gross way, the households might even borrow from banks, but their borrowings are less than their deposits with the banks. The structure of household saving (net) can be seen in Table 8.31.1. Thus arise the financial flow of funds, and the intersectoral patterns of net borrowings and net lendings. This last part is not covered in the book in detail. Savings are always dealt with at current prices. The net saving rate (as per cent of NNP) has increased from seven per cent in 1950-51 to 16.9 per cent in 1980-81, as against the NDCF rate of 19 per cent. The gap between domestic capital formation and domestic savings has to be bridged through net inflow of foreign funds. Generally this gap has existed except for a few years—1950-51, 1952-53, 1953-54, 1975-76, 1976-77 (not stated in the book) and 1977-78.

It is of interest to note that the household capital formation is also its savings in physical assets. And, this portion constitutes a fairly high proportion of the household total saving. Over the years this proportion has, however, declined, the households evidently preferring to hold their savings in financial form.

Another point of interest is that capital formation is computed in three ways and all the three series differ. The first, which serves as the 'control' series is made up of domestic saving plus net inflow of foreign funds. The second, worked out through the commodity flow method for pucca capital formation and expenditure method mainly for kutcha capital formation, is called GDCF by type of assets. The third series is primarily by expenditure method and for different industries of use. The aggregate capital formation in each series should tally, but they don't. But then that itself is a long story.

## MEASUREMENT OF POVERTY

The concept of poverty has been discussed in chapter 1 and further elaborated in chapter 9 which also discusses the methods and the results. To be able to measure poverty from time to time is an important function of the statistician and the economist. As related in chapter 1, poverty of a person or a household may be conceived of both in absolute terms and relative terms. In an absolute sense, a person may be deemed poor if he cannot get that level of consumption which is considered necessary to sustain him biologically. Say, he needs 2,000 calories per day. If a household cannot have such daily per capita energy then it is said to be poor. The nutritionists decide on some such minimum requirements which sets a line below which persons will be considered poor. As for poverty in the relative sense, the authors write: "The notion of poverty is perhaps better understood in a relative sense ... The general notion is easy to understand even though it is difficult to define exactly when a person A is better off than person B, particularly when their pecuniary statuses are not widely different." Talking about the nutritional criterion the authors say in chapter 9: "Similarly, other consumer needs like that of minimum clothing requirements will have to be determined regionally, keeping in view the local customs, disparities in habits, cultural differences and variations in climatic conditions and socio-economic conditions ... By its very nature poverty is multi-dimensional."

Poverty measurement involves data on distribution of income by size of income groups in respect of persons or households. One could then apply one or more of the measures of inequality to obtain a summary or parametric index of inequality. Based on the notion of absolute poverty line, an income level can be determined so that the proportion of persons or households below the poverty line and their share in the total income can be estimated. Income of course is one aspect. One could also measure inequalities in physical assets or in any particular part of these assets, say land, or one can even speak of geographical inequalities in, say, SDP. The authors have discussed these various facets of the problem in detail. They also suggest that in measuring inequalities socio-economic groupings, household size adjustments, occupational groups, etc, could be considered. The authors also mention several measures of inequality in measures like the Lorenz ratio or Gini coefficient, relative mean deviation, standard deviation or logarithms, and Theil's entropy measure, and discuss their limitations (except in the case of Theil's measure).

## DISTRIBUTION OF INCOME

The difficulty is that there is just no data on distribution of incomes for India. As the authors point out, studies have been made to somehow amalgamate consumption expenditure distribution by size class and the total household saving data and derive the income distribution of households. Some have used income-tax data. But each such attempt has its limitations. No direct data have been obtained. In the case of rural areas the debt and investment surveys conducted earlier by the RBI has thrown up useful data on distribution of assets and these have been studied. One is thus left with the only alternative to use the consumer expenditure data to study inequalities. What the authors say in this regard about the attempt by NSSO to obtain income data from households through the Integrated Household Survey (IHS) in a number of rounds beginning with 19th (1964-65) and ending with the 25th (1970-71) round is of interest. The authors say: "These data have not however been processed by the NSSO particularly because a closer examination of returns reveals that because the reference period for the data was only one month, due care could not be taken of fluctuations in the receipt of income, particularly in the rural areas due to seasonality and non-uniform flow of incomes." This is presumably a consequence of the monthly rounds of households selected for specific months so that each household is covered for the past month's data. But if NSSO envisaged collection of data on distribution of income one does not know what to say about the colossal failure on the part of NSSO to realise this elementary need to take into account the seasonality factor in planning the IHS. And for six years this went unnoticed! What a pity and what waste of resources. The authors deserve commendation for pointing out this huge failure. It has also been pointed out that IHS suffers from another limitation as a result of exclusion of imputed values of receipts.

So perhaps the most meaningful way to study the inequality may be through the household consumption expenditure data by deciles and apply one or the other measures of inequalities. This has been done by various experts and some results are given by the authors (Tables 9.5 to 9.11). It must however be pointed out that the inequality of consumer expenditure will be as a rule lower than that for income distribution. Even the poorest may spend something for food and some other basic amenities even by dissaving or debt and the rich will not of course spend all their income on such items.

The relative aspect of poverty is studied through the head-count ratio, i e, the proportion of people below the poverty line and the income-gap ratio, i e, "the aggregate income needed to bring all the poor upto the poverty line". The poverty line is determined on calorie needs per person per day and the monetary figure is worked out from time to time on this consideration. In 1979-80, at current prices, it was Rs 76 for rural areas and Rs 88 for urban areas. Table 9.12 gives a time series giving various relevant averages and ratios or measures for urban and rural areas. The authors conclude that "the results suggest that both in rural and urban areas there have been tendencies in inequality in the distribution of consumer expenditure as well as in population below the poverty line to increase in mid-sixties and decline thereafter. The authors, however, feel that "the alternative measures of Gini coefficient of distribution of consumer expenditure below the poverty line, Sen's measure and the income-gap ratio ... are of academic interest only". The high head-count ratio indicates the extent of the problem and this measure is in terms of absolute poverty, i e, absence of basic amenities. In this context, it is of interest to note that the Planning Commission's target for the Sixth Plan was to reduce the proportion of persons below the poverty line from 48.4 per cent in 1979-80 to 30 per cent in 1984-85. But the more interesting part is the announcement that 34 per cent of the target has been already achieved in the first two years of the plan. This statement is made in the face of evidence that over the last 13 years to 1973-74, the head-count ratio has hardly fallen from its earliest level of 0.56 (or 56 per cent) in urban areas to only 0.55 and has, if anything, shown a tendency to increase in rural areas from 0.55 in 1960-61 to 0.61 in 1973-74. Some experts outside the citadel of Planning Commission have disputed this claim; but the official assertion at the technical level does provide a big opportunity to politicians at the right time to propagate this figure in quantitative absolute terms. After all, what are the all pervading AIR stations and 180 and odd TV stations meant for?

A new dimension to this is imparted by an eminent economist member of the Planning Commission saying that it is not only nutrition-based poverty line that should be considered for calculations, but also the basic amenities provided free or almost free by government to people in terms of education, health and medical facilities, etc. He has quoted increases in per capita figures for these items. He does not and cannot say how these figures can be fitted into the *distributions* of present consumer expenditure. Per capita increases do not necessarily mean gains for the really poor. The gains could have been appropriated more than proportionately by those immediately above the poverty line. After all they are not by any stretch of imagination well-to-do households. Besides, the statement made by the eminent member of the Planning Commission only means that we really should have income distribution data including all the various imputations like free education, health, medicines, etc, apart of course from other imputations like owner-house rent. It is, however, amazing how liberties with concepts and data are taken by some economists.

Chapter 10 is a short one on factor inputs and growth of national income. Essentially, this chapter focuses on the questions of factors affecting long-term growth of GDP or NDP. "Given the stock of capital and labour force, an economy can potentially turn out a particular level of GNP when existing capacities are more or less fully utilised." Regarding developing countries like India. "the more important point which needs to be answered in this context is regarding the determinants of long period growth in national income and the extent to which the growth in physical assets and labour force

New from SAGE Publishers of the Professional Social Sciences

**Victor S. D'Souza**

ECONOMIC DEVELOPMENT, SOCIAL STRUCTURE AND POPULATION GROWTH

The link between population growth and economic development is a hotly debated topic. Existing studies have utilised only the perspectives of demography and economics. Their analyses are based on the economic decision-making model which rests on the concept of children as durable consumer goods. This approach has now been found to be both inadequate and unrealistic.

Professor D'Souza has added a third perspective—that of sociology. His study throws fresh light on the complex issue of population and development. Essential reading for demographer, planners and policy-makers all over the world.

are responsible for this rather than the actual level of GNP for a year given the potential income for the year". The authors then present a Table giving results of some limited studies made in this context (Table 10.2). The authors conclude: "While the post-Independence growth is much higher than the pre-Independence growth, this has been achieved largely by increasing factor inputs rather than by enhancing factor efficiency." Several Tables in this chapter give useful data. It is interesting to see that compared to 1950-51, all the sectors—modern commodity producing, modern services and the traditional—show increases in fixed capital/NDP ratio. For the modern services sector the capital/output ratio has increased much faster (2.35 in 1950-51 to 5.71 in 1970-71) and has overtaken the ratio for the modern commodity producing sector. Interestingly the ratio for the traditional sector has also exceeded 1. The authors observe that "the answer to higher economic growth lies not only in higher investment but higher investment in traditional industries with intensive utilisation of capital resulting in much higher productivity of capital and labour".

### PLANNING AND SHORT-TERM FORECASTING

Chapter 11 relates to describing how national accounts information system, at the official level, is used for macro-balancing, plan targeting and short period projection. "The overall macro-balance uses the matrix form of presentation to check the consistency of plan targets" and for plan formulation and evaluation. Prior to the formulation of the Fifth Plan, the different macro-aggregates were being used independently to predict and evaluate different aspects of the system. But since the Fifth Plan, an overall macro-balance is also attempted. The authors then proceed to describe the process. The model consists of three parts: (i) macro-economic model; (ii) input-output model; and (iii) consumption model. Deliveries of different sectors to public consumption, exports and to gross fixed investments are estimated exogenously in this model. The macro-model gives projections based on a gradual growth path for GDP at factor cost. The investment required for the five-year plan are estimated by applying a global incremental capital-output ratio consistent with the past data but taking care that the past ratios are affected by the extent of capacity utilisation. The aggregate terminal net imports of all types of goods and services are obtained with the help of the input-output model and are used to derive domestic savings necessary for achieving the desired level of investment. Aggregate private consumption is obtained as a residual after allowing for public consumption. The basis for projection of output levels is the inter-industry current flows in value terms at producers' prices and consist of 66 sectors. The projections and actual achievements are compared for plan evaluation at the end of each year.

The authors then describe how the system of national accounts is used in India, in a limited way for short-term forecasting. The forecasting is done through a simplified aggregative econometric model built around the aggregate GDP and broad categories of national expenditure. This procedure is preferred to use of disaggregated analysis similar to those in advanced countries "because of meagre knowledge of economic realities in a country like India and because of lack of theoretical basis necessary to explain the complexities encountered here". Perhaps the disaggregationists will contest this statement. "Dearth of relevant economic information at the micro-level and the use of unsatisfactory data base have also been responsible for the unrealistic results obtained from such exercises."

The basic model uses constant price variables and the exercise is carried out in two phases. Phase I of the model consists of a system of linear regression equations. It is seen that equations (1) and (2) of Phase I use the same two variables only and the third is a linear regression of deviations of total domestic product from the trend value on the same two variables in a way. The two exogenous variables are deviations from trend values of agricultural and industrial production. Equations (4) to (6) give the trend values. Equations (7) to (9) are the identities which yield estimates of primary, secondary and total domestic products as additions of deviations to trend line figures. The tertiary sector estimates are then obtained as residuals, given primary, secondary and total domestic production. In Phase II, disposable income, private final consumption expenditure, imports and gross investment, are first obtained in a system of linear regressions wherein estimated values of total domestic product and lagged variables are used as exogenous variables. Then through the identity relation

$Y = C + I + G - T + X - M$, Y is obtained (i e, GDP), in this, G, government current expenditure, T, indirect taxes, and exports X are exogenously determined outside the system of equations. Thus Phase I is used to estimate GDP from production side, Phase II obtains GDP from expenditure side. A simulation exercise with successive approximations of GDP estimates is then undertaken "to obtain a reasonably satisfactory estimate of GDP from two independent approaches". Further, a system of log-linear equations is used involving constant price variables and wholesale price indices for agricultural commodities, manufactured articles and all commodities. In all 23 equations and identity relations are made use of. Using the data for 1960-61 to 1973-74 the authors show projections for 1975-76. The real growth rate for GDP is indeed very close to the project one.

In this rather long review, an attempt has been to bring out the salient aspects of the book. Although at some places the reviewer may differ from the authors, there is no doubt that the book deserves commendation and is a useful addition to the literature on India's national accounting system. There is a good and detailed description of concepts, sources of data, methods employed to compute macro-aggregates, and the uses to which these processed data are put. The book does not contain any critique of the methods, but to that extent for the uninitiated the book is a good starting point, particularly since CSO's Sources and Methods and UN's SNA (1968 revision) are difficult and rather dull publications to digest. If the book is to be useful to students in India, a cheaper paper-back edition would be a welcome gesture.

## Telco

TATA ENGINEERING AND LOCOMOTIVE COMPANY (TELCO) and Honda Motor Company of Japan have signed a technical collaboration agreement for the manufacture of passenger cars in India. The agreement was concluded at a signing ceremony held at Honda's Head Office in Tokyo on July 10, 1985, between S Moolgaokar, Chairman of Telco, and Tadashi Kume, President of Honda. The agreement, which is subject to the approval of the Government of India, also provides for Honda to take a stake of around 10 per cent in Telco's equity. Telco will invest approximately Rs 200 crore in Pune for the manufacture of passenger cars and will produce the new model of 'Accord' which Honda has introduced only last month in Japan. Production is expected to commence in 1987 at a rate of 10,000 cars per year, rising to 40,000 per year in the fifth year. Starting with a high indigenous content, Telco expects to reach the level of 90 per cent within a reasonable period. Telco, the country's largest automobile manufacturer, also has the best record of product innovation, quality and ancillary development, amongst all Indian manufacturers. So far, Telco was concentrating only on the manufacture of commercial vehicles in view of the government licensing policy. The recent liberalisation of licensing will enable it to make a move into passenger cars. It is expected that Telco's project will be a pace-setter in the Indian passenger car industry. It will use the latest technology and will generate employment in a host of ancillary activities, including the supply of components and the service of cars. Indian consumers can now look forward to a truly modern, international car for families and executives.

# Educational 'Miracle' in Third World, 1950 to 1981

**Surendra J Patel**

*This paper aims to survey how far the Third World countries have succeeded, at least in quantitative terms, in their ambitious plans to improve rapidly their skill profiles over the last thirty years. The picture is general and will obviously not apply to all countries of the Third World.*

*The study begins with a general consideration of the strategic role of social technology in economic development and then moves on to look back at the advance achieved in the developed countries in the field of education over the last century. The next section then reviews the expansion in educational enrolment that has taken place in the Third World since 1950. This is followed by a summary indication of the educational distance between the developed countries and the Third World and of the implications of the findings of this study for the educational transition in the Third World.*

SINCE 1950 most of the countries in the Third World have emerged into independence. Their newly-established national governments were keen to accelerate the pace of their economic and social development. But the current thinking at the world level had condemned them to a vicious circle of poverty. They were poor, it was said, because they were poor in capital and skills. Their rapid economic development therefore could be ensured only through receiving as large a flow of foreign assitance as possible. These countries were thus urged to prepare the ground for obtaining an ever-enlarging inflow of foreign capital and skills and technology.

It is widely accepted that technology is embodied in capital goods, equipment and in skills. But in the final analysis even capital goods require technical skills for their production. In this sense, then, skill formation is the final embodiment of technology. Technology is thus the key to economic and social progess.[1] It was in recognition of this fact that the Third World countries had set in motion ambitious plans to improve rapidly their skill profiles. This study aims to survey how they have succeeded—at least quantitatively—in this objective over the last thirty years (1950 to 1981).

The basic data used in the study relates to the Third World (including China and the socialist countries in Asia) as a whole. The picture is general and would obviously not apply to all countries of the Third World. There are vast differences among these countries. Some have rather advanced skill profiles. In others skill development is just beginning. These differences are of critical importance in understanding the present level of the development of each individual country and in influencing the course of its future.

The study begins with a general consideration of the strategic role of social technology in economic development and then moves on to look back over the advance achieved in the developed countries, both capitalist and socialist, in the field of education over the last century. The next section then reviews quantitatively the expansion of enrolment that has taken place in the Third World since 1950. This is followed by a summary indication of the educational distance between the developed countries and the Third World and of the implications of the findings of this study for the educational transition in the Third World.

## I

## Strategic Role of Social Technology

Technology has generally been taken as a constant or a neutral factor in economic theory. It was therefore not considered an important subject for attention. Nor was it assigned any significance in the two-factor (capital and labour) production function. Harrod's model of development assumed a given set of capital-labour ratios and no technological development.[2] The urgent pressures of development of the Third World helped centre attention on the role of technology as embodied in capital goals and skills. It is now generally accepted that technology is the key element in economic and social transformation. Most of the past discussions on the role of technology had, however, concentrated upon what might be called physical technology—that is technology embodied in capital goods, equipment, tools and other instruments of production Relatively very little attention was given to what might be considered, in a broad sense, social technology.

The publication in 1957 of R Solow's major study underlined the limitations of the two-factor aggregate production function. It showed that nearly nine-tenths of the growth of per capita income in the United States of America over the four decades upto 1949 was due to technological progress. Only one-tenth could be attributed to inputs of capital and labour.[3] Since then other studies have corroborated the importance of Solow's findings.[4] Technology was thereby brought to the centre of development thinking, at least in academic circles. Examining historical evidence about the several factors which have contributed to the economic development of nations, Kuzntes concluded:

> The inescapable conclusion is that the direct contribution of man hours and capital accumulation would hardly account for more than a tenth of the rate of growth in per capita product—and probably less. The large remainder must be assigned to an increase in efficiency in the productive resources—a rise in output per unit of input, due either to the improved quality of resources, or to the effects of changing arrangements, or to the impact of technological change, or to all three.[5]

The three elements mentioned by Kuznets above constitute what may be conveniently called social technology. Defined this way, social technology covers all advances in skills acquired by people—individually and collectively. These skills are not limited only to the process of physical production. They also cover a wide spectrum of individual and social skills: for instance, for organising and managing the efficient working of the entire economic system; the distribution and marketing of goods and services; the provision—at present and over time—of the needed infrastructure; the innovation and introduction of new products and processes; research and development and design engineering, and many others. Social technology thus covers not only the individual's skills employed in the performance of his job, but also the collective influence of the working together of all the components of the economy, including division of labour and economies of scale.

Technology could thus be defined for analytical convenience in terms of its two elements—physical and social, each of which is embodied in capital goods and skills. There is little doubt that education at all levels—and the consequent upgrading of the skill profile—is the key factor in accelerating the improvement of social technology. It is the most powerful liberating instrument for economic and social progress.

It is not easy to measure precisely a country's skill profile. Education may be taken as the basic proxy indicator of progress in skill formation. There are, however, other important elements: for instance, informal education, on-the-job training, learning by seeing, doing and copying and technical education and experience, and so on, which significantly influence the formation of skills. But they are not easy to quantify in comparable numbers.

Even concerning the one single indicator of education, there are several considerations which have a direct impact on its effectiveness—for instance, the structure of education (division between technical and social training), inter-relationships between first, second and third levels of education, and above all the quality of training. Moreover, an expansion of the educational system is a necessary, but not a sufficient, condition for the acceleration of economic and social development. There are many examples of wasted educational investments. Apart from many other factors, it is equally important to ensure that the outputs of the system, that is the skilled men and women, have adequate equipment and tools and are employed effectively in the development process. Moreover, while educational enrolment, skill development and social technology are integrally linked together, it should not be imagined that a mere recital of educational achievements gives an indication of equivalent development of social technology. A system of individual and social motivation and opportunity binds these three together, and its absence could lead to ineffectiveness of education and skill formation. All these qualifications notwithstanding, formal education would still remain perhaps the most important, the largest, and decidedly the most measurable indicator of the advance of a country's skill profile. That is why as an initial attempt this study concentrates on advances in the first, second and third levels of education.

## II

## Skill Advance in Developed Countries

In order to appreciate more adequately the changes in the educational profile in the Third World countries, it may be helpful if a broad bird's-eye view were to be taken of the developments in education in the developed countries. It could help see more clearly the points of time when their educational advance gathered momentum, the pace of their advance, and the period of time taken by them to reach the levels current in the early 1950s. Such an understanding would be of considerable significance in appreciating the educational advance already made in the Third World countries and the future possibilities.

Over the last hundred years, much attention has been given to a study of the history of education. The reform of the educational system has been an active item on the social and political agenda. Changes in curricula and the methods of teaching have been studied by a continuing stream of commissions and committees. And yet, it is striking indeed that a systematic construction of comprehensive series on the levels and rates of development of education at various stages of the past history of the developed countries has so far received relatively limited attention. Long term series on education covering all the developed countries are far more difficult to find than, say, similar series on economic indicators. The description here is therefore only illustrative, pointing to major landmarks in the development of primary, secondary and higher education in only a few developed countries.[6]

In the history of civilisations the temples of worship and the temples of learning were to be found most often under one roof. But until the recent period, learning consisted mostly of the three Cs: catechisms, classics and counting. Secondary education meant being a journeyman or an apprentice. And higher education barely went beyond the superior faculties: theology, law and medicine. Even Voltaire emphasised the enlightenment of only the elite. Adam Smith advocated education mainly to relieve the boredom of the labourers, and that too in homeopathic doses only. As late as 1903, Mercedez thought that only the world's richest one million families would ever buy motor cars since too few servants had the ability of being trained as chauffeurs. Despite all the popular pressures, education particularly at higher levels was throughout the nineteenth century essentially a privilege of the aristrocratic and the very well-to-do. It is only in the recent period, mainly the last decades of the nineteenth century, that education began to be imparted to the large masses of the population of the developed countries.

### ILLITERACY

In view of this it is not surprising at all that the ratio of illiteracy in the mid-nineteenth century Europe was very high. It was over 40 per cent in England and Wales, and France. In Belgium it was around 50 per cent. Seventy-five per cent of all men and 89 per cent of all women in Spain were said to be illiterate in 1860. In Southern Italy, the ratio was as high as 90 per cent of all inhabitants.[7] Even in the United States, where education was given greater importance, the rate of illiteracy was under 40 per cent for the total population in 1877, but as high as 80 per cent for the non-white population.[8]

### PRIMARY EDUCATION

The universality of primary education is a relatively recent phenomenon. Upto the eighteenth century, it was limited to the clergy and aristocracy. The French revolution gave a great push to popular education. But despite that, the general education of the masses of the people was to remain mostly the concern of the Church in England and France upto the last quarter of the nineteenth century.

Let us take the case of England, the leading industrial nation throughout the nineteenth century. England had 13,000 Church schools with about 400,000 pupils in 1830. Only about three per cent of the total population of England and Wales attended primary schools in 1830. The progress thereafter was rather slow. The numbers of pupils rose to 1.2 million by 1870 or to between 4 and 5 per cent of the population. During the decade of the 1870s Disraeli introduced universal compulsory education, with certain exceptions. There was, therefore, a very rapid expansion between 1871 and 1880. The enrolment in primary education jumped from 1.2 million in 1870 to 4 million by 1881 and to 6 million by 1900, or to some 160 pupils per thousand of population. It may be pointed out in comparison that the ratio for the Third World as a whole was 49 students per thousand of population in 1950 and 137 in 1981.

While England was a pioneer in industrialisation, its educational progress was very limited. For illustrative purposes, we may relate the number of pupils in primary schools in a few of the countries in Europe to the relevant school-age population group. At mid-point of the last century, the proportion was 1:7 in England, 1:9 in France, 1:8 in Holland and 1:6 in Prussia which had fostered primary education more vigorously than elsewhere. Between 1840 and 1880s the population of Europe rose by 33 per cent, but the number of its children attending school by 145 per cent.[9] This may sound like striking progress, but its annual growth rate was a modest two per cent. The comparable rate for the Third World was 5.6 per cent between 1950 and 1981.

### SECONDARY EDUCATION

The expansion of industry and commerce, the enlargement of services both public (civil and military) and private—and the extension of the right to vote generated strong popular pressures for a faster increase in secondary education. Even then, its massive rise is a more recent phenomenon than that of primary education. The Bruce Commission was appointed in England in 1894 and the Act dealing with secondary education was passed in 1902. In consequence there was a near doubling of the schools on the grant list from 575 in 1904 to 1,047 in 1914. The number of students enrolled in secondary schools also more than doubled, increasing from 2.9 per thousand of population in 1904 to 5.5 in 1914, or about the same proportion as in the Third World as a whole in 1950. It may be pointed out that even in Africa, educationally the least advanced continent in the Third World, the comparable proportion was over six in 1957/58, or in fact higher than in England as late as 1914.

We may examine the experience of the United States. The first public high school was established in Boston in 1821. The proportion of high school age group attending school rose from only 10 per cent in 1900 to 50 per cent in 1930 and 75-80 per cent in the 1950s. The number of high school graduates per year rose from only 95,000 in 1900 to 1,860,000 by 1960 or by nearly 20 times.[10]

The development of secondary education in Japan was even more striking. The enrolment in secondary schools in as late as 1885 was only 20,000 students. The number increased rapidly to 100,000 by 1900, and around 10 million by 1960, or one hundredfold in 60 years.[11] The annual rate of growth was very high—8 per cent. But that in the Third World between 1950 and 1981 was even higher—9 per cent.

### Higher Education

Information about enrolment in higher education is very scattered. During the 14th century, the number of genuine undergraduates working for a degree could not have been much higher than 1,500 at Oxford, 2,500 at Bologna and some 3,000 students at the University of Paris. The enrolment at these universities is reported to have declined steadily thereafter so that the enrolment levels till the early part of the nineteenth century were not altogether dissimilar.

We may illustrate the long-term movement in higher education by an examination of the experience of the United States which has now the world's highest enrolment at the third level of education. But the beginning there was very modest. The number of students at the third level of education in 1870 was only 52,000. This increased to 238,000 by 1900 and to some 2.6 million in the late 1950s, or eleven times. The annual growth rate was around four per cent, compared with 9.8 per cent in the Third World from 1950 to 1981. The United States had by the 1950s some 16 students per 1,000 of its population. In line with the expansion of university enrolment, the number of graduates coming out of the universities and institutes of higher learning also rose from some 10,000 in 1870 to 500,000 by 1956.[12]

In comparison with the United States the enrolment in universities and institutes of higher learning had been much lower in Western Europe. Comprehensive estimates for the continent as a whole are not available. But it would seem that the enrolment could not have been much higher than one to two per 1,000 of its population in 1900. It rose to four per 1,000 in late 1950s. It may be added that the comparable level in the Third World as a whole was 0.6 in 1950. The proportion in the Third World in 1981 was over 5 per 1,000 of its population if China is included, and over 7 per 1,000 of the population if China is excluded—that is, higher than in Western Europe in late 1950s or only a little more than just 30 years ago.

The experience of Japan also underlines that the expansion of enrolment in the third level of education was mostly a 20th century phenomenon. There were barely 10,000 students in universities and institutes of higher learning in 1885. The number doubled to 20,000 by 1900. The pace accelerated thereafter, the number rising to 600,000 by 1960.[13] This means that there was less than one-half student per 1,000 of its population in 1900, or about the same situation as in Africa in 1950. The proportion in Japan rose to about 7 in 1960 or about the same as in the Third World excluding China in 1981. The point to note is that the Third World took only 30 years to attain a rise in this level which was achieved in Japan in 60 years.

The expansion of university enrolment in the Soviet Union is an even more recent phenomenon. As late as 1928 there were only 190,000 students, that is around one per 1,000 of its population or not much higher than in the Third World in 1950. This number rose very rapidly to 812,000 in 1940/41 and 3,258,000 by 1963-64, or some 15 students per 1,000 of its population.[14]

The third level enrolment directly influences the stock of scientific workers available to society. For example, it was reported at the International Conference on Organisation of Research and Training in Africa, organised jointly by the UNESCO and Economic Commission for Africa in 1964 that about a century ago the number of scientific workers in Western Europe was very low. It was a little above 20 per million of its population or not much higher than in the developing countries at that time.[15] It should be added that the proportion in Western Europe had by 1964 risen to over 2,000 per million of its population, which had more than trebled in the century.

The review above of the educational change in the developed countries is sketchy. But it helps to pinpoint the major landmarks of the change in the scene to obtain an overview. The rapid expansion of primary education on any scale began only towards the end of the 19th century in the developed countries; that of secondary education in early 20th century and that of higher education only around the years of the First World War.

## III

## Educational 'Miracle' in Third World

The Third World countries had become fully aware, often through very painful experiences of their own, of the superiority of the Western countries in skill formation. Among the very first acts of the newly-formed governments after gaining independence was to establish educational plans, setting forth ambitious targets. Till independence, a few students from the Third World were sent to the West for education. But the needs were so vast and the costs so forbidding that there was no real substitute for expanding, as rapidly as possible, national facilities for education at all the levels of learning.

The thirty years since 1950 mark a watershed in their history. Whatever views one may have on the quality of education offered or on the priorities established among the three levels of learning (not to mention adult education and other forms of informal training), one fact sharply stands out. There was a veritable educational explosion in the Third World. The thirst of their people for mastering the magic of enlightenment was unquenching. The people absorbed all—bad, and good and indifferent—they were offered.

In the process, an educational miracle took place in these thirty years. Its full story yet remains to be told by historians of educational advance. Its magnitude needs to be carefully measured. And its impact on the Third World itself and the world as a whole for the period ahead will have to be adequately assessed. As a beginning, we have put together at least the vast numbers which were involved in this educational miracle (see Table 1).

The information concerning the growth of enrolment between 1950 and 1981 in the Third World (including China and East Asian socialist countries) and other regions of the world is summarised in Table 1. We have also given comparative data for the developed countries—both capitalist and socialist—for the same period. The Table contains information on absolute numbers, the size of the increase between 1950 and 1981, the expansion in the number of students enrolled, annual percentage growth rates, and relative shares in world totals in 1950 and 1981. The data are sufficiently comprehensive so that there is no need to describe in detail each of the elements. The observations below therefore are only of a summary nature.

### Total School Enrolment

The enrolment in all the levels of education from first to the third one for the world as a whole expanded from 250 million in 1950 to 865 million in 1981. It increased some three and one half times rising annually at 4.1 per cent per year. It may be noted here that during this period the world population increased by some 2,000 million persons. Of this increment, as many as 620 million, or nearly one-third of the entire rise in world population, were absorbed in school enrolment spread over the three levels. It is difficult to imagine any comparable period in world history when the educational expansion was so rapid, the numbers involved so overwhelming.

Of much greater significance was the enlargement of total enrolment in the Third World. It increased from some 90-100 million students in 1950 to 627 million in 1981, or some six and one-half times. The size of the sheer numbers is staggering. It may be pointed out that of the entire increment of 620 million in the world school enrolment, the Third World contributed 530 million, or nearly 85 per cent of the total. Quite clearly, the educational advance of the post-Second World War period was mainly a Third World phenomenon.

In consequence there was a decisive reversal of the shares of the developed countries and the Third World in world enrolment. For instance, the developed countries accounted for two-thirds of the world enrolment in 1950, whereas the Third World's share was only one-third. This asymmetry was fundamentally altered by 1981. The Third World's share went up to 73 per cent of the world total. The share of the developed countries, both capitalist and socialist, shrank to only 27 per cent. These changes have thereby brought the educational shares more or less in line with the population shares of both the Third World and the developed countries.

The Third World is far behind the developed countries in many areas: for instance, in per capita national product, industrial output, foreign trade, and several other indicators. But as far as enrolment in education is concerned the Third World has covered in just 30 years the vast gap that separated it from the developed countries in 1950. People will continue discussing the income gap, the food gap, the foreign trade gap, the balance of payments gap, the industrial gap, the technological gap, and several other gaps, which are, or may become, the current fashion. With the enrolment gap now clearly covered by the Third World's lightning sprint, one can write an epitaph for at least one gap.

## PRIMARY EDUCATION

We may quickly review the Third World's advance at the first, second and the third levels of education. Third World enrolment in the first level rose from 80-90 million students in 1950 to over 456 in 1981, or some five times. The expansion was at about 5.6 per cent per year or slightly faster than that (5.4 per cent) in its overall gross national product.

It is noteworthy that in 1950 the developed countries with only 25 per cent of the world population accounted for 57 per cent of the world enrolment in the first level of education. Even in absolute numbers, the developed countries had 75 per cent larger enrolment in 1950—148 million in comparison with 80-90 million in the Third World. By 1981, however, this share was reduced to 21 per cent. Nearly the entire increment in world enrolment at the first level was from the Third World. In consequence, the Third World share in first level world enrolment rose to 79 per cent. This was slightly higher than its share in the world population, reflecting in part the predominance of younger age groups in its population. The enrolment gap, both in absolute numbers and in relative shares, was closed.

In 1950, a bare five per cent of the population of the Third World was in primary schools. By 1981, the share had risen to 14 per cent. One out of every seven persons in the Third World is now absorbed in primary education, deciphering the magic of the written word. The comparable level for the developed countries is 10 per cent, again reflecting in part the larger share of the aged in their population.

## SECONDARY EDUCATION

Between 1950 and 1981, the enrolment of Third World students at the second level grew at about 9.0 per cent per year, or faster than that for the first level of education. The total number in its secondary schools has gone up from only 10 million in 1950 to 143 million in 1981, or some 14 times. Per thousand of its population, there were less than six students at the second level in the Third World in 1950; by 1981 this number had risen to 46; or higher than the level current in the developed countries in 1950 (see Table 2).

In 1950, the developed countries had 31 million students at the second level, or three times more than those in the Third World. These relationships were almost reversed by 1981. The Third World now has 75 per cent more students enrolled in its secondary schools than the developed ones have in theirs. The big gap in absolute numbers has by now been covered.

As a result of differences in the relative growth rates in the Third World and the developed countries, the Third World has improved its comparable position from 24 per cent of the World total in 1950 to 64 per cent by 1981—that is, raising its relative share by 40 percentage points in 31 years, or by 1.3 percentage point each year. If these rates are continued, it is easy to see that the Third World enrolment in the second level of education will in less than a decade be on par even on a per capita basis with that in the developed countries. At the past rates, such a transition should occur by or around 1990. Not all that far away!

## HIGHER EDUCATION

The place of pride for Third World achievement in education belongs to higher education. The most impressive expansion has taken place in enrolment in universities and institutes of higher learning in the Third World. There were less than one million students in such institutions in 1950. The numbers multiplied to 18 million by 1981,

TABLE 1: EDUCATIONAL ADVANCE IN THE DEVELOPED COUNTRIES AND THE THIRD WORLD: 1950, 1981

| Areas and Enrolment Levels | In Millions | | | Index 1950=100 | In Per Cents | | |
|---|---|---|---|---|---|---|---|
| | 1950 | 1981 | Increases 1950-1981 | | Annual Growth | Share in World 1950 | Totals 1981 |
| Developed Countries[a] | | | | | | | |
| Level I | 112 | 120 | 8 | 107 | 0.2 | 57 | 21 |

| Level III | 6.4 | 49 | 43 | 670 | 6.3 | 100 | 100 |
| Total | 250 | 865 | 620 | 346 | 4.1 | 100 | 100 |

*Notes*: Totals may not agree owing to rounding.

a Covering OECD countries, USSR and East European countries.

b Including China; 1950 figures include rough guesses for Chinese data.

*Sources*: For 1950, "UNCTAD, Co-operative Exchange of Skills among Developing Countries: Policies for Collective Self-reliance" (TD/B/C 6/AC 4/8/Rev 1); for 1981, Binod Khadria, 'Generation and Efficient Utilisation of Skills for the Technological Transformation of Developing Countries' (unpublished manuscript, October 1984), based on data from UNESCO, "Statistical Yearbook 1983".

or 18 times. They were growing at 9.8 per cent per year, or doubling every seven years. This rate of growth of enrolment at the third level was nearly twice as high as that of the combined GNP of the Third World countries. It should be noted here that of the 30 million students enroled at the third level in the developed countries, nearly one-half million are overseas students from the Third World.[16]

Education at the third level was mainly a developed country monopoly in 1950. As high as 85 per cent of the world enrolment in this level was concentrated in the developed countries. In 1950, only one out of every seven students enrolled in higher education came from the Third World. There was a big change in this one-group concentration by 1981. The Third World's share in higher education rose to 38 per cent. Four out of every 10 students enrolled in institutions of higher learning came from the Third World in 1981. It should perhaps be added that this share would have been even higher were it not for the fact that the cultural revolution in China had decimated its enrolment at the second and third levels. The ground lost is now being rapidly covered by China with the result that its high rates in future will help raise, rather than lower as in the past, the growth rate of third level enrolment.

The Third World has raised its share in world enrolment in higher education from 15 per cent in 1950 to 38 per cent by 1981, or by about 0.7 percentage point per year. If the past growth rates continue in both the areas, these shares shoud be equal in about 15 years. It would take longer to reach equality on a per capita basis—say, half a century or so from 1981, based on a simple extrapolation of past trends.

It would seem, however, that such a simple extrapolation would be unrealistic in view of the fact that the 15-24 years age-group of the population of the developed countries is estimated to decline at an annual rate of 0.3 per cent between 1980 and 2000.[17] The past growth in third level enrolment in the developed countries, particularly rapid upto early 1970s, is unlikely to be sustained for this reason. It may well be that the actual rate might be nearer zero, as has been the case in recent years, or only marginally above. In that case, the educational transition for third level enrolment—shares being equal to population shares—would require a five-fold rise in Third World enrolment in higher education. A continuation of the past growth—9.8 per cent per year—could accomplish this in some 20 years, or just around the turn of the twentieth century.

TABLE 2: EDUCATIONAL DISTANCE BETWEEN THE DEVELOPED COUNTRIES AND THE THIRD WORLD: 1950-1981

| | 1950 | 1981 | Change 1950 to 1981 |

a Covering OECD countries, USSR and East European countries.
b Including China; 1950 figures include rough guesses for Chinese data.

*Sources:* For 1950, 'UNCTAD, Co-operative Exchange of Skills among Developing Countries: Policies for Collective Self-reliance' (TD/B/C 6/AC 4/8/Rev 1); for 1981, Binod Khadria, "Generation and Efficient Utilisation of Skills for the Technological Transformation of Developing Countries" (unpublished manuscript, October 1984), based on data from UNESCO, "Statistical Yearbook 1983".

It needs no emphasis that the contours of the transition and the period it would take depend on the relationship between the growth rates of third level enrolment in the two groups of countries. The logic of numbers and growth rates simply compel the conclusion that this is a matter of a few decades. The age of enlightenment for the Third World is not endless centuries away. It is easily forgotten that growth rates cannot be considered quite the same way as speed of cars: three times the speed would need one-third the time for covering the given distance. Nine per cent growth rate is three times as high as a three per cent one; but in 30 years, the final outcome is 13-fold at the former and only 2.3-fold at the latter—the ratio of rates being three, but of outcomes six. The ratio rises rapidly as the dimension of time is extended: for fifty years, it would be 17. This is all rather simple and straightforward, and need not have been stressed here, but it is too often overlooked in growth dynamics.

## IV

## Educational Distance among Nations and Its Implications

The preceding review of education developments in the Third World since 1950 brings strikingly a number of conclusions of considerable operational significance. Some of the more important ones may therefore be briefly summarised.

To begin with, the nineteenth century educational landscape in the most developed countries was not altogether dissimilar from that in the Third World in the 1950s. Broadly stated, the rapid development of primary education began in the developed countries during the closing decades of the nineteenth century; that of secondary education in the first decade of the twentieth, and of higher education only around the first World War if not later. These benchmarks are very approximate for experience varied from one developed country to another. Bearing this in mind, the educational distance[18] between the developed countries and the Third World around the 1950s, if measured in terms of years, would appear as follows:

—primary education: 60-70 years;
—secondary education: 40-50 years;
—higher education: 30-40 years.

Second, the advanced countries had developed by 1950 a considerable lead over the Third World countries in all the three levels of education. They accounted for some 30 per cent of the world population. But their share in world enrolment was 57 per cent for primary, 76 per cent for secondary and as high as 85 per cent for higher education. The Third World countries were plainly on the periphery of educational progress.

Third, the educational advance in the Third World between 1950 and 1981 has been simply spectacular. A "miracle", according to its dictionary definition, is an event inexplicable by natural laws and so ascribed to divine or supernatural action; or a marvel, an extraordinary event or object. The Third World's educational progress was by no means promoted by divine or supernatual forces. It was the crowning result of hard effort involving immense costs in financial and human resources. By any standards, it was a miracle, a marvel, an extraordinary event. By 1981, the Third World had on a comparable per capita basis:

- —equalled (or surpassed) the levels of primary enrolment in the developed countries;
- —reached mid-1950 levels of secondary enrolment in the developed countries; and
- —nearly attained the levels of enrolment in higher education in the developed countries in 1950.

Fourth, the educational distance between the two groups of countries is being rapidly covered. The gap in primary education, as described above, was practically closed by 1981. The attainment by the Third World of the second level enrolment levels in the developed countries is only a decade away and those for third level not much more than two to three decades away. Thus, catching up with comparable numbers is no longer a visionary's dream, a fantasy of the daydreamer. It has become plainly a task manageable in a finite time framework. That by itself is a landmark.

Fifth, the implications of this catching-up. It should be recalled that heated debates are going on about several questions: for example, the ways of improving the quality of education in the Third World; the drop-out and stay-on ratios; the appropriate choices in devoting resources to one or the other level, type or the form of education; the provision of mass literacy; democratisation of education by reducing the resources catering to the needs of the elites; the wastefulness of creating so many educated unemployed; decisions on the relevance of several types of education; such as, liberal, vocational and technical and scientific; and elements to be included in this or that type of strategy and plans to be followed in the future. These debates are very essential; their results have a direct bearing on the future. The problems are very real, and they merit continuous attention. They cannot, however, obscure the fact that the batteries of skilled men and women who will be called upon to steer technological transformation of the Third World countries are now all on the scene in most of these countries.

Finally, many problems still remain to be solved before the newly acquired skills began to yield dividends in terms of extra output and additional personal satisfaction, since education, we must rememer, is at the same time both an investment and a consumption good. Like mercy, it benefits the nation which gives it, and the citizens who receive it. The stock of skilled personnel is still small, since there is a time-lag between enrolment and graduation and between graduation and seasoning of the graduates by experience. It is too young, over 75 per cent of it being under the age of 40. The quality and the relevance of education needs to be improved considerably. There are yet miles to go in this respect. In many instances, the critical-mass has not yet been reached. Nearly everywhere the complementary infrastructure—equipment, facilities, laboratories, institutions, R and D resources, incentives—is very poor; and the interlinkages among disciplines and sectors are nearly non-existent. Individual and social motivation matters most in bringing about an efficient utilisation of skills already acquired; there is a great scope of improvement here. In consequence of all these weaknesses, collective efforts do not yet yield benefits larger than the sum of individual components: All these and many other shortcomings remain to be overcome to ensure an optimal use of the skill capacities which at great cost and sacrifice have been built up over these years. They need to be studied carefully, and their incidence has to be clearly identified so that each country devises an appropriate educational strategy to guide its development plans.

We have only given an overall image of the educational transformation of the Third World. The attainments vary from country to country. Several countries are far better and many others far behind, particularly the least developed ones; they were late-starters and their progress will no doubt require even more vigorous efforts in the future. And yet, the fact stands out that the thirty years have witnessed an immense advance, the impact of which will be felt in the years ahead. Despite all the problems outstanding, one would still have to say in admiration of these three decades: "What a great sprint it was!"

## LIC

LIFE INSURANCE CORPORATION OF INDIA (LIC) has a new Managing Director. S V Narayanan, who was the Executive Director (Investment), Central Office, Bombay, has taken over as Managing Director of the Corporation on July 2, 1985. A fellow of the Institute of Actuaries (London), Narayanan has more than 30 years' experience in insurance and has held various senior positions in LIC such as Zonal Manager, Kanpur, Bombay and Madras. He has travelled widely in Europe and was a delegate to the International Congress of Actuaries at Oslo in 1972. He was also a delegate to the Ninth African Insurance Conference held at Addis Ababa in 1982.

# Employment Goals and Development Priorities

**S P Gupta**
**T G Srinivasan**

*By adopting a concept of standard person-years in the Sixth Plan for measuring employment, the earlier neglect of the productivity aspect of employment was partly removed and the concept of gainful employment was emphasised. In this sense in the Sixth Plan for the first time the goal of employment and the goal of poverty eradication were reconciled and the apparent trade-off between employment generation and growth largely rationalised.*

*However, the earlier approach of treating employment as a recursive process remained unchanged in the Sixth Plan. No new approaches for choosing the production sectors keeping in view the need for maximising employment, say, by an appropriate policy of demand management or choice of techniques, were explored. In recent debates on the choice of the desired employment strategies for the Seventh Plan, this aspect has been specially emphasised. But at the same time not much thought has been devoted to the selection of a 'choice criteria' for prioritisation of sectors for making investment decisions keeping in view optimisation of employment as a major objective. This paper is an attempt towards filling this gap.*

GENERATION of employment has been a major goal in all our plans. However, after the Third Plan the quantitative estimates of generation of employment in the Plan have been discarded. This resulted in our inability to monitor the employment generation potentialities of the Fourth and Fifth Plans. In the Sixth Plan, the practice of making quantitative estimates of employment targets has been revived. In this process of revival one major improvement has been made specially in conceptual terms. In our previous attempts, the estimates of employment were done in terms of "head counts". The employment implication of this approach would literally ignore (1) the minimum needs for earnings and therefore welfare of the employees, and (2) the needs for improving productivity in terms of the use of resources, specially in countries where underemployment is very high. By adopting a concept of standard person years in the Sixth Plan for measuring employment, the earlier neglect of the productivity implication has been partly removed and the concept of gainful employment has been emphasised. In this sense in the Sixth Plan for the first time the goal of employment and the goal of poverty eradication have been reconciled. The apparent trade-off between employment generation and growth has been largely rationalised. But unfortunately, the earlier approach of treating employment as a recursive process, i e, as a product of a production choice remained unchanged even in the Sixth Plan. No new approach for choosing the production sectors keeping in view the need for maximising employment, say by an appropriate policy of demand management or choice of techniques, has been explored. In recent debates regarding the choice of the desired employment strategies for future plans, this aspect has been specially discussed. But at the same time, not much thought has been devoted to the selection of a "choice criteria" by which the prioritisation of sectors could be done for making appropriate investment decisions keeping in view the optimisation of employment as a major objective.

The general practice, so far has been to rank the activities or sectors in terms of their employment intensity per unit of output, measured either as a coefficient or an elasticity with respect to output. In this paper we are trying to prove that this selection criteria may not give the right choice of priority between sectors. This is mainly because the operative decisions in a planned economy work primarily *via* the choice in the investment allocations and that also in the public sector investment activity and not usually by the choice in the unit of output to be produced. Therefore, it is more important to examine the employment generation potentiality from a unit of investment and its consequences in production rather than exclusively by a unit of output produced for optimising employment over the Plan period. If the two criteria will give more or less the same rankings of industries or sectors then any choice between these two criteria could be academic. But our present analysis will show that the use of these two criteria give completely different pictures. Besides, the generation of employment by an investment activity has a direct employment impact and also has an indirect employment impact by the forward and backward linkages of the sector concerned. In many sectors the direct impact is very slow

TABLE 1: BASIC PARAMETERS USED IN THE EMPLOYMENT COMPUTATIONS

*Note:* * The estimates are at 1979-80 prices and capital refers to fixed capital only.

but the indirect impact is significantly large enough to justify giving a very high rank to these sectors in terms of their total employment generation capacity from given investment programmes. Our manufacturing sector is one such case in point.

Further, there are certain investment activities where the gestation lag of investment is very small and the production phase comes rather early. Certain other investments would take place in sectors like power and steel where the gestation lags are very large and therefore the asset formation stage would continue for a longer period before the production phase would come. We know that the employment generation capacities are very different between the asset formation phase and the production phase in many sectors. Also the nature of employment generation is different between the two phases; in the production phase it is more or less of a flow nature whereas in the asset formation phase it is of a "stock nature", i e, once for all over the gestation period. Therefore, we have to take all these into consideration for assessing the employment generation potentialities of different sectors. They are (a) the level of investment expenditure net of interest payments, (b) the time span of the plan and the direct and indirect employment generation from unit net investment. When all these factors are considered we may find a case where a sector which looks to be unattractive on the basis of direct employment generation per unit of output may prove to be very attractive taking direct and indirect employment into consideration and its investment costs.

## MODEL STRUCTURE

As has been mentioned already, in choosing the alternative investments, one has to decompose the effect of employment between 'direct' and 'indirect'. With the increase in the interdependence of the economy (inter-industry linkages) the forward and backward linkages of some of the activities are ever on increase. Unless, therefore, the policy-makers take into account the total effect of employment, the investment choices may get distorted. For this purpose it is found necessary to visualise the employment effects of an investment activity into two phases. In the first phase, which can be called the asset formation phase, the investment activity should be confined to the building of capital asset. This activity may spread over a period of time, depending on the gestation lag of investment of a sector. Subsequent to this, the capital asset thus created is put to productive use wherefrom a stream of output and employment would flow per period of time. This second phase is generally described as the production phase. In both the asset formation and the production phases, we can decompose the employment effects into direct and indirect. By direct employment generation we mean only that part of demand for labour which is placed by the concerned activity. On the other hand, indirect employment generation sums up all the employment of labour which has been associated for the production of the inputs required for this concerned activity both in the asset formation and in the production phases. This element of employment is generally known as the backward linkage effect. Leontief technical coefficient matrices are used for tracing the indirect employment effects. However, in order to assess the indirect employment effect of an activity, we should confine ourselves only to the domestic inputs required in the process of production; since the imported inputs would result in employment generation outside the country. However, if the imported inputs in question are of a competitive nature, given the scope for substitution, a part of the imported inputs can be combined with the domestic inputs for estimating employment generation within the country. In the present analysis we kept the domestic input ratio of the base year unchanged thereby implicitly treating all imported inputs as non-competitive. Similarly, in estimating the employment impact at the stage of asset formation, the likely import substitution should be also assessed. This applies mainly to the import of machineries and equipment, given that construction by definition is non-tradeable. In this analysis, all capital goods are assumed to come from domestic production. Thus our calculations of employment genertion in the production phase is slightly underestimated since over time imported inputs are likely to decline in the development process. On the other hand, the estimation of employment at the asset formation stage may have been slightly overstated since a part of machinery can also be imported. Algebraically,

$$e_i = 1' \, (I\text{-}A^d)^{-1} \left\{ K_i^c + K_i^m + F_i \right\} \, Q_i \quad \ldots(1)$$

$$e_i^{*} = 1'(K_i^c + K_i^m + F_i) \, Q_i \quad \ldots(2)$$

$$e_i(c) = 1' \, (I\text{-}A^d)^{-1} \left\{ K_i^c + K_i^m \right\} \quad \ldots(3)$$

$$e_i(p) = 1'(I\text{-}A^d)^{-1} . \, F_i \, . \, Q_i \quad \ldots(4)$$

$$e_i^{*}(c) = 1' \left\{ K_i^c + K_i^m \right\} Q_i \quad \ldots(5)$$

$$e_i^{*}(p) = 1' \left\{ f_i Q_i \right\} \quad \ldots(6)$$

where

$e_i$ : Total employment effects for the ith sector,

TABLE 2: EMPLOYMENT GENERATION DURING THE CREATION OF FIXED ASSETS WORTH RS ONE MILLION

| 12 Public administration defence and other services | 59 | 68 | 127 | 59 | 68 | 127.9 |

TABLE 3: EMPLOYMENT GENERATION DURING PRODUCTION WITH RS ONE MILLION FIXED ASSETS

*(In standard person years)*

| Sl No Sector | In a Typical Year | | |
|---|---|---|---|
| | Direct | Indirect | Total |
| (1) | (2) | (3) | (4) |
| 1 Agriculture and allied | 66.0 | 14.1 | 80.1 |
| 2 Mining and quarring | 10.7 | 18.3 | 19.0 |
| 3 Manufacturing | 35.6 | 75.2 | 110.8 |
| 4 Construction | 1058.3 | 1199.4 | 2257.7 |
| 5 Electricity, gas and water supply | 1.8 | 3.5 | 5.3 |
| 6 Railways | 26.3 | 12.2 | 38.5 |
| 7 Other transport | 26.1 | 13.3 | 39.4 |
| 8 Communications | 15.6 | 1.4 | 17.0 |
| 9 Trade, etc | 121.7 | 48.7 | 170.4 |
| 10 Banking and insurance | 756.1 | 268.3 | 1024.4 |
| 11 Real estate, etc | 0.2 | 3.1 | 3.3 |
| 12 Public administration, defence and other services | 107.4 | 75.2 | 182.6 |

$e_i^*$ : Direct effect for the ith sector,
$l'$ : Row vector of labour use per unit output,
$A^d$ : Matrix of domestic input-output coefficients,
$K_i^c$ : Column vector with construction proportion of fixed investment in the Jth cell and null otherwise when J sector represents construction activity,
$K_i^m$ : Column vector with machinery and equipment proportion in fixed investment in the Rth cell and null otherwise, when R sector represents machinery production,
$f_i$ : A column vector with incremental output to fixed capital ratio in the ith cell and null otherwise,
$Q_i$ : Fixed investment (net) in the ith sector (Rs one million),
$e_i(c)$: Total employment in the construction phase only,
$e_i(p)$ : Total employment in the production phase,
$e_i^*(c)$: Direct employment in construction phase,
$e_i^*(p)$: Direct employment in production phase.

The first two terms within the chain bracket in equation 1 measure the demand on fixed assets placed by the investment level 'Q' in a sector. The direct and indirect employment generation in the supply of these capital assets in the form of construction and machineries constitutes the employment effects in the asset formation phase. The third term in the chain bracket captures the employment effects which occur as a stream of activity per period over the lifetime of the asset.

TABLE 4: DIRECT EMPLOYMENT GENERATION OVER FIVE YEARS

| 3 | Manufacturing | 35 | 35 | 35 | 111 | 111 | 327 |
| 4 | Construction | 36 | 36 | 36 | 2258 | 2258 | 4621 |
| 5 | Electricity, gas and water supply | 15.3 | 15.3 | 15.3 | 15.3 | 15.3 | 76.5 |
| 6 | Railways | 36 | 36 | 36 | 38.5 | 38.5 | 185 |
| 7 | Other transport | 57 | 57 | 39.4 | 39.4 | 39.4 | 232.2 |
| 8 | Communications | 36 | 36 | 36 | 17 | 17 | 142 |
| 9 | Trade, etc | 57 | 57 | 170 | 170 | 170 | 624 |
| 10 | Banking and insurance | 57 | 57 | 1024 | 1024 | 1024 | 3194 |
| 11 | Real estate, etc | 61 | 61 | 3.3 | 3.3 | 3.3 | 131.9 |
| 12 | Public administration, defence and other services | 127 | 182.6 | 182.6 | 182.6 | 182.6 | 857.4 |

In the numerical exercise that has been attempted a few assumptions have been made which need to be borne in mind.

In sectors where employment coefficients are estimated as elasticities they have been converted as a fixed coefficient at a particular level of production and employment for linearising the model specification. This would mean that in sectors where employment elasticity is much less than unity, calculation of employment generation will suffer from an upward bias. Besides the employment coefficient in the machineries sector which is in fact a sub-sector of manufacturing has been assumed to be the same as total manufacturing.

The basic parameters used in the exercise are consolidated and presented in Table 1. The Technical Note to the Sixth Five-Year Plan (TN) is the main source of information. However, the capital output ratios in the TN are with respect to gross capital formation and incremental value added in each sector. For our purpose we require the incremental fixed capital to output ratio. The relation between the incremental fixed capital to output ratio ($K^*$) and the conventional 'ICOR' of the TN (K) is

$$K^* = \frac{K\vartheta}{(1 + \lambda)} \qquad \ldots(7)$$

Where $\vartheta$ : value added to output ratio.

$(1 + \lambda)$: ratio of gross investment to fixed investment.

The employment effects are presented for all the 12 sectors against an equal investment of Rs one million in each sector. The analysis is done in a partial equilibrium frame in the sense that the investment postulated is applied to one sector at a time keeping all other sectors frozen at 'nil' investment. Also this analysis is rather static in the sense that the employment coefficients are regarded as remaining unchanged over the entire output changes assumed in this exercise (i e, elasticity of employment to output has been assumed to remain at unity over the relevant range).

As the gestation lag for investments of different sectors are different and the life-time of assets differ from sector to sector, in order to estimate the total employment generation of any sector for a given investment, we need to know not only the length of the gestation lag of investment in that sector but also the length of life of assets created. Although we have some information regarding the average gestation lag of sectoral investment, the information regarding the life-time of assets

TABLE 6: EMPLOYMENT GENERATION POTENTIALITY RANKING
(In Descending Order)

| Sl No | Sector Name (1) | Direct Labour Intensity of Output (2) | Total Labour Intensity Per Unit Inv (3) | Employment Multiplier (4) |
|---|---|---|---|---|
| 1 | Agriculture and allied | 1 | 6 | 12 |
| 2 | Mining and quarring | 8.5 | 11 | 3 |
| 3 | Manufacturing | 8.5 | 7 | 1 |
| 4 | Construction | 7 | 1 | 5 |
| 5 | Electricity, gas and water supply | 11 | 12 | 2 |
| 6 | Railways | 4 | 8 | 6 |
| 7 | Other transport | 3 | 3 | 9 |
| 8 | Communications | 2 | 9 | 8 |
| 9 | Trade, etc | 6 | 5 | 10 |
| 10 | Banking and insurance | 10 | 2 | 11 |
| 11 | Real estate, etc | 12 | 10 | 4 |
| 12 | Public administration, defence and other services | 5 | 4 | 8 |

is not always available. Keeping in view we have a five-year plan, the estimate of the employment generation potentiality of a given sectoral investment has been computed on a five-yearly basis. Also the sectoral investment should be on a net basis, i e, net of interest liability over the gestation period. Accordingly equations (3) and (4) have been revised as following:

$$e_i(c)_{pl} = \sum_{\lambda=1}^{la} l \quad (I\text{-}A^d)^{-1} \qquad K_i^c + K_i^m \quad Q_{i_\lambda}$$

When la $\leqslant 5$; if la $> 5$, than treat
la $= 5$ ...(8)

$$e_i\,(p)_{pl} = (5 - la)^*[l \quad (1 - A^d)^{-1}\; f_i Q_i] \quad \ldots(9)$$

$$e_{i\ pl} = e_i(c)_{pl} + e_i(P)_{pl} \quad \ldots(10)$$

When la is number of years of lag when $\lambda = 1$ to la, $e_i(c)_{pl}$, $e_i(P)_{pl}$ and $e_{ipl}$ define total employment direct plus indirect in construction phase, in production phase, and in both the phases together, over a five-year plan period. Tables 2 and 5 present employment generation effects of Rs one million fixed investment (gross 7) in the asset creation phase and in the production phase.

## FINDINGS

There are altogether six tables. Table 1 presents the direct employment coefficients of unit output, the sectoral incremental capital-output ratios, and the gestation lags of investment in all the respective sectors. Although the sectoral classifications used in the Plan are in more details, for our present exercise they have been aggregated into 12 sectors matching with the sector classifications of the national income accounts. Table 2 presents direct and indirect sectoral employment generated during the phase of asset formation, over (a) the first year and (b) covering the entire period of gestation of the investment activity. Table 3 presents direct and indirect employment generation in each sectors during the production phase per annum resulting from an investment of Rs one million on fixed assets in the respective sectors. Table 4 presents the direct additional employment generation in each sector aggregated over a five-year period, arising from an additional investment of Rs one million on fixed assets in each sector. Col 9 of the Table gives the estimates of employment multipliers in each sector of the economy, the employment multiplier being defined as the ratio between the total employment generated from an activity to the direct employment generated in that activity. Table 5 presents the employment generation over five years in each sector including both the direct and indirect employment generation from an investment of Rs one million on fixed assets in each sector. Table 6 presents the rankings of the sectors in the descending order of the employment generation potentialities on the basis of their (i) employment intensity per unit output, (ii) employment intensity per unit investment, taking in the latter case the direct and indirect employment generation, and (iii) the estimate of employment multipliers. They are given in columns 2, 3 and 4. On the basis of these results we infer that the prioritisation of sectors for employment maximisation based on the employment intensity per unit of output will totally differ from those based on the direct and indirect employment effects per unit of investment. For example, according to former, sectors like agriculture, communication and other transport will be the top priority sectors from the point of view of employment generation whereas according to the latter, sectors like construction, banking, insurance and other services, and other transport will top the list.

The rankings of sectors by adopting employment intensity of output as the selection criterion is given in column 2 of Table 6, and corresponding rankings according to direct and indirect employment generation per unit of investment are given in column 3 of the same Table. The rank correlation between column 2 and column 3 is as low as $-0.281$ suggesting that selection of ranking of sectors by the two criteria will be totally different and therefore any choice of sectors for employment maximisation will need a prior agreement regarding the choice of the 'ranking criteria'. In our view although the former criteria, i e, employment intensity of output, is more in fashion in our country, for meaningful application of investment planning as a tool for optimum resources allocation for the country as a whole (and not exclusively for a given sector and for a given time) the latter criteria will be more appropriate. Column 4 of Table 6 gives the rankings of sectors in descending order according to the sectoral employment multipliers in each sector. Here again we find that the rankings are very different. The rank correlation between column 3 and column 4 is $-0.587$. This suggests that the priorities of different sectors will totally change if we take this third criteria (i e, employment multipliers). For example, according to this criteria, the manufacturing sector would top the list followed by electricity and mining. Indeed, it is clear from Table 6 that the indirect employment generation of manufacturing is nearly double even that of agriculture.

All these show that sectors like construction, other transport, finance and banking are extremely important as instruments of employment generation in the immediate future whereas manufacturing and electricity are important taking the long and medium term future into consideration. Although agriculture has a large direct employment generation capacity, it will be wrong to put all efforts into one basket, i e, concentrating all employment generation activities in agriculture, for solving our employment problem. Indeed, the prudent approach should be to attempt to achieve a faster growth of industries and expansion of the transport, construction finance and banking sectors of the economy, and to see that agriculture grows *pari passu* to be able to supply necessary additional inputs in the accelerated industrial process and also meet the demand for food from the growing income and employment base. This will reconcile the goals of employment generation and productivity.

# Economic Issues in Sericulture: Study of Karnataka

**H G Hanumappa**

**S Erappa**

*The potential of sericulture for generating employment and income in rural areas is the basis for the programmes initiated by the Government of Karnataka for promoting sericulture. This potential, however, varies as between traditional and non-traditional areas because of differing costs of production of mulberry leaf and rearing of silkworms.*

*This note attempts to assess the extent of these differences by working out the comparative costs of production on the basis of a sample of households for two points of time, 1980-81 and 1983-84. Broadly the results indicate that the employment potential is higher for hired labour in the case of mulberry leaf cultivation, while the family labour component is more pronounced in the case of silkworm rearing.*

CULTIVATION of mulberry leaf and silkworm rearing in Karnataka dates back to the 18th century. From the beginning, the Government of Karnataka played the important role of a catalyst to keep the sericulture industry going. It established a separate department in 1913-14 to look after some of the needs and also the problems of sericulturists.[1] Encouraged by the achievements of the sericulture industry, the state government undertook an ambitious plan for the expansion of sericulture covering a period of five years (1980-85), through a World Bank loan, and known as the Karnataka Sericulture Programme (KSP). This programme envisaged introducing sericulture in certain new areas of Karnataka, so that it can serve as an important source of employment and income generation in rural areas. The Government of Karnataka launched this programme in 1980 in 13 districts. For the traditional mulberry growing areas, this programme envisaged a further improvement in the existing infrastructural facilities, along with extending the area under improved mulberry and also encouraging rearing of improved and bivoltine silkworm. In the non-traditional areas, the plan was to introduce sericulture activities on a large scale to bring about economic transformation in these areas. In addition to providing the necessary infrastructure, the plan envisaged an effective extension of facilities so as to popularise sericulture activities.

There are very few studies which throw light on the process of socio-economic change brought about by the expansion of sericulture activities in a predominantly agricultural country like India. Also the studies tend to be either too general in their analysis of the situation or they are too narrow in their approach to provide insights or clues for a better understanding of the issues involved in sericulture activities. However, there are some exceptions.[2]

We are attempting here, on a modest scale, to present an overall view of the changes which have taken place at the household level in both traditional and non-traditional regions of the state in terms of sericulture activities. Further this note tries to find out at two points of time whether there is any change in the structure of costs and labour needs for the cultivation of mulberry leaf and silkworm rearing on the one hand and on the other, whether any change has taken place in the income earning capacities of the sericulturists. For this exercise, we are principally depending on the household data generated through periodic sample surveys which were undertaken at the Institute for Social and Economic Change since 1980. These data are supplemented by information gathered through intensive field visits to some of the non-sample villages also, where sericulture is making inroads into the economic life, particularly in the new sericulture regions of Bijapur, Raichur and Gulbarga districts. The two points of time selected for the present exercise are 1980-81 and 1983-84.

Both the number of sampled sericulturist households and the area under mulberry, at the two points of time, is not the same. The sample set selected for the year 1980-81 covered 747 sericulturists. When the frequency of the household survey was switched over

| | C | 0.37 | 0.35 | — | — |

*Notes:* T C = Total cost per acre (Rs)
C = Cost per kg (Rs)

from annual to quarterly in 1983-84, a sub-sample of 224 out of 747 was drawn and surveyed. Thus while the 1980-81 results presented here refer to those derived from the annual survey conducted in 1981, the results presented here for 1983-84 refer to those derived from the two quarterly surveys conducted in July and October 1983. Further it is important to note that though the number and area covered differ for the two points of time, the results are still comparable as the samples covered belong to the same frame and as the average mulberry area under each family has not varied much even though the sample size differs (Table 1). Also, the agro-climatic regions and the total number of sample villages remained the same. We have divided the study area into five regions, and grouped regions I, II and III as traditional, and IV and V as non-traditional (for details of the names of districts which come under the different regions, see the Appendix). Region-wise coverage of both the sample households and the area shows that a greater share of the samples lie in traditional region than in the non-traditional region.

Broadly speaking, sericulture activities at the farm household level comprise of two distinct phases. The first phase of the activity concentrates on the cultivation of mulberry leaf and forms part of the cultivators' overall farm level (outdoor) activities. In the second phase, rearing of silkworm is taken up as part of the cultivator's overall household level (indoor) activities.

If we begin looking at the variations in costs of production of mulberry leaf by regions, varieties and sources of water by and large the trend seems to be that in most of the cases under rainfed conditions the total costs as well as the cost per kg of leaf has shown a declining/stagnant trend (Table 2). But under irrigated conditions though the total costs of M5 are reported to be declining, the cost per kg of leaf yield is increasing in some cases (Table 3). This seems to be mainly due to declining leaf yields in gross terms over the two periods. However, when we attempt to work out the costs involved in sericultural activities we should bear in mind that, the total costs calculated here include those incurred on inputs like manure, fertiliser, irrigation costs, if any, and labour costs.[3] Under labour costs, we have included the imputed value of family labour utilised for the activities and the paid-out cost for the hired labour. Since we have included the imputed value of family labour, we arrive at a higher total cost. This needs further probing, and it is necessary to find out whether this is due to farm level inefficiency of the sericulturists or due to any other natural factors which might have affected the leaf yields in particular during 1983-84.

Another interesting issue which deserves consideration is the proportion of family and hired labour involved in the cultivation of mulberry leaf. Table 4 shows that hired labour seems to play a very crucial role in the farm level activities of sericulturists, which is an outdoor activity. This is strengthened by the fact that the coefficient of variation worked out for these two regions on the number of mandays (in terms of family and hired labour) indicates that over the period, the variation has increased for the number of mandays of family labour from 6.44 per cent to 25.83 per cent. But this variation has decreased from 15.83 per cent to 2.34 per cent (Table 4) for hired mandays. This indicates that there has been a rise in employment opportunities for hired labour at the farm level (outdoor) activities of sericulturists in both the regions.

This phase of activity of cultivating mulberry leaf is closely followed by the rearing of silkworm which is mostly an indoor activity. Employment generation in this phase has a greater implication for the absorption of family labour as it keeps most of the

*Notes:* i Local variety silkworm rearing is not reported in III, IV and V regions.
ii Bivoltine silkworm rearing was not reported in most of the regions during 1980-81.

TABLE 6: LABOUR (MANDAYS) UTILISATION IN SILKWORM REARING

| Particulars | 1980-81 | | 1983-84 | |
|---|---|---|---|---|
| | Own | Hired | Own | Hired |
| Traditional region | 23.67 | 13.18 | 26.67 | 14.39 |
| Non-traditional region | 12.67 | 20.70 | 18.74 | 16.98 |

family members fully engaged (mainly those who might have otherwise remained unemployed) through the rearing period.

With regard to changes in cocoon yields[4] between the two points of time, the bivoltine variety seems to have picked up in the traditional regions I and III (Table 5). But by and large, bivoltine rearing has not picked up as expected in the beginning of the KSP. Owing to failure of monsoons during 1983-84, we do find a marginal decline, in some regions, in the yields of the improved variety. However, there seems to be stability in both traditional and non-traditional regions in the yields of improved cocoons.

If we take a look at the labour utilisation aspect of silkworm rearing, we find that over the period the dependence on family labour increased in both traditional and non-traditional areas (Table 6). In the case of hired labour there is a marginal increase in the number of mandays required for rearing activity in the traditional areas while there is a reduction in the non-traditional area. This is an important trend as it brings out the fact that the contribution of the family labour component is increasing in the rearing activity which is indoor in nature. It also implies that family members, who were otherwise unemployed, get absorbed as regular labourers engaged in this activity.

In terms of net returns, at the outset, Table 7 gives us an impression that sericulture is not a viable activity. But as we have already noted, a major portion of the total costs worked out include imputed family labour value. If we add the imputed value of wages of family labour to what we have derived as net returns (Table 3), we do find sericulture as a profitable activity. In spite of adding up imputed values of several items, including the notional wages of family labour, the traditional regions shows greater stability than the new region. Hence, a careful look at the costs and returns structure does indicate that the activity provides greater employment opportunities for both family and hired labourers and also supplements considerably the total income of the family. Among different varieties, the improved and the bivoltine rearings showed signs of better prospects for earning higher returns than the local variety in the traditional region. In the non-traditional region the results show a mixed trend.

TABLE 7: TOTAL COST, GROSS RETURNS AND NET RETURNS PER 100 DFLS BY REGIONS AND VARIETIES

*(Value in Rs)*

| Regions | Total Cost | | Gross Returns | | Net Returns* | |
|---|---|---|---|---|---|---|
| | 1980-81 | 1983-84 | 1980-81 | 1983-84 | 1980-81 | 1983-84 |

| Improved | 399.44 | 659.00 | 627.57 | 729.00 | 228.13 | 70.00 |
| Bivoltine | — | 782.00 | — | 75.00 | — | −707.00** |
| III Improved | 396.90 | 742.00 | 724.35 | 931.00 | 327.44 | 189.00 |
| Bivoltine | 347.48 | 924.00 | 432.38 | 2208.50 | 84.90 | 1284.50 |
| Non-traditional | | | | | | |
| IV Improved | 404.38 | 560.50 | 757.02 | 610.00 | 352.64 | 49.50 |
| Bivoltine | — | 563.50 | — | 428.00 | — | −135.50 |
| V Improved | 527.61 | 937.00 | 815.55 | 797.50 | 287.94 | −139.50 |
| Bivoltine | — | 831.00 | — | 982.00 | — | 151.00 |

*Notes:* * Net returns presented here has been derived after including the imputed value of wages of family labour.

** Negative returns are due to failure of crops.

Added to these dimensions, our recent field visits to certain villages in Bijapur and Gulbarga districts revealed that in spite of problems of marketing, many sericulturists have been successfully producing both improved and bivoltine variety of cocoons. The transition from traditional crops to new crops like mulberry has been taking place in some of these villages at a remarkably rapid rate. We came across a cross-section of farmers who have recognised the advantages of pursuing sericulture as a profitable economic pursuit. Right from large joint families of dominant caste households, having the capacity to rear in batches of 500 to 600 dfls at a time, to a small holder belonging to the scheduled caste have all expressed their happiness over the benefit derived from shifting to sericulture. In the so-called non-traditional region of Bijapur, Gulbarga and Raichur several pockets of successful sericulture have emerged. As per our observations the main factors favouring this success include extension work of the sericulture department, the availability of water and labour and above all the interest and the enterprising nature of the new sericulturists. While our sample surveys have revealed the operational details of the activities, the field visits to successful sericulture villages have revealed the greater potentialities of the non-traditional region for expanding these activities.

# Change is permanent

**Change is the essence of growth, an edict of management.**

**And, in today's world, the choice before an organisation is not between 'change' and 'no change', but between managing the change and being managed by events.**

**Change, when consciously imposed from within, opens up new opportunities, new avenues of growth. Paradoxically, the process of change is, and has to be, permanent.**

**This is the philosophy behind the changing role of MMTC — from a mere canalising agency to an international trading house.**

Change, to MMTC, has meant putting its expertise in bulk buying and selling to larger purposes of national growth.

Like opening up global markets for India's small scale entrepreneurs. Adopting new strategies like Third country trading, Three-way trade, Joint ventures both in India and abroad, Equity participation abroad in sources of raw materials as well as in basic inputs.

Entering the arena of non-canalised items — ranging from importing PVC resins and mercury to exporting diamonds and graphite electrodes.

Improving customer service by decentralising operations, streamlining the distribution system and setting up Customer Service cells.

Reorienting the organisation to meet new challenges — through long-range planning, computerisation, systems reappraisal and organisation restructuring.

And this change already reflects in MMTC's performance. Non-canalised exports registered a fourfold increase in the first half of 1984-85, while the year's turnover is poised for a threefold rise. A record quantity of fertilisers was imported, at the right time, resulting in an all-time high foodgrain production and substantial savings in foreign exchange. Long-term contracts worth millions of dollars have been concluded for iron ores exports. For the first time, a counter-trade deal has been finalised with Zimbabwe for importing Asbestos against the export of engineering goods — an important step towards diversification and growth.

All this has led to increased employment opportunities which now exceed half a million and generated a new industrial and economic prosperity.

Yes, change is permanent. A philosophy chiselled in the minds of everyone at MMTC, the cornerstone of its success.

Institute of Rural Management, Anand

FACULTY RECRUITMENT

The Institute of Rural Management, Anand, provides research, training and consultancy services to co-operatives and other organisations engaged in rural development. The Institute offers a two-year residential post-graduate programme in rural management. It also offers Management Development Programmes and engages in research and consultancy. The Institute is housed on its own campus which includes faculty housing, students' hostels, auditorium, library, faculty and administrative buildings and a Management Development and Training Centre. A VAX 11/730 computer system has also been installed.

Its activities having increased recently, IRMA now requires more academic staff, and positions in the following fields are available:

**1) Finance & Accounting**
**2) Marketing**
**3) Behavioural Science**
**4) Quantitative Methods and Computers**
**5) Production and Operations Management**
**6) Strategic Management**
**7) Project Management**
**8) Communications Skills**
**9) Legal Environment**
**10) Farmers' Organisation**

The qualification required for faculty positions is a Ph.D. in basic or applied fields or a Master's degree with sufficiently long and relevant experience. Given the nature of the Institute's activities, persons with professional qualifications and practical experience in senior managerial positions or those with research and consultancy experience and publications to their credit, would be preferred. The decision of the Institute in all matters pertaining to the selection will be final.

**Pay scales:**

**Assistant Professor:**
Rs. 1200-50-1300-60-1900
(Gross salary at Rs. 1200 basic is approximately Rs. 2540/- excluding HRA)

**Associate Professor:**
Rs. 1500-60-1800-100-2000
(Gross salary at Rs. 1500 basic is approximately Rs. 2840/- excluding HRA)

**Professor:**
Rs. 1800-100-2000-125/2-2500
(Gross salary at Rs. 1800 is approximately Rs. 3356/- excluding HRA)

Dearness allowance and interim relief at Central government rates, housing on the campus and benefits like Contributory Provident Fund, Contributory Superannuation, medical insurance, group gratuity, vacation and leave travel concession, etc. as per the rules of the Institute, are included.

Interested candidates may send their applications including particulars such as age, qualifications with divisions obtained, experience, details of research and consultancies undertaken and names of three references, within one month from the date of publication of this advertisement, to:

The Director

# Export Illusions

A COMMITTEE of officials has prepared an assessment of the country's likely balance of payments situation in the Seventh Plan, according to one newspaper report. Why precisely this exercise has been undertaken at this stage is not quite clear. It is also not known how the committee's projections compare with those of the Planning Commission itself, since the draft Seventh Plan, which has been submitted to the Prime Minister this week, has not been made public yet. Another set of projections of India's balance of payments in the Seventh Plan has been prepared by the World Bank and is contained in the Bank's latest annual review of the Indian economy. It is interesting to note that, at a first glance, the view of the country's balance of payments prospects taken by the committee of officials seems to differ quite markedly from that of the World Bank.

The committee has projected the trade gap in the Seventh Plan at Rs 40,000 crore, the annual trade deficit rising from Rs 6,500 crore in 1985-86 to Rs 9,100 crore in 1989-90, the last year of the Plan. Net earnings on the invisibles account, including remittances, are estimated at Rs 18,000 crore in the Plan period, leaving a current account deficit of Rs 22,000 crore. To finance a current account deficit of this order, the committee has apparently worked out, it may not be necessary to rely on commercial borrowing in the international capital to the tune of more than Rs 5,000 crore, after taking credit for multilateral and bilateral assistance conservatively estimated at Rs 10,000 crore over the five-year period and for non-resident Indian deposits and investments at around Rs 500-600 crore annually. What thus seems to stand out in the committee's report is the reassuring suggestion that the balance of payments position in the Seventh Plan is unlikely to be so difficult as to require very large amounts of commercial borrowing, raising the threat of the country getting ensnared in a debt trap.

It is in this respect that the prospect as sketched by the committee of officials seems to differ the most from the World Bank's prognosis. In its latest report on the Indian economy, the World Bank has estimated that the Seventh Plan will call for a rough doubling of the gross capital inflow into India to $ 34.5 billion during the Plan period from $ 17.5 billion in the Sixth Plan. In turn this would imply, according to the World Bank, commercial loan commitments of the order of $ 4.5 billion a year in the Seventh Plan, or roughly five times as large as the amount of commercial borrowings the committee of officials deems necessary. The World Bank offers us the soothing reassurance that since our commercial borrowings so far have been relatively small we should face "no difficulties in raising the projected amounts in the commercial markets". That, however, is hardly the point. The question is whether we should go in for commercial borrowing on such a massive scale in the Seventh Plan. There can be no doubt that even those who are not easily fazed by the prospect of a sharp rise in the size of the country's debt servicing obligations would like to see commercial borrowing abroad in the Seventh Plan confined to the level indicated in the report of the committee of officials, if that were possible.

The question then is how realistic is the committee's projection of the requirement of commercial borrowing abroad given the Seventh Plan's overall growth strategy and in particular the policy of liberalisation of imports. There is, it appears, not much difference between the reports of the committee of officials and the World Bank in regard to the soundness of the strategy of permitting liberal imports. The committee, according to the newspaper report, has reiterated the essentiality of easy import of capital goods and raw materials for achieving the growth rates aimed at in the Plan. It is in their assessment of the growth of exports likely to be achieved in the Seventh Plan that the two reports seem to differ, and differ sharply. The committee has based its projections on the assumption of a 13-14 per cent annual growth of exports. The World Bank is markedly less hopeful about the prospects for India's exports in the next five years. True, the rate of growth of exports in the Sixth Plan was not unimpressive. But before assuming that this rate will continue and even accelerate, allowance has to be made for some special factors in operation in the last few years. One of these was the purely temporary emergence, for reasons of imbalances in refining capacity, of substantial exportable 'surpluses' of crude petroleum. Another is the continuous decline since 1980 in the exchange value of the rupee in relation to the dollar which has had the effect of inflating export receipts expressed in rupees. It is also worth remembering that there has been no worthwhile increase in exports of manufactures which have consequently been declining as a proportion of total exports. All this is common knowledge and has evidently weighed with World Bank—which can hardly be accused of 'export pessimism' ordinarily—in regard to its assessment of the likely growth of India's exports in the Seventh Plan. If the committee of officials has deliberately chosen to try a different track, will it be altogether uncharitable to suggest that the purpose is to lull anxieties about the likely consequences of a liberal import regime? It is possible, the committee's report would have us believe, to have the best of both worlds of liberal imports and strictly limited recourse to commercial borrowing abroad.

## *Kerala*

### Return of the Prodigal

BY now it has become fairly clear that the All-India Muslim League parted from the Left Democratic Front in Kerala last month essentially due to electoral and power considerations rather than for ideological reasons as claimed by the party's leaders. The state working committee of the AIML formally decided to quit the LDF at its meeting on July 19. The committee resolution on the subjects stated that the AIML had been part of the LDF for the last eleven years as the Front was seen as "a set up that opposed imperialist and communal forces and worked for the welfare of all sections of the people". The AIML had forged a relationship with the CPI(M)-led LDF "in spite of the fundamental and ideological differences between Communism and Islam with a view to protecting the interests of the Muslim minorities". However, the CPI(M), the resolution continued, "has now deviated from its line and failed to distinguish between organised struggles for rights of minorities and communalism of the majority".

The ideological rhetoric notwithstanding, the conditions which led to the formation of the AIML can hardly be regarded as ideological. The AIML leaders had functioned for a while within the parent Indian Union Muslim League as dissidents dissatisfied with the distribution of power following the death of the League's key leader, Syed Baffakki Thangal, in 1974. They broke off and formed the AIML ~~on being~~ consistently sidetracked. The IUML was, and still is, part of the United Democratic Front led by the Congress(I). The AIML hence could not possibly join the UDF as a separate entity and so probably had little option but to team up with the LDF.

The LDF's hopes of gaining Muslim votes through the AIML did not materialise. On the contrary the other LDF partners, chiefly the CPI(M), lost both electorally and politically; electorally, since safe seats had to be given to the AIML candidates to placate its leaders—in fact the present four AIML MLAs are said to have won from traditional CPI(M) strongholds—and politically since the CPI(M) stood accused of encouraging communal forces because of its alliance with the AIML.

The CPI(M) in Kerala now appears to be actively trying to rid itself of the charge of compromising with communal and regional groups for short-term electoral ends. The reasons underlying this change of stance could be partly the failure of such compromises to deliver the expected results and partly the need to restore a purer leftwing political line which could hopefully pull the party out of the long phase of stagnant, even declining, popularity in the state. The CPI(M) has launched a mass campaign calling for the abrogation of Muslim personal law which legitimises polygamy and oppresses Muslim women in other ways. The AIML says that the CPI(M) has no business to attack the Muslim faith. This deviation of the CPI(M), the AIML claims, led it to leave the LDF.

The AIML leaders may genuinely disagree with the CPI(M) campaign against the Shariat. But other stronger compulsions seem to have influenced their decision. First, they were probably fearful of losing support amongst the Muslims by continuing their alliance with the CPI(M). Second, the AIML leaders probably viewed the CPI(M) campaign as a good opportunity to secure a share in political power and try and ensure their future political survival by distributing patronage. So although the AIML leaders, while breaking from the LDF in July, claimed they would function as a separate neutral entity, the party has now merged with the IUML and is therefore a part of the ruling UDF.

## *Civil Liberties*

### Murder by Policemen

DEATH of people in police custody under suspicious circumstances has become a regular, and seemingly growing, occurrence in India, irrespective of the colour of the local administration. It has taken place in Delhi under the nose of the Union government, in West Bengal where the CPI(M)-dominated Left Front holds sway, in Andhra Pradesh ruled by a saffron-clad matinee-idol, not to mention the notoriously oppressive and mal-administered state of Bihar with the Congress(I) at the helm. Some of the victims may really be hardened criminals, though that does not provide either justification or even extenuating circumstance for their casual liquidation; in most cases, however, investigative journalists, civil liberties activists and even ordinary local people have identified the victims as objects of ire of the local establishment.

What is worse is that due to their continued and increasing incidence, such deaths, though widely suspected as and sometimes proven to be deliberate murders by the policemen, seem to be evoking less and less indignation among the people, which is a sign of a certain decomposition of the country's political culture. If allowed to persist thus unchallenged, they can ultimately seriously weaken the spirit of resistance against oppression and repression and thus deal a severe blow to the already much softened up democratic superstructure of our polity.

It is, therefore, high time that there develops a concerted nationwide campaign to check, it not totally eradicate, this brutal phenomenon. This campaign should be directed towards achieving the enactment of a Central Act under which a statutory body would *suo moto* initiate investigations and in appropriate cases take penal actions against the policemen found guilty. There should also be provision for immediate and automatic suspension of the implicated policemen, pending the statutory investigation.

Will our civil liberties MPs and other public men take up this question earnestly and without delay?

## *International Capital Flows*

### Glaring Asymmetry

THE international financial market has undergone two major changes during the first half of the 80s. Firstly, the share of bond issues has increased at the expense, naturally, of bank credit. Between 1981 and 1984 the share of bond issues improved from 40 per cent to 50 per cent. In the first six months of 1985, new bond issues reached a record figure of $ 80 billion whereas new bank credit added up to only $ 45 billion. Secondly, the access of the developing countries to the international financial market has come down drastically. The share of the developing countries in the total new finance raised declined from 24.3 per cent in 1981 to 14 per cent in 1984. Their share in the first six months of 1985 is believed to have come down to less than 10 per cent.

The two changes are closely interlinked. The share of the developing countries in bond issues was always very small, never above 10 per cent in a year. So naturally, as the share of bond issues increased, the access of the developing countries to the financial market taken as a whole declined.

But it was not just that. The developing countries' share in international bank credit, as distinguished from bond issues, also has declined. The decline has been both relative and absolute. In 1981 the developing countries could raise over $ 45 billion. The figure is believed to have come down to less than $ 15 billion in 1984.

Indeed, it can be argued that the relative decline of bank credit, i e, relative to bond issues, itself has something intimately to do with the upsurge of problems developing country debtors have been exposed to in recent years with regard to their external borrowing, especially market borrowing. Since, unlike in the late 70s access to international market borrowing is now confined almost altogether to developed country clients, official or private, and since the preference of the developed country clients is for bonds rather than bank credits, it was only natural that bond issues would become more prominent.

It is also of interest to note that although initially in the aftermath of the developing country debt crisis of 1982, the turnover of the international market declined, this is no longer so. Judging by the quantum of bond issues and bank credit in the first six months of 1985, it is not unlikely that the total turnover for the year as a whole may exceed $ 200 billion and approach even $ 250 billion. The highest turnover recorded so far was $ 186 billion and that was in 1981. This upsurge is not unconnected with the record trade deficits posted from month to month by the US which are necessitating larger and larger net inflow of foreign funds into the US. But to the pundits of international finance, the market acted stupidly when it lent to the developing countries, not when it lends massively to the US to finance its trade and budgetary deficits. Not unnaturally, Ronald Reagan is a great votary of the so-called free market ideology which sanctifies such asymmetry.

## *Prenatal Testing*

### Use and Abuse

*A Correspondent writes:*

PRENATAL testing for the purpose of early detection of diseases is expanding as a result of the recent advances in biotechnology which allow scientists to pinpoint disturbances in genetic material, DNA, which cause inherited disorders. Last year, scientists in the US made the breakthrough which helped to diagnose haemophilia prenatally by locating the gene responsible for producing the material that clots human blood. People without this gene suffer from haemophilia, a condition in which even a minor injury can cause prolong bleeding. Scientists at Johns Hopkins University are reported to have now developed genetic probes whereby prenatal tests can usefully be conducted to detect pregnancies with a high risk of haemophilia.

Sixteen medical centres in the US are currently studying a technique of prenatal testing called chorionic villus sampling or CVS. Through this test it is possible for doctors to detect taysachs, a genetic disorder whose victims tend to die in early childhood. A couple could no doubt learn whether or not their child would have taysachs through amniocentesis, a prenatal test which has been in use for several years now. But under amniocentesis, foetal cells are obtained by inserting a needle through the woman's abdomen and drawing fluid from the amniotic sac surrounding the foetus. The test cannot be performed until the 16th week of pregnancy, when the sac is large enough to be penetrated. Then the cells have to be cultured. So the results are not available for another two to four weeks by which time a foetus may be six months old. In CVS foetal cells are analysed from the chorionic villus and this test is possible to perform on a pregnant woman weeks before a pregnancy is noticeable or foetal movement is felt. Furthermore, chorion cells often do not have to be cultured. So the test results can be available within hours, if necessary. As for the test's safety, it is expected that it will be as safe as amniocentesis, although the present rate of miscarriage associated with CVS is much higher.

Researchers at Michigan State University are due to report on their experiments on a blood test that might be as fast as CVS but much simpler and less expensive.

US doctors hope that these new prenatal tests will radically alter the care provided in early pregnancy. Some expect prenatal diagnosis for potential genetic problems to become as common as blood test to detect pregnancy. But there is at the same time concern that the relative ease and speed of newly developing prenatal tests may cause them to be abused. It is known, for instance, that even in the US—but much more in countries and communities with a strong male preference—couples might choose to abort a pregnancy on the basis of the child's sex. The new prenatal tests, once they are sufficiently developed, would not be difficult to perform in undeveloped countries. In the case of amniocentesis in these countries it is common knowledge that most, if not all, couples want to know the sex of their would-be child and not whether the child would suffer from a genetic disorder. Should not some advance thinking be done here so that when we import new prenatal tests their abuse can be avoided, or at least controlled?

## *Indonesia*

### Execution of Mohammed Munir

A FRONT-RANK leader of the outlawed Indonesian Communist Party (PKI) and former chairman of the All-Indonesia Trade Union Federation (SOBSI), Mohammed Munir, was executed by the country's military regime on May 14, under cover of secrecy made possible by the severe censorship of news and stringent control over the media. What makes this execution particularly shocking is the fact that it has taken place 13 years after the passing of the death sentence and 18 years after Munir's arrest.

Mohammed Munir was sentenced to death by a lower court in 1973 and his appeal against the sentence was rejected by the High Court after a long time—only in November 1981. Later, the Supreme Court refused to entertain an appeal against the High Court judgment on some flimsy technical ground and Munir's wife's clemency petition on his behalf was rejected by the top ruler, General Suharto, in May 1983. A full year after that the military authorities in power decided to execute the death sentence all on a sudden. They did not agree to put it off even by a couple of days to enable Munir's wife to come to Jakarta from Surabaya for a last meeting with her husband.

Its inhumanity apart, this execution is considered significant for a variety of reasons. First, during the last decade and a half, no political prisoner, arrested and convicted in connection with the events in October 1965, has been executed. Second, there are at least four other condemned leading members of the PKI still waiting in their death cells—Gatot Lestario, Djoko Untung, Ruslun Widjayasastra and Rustomo, whose clemency pleas have been rejected by General Suharto. There is, therefore, speculation in Indonesia and concerned circles abroad, whether Munir's execution portends a similar fate for these other condemned communist leaders.

For some reasons or other, the Indonesian regime seems to have decided to make a display of its mailed fist presently. On April 12 this year, a Jakarta court passed sentences of imprisonment ranging from one to three years on 28 persons accused of participating in a demonstration in September last year, in Tanjung Priok. Indeed, some analysts have discerned a streak of nervousness in the junta's conduct since July 1977 when despite all sorts of manipulations within a tailored Constitution and electoral system, the armed forces' official party, GOLKAR, had lost four seats in comparison with the 1971 elections and the Opposition PPP (Development Unity Party) had actually topped the polls in two provinces, Aceh and Jakarta, and scored convincing victories in a number of districts in Java and Sumatra. Since then the ruling junta is reported to have been passing through some internal tensions and engaged in exercises for remodelling the political and military command structures. Whether Munir's hasty despatch has any connection with these political undercurrents remains to be seen. It is however causing concern about the fate of other political prisoners in Indonesian death cells—a concern widely voiced in some countries.

There has, however, been no report of any anger or sorrow expressed either by the communist countries or by communist parties anywhere, except for some peripheral links of the Dutch communists with the protests in Holland. Is it too much to expect some demonstrations organised before the Indonesian legations or some telegrams of protest to the junta demanding that the lives of the surviving communists in the Indonesian death cells be spared?

# For All Seasons?

NO aspect of the economic scene concerns the common man more than the behaviour of prices as they affect the daily life of every citizen. The behaviour of commodity prices has, of late, been causing considerable concern. On July 20, the wholesale price index for 'all commodities' touched a new all-time high of 362.3, showing an increase of 5.2 per cent over the March-end figure. Based on the rise since the beginning of the current fiscal year, the annual rate of inflation works out to over 15 per cent which, of course, suffers from the usual flaw in such statistical exercises. Rising for the fourth successive month, the all-India consumer price index number for industrial workers reached a record high of 606 in June, a rise of 3.4 per cent over the March figure of 586. The *Economic Times* retail price index for Greater Bombay for July shows an increase of 9.4 per cent over the 12-month period.

It is therefore scarcely surprising that the emerging price situation should have become the subject of animated discussion within as well as outside Parliament. In the debate on prices in Parliament on August 2, members from all sides expressed grave concern over what they termed as steep price rise and called for stern action against hoarders, black-marketeers and profiteers. The most significant aspect of the debate was the harsh criticism by some of the members of the ruling party who accused the government of doling out 'unreal' price statistics, not keeping the promise to hold prices under check, and of tolerating the 'unholy alliance between government functionaries and trade'.

Official assessment of the price situation ran along familiar lines. The Union finance minister V P Singh stated that while the government shared the members' concern over the rise in prices, the rise was 'not alarming' and was within 'manageable limits' and that the rise was due mainly to 'seasonal factors'. He doled out statistics to emphasise that the rate of inflation during the first quarter of the current fiscal year at 3.4 per cent was the lowest for any corresponding quarter over the past seven years and that the 5.6 per cent rise over the 12-month period ended June compared very favourably with the rise during the past few years. He contended that his budget had nothing to do with the rise in prices. Apparently, the finance minister does not think that massive deficit financing has any inflationary implications or the increase in disposable incomes resulting from the tax concessions has any bearing on consumer spending.

Few outside official circles will be inclined to share the finance minister's assessment of the price situation. The wholesale price index provides at best only a very broad indication of the general price situation. The index consists of a number of commodities, each having its own demand and supply equation governed by diverse factors. Experience about wholesale prices varies widely not only from state to state but also from place to place within a state. Sometimes local factors weigh so heavily on the market that difference in prices in the consuming and producing centres cannot be satisfactorily explained in terms of transport and handling costs. At the retail level, differences in prices, at times, exceed 15 to 20 per cent, depending on the commodity and the locality.

The Union finance minister may derive some statistical/psychological satisfaction from the decline in the rate of inflation during the April-June 1985 quarter but it means precious little to the common man who has to pay progressively higher prices for the commodities, including essential items of daily consumption, he buys. Real wages are getting sharply eroded with time. V P Singh cannot be possibly unaware that the average annual rate of increase in prices between 1970-71 and 1984-85 works out to 9.1 per cent in the case of the wholesale price index (average to average basis) and 8.5 per cent in respect of the consumer price index. In terms of 1955 purchasing power, the value of the rupee has come down to around 13.2 paise. There is little evidence to show that excepting a small section of the community family incomes have kept pace with the increase in prices. Worse still, the hardest hit are those who are least able to bear the burden of rising prices.

Finance minister V P Singh's as also of food and civil supplies minister Rao Birendra Singh's assessment that the rise in prices is essentially seasonal is highly questionable. Too much has been made of the steep rise in the prices of sugar, gur, vegetables and fruits. The finance minister has even gone to the extent of saying that "if the prices of vegetables do not come down I will accept the price rise was not seasonal". This is a rash statement, coming from the finance minister. The prices of vegetables vary very widely not only from town to town but also from locality to locality within a town. What has the finance minister to say about the pronounced contra-seasonal weakness in cotton and oilseeds/vegetable oils? Despite record mill consumption cotton prices have remained subdued at the fag-end of the season because of the bumper 1984-85 harvest of over 94 lakh bales (170 kg). And the easier tendency (prices are substantially lower than a year ago) in vegetable oils is attributable largely to massive imports year after year.

That seasonal factors do influence the course of prices will be readily conceded. But their impact can be mitigated through imaginative and efficient management of demand and supply. The seasonality factor is dominant only in the case of agricultural commodities. But the rise in prices since the beginning of the current fiscal year has been all pervasive. This is well borne out by the fact that the rise in prices under the 'manufactured products' and 'fuel, lubricants' groups has been more marked than under 'primary articles'.

The rise in prices is essentially a part of the secular trend, reflecting broadly the continuing wide gap between money supply and gross national product as well as inefficient management of available supplies of which sugar is a telling example. The secular nature of the rising trend in prices is all too evident from the fact that over the past 15 years (1970-71 to 1984-85) only twice (in 1975-76 and 1976-77) has the consumer price index recorded a negative growth and the average annual rate of increase in prices during this period works out to 8.5 per cent. During the 12-month period ended June 1985, the rise in prices has been as follows: jute, hemp and mesta textile 25.6 per cent, iron, steel and ferro alloys 18.5 per cent, gram 17 per cent, basic industrial chemicals 16.2 per cent, gur 15.2 per cent, sugar 13.2 per cent, milk 13.1 per cent, motor vehicles 12.5 per cent, electrical machinery 10.5 per cent, non-electrical machinery tools 8.6 per cent, raw tobacco 8.6 per cent, non-ferrous metals 7.8 per cent, electricity 6.8 per cent, cotton yarn 6.6 per cent, tyres and tubes 5.9 per cent, high speed diesel oil 5.5 per cent, cigarettes 5.3 per cent and cotton cloth (mill) 5 per cent.

Replying to the points raised during the debate on prices, the finance minister and the food and supplies minister were at pains to assure the members that the government was concerned over the rise in prices and that it was doing all it could do to stabilise prices. The price situation is being reviewed on a daily basis. A special action committee of secretaries was set up in March to ensure that there was no shortage of any essential commodity. The state governments have been directed to gear up their machinery to deal firmly with hoarders and profiteers out to hold the society to ransom. In the case of sugar, domestic availability is being augmented through large imports. Viewed in the light of the emerging price trends, the government's claim that the various measures it has taken have had a salutary impact on prices cannot command much credibility.

The price situation is disturbing. Fortunately, the government is comfortably placed in respect of foodgrain stocks and foreign exchange reserves which can be used to hold the priceline. Much will depend on how it goes about managing the economy. A really good monsoon can cover up only some of its shortcomings. Since the south-west monsoon has been very erratic this year, only ideal weather conditions until about the middle of October can ensure normal kharif crops. A setback in agricultural production is almost certain to aggravate inflationary pressures.

## *Power*

### On Starvation Diet

SHORTAGES and frequent breakdown in power supply are said to be a major reason for the inability of various sectors of the economy to attain planned targets. The power situation is therefore held responsibile for slowing down the pace of the country's development. Even so, from current indications the plight of this energy sector is likely to deteriorate in the Seventh Plan period, and probably get worse thereafter.

The Working Group attached to the Union Ministry of Power had sought Rs 65,300 crore from the Planning Commission for the Seventh Plan. However, the Commission has sanctioned only Rs 34,000 crore, reasoning that the Group's projected demand will not materialise, and also that similar cuts had been effected in the Plan outlays of other power dependant sectors, chiefly industry and agriculture. So the funds allocated are said to be sufficient to instal additional generation capacity of 22,000 MW in the coming five years, i e, a fifth lower than the requirement estimated by the Union Power Ministry.

Union Minister of State for Power, Arun Nehru, informed Parliament in this context on July 25 that the shortage of funds will not affect the ministry's performance. The power generation gap of about 7,000 MW would be mostly met by an overall improvement in the functioning of the plants. The minister added that there would be problems of distribution and transmission since the allotment of Rs 8,000 crore for this purpose by the Planning Commission is roughly only a third of what the ministry had sought. The minister's statements in effect imply that though the additional power needed by 1990 may be generated, it would possibly not be fully utilised on account of distribution and transmission bottlenecks. Arun Nehru was hopeful though of being able to mobilise the additional funds required by his ministry.

Raising additional funds is going to be difficult and might lead to problems in other sectors. There is little likelihood of the Planning Commission allocating additional funds to the ministry, given the paucity of resources at its disposal. The ministry has reportedly been working on the idea of setting up a Power Finance Corporation to fund projects. The Corporation would seek to raise money from the market and financial institutions as well as from external borrowing. But it is reported that the proposal is unlikely to be approved by the Union cabinet probably because other ministries too would make a similar demand, and more so, since it would merely add to the debt burden of the Union government. A similar problem of debt might undermine the other proposal of the Power Ministry as well, namely, of securing projects on a turnkey basis from abroad. Such a step would further adversely affect large indigeneous units like BHEL which depend on power projects for their orders.

The minister went on to assert that while power projects handled by the Centre would be completed on schedule the same could not be said of projects under the state government. This was because states initiate too many projects at the same time (in deference to political pressures) and therefore the funds are distributed thinly leading to considerable delays. Moreover, the State Electricity Boards are accumulating losses. At the start of the Sixth Plan the losses totalled Rs 4,400 crore. The state governments then averred that they would ensure that the losses were reduced by 80 per cent by the end of the Plan. Instead, the losses have now almost doubled and are expected to touch Rs 12,000 crore by 1990. Consequently the functioning of the Boards as well as new projects are bound to suffer from severe financial constraints. And, if the Union Power Ministry is unable to secure additional funds, power projects that were scheduled to become operational after 1995 are likely to become the major victims.

## *Plastics*

### Demand Boom

ACUTE shortage of law density polyethylene (LDPE), a vital raw material for the plastic processing industry, has forced a large number of small plastic units to down their shutters in the last few weeks. According to industry sources, even the remaining units have been operating at only 25 to 30 per cent capacity for want of supplies of LDPE at reasonable prices. The total number of plastic processing units in the small scale sector is about 6,000.

The current situation of shortage has arisen mainly because of a sharp increase in demand for LDPE from the packaging and moulding industries as also from the agricultural sector since last year. The milk pouch industry which has emerged in the last two years needs some 12,000 tonnes of LDPE per annum. This new demand coupled with a substantial spurt in the demand from the agricultural sector has resulted in a wide gap between demand and supply.

According to industry sources, the total demand for LDPE in the current year is estimated at 1,60,000 tonnes as compared to 1,39,000 tonnes last year. Since the present installed capacity of the three producers—Indian Petrochemicals Corporation, Union Carbide and ICI—is only 1,05,000 tonnes, production is hardly adequate to meet this demand. According to a source in IPCL, the largest producer of the item, the milk pouch industry and the agricultural sector are treated as priority sectors and their demand is met first and then supplies are made to other users.

The wide gap between demand and production has resulted in a high unofficial premium of about Rs 7,000 per tonne in the open market price of LDPE over and above the IPCL's delivery price of Rs 20,500 per tonne. True, the government has put LDPE imports under OGL in the last Union Budget but imports become costly in view of the prevailing high rate of import duty at 226 per cent *ad valorem*. At this rate of duty, the landed cost of the material works out to Rs 27,000 per tonne. Moreover, as most of the processing units are in the small and tiny sectors requiring from 25 to 100 tonnes of material per year, they are not in a position to directly import it on their own.

The Finance Ministry has recently authorised the IPCL to import 40,000 tonnes of LDPE, LLDP and HDPE for supplying to small scale user units in the country, and the first consignment of 10,000 tonnes is expected to reach Bombay in August this year. IPCL sources, however, feel that at the prevailing rate of import duty, the marketing of the imported material would be difficult. Small units would find the price uneconomical. Meanwhile, Bhogilal J Gandhi, President of the All-India Plastics Manufacturers' Association has urged the government to bring down the duty on LDPE to 156 per cent—i e, the same level as on other plastic raw materials such as HDPE, polypropylene, etc.

A reduction in import duty will enable the small scale processing units to get the imported material at a reasonable price. It would also bring down the unofficial premium in the open market. The domestic producers have been encouraged to raise their prices since the landed cost of imported material works out higher than the prices of the domestic producers in view of the very high import duty.

Of course, the domestic supply of LDPE is expected to increase significantly in the next few years. It is expected to double by the end of the Seventh Plan. A gas cracker complex being set up by PICL at Nagothane in Raigad district of Maharashtra is expected to be commissioned by 1989. New plants are also being planned by Polyolefin Industries and Century Enka. The existing capacities are also being augmented. It is therefore reasonable to expect that the supply position will improve substantially during the next few years. Till then, however, the industry will have to be helped through supplies of imported material at reasonable prices. The demand for the products of the industry is rising and the prospects for increasing exports are also good. The industry has achieved its export target of Rs 65 crore in 1984-85 and a target of Rs 80 crore has been fixed for the current fiscal year.

# Bhopal Tragedy and Sarkari Scientists

PUSHPA M BHARGAVA (*EPW*, June 1) is one of the few scientists who has drawn attention to a tragedy which is much more tragic than the Bhopal tragedy: "the little premium we place on human life—specially those who do not belong to the privileged class". The 'we' referred to by Bhargava include the business interests, their political patrons, the scientists of India, the activists in the fields of science and medicine, the political activists, the thinkers and scholars and the intellegentsia at large. Indeed, through our cynical contempt for the lives of the oppressed we have actively promoted a situation where every day we inflict tens of Bhopals on these people. The significance of Bhopal extends much beyond what is termed as the worst industrial disaster in the world. Bhopal has exposed the entire iceberg. It dramatically exposed the 'sarkari scientists' who were prepared to compromise fundamental scientific and medical ethics to provide a cover to the murderers. Perhaps most dramatic was the exposure of the intellectual, moral and political bankruptcy of those who claim to take the side of the oppressed.

Even if we do not take up the important considerations leading to the location of the plant, criminal negligence in implementation of safety measures and in the contingency plants to minimise damage to people in the event of an accident, the Bhopal tragedy was essentially a *public health* problem: many tonnes of highly toxic chemicals were literally sprayed over an area containing hundreds of thousands of people. It goes to the 'credit' of the sarkari scientists and their hangers on that they managed to convert this public health problem into problems of laboratory and clinical research. Adding insult to injury, they enacted the macabre drama under the strange name of 'Operation Faith'. It was a case of flagrant breach of faith.

There was a "lack of information from those who have it or should have had it" (Bhargava) on such elementary epidemiological aspects as the exact number of the dead, their distribution according to age, sex, place of residence and degree of exposure, the composition of the 'gas', the direction of its flow, its concentration and the rate of its descent in different areas. But, almost overnight, a huge research empire on the Bhopal tragedy came into existence with a fifteen million rupees grant from the government. It is an empire built on the corpses and comatose bodies of the Bhopal victims: While some scientists gleefully danced the macabre 'Dance on the Dead', most of the others decided not to notice it. It is grimly ironical that in the convulsive process of death, disability and suffering, the victims of the Bhopal tragedy have administered a stinging kick to those who pretended to take the side of the oppressed and exposed them in all nakedness for everybody to see. But, irony of ironies, most of viewers pretended not to see the nakedness and insisted that the emperor (of the research empire) is clothed in a most mervellous robe!

The struggle will be long drawn and difficult. I agree with Bhargava that "the epilogue will be longer than the drama". When that epilogue comes to be written, I will have a modest contribution to make. My colleague Lakhan Singh and I carried out a quick epidemiological and sociological study of the Bhopal tragedy during January 5-16, 1985; students of the Centre of Social Medicine and Community Health, JNU, helped us in analysing the data and we presented a preliminary report in a meeting of the School of Social Sciences of Jawaharlal Nehru University on February 11; it was published in the April issue of *JNU News* and in the *Medico Friends Circle Bulletin* of June 1985. When the epilogue comes to be written I would provide documentary evidence of the tremendous obstructions I had to encounter in getting the needed funds (Rs 2,700), in data collection and analysis and in catching the eye of the activists and the committed. Perhaps I (along with Bhargava?) am an intellectual 'chandal' threatening to cause pollution to the blue blodded Brahmans!

## Operation Flood and Energy Balance

THE paper "White Revolution in India: Facts and Issues" by K N Nair (June 22-29) presents a meticulously analysed objective viewpoint on the sources of growth in country's milk production. Trying to find statistical evidence to corroborate the higher milk production with increased feed availability in the recent years, the author has in fact established that the milk production estimates of the Ministry of Agriculture are sound. The chief reason cited for increase in feed availability is the increase in crop production which certainly cannot be denied.

The statistical analysis presented in the paper has once again proved the fact that India's milch animals thrive on agricultural byproducts and are capable of yielding higher quantities of milk with adequate feed and this is the approach of Operation Flood as well. With higher cereal production and through adoption of inter-cropping and multiple-cropping system in agriculture, feed availability has increased and this has contributed to breaking the phenomenon of declining productivity due to decline in per capita feed availability of the sixties. As feed supply, both roughages and concentrate from crop production increases, milk production is bound to rise despite lower growth in milch animal population. The study has very correctly established the fact that between 1972 and 1982 the productivity of both buffaloes and cows has increased, more rapidly in the case of buffaloes, and this phenomenon is quite evident in the Operation Flood milksheds. Covering less than 8 per cent of the total milch animal population in the country, a figure too small to contribute anything significantly, Operation Flood, through the spread effects of paying better for 10 per cent of the milk handled, is making a visible impact on the growth of milk production in the country.

While recognising the progress of OF-I as impressive the author has expressed some concern about the Operation Food strategy for increasing milk production. Operation Flood has not adopted any strategy which would upset the positive energy balance in India's dairy economy. On the contrary, emphasising the optimum utilisation of available crop residues and wastages and supplementary feed in the form of balanced cattle feed, Operation Flood has aimed at a National Milch Herd of those milch animals with the co-operative members who would have access to the technical input services provided under this programme. As these technical input services form an integral part of the programme, their extensive use by the members throughout the country would facilitate better upkeep of the milch animals and thus better production. This stock would form the basis for eventual change in the composition and production characteristics of future milch animals reared by the producer members. It certainly does not intend to achieve higher milk production through cross-breeding alone and therefore is nowhere close to the western model of dairying as mentioned by Nair.

In the US the per capita consumption of foodgrains is 1,000 kg a year of which only 70 kg are consumed directly by humans and the remaining 930 kg are fed to livestock system for producing highly valued animal foods including milk. In India the per capita availability of foodgrains is around 200 kg per annum and all of it is directly consumed by humans. Only foodgrain byproducts from milling go to the livestock system. Besides, the economic status of milk-producing farmers is such that they cannot afford uneconomic, wasteful feeding. Therefore, within the system there is a check on feeding practices. The balanced cattlefeed produced as part of Operation Flood II programme comprises upto 20 per cent oilcakes, and urea, molasses and other agricultural byproducts not fit for human consumption. This is the form of concentrates which is fed to milch animals. Thus a negative energy or protein balance in India's food system is nowhere in sight.

# Beginning to Perform

**Romesh Thapar**

I WAS in the capital of our former colonial masters when Rajiv Gandhi moved to a bold agreement with Longowal. Our newsmen who work for the British wrote of the positive approach praising the young PM for his courageous and successful initiative. Longowal's courage was, of course, forgotten. Sitting there in London, reading skimpy reports, the thought did occur that the move had cut through bureaucratic palsy and that had this been done two years ago it would have prevented the tragic rise of violence and terrorism.

The cynical western world is very impressed with Rajiv Gandhi, almost envious that troubled India has found a Prime Minister who is remarkably decent and upright amidst politicians who flaunt their harlot skills. Apparently, during his encounters abroad he was quite outspoken, even though simplistic at times. And, now, if he takes courage in both hands and begins to settle the many outstanding political problems left behind by his mother, he may well make his mark. But to get a grip over priorities and decide how they have to be sorted out in the complexity that is India is going to be tough, even dangerous.

I wonder if it is realised that the period which follows an agreement with the rebellious section of a community, no matter how 'compromising', can be terribly explosive. The terrorist gangs, facing the threat of losing their base, can lose all control of themselves. Some of the signs are visible. Unfortunately, the bureaucratic ambience of governance in India, and its heavy reflection in the handling of the electronic media, prevents the effective mobilisation of public opinion and the further isolation of the killers in disturbed areas.

Much will depend on the way the Sikh community moves to support intelligent and thoughtful leadership, sees the hollowness of men like Badal and Tohra who are cynical in the context of political commitments, and breaks the back of its lumpen youth who are using terrorism and murder to find for themselves a place in the sun. The stupidity of the psychopathic prattle about discrimination and identity, the one feeding on the other to create a minority status, only damages the community, reduces it to a communal aberration. The 'separate statehood' demand is a caricature. Everyone knows it is. More people need to say this openly and categorically.

Of vital concern to the future of India will be the general effort to see terrorism for what it is. With the growth of lumpenisation, every movement is tending to throw up its quota of persons wedded to violence, indiscriminate killing and a life style full of 'adventure', supported by suspect 'funding' and few 'inhibitions'. Even Gujarat is giving birth to the bomb-makers and bomb-throwers. Others must be planning a similar 'growth in the tempo of struggle'. And when these antics are wedded to religious vows and such clap-trap, there's no end to the disaster scenario.

A major re-think requires that Rajiv Gandhi free himself from the clutches of his authoritarian bureaucrats and corrupt political colleagues to open the way to a more frank and wide-ranging exchange of ideas and perspectives with the various formations of the Opposition, particularly the responsible elements. India at this moment of disarray and confusion cannot be ruled by brain-waving in some offices of the GOI. Significantly, Rajiv Gandhi has been speaking of the need for a new frame of development and growth, both in political and economic terms. Without it, we will only feed violent controversy, ugly confrontations and a general destabilisation which could threaten our fragile democracy.

Already we feel the lack of a serious national consultation on matters like reservation policies, the mandatory disciplines for places of worship, and questions pertaining to the migration of ethnic groups within the sub-continent together with the political repercussions which result. To be content with haphazard 'fire-fighting' would put the cohesion of the sub-continent under rather heavy strain. We have a great deal to learn from the last years of Indira Gandhi if we are to avoid the pitfalls.

Rajiv Gandhi, facing problems within his party over his agreement with Longowal, may well hesitate, and the general advice will be to mark time. The trouble is that a fast-changing India is becoming intolerant of those who prevaricate. And rightly so, because what appear to be political challenges are, in fact, economic—yes, concerned with the future well-being of communities and their place in exercising governing power. We need very much more thorough studies of these changing challenges. They cannot be viewed in the old frameworks. Newspaper reporting is a pathetic and unreliable substitute for deep analysis.

Democratic governance can no longer lull itself into the mistaken belief that popular anger or impatience is a permanent condition of life. That may have been before development consciousness took hold. Now, it is becoming explosive. Indians in power cannot be unaware, for they are being reminded almost daily in one way or another.

The only reassuring fact that is emerging is that this disturbed state is not exclusive to the sub-continent. It is global in almost every aspect, from rapscallion politicians to terrorists murdering in the name of this or that cause. Reassuring? Well, at least Rajiv Gandhi is beginning to perform. That is something.

*August 2.*

## Shree Chamundi Mopeds

SHREE CHAMUNDI MOPEDS' French collaborated plant at Tumkur near Bangalore was formally inaugurated by Giani Zail Singh, President of India. At the ceremony, the French government bestowed its prestigious award 'Chevalier De L'ordre National de Merite' upon A P Mehta, the chief of the Mehta Group of industries. This is the second highest award given by the French government, which is equivalent to British Knighthood. It is in recognition of "foreigners who have distinguished themselves by their merits towards France". Mehta is the third Indian to be so honoured. Karnataka has seen a blossoming of industries under the umbrella of the Mehta Group. The industries cover highly diversified fields such as ball bearings and mopeds. Soon a plant manufacturing cars will become a reality—another monument to the towering personality of Mehta.

# A Bergen Diary

### AM

GIVE or take a few thousand square kilometers, you are still left with 325,000 of them. The population has stabilised at around four million since the end of the Second World War, again give or take a few thousands. So you have barely 12 persons for each kilometer of land. That, if you are brash enough you would be tempted to conclude, is the problem of Norway, and the only one. Like all generalisations, this too would be too simplistic; for one thing, of the 325,000 square kilometers of land, two-thirds are hard rock, and not livable. Norway is one of those rare European nations which never succeeded—for that matter, never tried—to build an empire, or annex other people's land. Its last association with aggression of any kind was when the Vikings were around in the middle Middle Ages; there can be an honest dispute, whether, even during that time, the Norwegians were not more aggressed against. One obvious factor prevented the Norwegians from having an empire of their own: in the eighteenth and nineteenth centuries, while the other European nations were on the annexation binge in Asia, Africa and the Americas, they, the Norwegians, were otherwise engaged, engaged in asserting their own independence. Once the flourish of the Viking kings was over, ever since the trauma of the Black Death, Norway had been a province of Denmark. In the confusion following the dissolution of the Napoleonic empire, Norwegians seized their chance and declared themselves free. But freedom can be a lonely occupation if, over the centuries, you did not quite know about its prerogatives and obligations. So, even as they declared their resolve not to recognise any more the Danish king, representatives of the Norwegian people opted for a union with Sweden; the king of Sweden became Norway's new sovereign. An ambivalence however persisted: reading through Norwegian history books, you will be hard put to make up your mind whether Charles XIII of Sweden was 'elected' as king of Norway in 1814, or was 'acknowledged' as such. This ambivalence continued for nine decades; members of the Storting—and the Norwegian government elected by it—were unable to get rid of the suspicion that Stockholm was not reconciled to the concept of co-suzerainty and took the Norwegians to be their vassals. In 1905, Norway broke away again. On this occasion, once and for all, Norwegians made up their mind: no more sharing of royalty with other people, they must have a king of their own: a king, a king, their kingdom for a king. You could have guessed it, ambivalence is ambivalence, they turned toward the direction of Denmark in their search for royalty. The Danish king's grandson was an acceptable choice; he was duly coronated as Haakon VII, Norway's first own king, really and truly. As he was married to one of Queen Victoria's innumerable granddaughters—a daughter of then reigning Edward VII—the then principal imperial entity, Great Britain, was equally happy at the denouement.

It is a different matter why an emancipated European nation needed a royalty in the twentieth century in the first place. Perhaps a symbol, around which the entire people, free, according to grammar, for the first time since the medieval days, could unite, was desired. Thus a royal family was imported, and grafted into Norwegian soil. By all accounts, the experiment has been a tremendous success; the royal family never behaved as a royal family, and has established, beyond the slightest doubt, its democratic credentials. The residual problems were however a great many. You have no empire and no colony, you are on your own; you are also only a few measly millions; you can fall back on your timber and coal and iron ore and whatever you obtain from your maritime exploits, but would that be adequate to your needs? In the period till the end of the Second World War, defending the country's territorial integrity against the ambitions, both overt and covert, of Britain, Germany and, to a lesser extent, France, almost exhausted Norway. During the Second War, an impossible situation arose: the country got involved simply because the big powers, for their own strategic reasons, would not let Norway alone. The nation could not escape unscathed; while the overwhelming majority of the people rose in revolt against the Nazi occupying force, the episode of Vidkun Quisling still left a deep scar on the Norwegian psyche. Since 1945, the situation has clarified, and Norway is in the repose of the North Atlantic Treaty Organisation. Few people here will care to remember, or like it to be remembered, that Quisling first made his mark in the 1930s as an anti-communist crusader. The strident anti-communism of the North Atlantic Alliance is understandably played down in Norway, it is its aspect of protective shield which is continuously emphasised. But it can be quite a job to shed the ambivalence.

Just as it can be in matters cultural and linguistic. Norwegians have to keep up the pretence of the distinctiveness of their language; after all, it has produced, hasn't it, both Henrik Ibsen and Bjornstjerne Bjornson? But, beyond a point—and a very narrow point—Danish shades off into Norwegian, and Norwegian into Swedish, they being essentially spatial dialects with the same teutonic roots, so much so that a Norwegian does not even have to learn separately Swedish or Danish in school. You are Scandinavian, there is a continuous overlap in culture and attitudes with your proximate neighbours, there is overlap in most commercial and economic matters too and not just in the running of a common airline, and yet, you are Norway, even if you are a nation of only 4 million, even if, all along your eastern frontier, you are hopelessly interwined with Sweden, and, up in the north, it is an intricate threesome, on either side the fjords jut in and jut out, this is Sweden, this is Finland, this is Norway; further north, the tangle is even more hopeless, ask the Lapps, they will be quite confused where they really belong, whatever the formal political geography.

Nonetheless, Norwegians stress their separateness with a fierce ardour, and will gently remind you that, during the war against Hitler's Germany, they were combatants, while Sweden was neutral. There is another part of the story though. It could be a mere happenstance, but whether discrimination was actually practised or not by the mighty ones in Stockholm, the major foundations of Norway's economic growth were in fact built in the decades of the nineteenth century and before the break with Sweden took place. Pine and birch, birch and pine: Europe and America pined for Norway's forest products, and it has been a sequence of expanding exports all along. From lumber exports, the manufacture of pulp and paper became the logical next thing. And with iron and coal and several other minerals in the northern counties, steel and metallurgical industries entered the picture even as the nineteenth century was drawing to a close. If you have both wood and steel, alongside a long maritime history—a history which is a natural adjunct of your geography—you, inevitably, drift into shipbuilding. The shipyards of Bergen built some of the most fabulous ships during the hundred years between the 1850s and the 1950s; the Prime Minister who took the lead to separate Norway from Sweden, Christian Michelsen, was a lawyer, but he made his money in shipbuilding.

Norwegians, besides, had their fishing and whaling. It is from fishing boats that craftsmen branched out to shipbuilding. Fishing provided a key occupation, just as much as it provided a major export item, against which it was possible to import corn and vegetables necessary for a comfortable living, for, excluding the forests, the rest of the land is rugged, and does not easily take to agriculture.

Political contours and contexts got altered, wars intervened, the country was, every now and then, occupied by foreign troops and de-occupied, Bjornson and Ibsen made their cultural revolution, Edvard Munch blazed an altogether unexpected Scandinavian trail among the post-Impressionists, but the placid character of Norway's economic progress was not disturbed through the decades.

A nation may consist of only a few millions, but once it has begun to believe in itself, the belief itself acts as the greatest catalyst, the sense of belonging to each other begins; this sense of belonging, in its turn, generates pride, and from pride comes the strength. During the successive decades of the nineteenth and twentieth centuries, while the pattern of growth did not show much variance, and even the pace did not alter too much, the Norwegian economy continued to expand. Sophistication was soon added to specialisation. With economic growth, the occupational pattern too started to change, service industries, particularly construction, came to claim a larger share of the work force. The more important fact however is the overall advance the economy registered; even the depression of the thirties, one suspects, affected Norwav much less than it affected the other European countries.

But, there can be no mistaking it, the underpinning of growth was provided by the character of the people. It was solid, quiet, systematic application on the part of a proud people, who were jealous of their heritage, the heritage of a maritime nation, who wanted to sustain their distinctiveness as Norwegians first and foremost, and only subsequently as Scandinavians or Europeans. If you are only a few millions, despite your being only a few millions, if you are prepared to work hard—working hard is again a heritage, for you have survived through the centuries against the ferocity of nature by your toil and labour—and if you are singleminded in your objective to exploit the limited resources at your command, you would move forward, inch by inch, and suddenly one day the world would sit up and take notice. After Switzerland, Norway has now the highest per capita income in Europe; very soon, it is likely to be even before Switzerland. Roughly 40 per cent of the national income is earned from exports, exports of paper and pulp, lumber, furniture, electrometallurgical products, marine products, ships—and power. With water gushing down the steep fjords, hydro power is on tap, and Norway has the world's highest per capita consumption of electricity. Between the two World Wars, when the Labour Party was in full bloom, a comprehensive programme of social welfare measures had been taken on hand. The edifice of a welfare state was completed, without fuss and fanfare, in the fifteen years following the end of the Second World War. The average longevity is now around seventyfive years, and somehow fits with Norway's long summer days or long winter nights. You have little choice, in Norway, you have to grow old gently, respectfully, carefully, for, right across the border, you have the example of Sweden, where an excess of prosperity, superimposed on the Nordic psyche, has created different kinds of social turmoil.

Strength with tranquillity, tranquillity with strength, would seem to be Norway's private quest. The strength is assumed to come as much from economic achievements as through drawing on the nation's reservoir of pride. And tranquillity ought to emerge from a milieu which is divested of tension. Issues however do abound. For a nation of only 4 million, and two-fifths of whose national income originates abroad, it is impossible to walk away from the reality of the world's intricate interdependencies. For a country which cherishes tranquillity and peace—it is, after all, Norway's Parliament, the Storting, which awards each year the Nobel Peace Prize—it is equally impossible to be oblivious to the other reality that it shares a border with the Soviet Union too. Not infrequently, Soviet marine vessels allegedly stray into Norwegian territorial waters in the North and Barents seas; there is occasional excitement over reports about Soviet submarines making surreptitious forays into the depth of the Norwegian fjords. Perhaps it is these alarms which have drawn Norway into the net of the North Atlantic Treaty Organisation, into the allure of the supposed security which the umbrella of the combined Western might provides. But, again, ambivalence takes over, you have to draw a line, and, besides, it is not the Soviet Union, but the troops of a revanchist West European power, which overran Norway in the 1940s. So Norway will not allow itself to be tilted too much: it is a part of the customs union which is the European Free Trade Association, but it is not in the economic union which is the European Economic Community, it is not a part of the political union which is the European Community. The ambivalence runs all along. The royal families of Norway, Sweden and Denmark inter-marry, each of the monarchies is unbelievably democratised, but they retain their separate identities, just as the languages of the nations are almost the same, yet not quite; as if to stress the distinctiveness, in Norway's schools, along with the old style Norwegian—which anyone will be hard put to distinguish from Danish—it is compulsory to study the new style Norwegian, which has a larger proportion of the patois of those counties which, two centuries ago, were a part of Denmark, but are no longer so. Ambivalence is the guiding ideology. Don't you know, Norway has only four million people; don't you know, Norway has the highest per capita income in Europe, it has the lowest rate of unemployment . . .

Come to Bergen, you are, once more, face to face with the ambivalence. It is an excruciatingly beautiful place, with seven mountains stringing themselves together and offering to the sea a stretch of a meadow which in due course has become the city, and with literally thousands of tall, deep fjords edging themselves in at every nook and corner. The coexistence of land and sea is echoed in other features. Even a few decades ago, Bergen was the country's leading port, principal wharf, and major seat of shipbuilding. Giant boats from all over would steam into the harbour, lending it a magnificent international flavour; and yet, walk up a few cobbled alleys, Bergen is a quiet, dull provincial town. With off-shore oil explorations gathering momentum in the North Sea, Stavanger has now shot into greater prominence as a port, and, while Norway continues to be Europe's leading shipbuilder, Japan and South Korea are taking away many of the orders. So Bergen too is getting transformed. Just as, in the composition of the country's national income, services have now displaced industry, agriculture and forestry as the principal activity, in Bergen too, occupation is assuming a pluralistic hue. The University at Bergen was a modest event even a couple of decades ago. No longer; as departments multiply and students proliferate, it is now closing in on the the University at Oslo. And every citizen of Bergen would keep reminding you that Ibsen was director of the public theatre here, and not in Oslo, which was then not Oslo, but Christiania. Arts and the crafts, industry and the services, culture and physical endeavour keep meshing into one another; Bergen, with its breathtaking landscape, takes in these assorted ambivalences and weaves them together in a striking harmony, and, talking of harmony, someone will be there to let drop the information that, after all, Edvard Grieg the composer too was a burgher of Bergen.

Meanwhile, as North Sea oil is about to add another chapter to Norway's prosperity, the political scenario does not deviate from its tranquillity. At the last general election, the Labour Party, after umpteen number of years, was edged out from the government, and a delicate coalition of the conservatives and centrist groups took over. Not that it has made any difference to the texture of living for the Norwegians: the established social equilibrium is unlikely to be ever disturbed short of a major cataclysm. Another general election is scheduled for September. Maybe the Labour Party will stage a comeback, maybe it will not, does it really matter? A bit of ancient history, in the first election which took place immediately following the Second World War, the Communist Party, aglow with the glory of the resistance put up by its dedicated cadres, had won as much as 15 per cent of the popular vote. This proportion is now down to 0.3 per cent. Those who splintered away from the party in the 1960s, in the pattern repeated in most countries outside Eastern Europe, aligned themselves with younger elements who cut loose from the Labour Party; they are now known as the Red Electoral Alliance, and command 0.7 per cent of the votes. These days, this latter group is more pro-Albania than anything else. But, never mind, call it pluralism, call it ambivalence, they too coexist and are accorded respect as a germinator of ideas.

A basic question still lies ahead though. In this age of instant telecommunications, space satellites and micro chips, how does a small nation, so utterly dependent on the rest of the world for its living, preserve its personality? For the younger generation, jeans and rock music have been a great leveller. Norway provided the first Secretary General of the United Nations in the person of Trygve Lie; as a proportion of national income, its governmental aid to the developing countries is now the highest among the donor nations. There can be no questioning of its global conscience. But will tomorrow's global political culture permit Norway to stay on as Norway?

It is as good a question to mull over as any in Bergen's excruciatingly beautiful, ambivalent climate, with brilliant sunshine across the sea, the bay and the seven mountains sharing evenly each one of the three hundred and sixtyfive days of the year with steady, persistent, pouring rain.

## INTERNATIONAL AFFAIRS

# Sino-US Nuclear Diplomacy

### GPD

PRESIDENT Li Xiannian's visit to the United States would be remembered for several things. But easily the most important feature of that trip has been the nuclear co-operation agreement between the two countries. The agreement was initialled nearly fifteen months ago. The delay in its formalisation and ratification was taken by many observers as a sign of cooling off of relations between the two countries. In fact the anti-proliferation lobby and the increasing Chinese disenchantment with the United States were thought to be the major reasons why the co-operation project had been perhaps abandoned. With Li Ziannian's visit and the signatures put on the pact the speculation about the role of the agreement as a barometer of Sino-American relations has been laid to rest. A general trend has been confirmed. Sino-US co-operation is not going to remain limited to nuclear affairs. It is likely to extend itself to space technology as well. The American journal *Aviation Week* has started a series on space technology in China. We shall return to the theme at a later date. But it may be mentioned that Zhang Jiqing of the Chinese Ministry of Astronautics told the visiting American delegation that "China wants space co-operation but on an equal basis with the United States". He also said China had made progress with the Europeans and "hoped to make better progress with the US". China was also working on "co-operative space technology pacts with Japan". The message is clear. Politics is no bar to technological co-operation, be it space technology or nuclear technology.

The interesting bit about this agreement has, however, been the assurances the Americans have sought from the Chinese. The agreement does not commit China to any non-proliferation undertakings. In other words, the Chinese have not promised that they will not transfer nuclear technology to a third country. There has been speculation, particularly rife in this country, that the Chinese have supplied nuclear know-how to Pakistan. Neither this agreement nor any other statement by the Chinese confirms or denies this speculation. Yes, there was the statement by Zhao Ziyang that China does not export nuclear technology (like revolution, he might have well added, but for the fact that nobody has lately accused China of exporting revolution). Nobody took that statement very seriously. China would much rather let everyone believe whatever he or she wants to on the subject. Call us bad names if you like but we shall not say anything explicit on the matter, seems to be the typical Chinese attitude.

It makes good political sense, however, to assume that the Chinese have given to the Americans some kind of assurance, in all probability verbal, that they shall not contribute to the process of proliferation. Verbal assurances are not unknown in nuclear diplomacy. As one Indian daily has pointed out, France although not a signatory to the NPT is abiding by the guidelines of the London Club of nuclear suppliers. Being a nuclear power puts a country in a special class. It is like belonging to an aristocracy. A certain behavioural pattern then imposes itself upon the powers concerned. It is not for no reason that terms like 'club' are in vogue when it comes to the nuclear weapon powers. An outcaste does not and cannot belong to a club. Deng Xiaoping and his men would soon realise that their behaviour patterns *vis-a-vis* the big powers, more particularly the nuclear powers, are absolutely the same as the ones they were condemning vocally not so long ago.

It also makes good political sense that in spite of all this they have refrained from giving any written promises. To incorporate the American demand (that China should not export nuclear technology) in an agreement is to concede that a superpower has the right to lay down rules governing China's relations with a third country. In short, there is a problem of sovereignty involved in all this. The US cannot dictate that. China, in any case, will not agree to putting it down in writing. It is a legitimate question of 'face' and also the question of China's past positions. The 1963 partial test ban treaty as also the 1965 non-proliferation treaty were rejected by the Chinese on the ground that the nuclear powers were imposing political decisions on the non-nuclear powers. So written promises are out, at least as long as the Chinese are not full members of the nuclear club.

The question nevertheless remains as to why the Americans have accepted the verbal promises. They tried and pressed the point for a while, for a good fifteen months to be precise. They seem to have given it up now. The reasons are not far to seek. The Americans must have realised that the Chinese have nothing to gain from a nuclear Pakistan.

We know that this is not and cannot be a popular view in India. It would be no small mercy if it is not taken to be altogether blasphemous! A China-watcher was recently asked in an interview by the E A Ministry men as to how he reconciled China's expansionist and hegemonist policies in Indo-China with its professions of socialism. The China-watcher said that it is not for him to reconcile anybody's claims to socialism with his or her policies. We have cited this little story just to demonstrate the general mood of our policy-makers or of a section of them when it comes to China. Given this mood, it would be hardly a surprise if our remark is taken to be blasphemous!

However, power politics and its rules cannot be wished away. That the Chinese would have their finger in the Pakistani nuclear pie is not an altogether meaningless theory. But it is inherent in the logic of being nuclear that the power concerned generally would not like any other power to go nuclear if it could help it. It would be utter madness for the Chinese to have another nuclear power right at their door-step. This is not to say that they can stop it. It is only to suggest that they would not encourage it. In the meanwhile they have a lot to gain from the rather widely held impression that they may have something to do with the Pakistani bomb. 'Keep everybody guessing' is a good foreign policy principle.

It is interesting in this context that the Soviet Union has not said much—in all probability nothing—on the question of Sino-Pakistani nuclear co-operation, and for good reason too. It knows who is really to be blamed if Pakistan in fact goes nuclear. We shall have to wait and see if our new 'dynamic' leadership has the requisite courage to call a spade a spade and act on that understanding.

# Losing Battle against Rising Costs

### Hansavivek

*ESCORTS* was able to achieve increased turnover in most of its products during 1984, but it had to fight a losing battle on the profitability front due to cost pressure on inputs. Moreover, profits were also affected by prolonged labour unrest at the Bangalore plant, and, the company's new projects of the floating dry dock at Bombay and 350 CC motor cycle, which are still going through the initial stabilisation period. The dry dock, owing to problems of port jurisdiction and environmental controls together with continuing recession in the shipping industry, was functional for only about 5 months in the year. While the company's turnover increased from the previous year's Rs 253 crore to Rs 293 crore, gross profit declined from Rs 23.81 crore to Rs 21.71 crore. With both depreciation and the tax liability claiming more, net profit fell from Rs 14.12 crore to Rs. 8.67 crore. Dividend has been maintained at 22 per cent and is still covered 2.92 times by earnings as against 4.76 times previously. The piston assembly plant at Bangalore resumed working on February 12 last after a production linked settlement was signed.

The floating dry dock, India's first modern ship repair facility imported at a cost of Rs 20 crore, has been plagued with endless problems. Shortly after its commissioning in end December 1983, the government authorities did not permit it work for nearly 6 months until it was finally cleared by the Department of Environment. There were then problems regarding its location which had been temporarily cleared by the Nhava-Sheva port authorities till November 1984 and then extended under bank guarantee till end of February 1985. The company has made many representations to the Ministry of Shipping and Transport and to the port authorities to permit the dock to function at its present location with the assurance that the management would move it to a suitable alternate site as cleared by the government and port authorities within three months of the commencement of any civil or dredging work by the contractors engaged for the development of the port. In the circumstances, it was a credit to the Maritime Division that it earned over Rs 2 crore as 'deemed' exports including Rs 47 lakh as direct foreign exchange earnings. There was however a loss of over Rs 4 crore, mainly on account of interest, depreciation and adverse fluctuations in the Euro-dollar exchange rates. Shifting the dock to another acceptable site is under examination by the Ministry of Transport and port authorities.

The company produced and sold 12,461 Escort tractors and 8,652 Ford tractors maintaining its leadership in the tractor industry with a 26 per cent market share, despite lower sales in the disturbed areas of Punjab and Haryana. The company increased its motor cycle sales by 17 per cent from 69,432 numbers to 81,142 numbers. While the new Rajdoot Super 'D' is generating good consumer acceptance in urban areas, the standard model remains the work-horse of rural and agricultural areas where it is recognised as a rugged cross-country machine. Sales in the current year are expected to exceed the one lakh mark. The projected volumes for the production of

Rajdoot-Yamaha 350 CC could not be achieved, partly due to the ban on high HP motor cycles in disturbed areas and partly because of the highprice. Its induction into the army and the police would commence after the extensive testing in progress is completed. The company's new plant at Surajpur in UP for the Yamaha 100 CC motor cycle is nearing completion. This modern facility with an annual installed capacity of 1.50 lakh machines per annum would commence trial production by September. According to H P Nanda, Chairman, this highly fuel-efficient machine generates 11 BHP making it the most powerful yet most economical among the 100 CC motor cycles likely to be introduced in the country. There has been a progressive modernisation of all the plants. The company has invested over Rs 10 crore in 1984 in many new machines, which will contribute to higher productivity and profitability. The company has received approvals and industrial licences for capacity expansion for 15 lakh pistons and 15 lakh automotive shock absorbers plus a new foreign collaboration with Bilstein of West Germany for pressure shock absorbers. The company has also obtained approval for a collaboration with Faun of West Germany for a series of hydraulic mobile cranes with lifting capacities upto 40 tonnes. The Industrial Equipment Division showed a healthy growth during 1984 with sales of 187 cranes, 87 loaders and 252 other industrial machines. Sales of diesel gen-sets were extended to cover a range of 40 KVA to 1,000 KVA from local sources and from one HW to 14 HW from imported sources. Sales increased from 93 units to 206 units. The company's proposal to manufacture 24,000 outboard motors with foreign collaboration is expected to get on stream as soon as government clearance is obtained regarding its relocation in a notified backward area of UP. This would be India's first plant to manufacture outboard motors and would meet a large demand from hundreds of thousands of fishing boats on the coasts and rivers. The railway ancillary unit exported nearly Rs 60 lakh of railway shock absorbers. Capital investments required for the current year will be in the vicinity of Rs 40 crore and the company is making an issue of Rs 20 crore secured non-convertible debentures. The company may additionally raise Rs 20 to 30 crore by another debenture issue.

A major event during the year was the judgment of the Bombay High Court which upheld the decision of the board of directors refusing registration of shares lodged by the non-resident companies of the Caparo Group in May and August 1983. Special leave petitions were subsequently filed by LIC, RBI, Union of India, the company and others. The Supreme Court stayed the operation of the Bombay High Court judgment till the disposal of the appeals. In its order the Supreme Court stated that the "stay of the operation of the judgment hereby granted would not tantamount to acceptance or rejection of the judgment save and except that it requires examination by this court". The appeals have now been listed for hearing by a Constitution Bench of the Supreme Court on July 30. Bharat Ram, Ranganathan and Field Marshal Sam Manekshaw retired on June 30, 1984 having served the board for 5 to 15 years.

*TATA ENGINEERING AND LOCOMOTIVE COMPANY (TELCO)* is developing two series of light commercial vehicles which will be designated as the 407 and the 608 series. The 407 series will be ready for commercial production by December 1985 and the 608 series will be introduced soon thereafter. These vehicles have been designed from scratch for Indian conditions. Apart from some special steels which the company has been forced to import, the vehicles will have a 100 per cent indigenous content from the very start. At the same time, they will satisfy international parameters of performance. Being suitable for a variety of applications, the management feels that they will gain a substantial share of the rapidly growing market for this class of vehicles. Customers for both these new series of vehicles will have access to the same extensive service network and spare parts facilities which cater to the lakhs of TELCO vehicles already on the road. The company is also opening 8 additional stocking points to feed spare parts more speedily to the existing outlets. The lead the company has in commercial vehicles will help it in acquiring a similar position in the passenger car market which has been opened to it for the first time as a result of liberalisation in licensing policies for automobile manufacturers in January last. With the commitment to quality, the large pool of trained manpower and the extensive manufacturing and service infrastructure the company has already built, S Moolgaokar, Chairman, feels certain the cars that it fields will come out on top.

The company has entered into technical collaboration with Nachi Fujikoshi and Nigata of Japan for the production of numerically controlled flexible machining lines and machining centres. A large number of professionals are under training in Japan and India. A new electronics division is being set up at Pune to be manned by top-class electronic engineers to produce the controllers for machine tools. These engineers will also spearhead the company's efforts in factory automation and will support the maintenance of the sophisticated and expensive machine tools which will enable the company to produce efficiently, even at a low volume, a variety of components and aggregates necessary for upgrading and widening the range of vehicles. The company will produce and use more and more such machines in the years to come. The collaboration with Hitachi Construction Machinery Company is proceeding smoothly and facilities for spares, service and training of operators and mechanics are being established with its assitance. Meanwhile, the first Tata-Hitachi excavator was delivered towards the end of last year.

The company has turned in good working results for the year ended March 1985, even though demand during the first 8 months fell short of expectations. By December last, however, the performance began to catch up and the year ended with higher sales than in the previous year. A relentless push in costs kept profitability squeezed. Prices of steel, tyres and bought-out items increased substantially. The company had to increase its vehicle prices in April 1985. The company sold 45,605 vehicles in the domestic market as against 45,805 numbers in the previous year. In the export markets vehicles, spare parts and other products worth Rs 63.04 crore were sold compared to sales of Rs 31.31 crore in the previous year. Excavator sales slowed down during the year, mainly due to curtailment of government spending on large construction projects. The company earned a higher gross profit of Rs 65.98 crore against Rs 50.86 crore in 1983-84 following increase in turnover from Rs 755 crore to Rs 831 crore, reflecting enhancement of gross margins. Net profit came to Rs 23.13 crore (Rs 19.28 crore). Dividend has been stepped up by 3 points to 23 per cent and is covered 1.88 times by earnings as against 2.11 times previously. The company received a letter of intent for setting up a new plant licensed to produce 9,000 vehicles a year in UP. Construction work will start there as soon as the state government hands over the land being acquired by it. The company has also received the govenment's approval for increasing the vehicle manufacturing capacity at Pune to 35,520 numbers a year. This brings the total licensed capacity to 78,000 numbers and permits the company to make 97,500 vehicles in a year.

During 1984-85, over 70 per cent of the workforce went through retraining. To keep pace with the company's needs for manpower skilled in new technologies, time-bound plans for training employees in high technology areas are being implemented. In addition, TELCO has under training in various disciplines around 1,000 full-time trainees year after year.

*MAFATLAL FINE SPINNING AND MANUFACTURING COMPANY* is implementing the modernisation programme of the textiles division which had remained pending since 1983. The financial institutions have sanctioned the balance of term loan of Rs 140 lakh for this purpose. The management is also in the process of preparing a phased programme of replacing obsolete and outdated machinery with machines having improved technology so as to reduce the cost of production to meet the demand of the export market. The company is also continuing its renovation and modernisation programme in the chemicals division taking into consideration the need for balancing production to a large extent. During 1984-85, the company suffered a sharp setback in its working as reflected in a lower gross profit of Rs 3.11 crore against Rs 4.41 crore in the previous year despite the increase in turnover from Rs 99.36 crore to Rs 123.98 crore. This was mainly due to the poor working of the textiles division resulting from the recession in demand, sharp increase in prices of various inputs and severe competition from the decentralised sectors enjoying certain concessions and benefits. The chemicals division performed well with improvement in production as well as sales. Net profit dropped from Rs 234 lakh to mere Rs 84 lakh, which provided a cover of only 1.05 times against 2.97 times previously to the unchanged dividend of 12 per cent.

The company is taking all precautions to control environmental pollution and is implementing measures suggested by the various inspecting authorities to ensure safety. The company has offered for subscription 5 lakh 15 per cent secured non-convertible debentures of Rs 100 each to the existing equity and preference shareholders and 11 per cent debenture holders. In 1980-81, the company had received Rs 2.57 crore (including interest of Rs 91 lakh) by way of refund of excise duty paid by it on blended yarn during the period September 1965 to March 15, 1972, under the decree of Civil Judge, Senior Division, Navsari. On April 6, 1984, the High Court of Gujarat had decided the appeal filed by the government against the said decision in its favour and had directed the company to pay back the said amount to the government. The company filed an appeal in the Supreme Court for special leave to appeal against this decision of the High Court. While admitting the special leave petition of the company, the Supreme Court has granted a stay order and the matter is now pending before the Supreme Court. The company's appeals for refund of excise duty (wrongfully collected from the company in earlier years) on Mafron gases and yarn, were decided in favour of the company by the Tribunal. A refund of about Rs 135 lakh is due to the company on this account and it has taken credit for the same in the year's profit and loss account. Padmanabh A Mafatlal has resigned as Managing Director with effect from May 31 last, but continues to be a Director of the company. Hrishikesh A Mafatlal, Managing Director designated as Executive Vice-President, has been now designated as President of the company from June 13 last. Bhupatirai M Ghia and Shivabhai B Patel have resigned from the board from June 6 last. Ashwin N Shah and Bharat C Gosalia, senior executives of the company, have been appointed as additional directors with effect from June 13, 1985.

*COLOUR-CHEM* is diversifying its activities. It has received a letter of intent for the manufacture of meta phenoxy benzaldehyde, a major intermediate required in the production of synthetic pyrethroids the manufacture of which has recently commenced in the country. The technology for the production of this intermediate has been developed by the company's own R and D centre. The quality of the product has been well accepted. A plant for this purpose is under erection at the Roha factory where regular production is expected to commence from September 1985. As a part of the programme for further diversification, the management is examining the feasibility of investment in the manufacture of additional intermediates needed by the dyestuffs, pharmaceuticals and pesticides industries. The company has shown further improvement in its working results for 1984-85. Turnover has increased from the previous year's Rs 45.98 crore to Rs 52.94 crore and gross profit has looked up from Rs 4.33 crore to Rs 4.80 crore. These figures reflect a decline in gross margins. With the tax liability requiring more, net profit is Rs 1.30 crore (Rs 1.03 crore). Dividend has been raised by 2 points to 12 per cent and is covered 1.21 times as against 1.11 times previously.

There was a slight improvement in the demand for dyestuffs from the textile industry though the acute scarcity in the availability of acrylic monomers in the country, import of which was also banned, hampered the company's ability to meet the demand for binders from the textile industry. The tempo of increased sales of the products to other consuming industries, such as paints, printing inks, plastics, rubber, etc, was maintained at a satisfactory level. The revival in the leather industry helped to augment the sales of leather chemicals and auxiliaries though in relation to the company's installed capacity for these products the extent of improvement could be considered only as modest. The rate of growth of sales of intermediate chemicals manufactured by the company for the dyestuffs, pharmaceuticals and pesticides industries was restricted by the shortage of the essential feedstock, *viz*, acetic acid at a critical time of the year. The company's exports during the year improved by 11.7 per cent to Rs 4.48 crore. The profit margins were strained due to increase in costs of major inputs and the continued unequal competition subsidised by the scheme of differential excise duty on dyestuffs and synthetic resin materials. The steep increases in prices of such major raw materials as acetic acid and butyl acrylate, higher personnel costs consequent upon the new settlement with employees' union and a stiff increase in the cost of water supplied to the company were among the significant areas of cost escalation encountered during the year. Vanavil Dyes and Chemicals, a joint sector venture in Tamil Nadu, in which the company has invested Rs 45 lakh by way of equity participation, completed the installation of its plant for the manufacture of fast colour bases and some dye intermediates in February last and commenced production shortly thereafter. Its products have been well received in the market. It has secured an export order from USSR. The management has initiated steps to undertake the manufacture of other products licensed to it to ensure viability of operations. The operations of the company's joint venture in Sri Lanka, Haycolour, were inhibited by the continuing ethnic disturbances in that country and the prolonged delay in securing tariff protection from the Government of Sri Lanka. Haylays of Sri Lanka, who hold 60 per cent of the equity of that company, have informed Colour-Chem that the operations of the joint venture have started picking up since March last and that they are persisting with their efforts to obtain the necessary assistance by way of tariff protection from the Government of Sri Lanka.

In his Chairman's statement, B M Ghia has welcomed the government's textile policy. He is of the view that this would restore the textile industry to its prime status in the country's economy. He, however, has pointed out that the high level of excise duty of 31.5 per cent *ad valorem* on dyestuffs is a tempting incentive to excise evasion. Unless the duty is reduced to a reasonable level, the units of the industry which contribute more than 80 per cent of the direct and indirect taxes collected from it and account for a major portion of the industry's exports, will continue to remain debilitated. The impairment of their financial stability has obliged them to curtail their investment in R and D and weakened their ability to undertake continuous updating of their technology. Another issue which is causing concern to the industry is the placement of OGL, under the import policy for 1985-88, of many chemicals which have been efficiently manufactured in the country for years. Ghia concedes the need to tone up the indigenous industry by exposing it to international competition, but he observes that the policy of encouraging free imports of finished products manufactured in the country while including the raw materials needed for their manufacture in the 'limited permissible' (that is almost banned) list is harmful to the national industry. In the wake of the 1985 Budget the indigenous prices of many petro-based and agro-based chemicals have gone up steeply. When the indigenous industry has to use such high priced raw materials and can have no recourse to their imports because of their non-permissibility, it is unrealistic to expect indigenous products to withstand international price competition.

# Early Fruits of New Economic Policies

BM

THE quandary in which the government finds itself over the behaviour of prices, as the Union Food and Civil Supplies Minister frankly admitted during the debate on the prices situation in the Rajya Sabha, was more clearly spelt out by the Union Finance Minister in a letter he is reported to have written to his party MPs after the debate in the Lok Sabha on prices in which he was assailed for not controlling prices not only by the opposition but also his party members. The price rise, he readily agreed in his letter, affects voters directly and whatever else the government might or might not do, it was bound to come in for criticism if prices rise. It was, therefore, essential, he pleaded, that "we collectively apply our minds and see what can be done to restrain the price increase".

After taking such a reasonable stand, V P Singh went on to pose the real dilemmas facing him and the government. He, on his part, was ready and willing to make cuts in government expenditure which is the stock prescription presented by many for holding the price line. Government expenditure was "certainly a matter for worry", Singh admitted. But "this would mean less money for projects, a cut in subsidies and curtailed increase in DA etc", he pointed out. This was meant to put the critics in a spot. Would they in the ruling party as well in the opposition be willing for all or some of these measures to cut government expenditure and bring down prices?

He felt himself to be on even surer ground when he posed the question of containing the price rise in agricultural commodities, including foodgrains, edible oils and sugar. The government, he strongly argued, did not want to "depress prices too much" as that would hurt farmers. He went on to tell his partymen that the government was keen to arrest the tendency for prices of groundnut and mustard to fall and had, therefore, bought nearly 75,000 tonnes of mustard seed in order to keep up their prices. It was the government's duty, he pointed out, to regulate the releases and prices of agricultural commodities in such a manner that the "prices to the farmers remain remunerative". This line of reasoning presumably covered the releases of sugar as well. But the rise in sugar prices has been so scandalous that he wisely chose to refer in his letter to only edible oils and not sugar. Even the most ardent admirers of V P Singh in his party would not credit the government's handling of sugar releases and prices as inspired solely by the aim of ensuring remunerative price for farmer. But the bugbear of 'remunerative prices for the farmer' is unnerving enough as much for the ruling party as for the opposition parties. Neither can be expected to countenance anything less than the so-called 'remunerative prices' for the farmer and both sides clamour all the time for increasing the prices for the farmer. The Union Finance Minister thus found it easy enough to not only neatly side-step but also mock at the more popular bogey of big business and traders bringing about price increases. He was in a position to sharply reject any suggestion that his Budget which gave reliefs in direct taxes for which he had won so many plaudits and levied additional tax on certain selected items of consumption, among them petroleum products, could be held responsible for the rise in prices. Finance Ministry circles, in fact, hold that the sharp spurt in prices in the four weeks following the presentation of the Budget has been contained and it is only in a few selected commodities of daily consumption that inflationary pressures are still being felt because of seasonal factors or a gap between supply and demand. The position, according to them, will begin to ease when the seasonal factor will have spent itself in the case of some commodities and imports are arranged to improve supplies in the case of others.

The line adopted by V P Singh to confound the critics on the question of price rise is reinforced in a more cavalier fashion by other leaders of government, notable among them being the Union Minister of Food and Civil Supplies. Rao Birendra Singh has not hesitated to make even the churlish suggestion that the state governments were 'profiteering' on supplies from the Centre by fixing retail prices of foodgrains at a rate higher than the prices of the Food Corporation of India. He evidently had not provided for the costs incurred by the states on handling food supplies from the Central pool when his own cost of handling, transportation and storage is his ready explanation for the unduly large difference between the procurement prices and the issue prices of the FCI, which result in huge subsidies from the exchequer. Earlier, on another occasion, Rao Birendra Singh had glibly argued that while the Union government had made a 'conscious decision' to impose levies on its Budget on several sensitive commodities of mass consumption which had resulted in a spurt in their prices in order to raise resources for development, the state governments had aggravated the problem by measures only to raise revenues. He completely ignored in a fit of irresponsibility the pressure of the Union Finance Ministry and the Planning Commisssion on the state governments for vigorous measures to raise additional resources. The fact indeed is that whereas the Union government chose this year to propitiate the rich classes by generous cuts in taxes on their incomes and wealth and heavily taxed items of mass consumption, the state governments took far more equitable and commendable measures for the mobilisation of additional resources for planned development. This indeed has been decisive in upholding the size of the Seventh Five-Year Plan. But let petty politicking on the part of the ministers of the Union government in dealing with serious issues be ignored.

## Cuts in Government Expenditure

Let us take up the question of cuts in government expenditure which has been posed by V P Singh. It is obviously necessary to contain government expenditure if deficit financing is to be brought within manageable limits and increase in liquidity resulting in too much money chasing too few goods has to be controlled. But this must not be done in a mindless manner by pruning investment in development projects and programmes and cuts in subsidies which would hurt the mass of consumers and withholding of DA which would hit low paid workers in the public and private sectors. The Union Finance Minister has threatened to take precisely such steps. The key issue to face is indeed the relentless rise of the non-development expenditure of the government, including expenditure on the armed services and the organs of law and order which are given the highest priority by the government. Such expenditure must not be accepted fatalistically and treated as sacrosanct. The situation has come to such a pass that resources committed to security and order have begun to not only eat into those available for development but also threaten economic and social stability. This problem must be publicly discussed and not regarded as the sole prerogative of the government to handle in total secrecy. Development is the best guarantee of security and improvement in the life of the mass of the people the best assurance of peace and order; they must enjoy top priority in the scheme of things.

The problem of the rise in non-development expenditure is aggravated by misdirected investment of scarce resources in areas of low priority when mass needs are ignored and the demands of the upper classes tend to become the main concern. It is indeed remarkable that not only investment for the expansion of production of the means of private transport, entertainment electronics, five-star hotels and much else of a similar nature receives a high priority in deployment of available resources, whereas there is so much hesitation in using the resources which are available, among them most notably the surplus food stocks, for generating new employment and incomes in the economy. There is obviously a pressing need for reordering investment priorities for optimal deployment of available resources to meet mass needs in contrast to the growing trend in favour of disregarding the principles of austerity and squandering scarce resources for satisfying flashy, elitist demands of the upper classes.

Combined with strict regulation of expenditure, both in the public and private sectors, there is the pressing need for a vigorous effort for additional resource mobilisation. The generous cuts in taxes on incomes and wealth and goods and services of elitist consumption have not only swelled disposable incomes and elitist demand in the economy, they have also impaired the will for additional resource mobilisation. The cumulative effect has been not merely a deceleration but an absolute decline in the rate of savings in the economy from the peak of 24 per cent in 1978-79 to below 23 per cent in 1984-85. The expectation of the planners that the Seventh Five-Year Plan could count on an average savings rate of 26 per cent and an incremental rate of 30 per cent has, therefore, been falsified. The planners have now found that only a vigorous policy of promoting savings, both in the public as well as the private sector, including by way of direct and indirect taxes can hopefully push up the saving rate to 24 per cent in the Seventh Plan. No wonder the resources crunch on investment in the public sector as well as the private sector has become severe.

### SUPPLEMENTARY DEMANDS

It would be worthwhile to mention in connection with the unchecked rise in deficit financing the supplementary demands for grants which have been presented by the Union Finance Minister within just four months of the presentation of his first Budget. The deficit of Rs 3,280 crore left uncovered in the Budget will swell enormously if the present drift of policy on resource mobilisation and deployment remains unchecked. The deficit will enlarge to Rs 6,150 crore as a result of just the supplementary demands for grants which add up to Rs 3,872 crore. Taking into account certain receipts and recoveries, the net additional expenditure proposed is of the order of Rs 2,876 crore. The additional expenditure for which demands have been made add up to Rs 2,516 crore on the non-Plan account and Rs 1,355 crore on the Plan account. Since no measures for additional resource mobilisation are in the offing and are ruled out by the policy preference of the government, the additional expenditure which has been mooted will have to be financed by created money. The inflationary impact of such financing cannot be ignored. The pressures on prices can only mount in these conditions and smug assurances about holding the price-line will be found to be hollow.

A sizeable part of the supplementary demand of the order of about Rs 2,000 crore is, of course, on account of loans which have been advanced to the state governments to clear their overdrafts on the Reserve Bank. The states have also been provided ways and means advances as they would not have been able to function without such financial accommodation. But the book entries involved in these transactions do not in any way mitigate the evil of larger pumping in of created money into the economy. The states, on their part, would be loaded with the additional liability of servicing out of their revenues Central loans advanced out of created money. This would only add to their financial woes. The rest of the items of expenditure for which supplementary demands have been presented may not appear in themselves to be objectionable. In fact, the additional allocations for the Vizag steel plant and the aluminium project in Orissa are welcome. The provisions for these projects in the Budget were so meagre that there was a danger of the implementation of the two projects coming to a grinding halt. The additional allocations for the employment guarantee scheme is also welcome. But the fact is that the allocations for these and many other projects and programmes of positive development and welfare significance should not have been mindlessly pruned in the Budget in the first instance. The need for corrective action within four months of presentation of the Budget also shows that the Budget-makers had done a shoddy job. The relentless increase in food and fertiliser subsidies too is a matter of concern. The supplementary demands under these heads add upto more than Rs 300 crore. What also stands out in this context is that the estimates of expenditure have been found to be very wide of the mark and the estimates of revenue receipts can also no more be relied upon. This may not, however, have been due to the failure of the professionals who made the estimates. Political pressure in favour of under-estimating expenditure and over-estimating revenue in order to clear the ground for cuts in direct and indirect taxes to win kudos from the middle and upper classes would appear to have been responsible for a Budget which simply does not hold together. What may well be characterised as a mini budget without additional resource mobilisation has been presented in the form of supplementary demands for grants and this can only further aggravate and distort the budgetary balance.

### LONG-TERM FISCAL POLICY

It is remarkable that in the face of such a budgetary position, the Union Finance Minister should have pompously declared at a seminar organised by the Forum of Financial Writers recently that a new fiscal policy was in the process of being formulated for the Seventh Plan. The policy, he said, would be guided by the consideration of economic growth and not the collection of revenue for the government. A start in this direction, he might have added, had already been made with the Budget for the current year and the grant of concessions in direct and indirect taxes which left a large budgetary deficit. It appears, therefore, that once the long-term fiscal policy is formally announced by September end or early October as has been promised by the Finance Minister and begins to be implemented, the budgetary deficit will be allowed to swell unchecked with all its adverse consequences for price stability as well as availability of resources for investment in the public sector.

The policy of liberalisation and widening opportunities for private enterprise, Indian and foreign, has a logic of its own and fiscal policy can hardly be expected to escape it. This logic will become all the more relentless when increases in non-development expenditure, especially on security and law and order, are fatalistically accepted as inescapable. The upshot can only be that the Seventh Plan in the public sector will stand scuttled even before it is drawn up, let alone launched. Growth *versus* revenue as the alternative or competing aims of fiscal policy as projected by the Finance Minister is indeed a misleading proposition and tends to obfuscate the marked shift in official investment priorities. This shift is, of course, proposed to be brought about in a phased manner. The development of basic infrastructure of the economy and mass welfare will inevitably be downgraded in such a dispensation. The government would cease in stages to give priority to the mobilisation of additional resources for productive investment in the public sector and, in the name of promoting growth, let the community's savings flow into private channels to be invested entirely according to profit maximisation calculations. The government will still be raising revenue in order to meet administrative and security requirements but the effort to mobilise resources for development will be diluted. The growth objective will still remain but it will be passed on as the responsibility of private enterprise. The new fiscal policy norms and aims propounded by the Finance Minister really mean that the Indian State will cease, in a phased manner, to mobilise revenue surpluses for investment in development and welfare and revert to being concerned mainly with security and law and order. This impression is only confirmed by the recent speech of the Prime Minister to the police academy when he declared that "as we develop and grow, the primary need of any government is not development of vast projects, but maintenance of law and order."

Coming to remunerative prices for

farmers which are supposed to be accorded the highest priority, next only to law and order, there is a clear reluctance to take into account the changing levels of production and productivity in the farm sector. The cry of remunerative prices in this context can only subserve the vested interest of a thin upper stratum of surplus farmers. If indeed there has been a green revolution as is so vociferously claimed and there has been a significant rise in the levels of production and productivity in the farm sector, the gains of the green revolution must be equitably shared between producers and consumers with a part of the gains being mopped up by the public authority for investment in the expansion of the economic infrastructure and social consumption facilities. In the absence of equitable sharing of the gains in production and productivity either in the farm or the industrial sector, the prices of essential wage goods in the economy can only remain high with adverse impact on the incomes of industrial as well as agricultural workers.

Prices of commodities and services in themselves may be of no great significance if there were growth and new employment and incomes were being generated. But when growth remains sluggish or is inequitable, inflationary pressures are generated which provide a bonanza for asset-holders and traders and hit the working people hard. If in these conditions, the structure of relative prices is also tilted in favour of asset-holders and traders not only by the play of market forces but also by conscious political policy decisions, the position is bound to become intolerable for the working people. This is what is actually happening.

The leaders of the government, when they try to be forthright and outspoken as, for instance, V P Singh and Rao Birendra Singh have done in respect of official management of taxes and prices, tend to bare their ideological preferences and political commitments and connections. Fiscal policy for growth rather than for collecting revenue for the government, remunerative prices for surplus farmers, liberalisation for private business and attractive returns for capital are shibboleths which come handy for giving the right gloss to the perspective for economic growth in which the elite find their place and the people are left out in the cold.

**PRICES**

# Where It Hurts

### (By a Special Correspondent)

THE rise of 3.4 per cent in wholesale prices on a point-to-point basis, during the first quarter of 1985-86 as compared to 5.1 per cent in the corresponding period last year was the second lowest rate of inflation recorded during this decade. The lowest increase of 1.8 per cent was in 1978-79. But it is significant that unlike last year, the rise was confined to four commodities, *viz*, rice, fruits and vegetable, sugar and gur, all important wage goods. These four commodities having a weight of 18 per cent in the wholesale price index accounted for about 75 per cent of the price rise.

Commodity groups consisting of raw cotton, raw jute, groundnut and copra which recorded large increases in 1984-85, sizeably declined in 1985-86. The increase in fruits and vegetables and in rice more than offset these decline, and resulted in a rise of 4.3 per cent in the major group primary articles (see Table). The escalation in fruits and vegetables prices can be attributed to seasonal factors, but the uptrend in foodgrains prices is perplexing in the context of the large buffer-stock and the improved output in the last two years, prompting the government to actually export foodgrains. The only reason for the rise in foodgrains price seems to be the lagged effect of the increase in freight charges effected in the Railway Budget.

During the quarter the major group manufactured products rose by 3.2 per cent as against 5.1 per cent last year. The sugar group went up substantially by 17.5 per cent contributing about 31 per cent for the rise. The production and consumption of sugar last year was estimated at 60 lakh tonnes and 75 lakh tonnes, respectively. However, with sufficient imports and carry-over stocks there does not seem to be enough justification for the flare up in prices. The increase in the levy prices of sugar by 40 paise per kilo effective from April 1985 as well as the decision of the government to sell imported sugar at Rs 6 per kilo could be among the factors that have pushed up prices.

Edible oil prices dropped substantially by 6.8 per cent, contrasting with an increase of 10.6 per cent last year mainly because of better production of oilseeds, especially groundnut and copra and better availability of edible oils, particularly imported palm oil, in the fair price shops.

Better availability of raw jute (about 86 lakh bales against a consumption demand of 79 lakh bales) depressed the price of jute goods by 13.1 per cent.

On an average basis, the wholesale price index went up by 7.1 per cent in the first quarter of 1985-86 as compared to 7.5 per cent in the corresponding period of 1984-85 or 9.1 per cent in 1983-84.

The rise in the essential consumer articles groups reflected itself in the retail prices in different markets. For example, in the Bombay market the price of basmati rice went up by 27 per cent or by Rs 3 per kg, ordinary rice 4 per cent or Re 0.20 per kg, sugar 25 per cent or by Rs 1.20 per kg, and gur 12 per cent or by Re 0.70 per kg.

During the current fiscal year upto May, the consumer price index was up by 2.4 per cent or against a marginal rise of 0.7 per cent in 1984-85 or 3.8 per cent in 1983-84. Substantial increase in the wholesale prices of sugar, gur, rice and vegetables pushed up the consumer price index from 586 in March to 600 in May.

The conventional busy season came to an end by April. During the busy season 1984-85, the rate of inflation as measured by the wholesale price index was 1.9 per cent, the same as in the 1983-84 season, but much

TABLE: TRENDS IN WHOLESALE PRICES

| | | First Quarter of Financial Year | | | Busy Season | | |
|---|---|---|---|---|---|---|---|
| | Weight | 1985-86 (1) | 1984-85 (2) | 1978-79 (3) | 1984-85 (4) | 1983-84 (5) | 1982-83 (6) |
| All commodities | 100 | 3.4 | 5.1 | 1.8 | 1.9 | 1.9 | 4.5 |
| Primary articles | 42 | 4.3 | 6.2 | 2.5 | −1.5 | 1.6 | 5.2 |
| Foodgrains | 13 | 3.0 | 2.7 | 0.3 | −1.9 | −4.2 | 4.3 |
| Cereals | 11 | 3.9 | 0.9 | 0.9 | 0.2 | −6.6 | 5.0 |
| Pulses | 2 | 0.6 | 8.8 | −1.5 | −7.3 | 5.0 | 1.8 |
| Fruits and vegetables | 6 | 21.2 | 16.7 | 4.2 | 8.0 | −8.3 | 29.0 |
| Fibres | 3 | −11.3 | 15.4 | −1.7 | −11.0 | 20.5 | 7.0 |
| Oilseeds | 4 | −3.3 | 9.7 | 5.8 | −10.7 | 6.2 | −0.7 |
| Fuel, power light and lubricants | 8 | 1.4 | 1.4 | 0.8 | 7.0 | 3.1 | 5.9 |
| Electricity | 2 | 2.6 | 5.1 | 4.1 | 2.7 | −1.3 | 14.5 |
| Mineral oils | 5 | 1.4 | 0.4 | −0.2 | 10.6 | −0.1 | 4.1 |
| Manufactured products | 50 | 3.2 | 5.1 | 1.4 | 3.4 | 1.9 | 3.3 |
| Sugar group | 7 | 17.5 | 14.2 | −1.9 | 0.8 | −5.4 | −1.5 |
| Edible oils | 4 | −6.8 | 10.6 | 3.3 | −9.0 | 4.2 | 4.3 |
| Cotton textiles | 8 | 1.5 | 0.6 | −1.4 | 0.8 | 2.3 | 4.1 |
| Jute textiles | 1 | −13.1 | −0.8 | −6.5 | −5.2 | 29.5 | −10.1 |
| Steel items | 3 | 0.4 | 11.5 | 12.3 | 11.2 | 0.1 | 4.7 |

lower than the 4.5 per cent recorded in the 1982-83 season. The price increase was kept down mainly due to the fall in prices of 'primary articles', which offset the Budget-induced increase in the major groups 'manufactured products' and 'fuel, power, light and lubricants'. Primary articles recorded a decline of 1.5 per cent as against a rise of 1.6 per cent in 1983-84 and 5.2 per cent rise of 1982-83.

Fruits and vegetables recorded an increase of 8 per cent as compared to a fall of 8.3 per cent last season. The rise can be attributed to seasonal factors. Though cereals recorded a small increase of 0.2 per cent in contrast to a fall of 6.6 per cent in the last season, the decline in prices of pulses by 7.3 per cent in contrast to a rise of 5 per cent in 1983-84 resulted in the fall in foodgrain prices. Foodgrain prices went down by 1.9 per cent as against a larger decrease of 4.2 per cent last season, mainly due to better availability. Prices of fibres recorded a fall of 11 per cent in contrast to a rise of 20.5 per cent last season. Prices of raw cotton and raw jute both fell substantially by 11 per cent and 13 per cent, respectively. Oilseeds prices declined by 10.7 per cent as against a rise of 6.2 per cent last season as the availability of groundnut and copra improved on account of larger production.

Fuel, power, light and lubricants rose by 7 per cent as against a smalle rise of 3.1 per cent last season on account of the adjustment in mineral oil prices effected in the Budget. Mineral oil rose by 10.6 per cent.

The major group manufactured products has gone up by 3.4 per cent as compared to 1.9 per cent last season mainly because of the rise in prices of sugar, iron and steel items and aluminium. These three commodity groups accounting for about 6 per cent of the weight contributed about 44 per cent to the general price rise. Sugar rose by 10.3 per cent mainly due to lower releases of sugar (about 10,000 tonnes less) for free sale in April. Gur recorded a decline of 2.9 per cent during the period. The iron and steel group and aluminium were up by 11.2 per cent and 6.3 per cent, respectively, largely reflecting the impact of Budget proposals. Prices of edible oils dropped by 9 per cent contrasting to a rise of 4.2 per cent last season, mainly because of large decreases in coconut oil (35 per cent) and groundnut oil (3.7 per cent) prices.

The consumer price index for industrial workers showed a marginal rise of 0.3 per cent during the busy season 1984-85 on a point-to-point basis as compared to 0.2 per cent in 1983-84 and 3.5 per cent in 1982-83. On an average basis, the rise of 5.2 per cent in the 1984-85 busy season is much less than that of 12.1 per cent recorded in the 1983-84 busy season and of 8.8 per cent in the 1982-83 busy season.

### ANDHRA PRADESH

# Plight of Prisoners in Vizag Jail

**M Shatrugna**

SOON after the 'restoration of democracy' in the state in September last year, NTR had announced an amnesty to a large number of prisoners of various categories. Many thought that the amnesty would cover all the life-termers who had put in long years in jails. But their hopes were belied when the actual orders—G O Ms No 580 dated 20.10.1984, Home (Prison-C) Department—giving details of the remissions were released. Political prisoners by and large were excluded from the government scheme. Those convicted for offences under Sections 120-B, 121 to 130, 359 to 377 and 395 to 402 IPC were totally left out of the amnesty.

What are these 'dangerous' sections? While Section 120-B deals with criminal conspiracy, Sections 121 to 130 come under 'Offences against the State'. Sections 359 to 377 deal with kidnapping, rape, abduction, etc. Sections 395 to 402 deal with robbery, dacoity, etc. Thus the Government Order lumped 'general crimes' with 'political offences'; while 'offences' falling under Section 120-B and 121 to 130 are generally political in nature, those falling under the other sections by and large fall in the category of 'general crimes'. Because of this grouping, political prisoners who have spent long periods in jails, sometimes over 14 years, were denied the benefit of the government amnesty. Though various judgments of the Supreme Court have specifically suggested that a life term should not cross ten years, the state government chose to ignore this guideline. Also, there was a certain amount of selectivity in the granting of amnesty even among political prisoners. While six political prisoners including Chowdhary Tejeswar Rao and P Hasnar were quite rightly released, a number of others including Martala Pulla Reddy, C V Krishna Reddy and Shaik Kalesha of the Tallapalem case in Nellore district who are in the Vizag jail were not granted amnesty. Worse still, the living conditions of all prisoners in general and political prisoners in particular have deteriorated coinciding with the announcement of the amnesty.

The Vizag jail is a case in point. Anyone who has been in jail knows the long drawn struggles that have to be undertaken to get even petty things like a newspaper of one's choice, a separate kitchen, regular interviews with the approved list of visitors, etc. For instance, political prisoners in the Visakhapatnam jail had to undertake a 70-day hunger-strike in 1970 to get a separate kitchen for themselves. Though this arrangement was continued for about 15 years, the separate kitchen was wound up last year. Added to this loss was the advancing of the 'lock-up time' from 7.30 pm to 5.30 pm and cancellation of direct interviews with visitors. Political prisoners now have to talk to visitors through a 'window'. The Visakhapatnam jail has also evolved new methods of exploiting the cheap labour of prisoners. Vegetables and mangoes tended and grown by them are transferred out denying a share to the producers. Diet rules have been amended affecting the health of the prisoners. Recently the daily quota of milk for the whole jail was reduced from 3,000 litres to a bare 300 litres and the mutton quota from 400 kgs to 10 kgs. Eggs have been totally withdrawn. Earlier butter milk mixed with lime juice was supplied during summer. Now that facility is gone. Prisoners have been denied even hand fans now. Coinciding with these changes, corruption in the jail has increased. Even inexpensive medicines like Incidal, vitamin C or Thorangam tablets are drawn for the 'hospital' but supplied to the jail authorities.

Subjecting prisoners, especially those belonging to the weaker sections, to intimidation, indignity, beating and at times prolonged torture are a routine feature in Indian jails. The Bhagalpur blindings in Bihar and the prolonged imprisonment of undertrial prisoners, sometimes for as long as 30 years, elsewhere have attracted wide attention. The Vizag jail has its own method of harassing the prisoners. Recently an ordinary criminal, Karaja Venkataramana (C No 1836) was found with 'civil' money on his person. He was thrashed mercilessly and had his arm broken by the deputy jailer. The incident took place on May 27. Though deputy jailer is not a 'big fellow' officially, he wields enormous power next only to the Superintendent of the jail. In another case, *ganjai* (charas) was alleged to have been found on the person of Battina Prasad and two others. All the three were thrashed and put in solitary confinement. Unable to bear the humiliation and torture, Prasad unsuccessfully tried to hang himself with a towel. He was caught and admitted into the city mental hospital for 'treatment'. In an interview given to the Telugu Daily *Andhra Bhoomi* (8.6.1985) Prasad related his heart-rending story vividly describing the abominable conditions in the jail.

Any health problem is treated casually with either APC tablets or terramycin injections. Recently a heart-patient Sudhakar complained of chest pain. Though the jail doctor asked the police for an escort to take the ailing patient to the K G Hospital. Sudhakar was not taken to the hospital for treatment. The doctor however wrote in the M D Journal No 159 dated 9.4.1985 that

Sudhakar was dispatched to the cardiology (ICCU) Unit, K G Hospital at 11.10 pm for treatment and brought back at 0.30 hours after treatment. Such instances are many.

The state government's budget for 1983-84 showed an impressive Rs 7.90 crore for jail administration. How much of this money reaches those for whom it is meant is anybody's guess. The Telugu Desam government which had promised a 'clean' administration should extend its cleaning operation to the jails in the state also.

## GUJARAT

# Anti-Reservation Movement
## A Political Assessment

**Ashim K Roy**

AN agreement has been reached between the Gujarat government, the Gujarat Vali Mandal and Navrachna Samiti, the bodies spearheading the five-month old anti-reservation agitation. Whether this four-point agreement will bring normalcy in the state is yet to be seen. For one, a section of the anti-reservationists, mainly the students, have opposed the agreement, and secondly, the communal strife has shown a fresh spurt. Nevertheless the accord itself and the process by which it was arrived at are politically revealing. They show the developing character of the Indian polity.

Amarsinh Choudhary has unequivocally scrapped the 18 per cent increase in reservation for the other backward castes (OBCs) until a national consensus on reservation for the OBCs is arrived at. As regards the 10 per cent reservation existing from 1978, the Chief Minister has agreed to set up a committee of a sitting High Court judge and two retired High Court judges to review the matter which will submit its report latest by 1987, so as to enable the state to take a decision by March 1988, when the 10-year term of the present reservation policy ends. No doubt by that time the national consensus will also have been reached.

If Gujarat has just witnessed the longest and the bloodiest anti-reservation movement, the accord now reached will also have a powerful influence in reshaping the reservation policy in the country as a whole. The basic premise of the Gujarat accord is a national consensus. The reservation policy for OBCs which till now was decided on a state basis, will henceforth be remoulded according to this national consensus.

The plurality of the backward castes and their diverse composition in different states and regions makes it difficult for them to be brought within the ambit of a homogeneous national codification. This fact has been well established in the reports of the numerous commissions constituted by the different states to study and identify the OBCs as also in the report of the Mandal Commission. Very few states have been successful in implementing a reservation policy for the OBCs. In the northern states the domination of upper caste Hindus is so strong that such policy has either died in its infancy or has had to be abandoned in face of strong opposition. In this context, a so-called national consensus is nothing but a ploy of the ruling higher caste elites, irrespective of their political affiliations, to arrive at a consensus among themselves on this question.

Reservation for OBCs, if it has to exist, has to have a principle on which it is founded. The backwardness of these castes has to be quantified for the arithmetic of reservation to be worked out. The measure most widely used is the coefficient of equality, which is the ratio of the percentage of OBCs availing of an opportunity (such as jobs, literacy, etc) to the percentage of OBCs in the total population. A ratio of one is to one (1:1) implies complete equalisation of opportunities. In a democratic set up caste-based reservation can be said to reflect the democratic ethos only when the percentage of reservation is equal to the percentage of OBCs in the total population and such reservation has to continue till the coefficient of equality becomes one.

Any national consensus on the percentage of reservation other than one arrived at by the above method will mean a retreat from the democratic principle. However, if political trends in the last few years are taken as a pointer, then the national consensus that is likely to emerge can mean at its worst complete abandonment of the policy itself and at its best a percentage of reservation far below that required to ensure equality of opportunity. It will mean that reservation will have no scientific basis, but will be totally ad hoc and arbitrary, based solely on the agreement among the 'dwijas' on the extent of concession to be given to the backward castes.

The Gujarat agitation and the accord manifest the process of realignment of forces in the country. There are many factors that led to the downfall of the Solanki ministry. The major one being Solanki's incapability to handle and control the anti-reservationists. But to find the cause of this incapability in some flaw in the personality of Madhavsinh Solanki would be to miss the very essence of the problem. His inadequacies, his vacillations, his incapacity can only be understood in context of the realignment of forces on a national scale.

The enhancement of the reservation quota for backward castes by Solanki on the eve of the last election might have brought the Congress(I) immediate benefit in the election. But the reservation policy was in contradiction to the direction of realignment taking place at the Centre's behest. This contradiction could have remained subdued, at least for the time being, and not erupted if the students and the Vali Mandals had not begun their agitation. But once the higher castes persisted in their attack, the contradiction was exposed and the Congress buckled under.

The party that had received a massive mandate from the backward castes and depressed people failed to mobilise these very people into an effective opposition to the anti-reservation movement. It could not because, in the first place, the Congress(I) had increased the reservation quota only with the election in mind and not to mobilise and uplift the depressed and backward people. And, second, the contradiction had polarised the party itself.

Throughout the agitation, there was one constant fear that sapped the strength of the Solanki ministry. It was the fear of where and when Rajiv Gandhi's Damoclean sword would fall. This made Solanki vacillate and indecisive in every action. He was caught in the pincer of the higher caste Hindus. The frontal attack came from Vali Mandals and the Navrachna Samiti. They were subsequently joined by the political parties like BJP and Janata, protesting against police atrocities (though they never highlighted the real atrocity of police in areas where the police indiscriminately fired and burnt down Muslim houses). On the other side, the Centre, though remaining silent, was a reserve force of the caste Hindus.

Solanki was aware that though he had rejected the economic criteria for reservation, the Approach Paper of the Seventh Plan expounded reservation based on economic criteria. And further, that Rajiv Gandhi was of the opinion that the existing reservation policy needed review. But then Solanki was no fighter for or benefactor of the backwards. In the end, when the sheer instinct for political survival made him hesitantly make an attempt to fight back against the anti-reservationists, he sought support not of the party but of his own caste people. The Laxmipura Kshatriya Sammelan and the 'sword puja' episode, instead of helping him, intensified the conflict both outside and inside the Congress(I). The upper castes retaliated with complete unanimity. The business community with all its mahajans called for closure of business for five days—an unprecedented event in free India. The Congress dissidents, with their underlying upper caste bias, accused Solanki of inciting caste war. The students and parents announced another Gujarat bundh, which subsequently acquired the distinction of unleashing the worst communal riots. The Centre could no more remain silent, and when it broke its silence, the sword fell on Solanki's ministry.

Though the new ministry is being headed by a chief minister who comes from a tribal background, the realignment of forces has begun in Gujarat. The Centre has asserted itself. The new ministry inducted higher caste legislators and the balance has moved in their favour. Further, the four-member cabinet sub-committee to negotiate with the anti-reservationists was headed by an upper caste minister, Vallabhbhai Patel, and included only one member belonging to lower castes. Even this sole member was there for name's sake as he is a scheduled caste and the matter under dispute was reservation for OBCs and not for SCs and STs.

*July 27.*

# Self-Defence and Police Racism in Britain

**Kalpana Wilson**

ON July 10, a major British trial in which seven young Asians were charged with affray ended with four of the Asian defendants being found guilty. During the eight-week trial at the Old Bailey in London and in the months preceding it, a further 90 people had been arrested while taking part in the massive defence campaign launched on their behalf. As the four people convicted await the judge's sentence, due in the first week of August, black communities all over Britain are having to come to terms with a drastic shift in the attitude and tactics of the British state, and are assessing the reasons for the failure of the defence campaign and developing new strategies for survival in the future.

The case itself developed from events on April 7, 1984 in Newham in East London. That day there were a series of random attacks on Asians by a group of racists who drove around the area, dragging Asians off the street into their car and assaulting them with a claw-hammer. In one of these incidents, a 16-year old boy was left lying unconscious in a ditch. Although they were given the registration number of the racists' car, the police refused to take any action. That evening there was a confrontation between young Asians and whites outside the Duke of Edinburgh pub which was well known locally as a base for fascists where racial attacks were planned.

Even before the fight began, the police, who were nowhere to be seen all day, moved in and arrested one Asian youth. Over the next few weeks, six more Asians were arrested. The Newham Seven, as they became known, were all charged with affray, a charge which carries a sentence of upto ten years imprisonment. Three whites who had attacked some Asians who were driving past the pub were charged with common assault, a far less serious charge. The main perpetrators of violence last April were not in the dock on July 10. It had taken the police a whole year to arrest the occupants of the car and their trial has not yet come up.

The evidence which emerged during the trial showed the extent to which racist attacks have become an everyday occurrence. In areas like Newham, black people face attacks on the street, in school playgrounds, in community centres and places of worship. Even in their homes they are not safe from attack, with windows and doors being smashed and kerosene poured through letter boxes. Even more strikingly it showed the extent to which Asians have been forced to defend themselves and their communities from these attacks. In 1984 out of 75 cases of racial attack reported to the police in Newham, the police took no action in 85 per cent. Many more attacks are not reported because, black people say, experience has shown that not only are the police unwilling to track down the perpetrators of the crimes, but they are more than likely to harass the victims of the attack. When a point is reached where young Asians feel they have no choice but to take action themselves, the police immediately arrest and charge them. It was this struggle between Asians and a police force which has been seen to be racist which, even more than the attacks themselves, formed the focus of the Newham Seven trial.

This is nothing new. In 1981, twelve young Asians from the northern town of Bradford were accused of making petrol bombs to use against racist attackers and faced conspiracy charges carrying possible life sentence. For the first time the reality of what it means to be black in Britain was openly stated in a British court as the defendants testified to the constant threat and the lack of protection which had prompted their actions. Not only the youth but all sections of the Asian community in Bradford mobilised in their defence. All twelve were acquitted. In 1983, eight Asians were arrested in Newham itself. A group of racist youths had been entering the playground of a local primary school and beating up children. The 'Newham Eight' were part of a group of older boys who decided to patrol the area when the school finished in order to protect the children coming out. While they were doing this, a carload of white men drew up and a fight ensued. It was only then that the men identified themselves as plainclothes policemen and arrested the boys.

Both these cases developed the concept of 'self-defence' for black communities. Neither the defence counsel nor the people who consistently picketed the courtrooms denied that the defendants had committed the 'crime' of which they were accused. Instead they argued that actions in self-defence, or in defence of one's community, against racism must not be considered crimes.

But if these were the precedents of the Newham Seven trial, the trial also had several new and important features. While in the earlier two cases the defendants had originally been charged with conspiracy the Newham Seven were charged with affray. Unlike conspiracy, this is not an openly political charge, having in the past been associated with gang fights. At the same time it can be used when there is practically no evidence, since all that needs to be proved is the presence of the defendant at the scene of a 'disturbance'. However since their case hinged on a 'disturbance' having occurred, the police were forced to also arrest some white people. Yet paradoxically while the presence of three whites along with the Asians in the dock meant that the prosecution had to mention racism, it actually decreased the Asians' hope of acquittal by trivialising racism as a mere pretext for gang fights. Racist attacks were equated with defending oneself against them.

All this is in line with the current state policy of presenting Britain as a 'pluralist'

nation where different ethnic groups coexist on a completely equal basis and the only contradictions are caused by 'cultural' differences. It masks the reality of a class society in which black people are at the bottom, are given the lowest paid jobs and the worst housing, and form the most oppressed sections of the British working class. And in fact it is this reality and black people's increasing militancy which have made the state so determined to crush organisation on their part. The systematic way it is now going about this emerged starkly during the trial when one of the main prosecution witnesses, a waitress in a cafe frequented by young Asians, revealed that even before the Newham Seven case, she had been used by the police to inform on conversations she overheard there.

At the same time, the case demonstrated that these subtler methods have been accompanied by a massive increase in state violence. For black people the brutality of the state has never been in question. There has been a continuous escalation, culminating in the rape of Jackie Berkely, a young Afro-Caribbean woman in a police station. It is simply that the boundary has shifted: 'democratic' Britain is now, particulary since the miners' strike, more open in its violence towards people exercising their civil liberties.

When in May this year, a 3,000 strong demonstration in support of the Newham Seven marched past Forest Gate police station in Newham, snatch squads of police jumped over crash barriers and dragged people out of the crowd at random. Witnesses saw several demonstrators being kicked and punched on the ground. Many of those arrested were young boys of thirteen or fourteen who were already beginning to face police harassment on the streets—stop-and-search operations are now common practice in black areas—and who, along with the parents of the defendants and other older members of the Asian community, provided some of the strongest support for the campaign.

State brutality continued right into the court: in the first week of the trial, one of the defendants, 17-year old Pervais Khan was beaten up by prison officers during the lunch recess in the cells of the Old Bailey because as a Muslim he refused to eat the pork pie he was given for lunch. He was so badly hurt that he was unable to appear in court for several days and for the first time the case hit the headlines of the daily newspapers. In spite of this, the judge refused to take any action. (Pervais Khan is now suing the Home Office for assault.)

Meanwhile outside the court, arrests of supporters continued. People who had been present during the Newham Eight trial eighteen months earlier noted a marked difference; the police appeared in far greater numbers now, often almost outnumbering the pickets. Standing shoulder to shoulder inches away from the demonstrators, they taunted them with racial abuse and tried to provoke them to step into the road where they would be arrested for obstruction. Then after an hour or so, they would charge, disperse the pickets and make random arrests.

On the last day of the trial, the police kept a relatively low profile. Tension mounted as the people outside waited for the verdict. Then, as soon as it was announced, large numbers of police appeared as if from nowhere, forming a cordon along the barriers behind which the pickets had been forced to stand, and hovering menacingly around the elderly Muslim men, fathers of the defendants, who were emerging devastated from the court room. As one of the demonstrators commented, "It was as if now they had the verdict behind them, they had won, and they felt they could now do anything they liked to us, to black people."

Less than a week after the Newham Seven trial ended, a pregnant woman and her two small children were killed in an arson attack on an Asian home in an East London suburb. No one has yet been arrested. October will see the start of the trial of Gerald Pryce, a 19 year old Afro-Caribbean. Gerald's 16-year old brother Eustace was stabbed to death by racists in Newham last year. The murder was witnessed by several plainclothes policemen, who were passing the spot on a bus. They immediately arrested Gerald Pryce, who has now been charged with affray. The Newham Seven Defence Campaign showed that Asians and Afro-Caribbeans, especially the youth, are now not only facing the same form of repression, but are organising together to fight it. But it also showed that it is no longer possible to rely on British juries for justice: in spite of the glaring inconsistencies, contradictions and pure racism in the police evidence, in spite of one incident where two police officers were actually caught rifling through defence barristers' briefs during the lunch recess, the jury in the Newham Seven case, consisting of nine whites and three blacks (none of them young or from Newham), seemed to have swallowed the 'pluralist' myth. Caught in the apathy and indifference which has evolved alongside the increasing repression, they duly provided a verdict which must have entirely satisfied the police. Not only did they find four of the Asians guilty of affray—significantly these four were considered the most politically conscious, and had faced police harassment before this case—but they also confirmed the implication of gang warfare by finding the three whites guilty of common assault, for which they were fined a mere £ 100 each.

Thus it now seems that the black community in Britain can no longer depend on legal battles, or even campaigns around specific cases to defend themselves against the onslaught of the British state. Only a sustained and coherent political movement can effectively direct the anger and resistance which this repression has generated.

## Essar Shipping

ESSAR SHIPPING, growth-oriented shipping company with diversified activities in shipping and offshore services and with a dividend paying record, is entering the capital market on August 20 with a linked issue of 50 lakh equity shares of Rs 10 each and 3 lakh 13.5 per cent non-convertible debentures of Rs 100 each. The applicants will have to simultaneously apply for a minimum of 100 equity shares and 6 debentures and thereafter in the proportion of 50 equity shares and 3 debentures. The company has planned a capital expenditure of Rs 100 crore over the next two years to acquire modern chemical tankers and product tankers in keeping with its policy of owning specialised vessels for specific long-term trades. The company has just acquired a multipurpose support vessel at a cost of about Rs 20 crore. This is a sophisticated vessel which can be used for fire-fighting, pollution control and rescue operations, in addition to diving support operations for the ONGC.

According to Ravikant Ruia, over 95 per cent of the company's turnover is from fixed time charters. The tankers are on long-term charter basis with clients in the oil and petroleum industry. The offshore supply vessels and the diving support vessel are on fixed time charter with the offshore industry. The fixed and long-term charters ensure regular and assured return over a long period of time and protects the company from the vagaries associated with the shipping industry. The company achieved an income of Rs 29 crore and earned thereon a gross profit of Rs 14.71 crore and a net profit of Rs 4.71 crore and paid a dividend of 20 per cent on an equity share capital of Rs 19.67 crore for 1984. It expects to lift its income to Rs 36 crore in the current year and to take it to Rs 44 crore in the next. On this basis, gross profit is expected to be around Rs 16-17 crore and Rs 19 crore and net profit Rs 6 crore and Rs 7-7.5 crore in 1985 and 1986, respectively. The company expects to pay a minimum of 12 per cent dividend for the current year to which the new shareholders will be entitled on a pro rata basis. As at the end of 1984, the company's net worth stood at Rs 46.69 crore. With the present issue, the Ruias' shareholding will come down from 100 per cent to 80 per cent. This is intended to be reduced further to 60 per cent in the next 3 years. The public issue is jointly managed by the Merchant Banking Divisions of SBI and J M Financial and Investment Consultancy Services. Standard Chartered Bank and Citibank are advisors to the issue.

**FROM THE CHAIR**

# Haryana Financial Corporation

## Speech of the Chairman, Shri B S Ojha, IAS, at the 18th Annual General Meeting held on 22nd June, 1985

Gentlemen,

IT is a matter of great pleasure for me to welcome you to the 18th Annual General Meeting of the Haryana Financial Corporation.

The Director's Report and Audited Statement of Accounts for the year ended 31st March, 1985 are already with you and with your permission, I take them as read.

### Economic Review:

Indian economy has shown considerable progress during the year. An average growth rate of 5% in the current year 1984-85 has earned well deserved praise from the World Bank. With a good monsoon and improved performance in certain key sectors, there is reason to look forward to further improvement in the economy during 1985-86. The pragmatic approach to regulatory provisions and reduction in taxation recently announced would take the country beyond the take-off stage.

The Government decisions to do away with the obligatory requirement of registration with the Directorate General of Technical Development in respect of 25 selected industries which have been brought out of the purview of industrial licensing, enhancing the limit of investment on plant and machinery in small scale sector from Rs. 20 lacs to Rs. 35 lacs and from Rs. 25 lacs to Rs. 45 lacs for ancillary units and steps taken for substantially widening the scope and lending limits of State Financial Corporations proposed to be revised from Rs. 30 lacs to Rs. 60 lacs are some of the measures which would go a long way to further increase the growth rate. The inadequacy of entrepreneurship is one of the major constraints in the growth of industrial and business activities. The Government of India has thus adopted a conscious and deliberate policy not only to provide various incentives for the growth of small industries but also to develop entrepreneurship on a large scale. In this context, the Government has established the National Institute of Entrepreneurship and Small Business Development to act as an apex body for co-ordinating entrepreneurship development programmes for specific target groups and areas and material organising and conducting programme's for motivators, trainers and entrepreneurs etc. Though a number of organisations and institutions in the country are engaged in the field of entrepreneurship development, the National Institute of Entrepreneurship and Small Business Development has been set up to play the role of an apex body.

A stable economic growth of five per cent envisaged in the Seventh Plan (1985-90) requires the industrial production to rise by about eight per cent a year. The industrial sector has to absorb the growing labour force.

Though the over-all economy in the country showed a favourable trend, industrialisation, particularly, in the Northern region was hampered mainly due to acute power shortage and non-availability of basic raw materials.

The upward trend of industrial growth in the State has touched new heights with the availability of liberal incentives, infrastructural facilities and financial assistance. Your Corporation continues to have a definite role to play in the achievement of industrial growth of the State.

### Performance:

Haryana Financial Corporation has completed 18 years of service for the cause of industrialisation of the State. The emphasis has been on the development of small scale sector and on the rural and cottage industries which provide more opportunities to the lower strata of society and economically weaker sections. The small scale sector is the most important sector in the industrial growth from the point of view of employment and production as it makes sizeable contribution to the economy of the country.

I am happy to inform you that the Corporation has exceeded the targets fixed by the IDBI in all the areas of operation namely, sanctions, disbursements and recovery. This has been possible on account of decentralisation of activities, proper delegation, streamlining and simplification of procedure and system together with a regular follow up of cases at every stage. The income by way of interest on loans and advances of the Corporation rose to Rs. 552.33 lacs during the year 1984-85 as against Rs. 327.88 lacs during the previous year 1983-84. Your Corporation earned a net profit of Rs. 130.14 lacs as against Rs. 59 lacs in 1983-84 on cash system of accounting; recording an increase of 117% over the previous year. Similarly, the income registered an increase of 68.26% as against 33.67% in the previous year. The net profit after providing for taxation of Rs. 43.09 lacs comes to Rs. 87.05 lacs. This increase has been achieved as a result of effective management of funds and excellent recovery made during the year. During the year, we have sanctioned loans amounting to Rs. 2,187.79 lacs to 562 units, registering an increase of 4.18% over the budgeted figure of IDBI. The notable feature about these sanctions is that most of our assistance went to small and tiny units. Out of the total amount of Rs. 2,187.79 lacs, sanctioned during the year, 89.83% of the amount has gone in favour of small scale sector and village and cottage industries and tiny sector. Further, a sum of Rs. 935.56 lacs sanctioned to 244 units, i.e. 42.76% of the total assistance sanctioned during the year, has gone to the units located in the identified backward areas of the State.

The level of disbursement is the real measure of progress in implementation of projects. I am glad to inform you that disbursement rose to Rs. 1,579.06 lacs during the year 1984-85 recording an increase of 16.4% as compared to the amount disbursed during the previous year. Your Corporation's contribution to the development of backward areas continued to be substantial and an amount of Rs. 679.35 lacs out of the total amount of loan disbursed has gone to 245 units located in the such areas. Effective monitoring and regular review at all levels has speeded up the implementation of projects thus reducing the gap between sanctions and disbursement considerably. This success in the field of disbursement has, no doubt, been made possible by generous assistance from the IDBI. Despite financial constraint, the State Government has made contribution of Rs. 10 lacs towards equity loan during the year, with the IDBI making matching contribution. The refinance from IDBI continued to be the main source of finance and the Corporation received an amount of Rs. 757.26 lacs during the year. It is heartening to note that the Corporation did not float any regular bonds during the year. Availment of refinance has been 47.79% of the total loan disbursed and 52.05% of the disbursement were made mainly from the recycling of our own funds and recoveries. This reveals that the Corporation is reducing its dependence gradually on long term costly borrowings. This is a healthy feature and is also in line with the recommendations of the Dave Committee of the Industrial Development Bank of India. The proper monitoring and follow up of the assisted units enabled the Corporation to effect recovery of the order of Rs. 1,450.38 lacs. Recoveries registered an impressive rise from the level of Rs. 1,148.64 lacs during the previous year to Rs. 1,450.38 lacs this year. This is mainly due to efforts put in by the officers of the Corporation.

### 20-Point Programmes:

The 20-point programme aims at providing greater thrust in order to solve complex problems of socio-economic development, ameliorating economic conditions of the rural poor and other weaker sections of the society, creating infrastructural and other facilities vital for bringing about a fundamental change in the social outlook and achieving the objective of reducing economic inequality in our society. The programme is the bedrock of progress and prosperity and seeks to bring improvement in living standards of the people.

The Government has adopted the programme as its main plank for rural development and the principal guiding force behind all developmental efforts in the State.

Under the 20-Point Programme, the Corporation sanctioned an amount of Rs. 935.56 lacs out of Rs. 2,187.79 lacs in the industrially backward sector and disbursed an amount of Rs. 679.35 lacs in the identified industrial backward areas. The Corporation has sanctioned Rs. 6.33 lacs to 31 units under rural and industrial scheme. In addition to this, the Corporation sanctioned a total financial assistance of Rs. 13.86 lacs to 26 units under the tiny sector. This has gone a long way to create employment opportunities and infrastructure facilities in order to improve the standard of living of the people of that area.

### Looking Ahead:

Starting with a modest business of Rs. 115.40 lacs in 1967-68, the business operations have grown up to Rs. 2,187.79 lacs in gross sactions in the year 1984-85. This is no mean achievement. Our entrepreneurs have exhibited enough faith in your Corporation which is indeed gratifying. On our side, the thrust has been to extend maximum facilities by streamlining the procedures and by promoting an organisational culture of service. The role of the Corporation in developing and strengthening the industrial base in the State is impressive. It has acted as a catalyst for the rapid industrialisation of Haryana.

The increased scale of operations demands still better services to the entrepreneurs at their door steps. 12 Branch Offices and 3 Regional Offices at Faridabad, Panipat and Hissar provide improved services to the entrepreneurs. In the year under review, we have opened two field offices at Karnal and Ambala in order to meet our commitment of better and improved services to the entrepreneurs in their areas of operation. We have gone ahead with the Corporation's declared aim of decentralisation and delegation of more powers to Branch Managers and Regional Managers. However, certain additional steps are required to be taken for effecting further improvements in the areas of appraisal of projects, documentation, monitoring and management information system to keep pace with the rapid expansion of the business activities of your Corporation, I sincerely hope that we will be able to achieve our goal and will show better results in the years to come. Recoveries of loans particularly from the suit file and over dues should attract our utmost attention in future. Besides, project monitoring, follow up and better branch co-ordination will also form part of our activities.

I am also very happy to note that relations between the management and the employees at all levels have been very cordial throughout the year. The endeavour of the management should be to create an atmosphere where everyone considers himself a member of the family. In order to meet fresh challenges to sustain the growth and to improve upon its past performances, the Corporation nominated various officials for training programmes organised by IDBI and other national institutions during the period under report.

The Corporation is grateful for the financial assistance and co-operation extended by IDBI and also the valuable co-operation and assistance received from the State Government and other Centre and State level institutions, including Reserve Bank of India and commercial banks.

I would also like to express my appreciation for the dedication with which the officers and the staff of the Corporation at all levels have worked during the year. I would like to place on record my appreciation for the very good performance of Shri J. K. Duggal, IAS, Managing Director of the Corporation, who, with his initiative and dynamic outlook contributed substantially towards this achievement.

I thank you all for attending the Annual General Meeting and hope that the Corporation will continue to have your co-operation and goodwill in full measures in the year ahead.

**B.S. OJHA**

**BANGLADESH**

# General Crisis of the Bourgeoisie in Bangladesh

### Badruddin Umar

THE basic development of the bourgeoisie in Bangladesh took place, after December 1971, not through exploitation of the working people but through a ruthless plunder of existing wealth and property. It will be easy to understand the process if we consider the fact that the ruling party at that time, the Awami League, did not really represent any of the basic and important producing classes and was primarily composed of such non-productive sections of the people as lawyers, jute brokers, petty traders, insurance agents, primary and secondary school teachers, unemployed youth, students, etc. It is true that some small land-owners and owners of industries, and here and there a few comparatively big ones, happened to be in the Awami League but its main composition was as has been stated above.

On December 16, 1971, political power fell into the hands of the Awami League and thereafter most of their leaders and workers of any consequence began to enrich themselves with the help of their newly-seized political power. Previously they owned little property either in land or in the sphere of industry and trade, and in the new situation they could rapidly enrich themselves only in one way—through plunder of the existing wealth. And they began to do so with great abandon.

At the initial stage the wealth and property of Pakistanis and of those who were branded as collaborators covered the area of this reckless plunder. Their houses and shops were occupied and plundered, all kinds of transports were seized, an enormous amount of cash was extracted from them and they were squeezed in every possible manner. In the situation, as it obtained at that time, even the properties of others who were neither Pakistanis nor collaborators by any description were attacked and seized. Thus a kind of primitive accumulation began and a new class of property-owners replaced the old ones.

The next phase of this plunder started with the nationalisation of industries. There was nothing wrong in taking over the industries of Pakistanis which constituted about 70 per cent of total industrial property in the then East Pakistan. But, in the name of socialism, the industries owned by Bengalis were also taken over and they were removed from the sphere of industry and replaced by completely new and inexperienced people. These managers and administrators of industries were either Awami Leaguers or closely connected with them. Being politically strong and secure, they began to plunder the industries at will and enrich themselves at the cost of the industries they were supposed to organise and look after. This plunder of industries went hand-in-hand with plunder in the sphere of trade.

The vast accumulation which followed this plunder originated in an anarchic situation and owing to certain other factors it created further anarchy in the economy as a whole. In the name of socialism investments over three lakh taka were prohibited but on the other hand the newly acquired money and wealth were seeking investment opportunities. Since it could not be invested legally, it had to take the other path. Thus arose in Bangladesh an unprecedented and elaborate network of illegal trade, both domestic and foreign. Hoarding, black-marketing and smuggling led to further accumulation in the hands of the plunderers and these were the people who constituted the most powerful section of the bourgeois property-owners in this country. As such they came to exercise enormous influence on the political developments in Bangladesh.

With the decline of private industries the former industrialists turned to indenting and they were joined by numerous newcomers in the field. This again gave rise to an area of plunder through the mechanism of under and over invoicing, and it threw up a new crop of rich people.

It is quite clear from what has been stated above that the new bourgeoisie in Bangladesh grew and developed not primarily through production and exploitation of the working people but through all conceivable forms of plunder. Thus it had no legitimacy even according to the usual bourgeois standards of morality and it began to adopt illegal means on such a scale and with such impunity that soon it appeared quite normal and even respectable in the eyes of some. This was the state of affairs at the time when the Awami League was overthrown in 1975.

The period following the overthrow of the Awami League saw further consolidation of the economic power of the new bourgeoisie. The rate of profit in trade continued to be much higher than in agriculture and industry and, the motive force of capital being the maximisation of profit, capital flow into the channels of trade. And during the course of its development and expansion it continued to illegally expropriate the assets and resources of the nationalised industries.

But this is not the end of the story. The arms of the new bourgeoisie also reached the nationalised banks. Tens of millions of takas were advanced to this class of people in the name of promoting industry, agriculture and legal trade but the major portion of this credit was diverted to the channels of illegal trade or simply taken out of the country. Thus hundreds of crores of takas remained unpaid and even to the present day neither any government nor the banks themselves have been able to touch them and force them to return the money advanced to them.

The nationalisation policy of the Awami League did not promote socialism in this country and it was never really meant to do so. It became effective as a means to the transfer of wealth and property from some hands to some other hands. And with the development of this process a demand was raised for the return of nationalised industries to private hands and for providing sanction and facilities for new private industries. This noise for a return to the good old days of private enterprise became more and more vociferous in the last days of Awami League rule and subsequently led to a reversal of the industrial policy and opened new opportunities for so-called industrialists. Thus more and more nationalised industries began to be returned to either their previous owners or to whoever was favoured. And in addition to these, licences and other facilities for new private industries began to be granted on a rather liberal scale. The nationalised banks generously made advances to these 'industrialists' who in various ways robbed their own industries and at their cost enriched themselves through illegal purchases of raw materials, over-invoicing and under-invoicing, and also by simple transfer of loan money to other channels.

In all such activities these 'industrialists' now continue to get the same kind of political and administrative patronage which they used to get during the Awami League regime as well as during the regime of Ziaur Rahman. Being experienced in the 'technical know-how' of the art of plunder the new bourgeoisie is doing well.

But there is the other side of the story. The process of plunder which has been described above has created a very grave and serious crisis within the bourgeois economic system by undermining productive activities and by making industrial capital subservient to the interests of trade. Anti-production forces have taken such a grip on the system itself that in the course of its movement it is creating new and numerous impediments in the sphere of productive activities. This crisis has now engulfed the entire bourgeois economic system and is being reflected in a thousand ways at the level of the superstructure—in politics, in social relations and in culture. This crisis can neither be overcome nor resolved within the existing framework. It is bound to develop further and liquidate the system.

# Factory, Family and Women

**Padmini Swaminathan**

**All Day Every Day: Factory and Family in the Making of Women's Lives** by Sallie Westwood; Pluto Press, 1984; £ 5.54, pp 259 + ix.

SALLIE WESTWOOD spent a year on the shopfloor with women working for the 'Stitch Co' hosiery company in 'Needletown', the centre of the hosiery industry in Britain. The factory employs nearly 2,000 workers, two-thirds of whom are women, one-half of the latter being women of colour (mainly Asian) and so complexities of race, class and gender are delicately intertwined. The book, in the author's own words, is about "sisterhood and strength, weakness and division, the inherent contradictions of women's lives under conditions set by patriarchal capitalism" (p 1).

The book also suggests that gender identities are not produced and reproduced simply in the home or through schooling and the mass media (although they all play a part) but centrally through the workplace. "The move from the home into the factory simultaneously opens and closes doors. The liberating potential moves women together to take on a collective struggle, but it is also in the workplace that young women are encouraged to embrace domesticity, become brides and have children" (p 6).

The gender division of labour in the factory is typical of that in the industry as a whole: the men are knitters, mechanics, dyers and top managers; the women work in the finishing process as they have traditionally done, and in personnel and white-collar jobs. The penetration by the gender division of labour into the heart of the labour process is also shown by the fact that technical control over the production process is in the hands of men. The machinery in the department is serviced, repaired and moved by male mechanics under the authority of a senior male mechanic—all of them white. If a machine breaks down, a woman has to wait for a male mechanic to arrive, a situation which subordinates women to male skills and expertise.

Job evaluation in the factory is done through what is commonly called 'the minutes', the latter being common parlance for the measured day work (MDW) system. Quite simply, the MDW system is one in which pay is fixed against a specified level of performance. The specification of the targets that women have to meet is set by the work-study analyst in relation to an overall grid of values given to each movement of an operation. These are then translated into dozens, the basic unit in which the clothes are ultimately produced and sold. The MDW scheme offers management both control over the labour process and the workforce and a means of calculating labour costs as a fraction of production costs (p 47). The grading of workers based on the MDW scheme was an important manner in which the management controlled the workers. It divided the workforce: women doing the same job but in different grades would be earning different wages on the basis of different targets of production. All women were clearly aware of this and up against the minutes despite the complexities of the MDW scheme which superficially mystified the contact between worker and employer. None of them believed there was a fair bargain to be struck between management and workers in a system that fragmented their effort and their time in the pursuit of profits. The women saw the MDW system as a scheme for deskilling them, taking away from them their craft and dexterity. They discussed the issue of skill often. They were aware that designs were increasingly simplified to allow for cheapness in make-up and that speed, not skill, was at issue (p 46).

Though numerically women outnumbered men in the union, they were locked out by the men not only from positions but from discussions as well. It was assumed that women worked for pin money or that factory work was not the real work in which women were involved and to which women were committed. In this way women's work and contribution are minimised, trivialised and viewed as peripheral in relation to the work and contribution of male members of the union. The emphasis upon the male bread-winner and the assumption made by male trade unionists that the world of labour is a male world shows a union organisation that reproduces the patriarchal forms of the factory.

According to the author, to the women at Stitch Co the ideological and material parameters of their lives presented marriage and children not as burdensome and oppressive, but as liberating events—part of the great adventure of life. In taking hold of these moments, young women locked themselves into domesticity and subordination. The contradictions deepened because the young women felt that in choosing a boy friend and getting married, they were exercising some control over their lives and joining the adult world (p 104).

The author has gone into considerable details trying to illuminate the overwhelming desire for marriage among the women at Stitch Co, and the exuberant celebration of romance and womanhood that goes with it. The common pattern among engaged couples was to pool their income and to save one wage packet and live on the other. Saving together did not necessarily mean suffering together. It seemed that the men had fewer restrictions on them. "They still bought motorbikes and went to the pub for a night out with the blokes while the women stayed home to do the ironing" (p 110).

Most of the Indian women at Stitch Co were Gujarati Hindus who had arrived in Britain following the exodus from East Africa. Despite having moved once to East Africa and again to Britain, Gujaratis (and especially certain groups among them) held fast to the life of the village, including its caste distinctions and the importance of reproducing these through marriage.

For Indian women, marriage was the issue that brought into sharp focus their subordination and the way in which they were subject to the power of parents and older brothers. There was a growing resentment of the manner in which women were denied the opportunity to have a part in what was the most important decision of their lives. It is important, therefore, to view the desire for romantic love and compassionate marriage as only part of the issue. The fundamental claim that was being staked was that women should be given greater freedom and control over their lives as individuals in their own right (p 45).

The description of how young women cope with the new roles that are thrust upon them by marriage is a story of disillusionment, of 'arms in the sink' and of time spent labouring for men and children. The women, however, had internalised the notion that womanhood was bound to the care of others, especially of husbands and children. Any criticism seemed cruelly out of place and was interpreted as a criticism of them, not of the men and children in their households and the way that domestic labour was organised. "It was all perfectly understandable but it meant that women colluded in their own oppression by insisting upon their rights to manage the home and their duty in working for the family" (p 169).

Both women and men are encouraged to believe in the family as 'natural' and desirable. The concomitants of this view are that heterosexuality, the gender division of labour within the family and the power of men in the home are all part of a natural world which cannot, therefore, be challenged.

The analysis of the shopfloor culture and the deep-rooted spirit of opposition within it, the richly textured study of the drama of everyday life and the complicated interplay of the influences of home and life, the exposition of the poverty of conceptual frameworks that separate home and work and treat them as two distinct spheres—these are the major contributions made by the book to our understanding of the relationship between oppression in the two spheres of family and workplace and of the processes which maintain and reinforce it. While laying bare the contradictions that mark women's lives, the author admits that "there are no prescriptions for action here and no single, clear route through the complexities" (p 230).

While the particular instances of Stitch Co where women work under one roof is not the characteristic feature of employment of women in general, the issues raised in the book concerning the ideology of feminity and a social construction of women that is tied to domesticity and dependence in the home, issues surrounding women's fertility and sexuality, the sexist ideologies in the trade union movement, the struggle against racism in general and women's struggle against racism in particular are all pertinent and relevant to women's struggles all over the world. Westwood's study leads inevitably to the following questions:

(1) What is the relation between the household and the economy and what is the relation between women in production and women in the household?

(2) What would be the effects of the elimination of the family and what would be the specific impact on women?

(3) Would a change in the social system (say from capitalism to socialism) *ipso facto* imply the end of women's oppression? If not, what further structural changes must be made to free women from oppression?

These are questions that are currently being debated and researched and yet in each of these areas considerable ground needs to be covered. Studies such as "All Day Every Day" are imperative to lay bare the contours of the forms and complexities of women's oppression and to delineate the outlines of a policy aimed at removing oppression of women.

# Indo-Soviet Trade: Dynamics and Constraints

### Arvind Vyas

**Indo-Soviet Trade** by R G Gidadhubli; Somaiya Publications, Bombay; pp 246, Rs 120.

THE object of Gidadhubli's study is to analyse the nature of the Soviet import market for 12 major commodities exported from India. These 12 commodities are (i) tea, (ii) coffee, (iii) tobacco (raw), (iv) black pepper, (v) cashew, (vi) shellac, (vii) raw leather (small), (viii) raw wool, (ix) jute, (x) jute bags, (xi) jute packing materials, and (xii) cotton textile fabrics. For each commodity the author examines the following issues: (a) trends in Indian exports (i e, Soviet imports), (b) unit value realisation, (c) reasons for the very wide fluctuations in Soviet imports, (d) problem or re-export or switch trade, and (e) future prospects for Indian exports. Let us consider each of the issues in turn.

The 12 commodities selected for study are important items of export from India. They are also important in the list of Soviet imports from India. Their significance has declined relatively between 1965 and 1980, both in overall Soviet imports and with respect to imports from India (p 152). However, India has maintained its position as one of the leading suppliers of these commodities to the USSR, and India's aggregate share of Soviet imports of these commodities has been quite steady in the range of 40-50 per cent in value terms during the period 1965-80 which clearly suggests that imports from India play an important role in the Soviet import market.

Within this overall picture, there are variations with respect to specific commodities so far as total imports are concerned. In the case of tea, coffee, black pepper, jute bags, jute packing material and cotton textile fabrics there was a general increase in the quantity of imports, year-to-year fluctuations notwithstanding. In other words, the Soviet import market has been expanding in respect of these commodities.

On the other hand, raw wool, raw leather (small), jute, shellac and to some extent tobacco (raw) and cashew show a general declining trend, particularly after the mid-1970s. Hence Soviet demand in respect of this group of commodities appears to be lessening.

*Unit value realisation*: Between 1965 and 1980 unit value of Soviet imports of tea, raw wool, jute, jute bags and jute packing material increased by about 20-30 per cent. In contrast to these commodities, in the case of coffee, raw tobacco, black pepper, shellac and cashew, unit values increased by over three to five times. In the case of cotton textile fabrics the unit value of Soviet imports increased by about 90 per cent between 1965 and 1980.

During the years 1976-80 the unit value of Soviet imports are seen to be lower than world market prices by about 25 to 30 per cent in the case of tea and black pepper and 40 to 50 per cent in the case of coffee. Even in the case of raw tobacco import unit values were lower than international prices, though by 1979 Soviet import unit values were coming close to the world market prices.

The author's overall conclusion is the following: "On the whole, India was not put to any disadvantage in the Soviet market so far as unit values are concerned. However, in the case of jute bags, and jute packing materials India has consistently received lower than average unit values from the Soviet Union in the last few years. This trend may be observed with much less consistency in the case of jute and tea" (p 157). The author goes on to argue that unit values have generally influenced the choice of Soviet planners regarding the quantity of imports and sources of supply, with some exceptions—"when political relations are strained, the trade relations are strained between any two countries but more so in the case of socialist countries where foreign trade is a monopoly of the state" (p 159).

*Fluctuations in Soviet imports*: There have been wide yearly fluctuations in the quantity and value of imports into the USSR in respect of the selected commodities. The author advances the following reasons for the fluctuations: (i) The foreign trade sector, unlike the domestic economy, does not come under the effective control of Soviet planners. Soviet planners have the choice of determining the quantity of import specified in the trade agreement from any given country in any given year (p 154). (ii) The commodities under study are primarily consumer goods. From the point of view of the Soviet economy, they are not considered as essential as machinery and equipment. Hence the Soviet planners may decide to cut down imports in a year if import prices rise significantly. This has happened in the case of imports of shellac, raw wool, raw leather (small) and cashew. (iii) Lack of communication between planning and executive organs and an overall lack of co-ordination amongst various organisations engaged in foreign trade. In other words, the imperfections of a planned economy might cause, among other things, fluctuations in imports (p 155). Finally, the author concludes that "judging from the fact that fluctuations in yearly imports occurred frequently and on a large scale, it is unlikely that supply could have been a major constraint . . . there has been no supply constraint from the Indian side . . .".

*Re-exports or switch trade:* Gidadhubli finds little evidence of re-export on the part of the USSR. For example, in the case of tea, tobacco and cotton textiles (of which the USSR is a major producer), the share of exports to domestic production varies between one and two per cent—a factor which weighs against any argument about the possibility of switch trade by the USSR (p 160). Secondly, the average unit values of exports have invariably been lower than the average unit values of imports, and the difference between them has been quite large. This further complicates the switch trade argument against the Soviet Union since obviously no country would import a product at a higher price and export the same at a lower price. Hence on the basis of the aggregate data alone it may be difficult to argue that the Soviet Union might be indulging in switch trade. Finally, only a small portion of tea, textiles, or tobacco was exported to hard currency areas and the unit values of exports to hard currency areas were far lower than the import values. Therefore the argument that the USSR made substantial hard currency earnings by re-exporting to the capitalist countries does not hold good.

*Future prospects for Indian exports*: Forecasts of imports of select commodities based on past trends suggest likely modest increases in tea, coffee, cotton textiles, jute bags and jute packing materials in respect of both total Soviet imports and imports from India. In a few items like raw wool, raw leather and jute there is likely to be a decline in imports into the Soviet Union. India might hope to maintain its level of imports to the Soviet Union in the case of black pepper. In respect of raw tobacco although an increase in Soviet import is not likely, India might improve its share in the Soviet market by 1985 (p 164).

On the whole, Gidadhubli's study is a very useful addition to the growing literature on Indo-Soviet economic relations. A feature of the study is that the data are based almost exclusively on Soviet sources. There are, however, three important issues which are left unanswered and, in fact, constitute important weaknesses of the study. Among these issues is the existence of the so-called trade surplus. In the words of the author: "the time series data of imports, exports, and balance of trade between India and the Soviet Union, in rouble values, [make it] clear that between 1965 and 1980 the Soviet Union had a surplus balance of trade only for four years and the extent of surplus was only about 41.5 mn roubles. But India has been enjoying a favourable balance of trade since 1969 (except in 1979) and during the period 1965-1980 India has accumulated a substantial surplus of over 1,145.4 mn roubles on trade account with the Soviet Union. This may help India repay loans received from the Soviet Union for various projects built with Soviet assistance during the last two decades, and also enable India to import oil and industrial raw materials from the USSR. However, Soviet foreign trade specialists who believe in the bilateral balancing of trade with every country will no doubt be concerned about the persisting balance of trade in favour of India. They expect India to import a larger quantity of machinery and equipment from the Soviet Union in order to bring the volume of trade on par in both directions. Such a viewpoint may be justified in the long-term interest of sustaining and increasing the volume of Indo-Soviet trade when the loan repayment burden is reduced. Otherwise, India may be faced with the problem of extending short-term credits to the Soviet Union for importing from India, something which a developing country like India cannot really afford. Alternatively, the volume of Indo-Soviet trade may go down, which may affect India more than the Soviet Union" (pp 65-66).

In fairness to the author, it must be pointed out that at the time of writing his book he did not have access to information which the reviewer was able to obtain from official sources. On the basis of this information it can be conclusively argued that the 'surplus' issue is no more than a red herring. The purchase of defence equipment by India from the Soviet Union is not shown in the trade account. We pay for these items through our exports. The special payments arrangements in a bilateral system of trade and payments has in effect meant that trade is balanced in terms of payments.[*]

The above feature, along with the fact that India can extend 'technical credit' to the USSR as part of the trade agreement between the two countries, takes the wind out of all arguments which say that Indo-Soviet trade has 'reached a plateau', thereby implying that India should switch to a system of convertible trade with the USSR.

Demolishing the myth of the trade surplus does not imply that there is no need on the part of India for importing more machinery and equipment. This is a complex question relating to the nature of Indian industrialisation, the suitability of Soviet technology for particular branches, etc. To the best of my knowledge adequate work has not been done in this area and I will therefore confine myself to the barest essentials of the problem.

Since the end of the 1960s Indian industry is witnessing the phenomenon of stagnation reflecting, in Marxian terms, both a crisis of disproportionality and a crisis of underconsumption. It follows that there is no merit whatsoever in the view which argues that India has reached a stage of economic development where there is no longer any need for the development of heavy industry. A corollary of this view is that India needs the introduction of so-called modern technology which the Soviet Union is unable to supply since it itself is technologically dependent on the West. Hence, the so-called 'need' for inviting the multinationals for generating further growth and productivity.

The above views reiterate the contradictions of the Indian industrialisation experience. As far as the Indian economy is concerned, the infrastructural constraints—shortage of coal, steel, power, fertilisers, etc—are still dominant. Thus the constraints of the 1950s and 1960s are still dominant and there is great scope here for Indo-Soviet economic co-operation, if only the internal contradictions of economic development in India can be overcome. In fact, the plea for the introduction of multinationals, etc, is tacitly expressing the view that the future growth of the Indian economy is dependent on the growth of external markets (i e, the internal market cannot expand since the distribution of income is very skewed) and the inflow of foreign investment. These tendencies and such thinking have been dominant in India since the mid-1970s and it seems that this is one of the main barriers to increasing Indo-Soviet economic co-operation.

The second important issue which is inadequately dealt with in Gidadhubli's work relates to the problem of the realisation of unit values for our imports. How significant is the problem? The author is ambiguous on this question since every time unit values are higher or lower in relation to international prices, he points out that comparisons are difficult because of the possible differences in the quality of the product in question (p 157 and elsewhere).

Finally, a minor point which the author could have clarified at the outset when looking at the export (import) trends of each of the 12 commodities in question. For each commodity, the author examines the trends in domestic production and argues that at times the "increasing trend in domestic production seemed to have contributed to a general decline in imports" (p 121). It would help the reader if he had outlined the basic system of material balances in a centrally planned economy, taking into account foreign trade. This involves solving balance equations of the following type for different commodities: Sum of gross output + imports = intermediate use + final consumption + exports.

YEARBOOK ON INDIA'S FOREIGN POLICY, 1982-83

This series of yearbooks provides an independent critique of India's foreign policy on a continuing basis. With its geostrategic importance and its active involvement in international affairs, India's foreign policy formulations have had an impact far beyond its own frontiers. This important series will meet the needs of all those who require a single source which will provide both analysis and reference material.

Contributors to the first volume include M.S. Rajan, S.D. Muni, Pushpesh Pant, Christopher S. Raj, Anirudha Gupta, H.S. Chopra, Devendra Kaushik, B. Ramesh Babu, M. Zuberi, T.T. Poulose and K.K. Bhargava.

---

[*] I am grateful to Suresh Kumar, project director on Indo-Comecon Economic Relations (sponsored by ICRIER) for explaining this point at a workshop in New Delhi on September 8, 1984. In other words, a part of the so-called trade surplus helps to balance the balance of payments.

# Infant Mortality in India

## Level, Trends and Determinants

**Leela Visaria**

*This paper aims at a critical review of the available data on the level of and trends in infant mortality and of the associated differentials during the last quarter of a century. An attempt is made to identify the gaps in our existing studies where future research efforts may be oriented.*

*The paper begins by setting out an approach to the analysis of data on infant mortality. Following that the national and the state level estimates of neonatal, postneonatal and overall infant mortality by sex and rural-urban residence are reviewed. Attention is then focused on the available evidence on the contribution of various prenatal, natal and postnatal factors to infant mortality during different time period. This approach is adopted to help identify and assess the possible role of different intervention programmes.*

[The paper is being published in three parts for reasons of space. The first part appears below and the second and third parts will follow in the next two weeks.]

### AN APPROACH TO ANALYSIS

ALMOST 20 years ago, J Bourgeois-Pichat had highlighted the differences in the relative importance of "endogenous" and "exogenous" causes of infant mortality in different countries (Bourgeois-Pichat, 1964). While the exogenous causes were mainly infections and parasitic and relatively easier to control, the endogenous causes formed a "hard core" (mainly congenital malformations) which are most difficult to prevent or correct. It is often postulated that as IMR declines, deaths due to exogenous causes are prevented or eliminated and the endogenous causes assume relatively greater importance. Also, deaths due to endogenous causes are supposed to be predominant among neonatal deaths occurring during the first month or four weeks after birth and even more among the early neonatal deaths occurring during the first week after birth. As exogenous causes of death are controlled, the post-neonatal mortality is expected to decline more sharply; and the share of neonatal mortality among infant deaths would increase.

The experience of Kerala state, which has experienced a significant decline in infant mortality in the last two decades, however, does not fit into this pattern. The SRS based data suggest a virtually constant share of neonatal deaths among the total infant deaths while the IMR declined from 74 in 1965-67 to 60 during 1970-72 to 48 during 1976-78. The neonatal deaths in Kerala formed about 61 per cent of all infant deaths during the latter two periods. This percentage was not much different from that in Uttar Pradesh (56) with an IMR of 174 for 1976-78. A recent three district study of Kerala based on children ever born between 1950 and 1980 indicate that neonatal mortality which formed 68 per cent of all infant deaths (IMR of 107) among those born before 1960 steadily increased to 89 per cent for the 1975-80 birth cohort (IMR of 46). This pattern fits well with the Bourgeois-Pichat model and implies that the environmental factors responsible for postneonatal mortality are the first to be controlled (Zachariah and Patel, 1983). However, the respondents were required to recall not only the infant deaths but also their timings which occurred anywhere from 2 to 22 years prior to the survey. The problems of recall lapse can vary for respondents of different age groups and affect the data such that one cannot be sure of the emerging pattern.

Elsewhere in the developed world, the infant mortality rates have declined to 12 or less in countries of Scandinavia, North America, Japan and Western Europe. Obviously, even the endogenous causes of infant deaths in these countries have been controlled to a much greater extent than was considered feasible in the past. One can argue that we need data on the causes of infant deaths to assess the continuing relevance of the Bourgeois-Pichat framework. But *prima facie*, there is a case for reviewing the approach.

Mosley and Chen (1984) have recently proposed an analytical framework specifically for the study of child survival in developing countries. Integrating the approaches and methodologies of both social and biological studies, they seek to identify a set of proximate determinants or intermediate variables that directly influence the risk of morbidity and mortality and through which all social and economic determinants must operate. They group the proximate determinants into five categories of (a) maternal factors: (age, parity and birth interval); (b) environmental contamination: (air, food/water/fingers, skin/soil/inanimate objects, insect sectors); (c) nutrient deficiency: (calories, protein, micro-nutrients); (d) injury: (accidental, intentional); and (e) personal illness control: (personal preventive measures, medical treatment).

Jain (1984) proposes to distinguish between factors operating at the village, household and the individual level.

The individual level factors are further divided into six categories according to the timing (prenatal, natal and postnatal) and type of care (medical and non-medical, with the medical care further subdivided into preventive and curative). The six categories of individual factors are: (a) prenatal medical care; (b) prenatal non-medical care; (c) medical care at the birth of the child; (d) postnatal non-medical child care; (e) postnatal preventive medical child care; and (f) postnatal curative medical child care.

The household and the community level factors include the physical, social and economic environments of the household and of the village or community, which both interact with and operate through individual level factors. A multivariate analysis is expected to shed some light on the factors that operate simultaneously or through other independent variables. The unfortunate non-availability of data at the household level has prevented a full-scale empirical demonstration of this approach.

With the revival of interest in mortality research, one can expect more work on the analytical approaches. However, any framework intended for serious consideration must be more than an exhaustive list of variables that may have some remote link with mortality. Parsimony and selection with an explicit statement of the mode of interaction and the nature and/or direction of relationship would facilitate both our understanding and further empirical work.

Jain's distinction among the proximate individual factors is useful for policy formulation and for any action programme, because it can separate forces or influences operating through the biological mother, which determine both the outcome of pregnancy and the chances of survival of infants, the immediate birth practices or the intranatal factors, and the postnatal factors including breast-feeding, immunisations, etc.

## THE DATA BASE

Despite the obvious importance of and widespread interest in infant mortality in India, the data base on the subject has been quite weak. The pre-Independence estimates of infant mortality in India were based essentially on the births registered by the civil registration system. The system had a relatively better coverage in the cities in British India but was never considered dependable for the estimates of infant mortality. The IMRs estimated from these sources showed a decline from over 200 during 1911-20 to about 134 during 1941-50. These values are often cited without any comment in the Health Statistics of India published by the Directorate General of Health Services and even in some of the Indian "Country Statements" at International Conferences. It is overlooked that the census actuaries preparing the life tables for India had estimated infant mortality of much higher values of about 240 during 1921-31 (249 and 232 for boys and girls, respectively), and 183 during 1941-51 (190 and 175 for boys and girls). An IMR of 146 (153 and 138 for boys and girls) was assumed for the period 1951-61 on the basis of the estimates available from the NSS 14th Round for rural India. No allowance was made for the effect of the well known recall lapse, which is generally greater for deaths and particularly for infant deaths so that the IMR estimates are more affected than the overall death rates. The subsequent NSS Rounds up to 1964-65 continued to give some estimates of IMR, which declined to about 114 in rural areas and 80 in urban areas in 1964-65 (National Sample Survey, Report Nos 48, 121, 132, 144 and 156).

The Data base began to improve after the Sample Registration System (SRS) was launched and its results for rural India for 1968 and 1969 were the first to confirm that the

| 1978 | 80 | 56 | 136 | 58.8 | 41 | 30 | 71 | 57.8 | 77 | 50 | 127 | 60.9 |

*Sources:* 1 Office of the Registrar General, "Sample Registration System, 1970-75", New Delhi, 1983.
2 Office of the Registrar General, "Sample Registration System, 1976-78", New Delhi, 1983.

actual level of infant mortality (around 140) was higher than that indicated by the NSS. As the coverage of the SRS expanded to include urban areas, it became the only dependable source of information on the IMR and on other vital rates in the country. The consolidated reports on the results of the SRS for 1970-75 and 1976-78, published during 1983, have released for each year the basic data on perinatal mortality, stillbirth rates, neonatal mortality and postneonatal mortality for the 15 major states (Office of the Registrar General, 1983). Although the SRS estimates IMR and the neonatal and postneonatal mortality rates by rural-urban residence and sex for India as a whole and for its states, the rich potential of this unique longitudinal survey has, however, remained grossly underutilised, partly because of the inadequacy of resources and the limited scope of the standard tabulation scheme.

In 1979, the International Year of the Child, the Department of Social Welfare and the UNICEF funded a survey on Infant and Child Mortality, that covered about 7,28,000 households in 2,345 rural units and 1,328 urban units of the SRS. Carried out along with the half-yearly survey during January-March 1979 (approximately), it collected data on deaths among children born alive during 1973-78 (five years preceding the survey), and on various characteristics of the ever-married women and of the households or the villages and blocks with a reference data of December 31, 1978 (Office of the Registrar General, 1981).

The voluminous report of the survey provides several univariate and bivariate tabulations that show differentials in IMRs in rural and urban areas of major states; but a multivariate analysis is yet to be attempted. The relative importance of several simultaneously operating and/or mutually correlated factors cannot be estimated or identified with the published data.

A new survey has been launched during 1984; but as frequently happens with the Indian statistical data (for example, those collected by the National Sample Survey), without full exploitation of the potential of the data gathered in the 1979 survey. Some surprising reservations about the sample size of the 1979 survey and about the lapse of time since the survey was conducted are compounded by the limited facilities for the processing of data on the computer.

Yet, the SRS and the 1979 Survey of Infant Mortality by the Office of the Registrar General are the best available sources of data on the subject. Availability of these data has been the major factor that has led the national health policy to aim at a goal of halving the IMR to 60 or less by 2000 AD, relative to the estimated 1976 level of 127 (and the 1978 level of 125).

According to the SRS data for recent years, the IMR has declined to about 114 in 1980 to 110 in 1981. Compared to Sri Lanka and China with an IMR of 32 and 67, respectively, in 1982, the Indian IMR is considerably higher. These differences reflect both the challenge and the scope for progress on this vital front which is an excellent summary index of the level and development of health and related social infrastructure.

To facilitate discussion of the SRS based IMR data, the available data have been summarised in Tables 1-4. Some of their key features are noted here.

*Source:* Office of the Registrar General, "Survey on Infant and Child Mortality, 1979", New Delhi, 1981, pp 54, 210, 401 and 722.

Table 1 shows the IMRs by sex and rural-urban residence for India as a whole. The data show the urban IMR to be significantly lower than the rural. In several years, the IMR for girls in rural areas exceeds that for boys, a reflection of the well known and widespread discrimination against girls that prevails in many parts of India.

Table 2 seeks to highlight the inter-state rural-urban differences in IMRs with the help of three-year averages for the period 1970-78 and two year averages for 1979-80. The Table excludes Bihar and West Bengal, where the SRS had some serious difficulties until very recently. Rather surprisingly, several states such as Rajasthan, Orissa, Haryana, and Assam showed higher IMRs during 1973-75 than during 1970-72. Between 1970-72 and 1973-75, the IMR showed an increase of 10 per cent or more in Haryana, Orissa and Rajasthan and of around five per cent in Assam and Uttar Pradesh; it remained almost unchanged in Andhra Pradesh, Gujarat, Madhya Pradesh, and Maharashtra; and showed a decline of varying order in Himachal Pradesh, Kerala, Karnataka, Punjab and Tamil Nadu. While some of the differences were suggestive of random variations around a true value, and declines seemed plausible as indicating a welcome downward trend, the apparent increases are often considered spurious, reflecting underestimation of the true level in the initial rates for 1970-72 in the particular states. Even the declines could be discounted because the SRS was somewhat out of gear during 1974 and had hardly stabilised during 1975. Taking into account the subsequent data for 1976-78 and 1979-80, one observes a downward tendency in the IMR, sometimes after some upward fluctuation, in almost all the states with the exception of Jammu and Kashmir, Madhya Pradesh and Orissa. Among these three states, Jammu and Kashmir has been reporting the second lowest IMR among the states for which estimates are available; but Madhya Pradesh and Orissa (with a large tribal component in their populations) had the second and the third highest IMRs in the country.

In several states where the IMRs suggest a decline, the urban rates, (which have a higher standard error because of the relatively smaller sample), show a larger decline than the rural IMRs. This is true of Andhra Pradesh, Assam, Rajasthan, Tamil Nadu and Uttar Pradesh. Rather, surprisingly, urban areas of Gujarat show almost the same IMR during 1979-80 as urban areas of Uttar Pradesh. This seems odd and merits further investigation.

The Indian Council of Medical Research has already sponsored some prospective studies during 1980-82 in Kerala, Tamil Nadu and Uttar Pradesh which have the lowest, intermediate and the highest IMRs in the country. Similar studies of intra-state variations in IMRs would be useful if the relevant data can be made available to researchers interested in the subject.

## NEONATAL AND POSTNEONATAL MORTALITY

Table 3 seeks to present the neonatal and the postneonatal mortality rates for rural and urban India for 1970-78. Except in 1977,

the percentage or neonatal deaths to all infant deaths does not show any noteworthy rural-urban difference. Both neonatal and postneonatal mortality rates are lower in urban areas than in rural areas.

Table 4 presents similar data by state and rural-urban residence for 1970-72 and 1976-78. Table 5 shows the neonatal mortality as percentage of infant mortality. Comparing the 1976-78 data with those for 1970-72, it is observed that the percentage of neonatal deaths shows an increase both in rural and urban areas. A rural-urban difference arises because of the odd low value of neonatal mortality observed in urban India in 1977. The data for 1970-72 show a surprising low proportion of neonatal deaths in Punjab (20 per cent), with rural areas of Tamil Nadu, Jammu and Kashmir and Himachal Pradesh reporting neonatal deaths of the order of 42 to 48 per cent. By 1976-78, the neonatal mortality rates had risen sharply in Punjab and in rural areas of Tamil Nadu and Jammu and Kashmir, but not in rural Himachal Pradesh, where the percentage had actually declined. (It is possible that in 1970-72 in Punjab some neonatal deaths are classified as postneonatal deaths.)

For 1976-78, in rural areas, the highest percentage of neonatal deaths (about 70) is reported in Andhra Pradesh; while in Kerala and Uttar Pradesh, the corresponding percentages are 62 and 56. In urban areas, the lowest percentages of neonatal deaths (47-48 per cent) are reported by Kerala and Orissa (although the urban IMR in Orissa was 82, more than twice that in Kerala, 38). The highest proportion of neonatal deaths in urban areas is reported for Karnataka—67 per cent and urban Assam comes next. *Prima facie*, one is led to the conclusion that the control of pathogens responsible for lowering postneonatal mortality also extends to neonatal mortality so that the proportions of the two are not altered significantly. To confirm this hypothesis, we must find data on the causes of neonatal and postneonatal deaths; however, such data are not available. As shown in Table 6, the 1979 Infant Mortality Survey has tabulated the deaths attributed by the respondents to the 10 "most important" causes in India and in various states. Table 6 reports the data for three states—Gujarat, Kerala, and Uttar Pradesh.The 10 causes account for varying proportions of deaths in different states, (40 per cent in Kerala and 78 per cent in Uttar Pradesh) so that no clear or firm conclusions are possible. Yet, over 30 per cent of the infant deaths in rural Uttar Pradesh were attributed to tetanus, which accounted for less than two per cent of the infant deaths in rural Kerala and did not figure among the 10 most important causes of death in rural Gujarat. Tetanus was important also in urban Uttar Pradesh accounting for 23 per cent of infant deaths, but not in urban Gujarat (only two per cent) or in urban Kerala. Tetanus is apparently identified without much difficulty and the estimates for Uttar Pradesh are similar to those reported by Simmon *et al* cited below. However the absence of tetanus among the 10 most important causes of infant deaths in Gujarat does not mean that the problem is unimportant in the state.

Dysentery and diarrhoea seem somewhat more frequent causes of death in urban areas than in rural areas (accounting for 10 per cent and eight per cent of infant deaths, respectively). Among other causes of infant deaths, prematurity and various respiratory diseases including pneumonia, bronchitis and influenza are mentioned more frequently. Prematurity is related to the mother's health and nutritional status. The respiratory diseases, on the other hand are related partly to the BCG and other immunisations (such as for measles) and call for an active programme of postnatal care. The feasibility for using the village health workers or guides to control some of these disease, suggested by an innovative programme of the Postgraduate Institute for Medicine and Research, Chandigarh, opens up an interesting area of community-based research (Kumar and Datta, 1984).

## MOTHER'S AGE AND PARITY AS VARIABLES INFLUENCING INFANT MORTALITY

It is an accepted part of received wisdom that the IMR shows a U-shaped or a J-shaped relationship with the age of mothers as well as with parity. The two variables are of course usually highly correlated. The underlying factors might be both biological and social or cultural.

A very young mother is biologically not fully mature, so that the probability of pregnancy related complications is high. Also, young mothers, being inexperienced, may not be able to take proper care of the young infants, even though in the Indian setting they receive considerable support from their kin group. The latter can be both an asset and a constraint to the extent that the traditional outlook and superstitions of the older family members with regard to infant care may not always be conducive to an infant's health and survival. Beyond age 30, the risk of pregnancy complications apparently increases because of the increasing inflexibility of the female reproductive organs. Among the Indian studies seeking to identify the high-risk women, the height and weight of the pregnant woman are considered important criteria in addition to age and parity.

The 1979 Survey on Infant and Child Mortality shows parity specific IMRs by literacy status of the mother only in the form of index numbers, with the rates for the first parity taken as the base. The implicit pattern conforms to the expected relationship with parity and the range of variation appears smaller among the children of illiterate mothers than among children born to literate women or to women having primary education (Office of the Registrar General, 1981, p 32).

TABLE 11: PERCENTAGE DISTRIBUTION OF NEWBORN BY BIRTH WEIGHT AND LITERACY LEVEL OF MOTHERS

| Birth Weight (gms) | Literacy Level of Mothers | | | All |
|---|---|---|---|---|
| | Illiterate | Under Matric | Matriculate and Above | |
| <2000 | 4.1 | 2.7 | 1.5 | 2.7 |
| 2001-2500 | 23.3 | 21.2 | 16.5 | 20.2 |
| 2501-3000 | 47.6 | 44.5 | 45.6 | 45.8 |
| 3001-3500 | 31.2 | 26.7 | 28.9 | 25.7 |

Given the limited feasibility of additional tabulation and analysis of the SRS data on IMR, noted above, it is important to explore the micro-studies of births and infant deaths. Several such studies have been undertaken and the medical literature is full of them. Many studies are currently in progress. Several of them are based on hospital births, which tend to be selected; because except in the major metropolitan centres, only a relatively small percentage of babies are delivered in hospitals. The hospital data are selected in terms of social status of the mothers also, with an over representation of the higher as well as the lower socio-economic strata (depending on whether the facilities are priced or offered free) and of cases with complications.

The hospital data have the advantage, however, of being relatively more reliable than those collected in retrospective surveys. They also include, as a routine, information on the weight and length of the baby at birth; and, in the event of death, the cause of death is likely to be diagnosed better than in the case of domiciliary deliveries. Also, the hospital data are likely to be more dependable for the early neonatal mortality than for the late neonatal or postneonatal mortality, which occur after the mothers and the new-born babies are allowed to return home.

Tables 7 and 8 summarise the results of a few hospital-based studies reporting on the relation between early neonatal mortality and (a) the age of the mother and (b) the parity of live birth. All studies show a U- or a J-shaped relationship between age of the mother and early neonatal mortality and parity and early neonatal mortality.

The weight of a baby at birth, which often reflects the duration of pregnancy, is an important determinant of neonatal mortality. The relevant data shown in Table 9 report both the distribution of babies covered by six studies by birth weight and their early neonatal mortality rates. The WHO standards specify babies with a birth weight of less than 2,500 grams as high risk and needing special care. However, according to our six studies between 24 and 37 per cent of the babies had a birth weight of less than 2,500 grams. The Indian pediaetricians regard the WHO standard as too high and unacceptable because the short stature or height of the Indians contributes to a low birth weight (Bhargava *et al*, 1980). It is felt that full-term babies weighing between 2,000 and 2,500 grams can certainly survive with minimum inputs.

The risk of mortality is very great for Infants weighing less than 2,000 grams, as is evident in Table 9. An infant weighing less than 1,000 grams succumbs to death soon after birth and even if it survives during the first week in hospital conditions, the probability of its survival even upto a few months may be slim. In fact, Bhargava, on the basis of a 10 year longitudinal study, reported a survival of only 33 per cent for infants with birth weight of less than 2,000 grams (Bhargava, 1975). Maximum mortality occurs in the first month itself.

It has been widely accepted that birth weight is responsive to better nutrition associated with higher incomes. Shanti Ghosh's study of 6,000 births in Delhi during 1969-70 shows the proportion of low birth weight babies to be inversely related to per capita income as well as literacy and education (Ghosh, *et al*, 1977). Das's data also confirm this. These data are shown in Tables 10 and 11. Of course, the literacy and educational attainment of women are positively associated with the economic status or the income level of the household and the disentangling of the income and education effects on the nutritional status of the mother and on birth weight is probably a difficult exercise. However, it is presumably easier to inform and educate literate mothers about the means and importance of avoiding anaemia and adopting a diet during the last trimester that would facilitate a viable birth weight and survival of the new born.

Studies summarised in Table 12 suggest that a modicum of antenatal care can lead to a significant decline in neonatal mortality rate. In Ballabgarh, three or more visits to the antenatal clinic, two doses of anti-tetanus vaccine and 100 tablets of iron and folic acid lowered the neonatal mortality rate to almost 25 per cent of that in the control group. The studies in Gulbarga and Pondicherry do not provide adequate information on the specifics of the antenatal care offered; but presumably the visits to antenatal clinics led to the administration of tetanus toxoid as well as iron and folic acid tablets. Relative to the control groups, neonatal mortality rate was 40 per cent lower in the study group in Gulbarga and between 23 and 55 per cent lower in Pondicherry.

Studies also indicate considerable effect of antenatal care on the percentage of children with a birth weight of less than 2,500 gms or on their mean birth weight. The NIN studies showed considerable increase in the mean birth weight with a dietary supplement given to pregnant women during the last trimester of pregnancy. A small difference (of 20 grams) in the protein content of the supplement do not have any effect on the mean birth weight.

Table 12 is by no means exhaustive and several more studies have presumably been completed. Also, for analytical purposes, one needs to know also the distribution of babies by birth weight rather than only the mean. Likewise, it is necessary to study the problems, if any, involved in ensuring regular checkups or visits to the antenatal clinic which are said to be quite formidable until a community health centre builds up its rapport with its clientele. However, the evidence points to considerable scope for lowering even neonatal mortality through relatively simple antenatal care. Further, it may be possible to lower the recurrent cost of dietary supplements through an appropriate educational programme.

**(To be Continued)**

## China's Industry in First Half of 1985

THE first half of 1985 witnessed a sustained, stable and co-ordinated development of China's industry and transportation, with a simultaneous growth in output, profits and state revenue, according to Zhao Weichen, China's Vice-Minister of the State Economic Commission, speaking at a meeting on industry which was held in Beijing on July 13. In the first six months, state quotas for energy production and transportation was overfulfilled, Zhao Weichen noted. During this period, China produced 410 million tons of raw coal, 61.46 million tons of crude oil and 199.1 million kwh of electricity—representing increases of 11.8 per cent, 10.9 per cent and 9.1 per cent, respectively, as compared with the same period of last year.

From January to June the gross volume of railway freight was 630 million tons, a rise of 4.9 per cent, and that of railway passenger transport nearly 600 million, up 10.3 per cent. The volume of cargo handled at seaports went up by 15 per cent, the turnover of air transport by 54.5 per cent and posts and telecommunications transactions by 22 per cent.

Of China's 30 major light industrial products, 25 showed increases in output. In the first six months of the year, the proportion of light and heavy industries maintained a balanced growth at 51:49.

The total value of social retail sales reached 192.9 billion yuan, an increase of 29.1 per cent over the first half of last year. The January-June state revenue rose by 25.9 per cent.

Zhao Weichen attributed the increase to the overall economic restructuring with the reform of the urban economy as the focus, the development in inter-departmental and inter-regional relationships, and the efforts to improve enterprise management and promote technological advances. However, he said, the rapid growth of industrial production caused strains on transportation, and the supply of raw materials, power and funds. He urged that extra efforts be made to improve economic efficiency and quality of products, increase exports and strictly keep to the state contracts so as to fulfil all state quotas.

# Intoxication as a Social Evil

## Anti-Alcohol Movement in Uttarakhand

**Shekhar Pathak**

*The present anti-alcohol movement in Uttarakhand radically differs from earlier attempts to combat alcoholism. Although liquor remains the primary focus, the movement recognises the social system in which intoxication operates. While alcoholism is the means by which state commercialisation has sapped the vitality of the hill society, it is only a symptom of the deeper malaise of predatory capitalist 'development'. There has been a consistent attempt to understand alcohol as a social phenomenon.*

*On different occasions, activists of the movement have made it clear that their opposition is not intended as an encroachment on the individual rights of citizens and they are not dreaming of a society with total and successful prohibition. However, in a region where the basic necessities of food, clothing and shelter are a growing problem for the bulk of the population, alcohol consumption cannot be viewed with equanimity.*

*The major demand of the movement has been employment in place of alcohol. It is a bitter irony that while army recruitment marked the advent of liquor in Uttarakhand, youths are now rejected by the military on grounds of ill-health. Prohibition by itself is not adequate to eradicate alcoholism as a social evil; on the contrary, it may have certain adverse consequences. As such, the anti-alcohol movement views prohibition as the first step in a more fundamental restructuring of society.*

> '... more people have died for their drink and dope than for their religion and country ...'
>
> —Aldous Huxley

SINCE early 1984 the Uttarakhand area of UP has been in the grip of a widespread social movement.[1] The '*nashe nahin rozgar do*' (give us employment, not intoxication) movement is directed at the disease of alcoholism caused by the sale of illicit and licit liquor and spirits sold in the form of medicines and the economic and political interests that buttress this trade. Originating in Almora district under the leadership of the Uttarakhand Sangharsh Vahini (USV) and supported by several other mass organisations, the movement rapidly spread to Nainital and other districts of Uttarakhand.

As with forestry, big dams and mining, the alcohol trade is not an isolated issue but is intimately bound up with the social and cultural disintegration of hill society. The social issues which were behind the genesis of the decade-old Chipko Andolan have now metamorphosed into opposition to liquor. Apart from its tangible material impact, such as a drop in army recruitment and ill-health, alcoholism has had profound cultural consequences such as break-up of families, increase in crime, etc. Given the economic, political and social consequences of intoxication, opposition to this evil and the social system that provides its underpinnings was the only available alternative.

### HISTORICAL BACKGROUND

The story of alcohol in the hill by and large dates from the British period. Prior to that, liquor consumption was restricted to the Tarai and the Bhotiya traders who inhabited the upper valleys. While the latter distilled their own liquor for self-consumption, the virtual absence of alcohol in the settled communities of Uttarakhand was repeatedly commented upon by British officials.[2] In the early years of colonial rule, too, the advent of alcoholism was restricted. Thus in 1839-40, the revenue that accrued to the government from liquor was only Rs 1,717 for the whole of Kumaon and it was Rs 6,794 for Deharadun district.[3] Indeed, most shop-keepers were unwilling to stock liquor. One traveller commented on the fact that Kashi Sah, a prominent businessmen of Almora, stocked all kind of goods, but liquor was unavailable.[4]

Under colonial auspices, liquor spread slowly, with the advent of the army and other government departments and the establishment of cantonments and hill stations. From the inception of colonial rule (1815), the British recruited soldiers from the hill peasantry. As early as 1858 a recruiting office had been opened in the border area of Pithoragarh. Soldiers were recruited in large numbers into the Gorkha Rifles.[5] Contemporaneous with these developments revenue from liquor in Kumaon increased from Rs 534 in 1822-23 to Rs 1,054 in 1836-37 to Rs 29,013 in 1882-83 (Table 1). While these figures may indicate the spread of liquor, consumption remained restricted to towns and army encampments. Commenting upon the continued absence of liquor from village life, Henry Ramsay, Commissioner during 1856-84, was emphatic that no liquor shops would be allowed to open outside of hill stations and cantonments.[6] In 1891, the Senior Assistant Commissioner had remarked that in Garhwal the villages were virtually free from alcohol.[7] However,

*Source:* District Gazetteers and Census Reports.

in the same year another officer had found the staff of the Badrinath temple consuming liquor obtained from the nearby Bhotiya villages. Presumably to stop this trade, liquor shops were opened at Phegu below Kedarnath and Joshimath below Badrinath, marking the formal advent of liquor in the Mandakini and Alakananda valleys.[8]

The slow penetration of colonially-sponsored commercialisation and the recruitment and subsequent return of hill soldiers thus induced the spread of liquor consumption in Uttarakhand. This process had an impact, if barely discernible in the early period, on village life. The induction of the liquor trade by the state in the late nineteenth century was motivated by prospects of added revenue, a motivation that has remained unchanged till the present day. In this context it is worthwhile recalling the prescient comment of an Almora newspaper:

> Those who consume liquor and opium are subject to a rapid deterioration in health and indeed immiserisation. They even resort to robbery, murder and sundry other crimes. It is a matter of shame for the government to encourage such activities merely to augment its revenue earnings. We urge that trade in alcoholic liquor and medicines be stopped immediately. . .[9]

Yet village society continued to abjure alcohol. Around 1907-8 opening of liquor shops in Bageshwar and Chaukhutia was successfully opposed. Opposition to alcohol also formed an important part of the freedom struggle. The emulation of European habits of drinking on the part of members of the lower castes and youths was subject to criticism[10] by organs of the different caste-groups—Sarola Sabha (Brahmin), Khastriya Sabha and Shilpkar Sabha (Harijans). Thus the civil servant Walton reported that hillfolk by and large did not crave for alcohol, although revenue did accrue on account of alcoholic pilgrims.[11]

### ALCOHOL AND NATIONAL MOVEMENT

From the early twentieth century, the Congress had made prohibition an important plank of its platform. Under Gokhale's leadership, it had in 1912 asked the government to enforce prohibition instead of using liquor sales as a source of revenue. The issue was taken up on a nation-wide scale during the non-cooperation and civil disobedience movements—with some success, as the drop in excise revenue during 1920-40 indicates (Table 2). In January 1925 a letter pleading for prohibition and signed by 30,000 women was sent to the Viceroy. The matter was also taken up in the Council and other legislative bodies.[12]

The best opponent of alcoholism was of course Gandhi. Holding it responsible for the destitution of many labourers, he went so far as to call alcoholism a greater evil than theft and adultery.[13] In the Gandhi-Irwin pact of 1932, he had managed to insert a clause declaring the peaceful picketing of liquor shops as legal. Gandhi continued to propagate prohibition till the end of his life, focusing not merely on its adverse medical and social impact, but on the revenue-orientation of the state.[14] However, this steadfast attitude was opposed by several other leaders in the Congress.

While the dissenting stream in the Congress came into its own only after Gandhi's death, the contradictory pulls within the organisation were manifested when the Congress assumed power in 10 states after the 1937 elections. Only Madras and Bombay enforced prohibition. The United Provinces Government which enjoyed a revenue of Rs 1.75 crore from liquor in 1936-37 was loth to give it up. However, on April 1, 1938 the Congress ministry did declare six districts to be dry, but when the Congress ministry resigned in 1939 prohibition was promptly lifted.

During the Second World War, recruitment of hill soldiers was carried on with intensified vigour. Recruiting agents, including senior officers, would enter villages with crates of liquor as an inducement to join the army. Liquor stalls were also opened at fairs, such as the one in Gauchar, where recruitment took place. Liquor consumption in the cantonments reached a new high declining only when British soliders left after the war.[15]

## Post-Independence Situation

Prohibition was an old subject in a newly independent country. Article 47 of Indian Constitution was devoted to this problem. Even the prohibition enquiry committee repeated the exhortation in favour of prohibition,[16] but prohibition never developed as a national policy.[17] While paying ritual homage to Gandhi, the Congress government which assumed power in 1947 was clearly dominated by those who regarded liquor as a valuable source of revenue. This led to an anomalous situation where a liquor excise department and a prohibition department both existed side by side. As no political party made it a major issue the task of propagating prohibition was left to isolated individuals within the Congress and Sarvodaya activities. The latter viewed alcoholism in isolation from the larger economic and political context—an omission that was to have serious implications in later years.

Between 1948 and 1960, several districts were declared dry in UP. But before the hill districts could be declared dry, the policy was abruptly reversed. Simultaneously, the process of commercialisation and capitalist penetration initiated by the five-year plans led to a slow growth in liquor consumption.[18] The war with China led to three new border districts being created in UP—Pithoragarh, Chamoli and Uttarkashi—and large-scale construction of roads to facilitate troop movement. These developments gave a further fillip to commercialisation and consequently to the sale of alcohol.

Opposition to liquor was initiated by Sarvodaya workers in 1962. Sohanlal Bhubhiksuk, a follower of Vinoba Bhave, started a 'postcard' movement opposing the government's policy on liquor. When this method failed, a three-month long dharna outside liquor shops at Pauri and Kotdwar was commenced. Bhubhiksuk also went on a hunger fast on the steps of the Legislative Assembly in Lucknow. Although the government did agree to shut four shops on the pilgrim route, the movement never enjoyed popular support and fizzled out in due course.[19]

In 1965, the movement resurfaced in Silyara, led by the Sarvodaya couple Sunderlal and Vimla Bahuguna. After a proposal to open a liquor shop at Ghansali near Silyara was successfully opposed, the movement engulfed large areas of Tehri district. It also spread to Thal in Pithoragarh and Chaukhutia and Garur in Almora respectively.[20] After a deputation of women led by the veteran Gandhian Sarala Devi met Chief Minister Sucheta Kripalani, distilleries were closed in several places. In this movement many Sarvodaya workers including C P Bhatt and Ghanshyam Sailani played a crucial role.

Pressurised by the movement the government on the occasion of Gandhi's centenary declared the three border districts to be dry in 1969. In the same year vigorous opposition to the sale of liquor and tincture in Pauri led to tincture shops being burnt and traders fleeing. Apart from students, women played a major role in the agitation, one old lady being bestowed the title of 'Tincturi Ma'.

In 1970, Tehri and Pauri were declared dry. The substantial gains of the movement (five districts being declared dry) were offset on April 14, 1971 by a decision of the Allahabad High Court, following a petition by wine merchants, declaring the ban illegal. The subsequent reopening of liquor shops was however firmly resisted, especially in Tehri where a massive gathering on November 20, 1971 led to many arrests. In April 1972 the state relented and the five districts again went dry.[21]

The major weakness of the movement stemmed from the fragmented perceptions of its Sarvodaya leaders. Treating alcoholism essentially as a moral issue, they were unable to locate alcoholism within the broader social processes of which it was a constituent element. No analysis was forthcoming of the links of the liquor trade with the state or more generally of the distorted nature of capitalist development. Inevitably, the sale of intoxicants recommenced and in a matter of a few years the distillation of country liquor became Uttarakhand's major 'cottage' industry.

## Janata Party

The next phase of the history of liquor and the opposition to it was inaugurated by the victory of the Janata Party in the 1977 elections. Although local students were aware of the social context of alcoholism, neither the Congress nor Janata candidates had raised the issue during the elections.[22] However, largely on the initiative of Prime Minister Morarji Desai, and despite opposition from within the cabinet, the implementation of prohibition was taken up. Thus all eight districts of Uttarakhand were declared dry in consonance with this policy. Additionally 18 medicines with alcoholic content came under the purview of the Abkari department.

Notwithstanding its unprecedented coverage the new policy remained ineffective partly due to opposition within the Janata Party and public apathy, but chiefly due to the development of an illegal trade. Apart from country liquor, this comprised a wide range of liquids being sold as 'tonics' and whose sale had been allowed by the High Court. Several pharmaceutical companies began selling liquor under government permit for medicines, contributing to a flourishing trade.

## Return of Congress

The Congress victory in 1980 saw Almora, Nainital and Dehradun returning to their 'wet' status while in another three districts—Pithoragarh, Tehri and Pauri—liquor was sold under permit. The close links which the liquor contractors, like their counterparts in the timber and mining trades, had formed with the state were evident when one prominent businessman was awarded the Padma Shri in 1970. Congress leaders at both local and national levels actively supported the trade.[23]

The steady development of the liquor trade since 1947, notwithstanding the short periods of prohibition, was given a tremendous fillip by the return of the Congress. Table 3 gives details of the rapid increase in consumption in recent years. However, these figures relate to alcohol sold under government auspices only, i e, they do not include the myriad forms of liquor distilled illegally or sold as 'medicines'. These are manufactured at several centres in the plains—Amritsar, Moradabad, Sonepat, Najibabad, Bareilly, Pilibhit, Kanpur, Ghaziabad, Patna, etc—and brought in trucks to the hills (Table 4).

With their 'real' alcohol content often exceeding 80 per cent, these liquids are to be found in the remotest areas of Uttarakhand. In fact the rapid turnover has given rise to a flourishing trade in empty bottles with collection centres being set up in several distant hill towns.[24] According to one survey, a single shop in Dwarahat sells Rs 3,000 worth of 'Ashoka' liquid daily; similarly in the cantonment town of Ranikhet (population 18,000) consumption of Ashoka exceeds 2,500 litres a month.

Such examples could easily be multiplied. The point to be emphasised is that despite token attempts to regulate the trade, the state has been instrumental in the spread of liquor. As a result, the money spent by the population on different grades of alcohol is considerable—probably exceeding the amount allotted by the UP government yearly for the 'development' of the hill areas, i e, Rs 125 crore for 1983-84.

## Background of Present Movement

The decade-old Chipko movement that had achieved some notable successes was followed by other movements against the siting of big dams, mining, and for the settlement of displaced villagers in the Terai. While the background of these recent movements is important in understanding the nature of participation in the anti-alcohol movement, the specific causes of the present upsurge are as follows:

(i) Spread of diseases among men and especially youth consequent on alcoholism. Chest disorders (including tuberculosis) and cirrhosis have been widespread. According to one report 60 per cent of all TB cases in Delhi originate in the hills. Within Uttarakhand it has been estimated that at least 25 per cent of all cases of ill-health can be traced to alcohol.[25] Many deaths have also been reported, largely on account of the consumption of liquids, suras and illicit liquor. In 1984 there were more than 10 deaths in Nainital city alone where consumption of liquids, suras and illicit liquor is the lowest.

- (ii) The sharp fall in recruitment to the army attributed by Lt General G S Rawat, Vice Chief of Army Staff, to the deterioration in the health of hill youth. In a recent recruitment drive for the Garhwal regiment only 35 out of 500 men interviewed were found fit.[26] A foot march organised by PAHAR also found that the number of retired soldiers exceeded serving personnel in most villagers.[27]
- (iii) A more general economic deterioration following the transformation of a subsistence economy into one dependent on remittances (the so-called money order economy). Even in those areas where farming or horticulture still remains viable, a large portion of the earnings is spent on liquor. This phenomenon is especially acute near tourist spots and cantonments and has brought great hardship to housewives and children.
- (iv) The growth of murder and crime in an area where till well into the twentieth century the absence of police had testified to the virtual non-existence of crime. Various incidents of physical assault and murder have been reported, whose perpetrators were invariably under the influence of liquor. In Chaukhutia block alone since 1980 there have been 12 murders connected to the liquor trade. There were incidents of police firing at Nainital in October 1983 and Nandprayag in February 1984. Even the burning and death of Debki Devi in Pithoragarh in August 1984 had relation with liquor.[28]
- (v) The many incident of serious road accidents in which drunkenness is believed to have been the cause.[29] Often involving bus-loads of pilgrims, such accidents with heavy loss of life have been a feature in recent years.
- (vi) The close connection, at all levels, of the political system with the liquor trade. From village headman and block pramukhs to members of parliament, politicians have lent tacit and occasionally open support to the trade.[30]
- (vii) The influence of liquor on the cultural life of Uttarakhand. Alcoholism has become an integral part of all life-cycle ceremonies, from naming to marriage and even cremation. The priests in many of the celebrated temples are no exception. Liquor shops have opened near schools and colleges and at transport depots.[31]
- (viii) The creation of a class of new-rich businessmen connected with the liquor trade who have come to exercise a disproportionate influence on the social life of Uttarakhand. Actively helped by the police and excise and other wings of the state machiney, liquor contractors have been able to develop a thriving trade in spurious and illicit spirits in addition to the trade in alcohol distilled under licence. The free granting of 'permits' even in districts nominally declared dry—Pithoragarh, Chamoli, Tehri, Uttarkashi and Pauri—and the open smuggling of spirits across the Himachal and Nepal borders is responsible for the sale of alcohol in virtually every village of Uttarakhand.[32]

While the above factors helped clarify the social context of alcoholism for the population, the present movement had been preceded by sporadic incidents of protest. In August 1981 the students of Sumitranandan Pant Inter College in Kausani (Almora) stopped a vehicle carrying liquor and broke the bottles. In March 1982 liquor stalls were destroyed in Ufrekhal (Pauri). In April 1982 illegal stills were raided by officials at Pauri and Kotdwar. In the same year several incidents were reported—Pauri (August), Dehradun (November), Uttarkashi (December)—of stoppage of trucks carrying tincture from the plains to the interior villages of Garhwal. The next two years saw similar cases in Kumaon when vehicles carrying Ashoka liquid were successfully stopped—Almora-Bharadi road (April 1983), Rankhet (May and June 1983) Manila and Ramnagar (January 1984). Occasionally the contractors were also caught, while in at least one case (Manila) a bonfire was made of the liquor.

Such intermittent opposition could not however crystallise into a more widespread movement. The chief lacunae was the lack of a viable organisation to co-ordinate and channelise the growing protest. Neither Sarvodaya or Chipko activists, nor the women who had played an important part in the earlier movements were able to proceed beyond localised protest. Concerned individuals and organisations preferred to utilise legal channels by petitioning district authorities or instituting court cases.

In the circumstances, the lead was taken by the USV, a youth organisation founded in 1977. At the function it held to commemorate the late Chandra Singh Garhwali, hero of Peshawar, at Almora on April 23-24, 1983, the USV resolved to start a people's movement around the alcohol, forest and mining questions. A large procession organised for the occasion raised slogans against the liquor trade, the rape of the region's natural resources and the impending forest act.[33] The succeeding months saw the propagation of these ideas in various cultural forums and environmental camps. When other organisations like the Uttarakhand Kranti Dal responded to the call, the local MP Harish Rawat also gave a call for prohibition. On September 21 the murder of an Almora youth by persons connected with the liquor trade focused popular attention on the trade and its some political links.[34] From January 1984 the cultural troupe 'Jagar' embarked on a foot-march from Bhawali (Nainital) to Srinagar (Pauri) to spread the movement in the villages through the medium of folk songs and theatre.[35]

### THE MOVEMENT

The movement was now imminent. On February 1, 1984, it broke out at Chaukhutia, which by virtue of its location—the western extremity of Almora district, bordering Pauri, Chamoli and Ramnagar (Nainital)—was a thriving centre of the illegal liquor trade. On that day, villagers surrounded a liquor inspector, sitting ironically in a contractor's jeep containing crates of alcohol, and demanded that he act to stop the trade. The next day, USV organised a meeting at village Basbhira, five kilometres from Chaukhutia. On February 14, a march was undertaken between the two villages. Large public meetings (attended by over 10,000 people) were organised at Chaukhutia on the 20th and 26th. Liquor shops were surrounded and local officials gheraoed.

Now the movement spread rapidly. Activists fanned out into the villages and in the following weeks meetings and demonstrations were held in different villages and towns of Almora, including Someshwar, Syaldeh, Mashi, Bhikiasen, Garur, Tarikhet, Ranikhet, Bageshwar, etc. The movement also made its presence felt at Nainital, Bhowali, Garampani and Ramgarh in Nainital and Berinag, Dharamghar and Pithoragarh town in Pithoragarh district.

A camp was organised at Tarikhet on March 10 and 11. Utilising the fairs and celebrations held during Holi, activists spread word of the movement and of the need to oppose the forthcoming liquor auctions. On the 20th bus-loads of villagers carrying food and with traditional flags and musical instruments came to Almora from all directions. When the auctions were postponed to March 26 and 27, the movement called for an Almora bandh on the 26th which was effective throughout Kumaon. Despite the promulgation of Section 144, a procession was held to oppose the country liquor auction on the 26th. 51 arrests (36 men and 15 women) were made by the police although the women were released the same night.[36]

With the leaders out of the way, the authorities hoped to proceed with the auction of the English liquor tenders on the 27th. In this, they were foiled by the frenetic attempts by activists to send word to nearby villages to send reinforcements. On the 26th itself, four well known contractors were caught on the main road at Garampani on the Nainital-Almora road, their faces painted black and pledges never to sell liquor again extracted from them.[37] Led by women, a large demonstration was held outside the district office at Almora on the 27th, amidst scenes reminiscent of the opposition to the timber auctions during the hey-day of the Chipko movement.[38]

The movement took a new direction from the inception of the new financial year (April 1, 1984) when the picketing of liquor stills was commenced. The police with the help of lumpen elements resorted in several places to lathi-charges and even, as in Almora on April 5, to throwing acid on the demonstrators. Activists responded by organising an Almora Bandh on the April 6 and burning effigies of the district administration.[39]

In the face of such sustained opposition, the authorities decided to adopt repressive measures. On April 12 a meeting held at Someshwar demanding the release of those arrested on March 26 was the provocation for an unprecedented assault by SDM U D Chaube and PAC Jawans. The SDM's men indiscriminately attacked people in Someshwar bazar, school children, and even women working in the fields. In the nearby villages of Totashiling and Binta, similar scenes were witnessed with several arrests being made. The same evening, lumpens attacked a group of women holding a reading of the Ramayan outside a liquor still at Bhowali in Nainital district. In response to these events, processions were organised the next day at Ramgarh, Bhimtal and Bhowali, eight USV activists were in the meantime arrested at Ranikhet where the Mahila Sangthan Morcha had commenced a dharna outside a liquor still.

Large demonstrations were held at Almora and Nainital on the 14th and 15th, while shops in Ranikhet remained closed on the latter day. From the 16th, the Mahila Sangathan commenced a series of hunger strikes in Almora. Finally, on the 20th, Almora was declared a dry district with effect from June 1, 1984. Now the focus of the movement shifted to Nainital, *via* a procession in Bhowali on April 23 and commencement of hunger fasts the next day outside the district office in Nainital town. Assisted by several fraternal organisations[40] and by a large number of students, USV intensified its campaign through meetings, street plays, and demonstrations.[41]

Meanwhile, the picketing of a country liquor still had been commenced at Tallital, a programme that continued for several weeks until the still was finally closed in June. On May 2, the Nainital hunger-strikers were arrested. Although the 39 activists arrested in March were released in Almora on the 3rd a fresh group commenced a fast in Nainital.

This latter fast was broken on May 14 after a meeting in Nainital with Hill Development Minister C M S Negi. Following this meeting a ten-member team left for Lucknow to have talks with the state cabinet. The chief minister proclaimed that Nainital would be declared dry by the end of June and appropriate steps taken to ban trade in illegal medicines.

Keeping in view the history of broken promises, the agitation continued with a fresh programme involving the non-payment of government taxes in Almora from May 1. May Day also saw solidarity being expressed by workers in both Nainital and Almora. The pre-planned Askote-Arakote foot-march organised by PAHAR commenced on May 25 took the message of the movement, while the next day saw a large meeting in Chaukhutia culminating in several arrests. On the 27th the local MLA alongwith Central Minister Vasant Sathe were gheraoed in Ramgarh (Nainital). On June 4, Union Industry Minister N D Tewari's car was stopped by women in Nainital. On the 17th, a demonstration involving people from all over Kumaon was held in the same city. Despite heavy rain, between ten and twelve thousand demonstrators had collected.[42]

Meanwhile, the 45-day Askote-Arakote march concluded on July 9, traversing 850 kms in six districts doing detailed study and survey of remote Uttarakhand and coming into contact with almost 500 villlages. Subsidiary marches had also been organised from Srinagar to Almora and Kotdwar to Duddhatoli. The marchers acquainted themselves with the situation in the villages where support for the anti-alcohol movement was uniformly expressed.[43]

Although, liquor shops were shut throughout Almora from June 1, the movement continued through periodic checks on the illicit liquor trade. Over a thousand bottles of spirit were seized in Ramnagar on July 21 while in other areas commercial vehicles were stopped and searched and a 15-day dharna organised in front of the biggest Sura Store in Almora. With a view to extending the movement to Garhwal, a meeting was organised in Pauri on August 4 and 5, 1984. With the state failing to declare Nanital dry, demonstrations were held throughout September. Although the monsoon had slowed down the tempo of the movement, a signature campaign was initiated in support of the public litigation opposing the sale of illegal spirits and is currently before the Supreme Court. The movement continued in many places. The fruit belt centre of Ramgarh in Nainital district is worth remembering, where the people, led by local women-folk, Mahila Sangathan and USV activists, continued the struggle and finally won in March 1985 when the state government closed the Ramgarh liquor shop with 14 rural liquor stills in Nainital district also.[44] In Almora district the movement slowed down and this year the impact of the movement was felt when the contractor system came to an end and a co-operative society took the work of distributing liquor to permit holders. In different parts of Uttarakhand the protests against *nasha* are again emerging.[45] But the state government headed by a leader from this hills is less sensitive and the Central government has no time to think about this issue. Only the people's movement will make the Central government change the Drug Act. The movement is going on and some people are waiting for the Prime Minister's reactions.

## A Provisional Analysis

As the anti-alcohol movement is yet to run its course fully, it is not possible to sit in final judgment over it. Any analysis that can be made is strictly provisional and preliminary.

Notwithstanding the tentative nature of this section, then, it will be apparent from the foregoing that the present movement radically differs from earlier attempts to combat alcoholism. Although liquor remains the primary focus, the movement is cognisant of the social system in which intoxication operates. While alcoholism is the means by which state commercialisation has sapped the vitality of the hill society it is only a symptom of a deeper malaise of predatory capitalist 'development'. There has been a consistent attempt to understand alcohol as a social phenomenon as evidenced both by the movement's slogans[46] and its declared aims which are given below:

1. The entire hill area be declared dry; where liquor sale cannot be avoided, it should be done through a government agency only. The contractor system should be totally abolished.
2. Sura, 'liquid', biotonics and all other beverages with an alcoholic content exceeding 10 per cent and being sold as 'medicines' be banned. Genuine medicines with high alcohol content be sold/given at government hospitals only.
3. Necessary changes be made in the legislative (Drug Act and excise rules) and administrative machinery (excise and police departments) to properly implement and monitor these proposals.
4. Local people be given employment in all existing and new industries in Uttarakhand. In addition, traditional crafts like wool, wood, metal, stone, etc, be given encouragement so that a viable cottage industry comes to replace the alcohol trade.
5. A critical analysis be made of the political, economic and cultural consequences of alcoholism in Uttarakhand and its relation to the present political-economic system.

On different occasions, movement activists have made it clear that their opposition is not intended as an encroachment on the individual rights of citizens and they are not dreaming of a society with total and successful prohibition. However, in a region where the basic necessities of food, clothing and shelter are a growing problem for the bulk of the population, alcohol consumption cannot be viewed with equanimity. In fact, the argument that alcohol provides 'entertainment' or that is a basic human necessity only deflects attention from the larger social context of the liquor trade.

The major demand of the movement has been employment in place of alcohol. It is a bitter irony that while army recruitment marked the advent of liquor in Uttarakhand, youths are now rejected by the military on grounds of ill-health. However, prohibition in itself is not adequate to eradicate alcoholism as a social evil on the contrary, as the experience of USA in the 1920s and 1930s testifies, it may have certain adverse consequences. As such the present movement views prohibition as only the first step in a more fundamental restructuring of society.

The movement has posed major problems for political parties in Uttarakhand. While individuals have on occasion expressed their support, most parties are threatened by the movement's rejection of what it terms the 'vote and note (money) form of politics'. Many politicians have close links with the liquor traders who are a prime source of funds. This ambivalence is also reflected in the attitude of the ruling Congress Party. While successive chief ministers have on occasion expressed support for the aims of the movement, local Congress workers initially participated and even claimed that the decision to declare Almora dry was as a result of their efforts.[47] However, the intensity of the movement and its incorporation of broader social goals has led more recently to the Congress dubbing the activists as 'extremists'.

Despite the lukewarm attitude of political parties, the movement has been supported by all sections of Uttarakhand society. Apart from women who have played a historic part, peasants, workers, students, teachers and journalists have participated in large numbers. Interestingly, several young men, earlier addicted to liquor, underwent a transformation and are now among the movement's leading activists.

Of course, the contours of the present struggle cannot be understood without reference to the recent history of social movements in Uttarakhand. Protest around the questions of open-cast mining, theft of antiques, big dams, deforestation, floods and landslides have been a feature of the past decade. Many of the activists spawned by these struggles have played an important part in the anti-alcohol movement. This path of continuity is perhaps best exempted by the role played by erstwhile activists of the Chipko Andolan. In fact, the USV and the activists close to it can be said to represent the third stream within Chipko. While the leaders of the other two wings (though it must be mentioned that there is a considerable difference between these two wings) have been awarded the Padma Shri and the Magsaysay Award respectively, the third wing has been the target of state repression. This is perhaps because it has consistently refused to divorce environmental degradation from the inequitous society on which it is premised. In the circumstances, it is unfortunate that most of the Sarvodaya workers have adopted an equivocal attitude towards the anti-alcohol movement. While one Sarvodaya organisation initially participated in the movement and later withdrew, others have preferred to stay aloof rather than express solidarity with their past Chipko comrades.

The state's prevarication on the issues of prohibition in Nainital and the illicit spirit trade are perhaps designed to wear out the present movement. As such it may not be possible to predict the future course of the movement with certainty. It however continues to treat alcoholism as a social-political phenomenon and not exclusively as an ethical or moral issue. In this respect it bears a similarity to similar struggles against alcoholism presently being waged in Manipur and Chattisgarh.[48] Intoxication is however only one manifestation of a diseased social order whose supersession is the common endeavour of other contemporaneous struggles of the oppressed and marginalised sections.

## Notes

[I express gratitude to Ramachandra Guha with whose involvement the presentation of this article became possible.]

1 Uttarakhand incorporates the districts of Almora, Nainital and Pithoragarh in Kumaon and Dehradun, Tehri, Uttarkashi, Pauri and Chamoli in Garhwal. # Rational Approach towards Fuelwood Crisis in Rural India

V J Patel

*A majority of India's rural population still uses firewood for cooking purposes. With vanishing forests, there is a shortage of firewood. An integrated programme for fuelwood production to meet the total requirement of the country is an imperative need. But the implementation of such a programme would pose serious problems. It would be more useful to begin with projects covering specific locations like a village or a block, aiming at making them self-sufficient in fuelwood. The experience gained thereby could help in formulating an overall long-term strategy. This paper discusses the experience of some specific projects in Gujarat state.*

## Introduction

THE vast majority of the rural population in India still use firewood for cooking. With vanishing forests, there is a shortage of firewood. The worst sufferers in this fuelwood crisis are women and children. An integrated programme for fuelwood production to meet the total requirement of the country, is obviously an imperative need. But its immediate implementation would pose serious problems. It would therefore seem advisable to begin with projects covering specific locations. The experience gained in carrying out such projects could then be carefully scrutinised to serve as an important input in constructing an overall approach within the framework of a long-term strategy. Such projects could cover a village or a block of villages, aiming at making them self-sufficient in firewood.

### THE MAIN CONSIDERATIONS

Let me summarise some of the main considerations underlying the approach proposed in this paper:

The vast majority of the rural households still use fuelwood for cooking.

In the absence of such fuelwood, they use animal waste (which is a good source of organic manure) or agriculture waste.

Agricultural labourers who constitute a predominant group among the rural poor, do not have access to agricultural waste. Hence 20 per cent of their labour time is spent roaming in search of fuelwood.

The income of the other rural households is so low that they cannot buy firewood. Hence they too have to waste time collecting fuelwood or animal waste. With vanishing tree cover in the countryside, however it is not only becoming more and more difficult to find fuel, but the use of animal waste for such purposes is at some time very inefficient depriving agriculture of natural fertilisers.

The family members responsible for collecting firewood are mostly women and children. Children forced to search and collect fuelwood are thus not able to go to the school.

The real solution for the shortage of firewood in the countryside does not consist therefore of merely producing and selling a sufficient quantity of firewood. It should aim at using unsaleable firewood, which should be made available free to the landless labourers. If projects aim at producing big size firewood logs, these will find their way to the urban areas and the firewood crisis in the rural areas will continue. In short, the main thrust of the projects should be towards producing thin firewood which is difficult to transport to the urban areas and which could be supplied to the rural areas at minimum cost.

### ESSENTIAL ELEMENTS OF THE SCHEME

The unsellable firewood should consist of the thin top parts of trees. It is uneconomical to transport it to the urban areas and is equally difficult to sell it and hence will remain in the rural areas as unsaleable commodity.

Part of the fuelwood requirements of the rural areas is met from the agricultural waste, such as cotton sticks, arhar sticks, etc, and part from the firewood of trees grown on public and panchayat lands. The project should aim at meeting around 70 per cent of the total firewood requirement from unsellable firewood produced on private lands.

About 10 per cent of the farmers are comparatively better off and hence have other modes of cooking using bio-gas, kerosene, thick logs.

The thin tops of the trees grown on farmers' fields need to be removed for imparting agricultural practice. This costs some money. Instead of spending money, most of the farmers will be prepared to allow their agricultural labourers and neighbours to carry headload of this unsellable firewood while returning home after completing their daily work.

The scheme envisages irrigated High Density Agroforestry on the pattern developed by Jivrajbhai Patel Agroforestry Centre at Surendrabag[1] and now followed by many farmers. The trees are planted at a close distance of about 60 cm × 60 cm and cultivated by using inputs of the green revolution, such as fertilisers and irrigations. A scheme for rainfed condition is also presented.

A sufficient number of farmers should be motivated to participate in such energy plantations starting with Border Plantation on their farms. In most cases, the land around the border, not used for agricultural crops, could be productively employed for the purpose.

Arrangements should be made to make necessary finance available through bank loans till the plantations reach the cutting state.[2]

The present firewood stoves have a very low efficiency. Production of firewood should therefore be linked with the provision of more efficient firewood stoves. Thus, both these tasks should be carried out together. Each household participating in this programme should be supplied with improved firewood stoves. Perhaps a gas stove (similar to one used with bio-gas) and a small gasifier using 5 to 8 kg of firewood daily will be ideal for this purpose. Moreover, such an efficient stove will reduce the hazard of smoke in the kitchen. Thus, by providing an improved firewood stove, fuelwood requirements could be halved, the area under energy plantation can also be halved. Till such stoves are supplied, the area recommended in this paper for energy plantation should be followed.

### THE SCHEME FOR SELF-SUFFICIENCY IN UNSELLABLE FIREWOOD

As explained earlier, we must aim at making a village or block of villages self-sufficient in unsellable firewood. On the basis of available statistics, the distribution of households in rural areas is as follows:[3]

| | Per 100 Households |
|---|---|
| Landowners | 42 |
| Small and marginal farmers | 28 |
| Farmers other than small and marginal | 14 |
| Families of landless labourers and others | 58 |

Since farmers other than small and marginal ones use firewood of reasonably big size, kerosene stoves and bio-gas, it is the group of landless labourers and small farmers accounting for some 86 per cent of the rural households, who need unsellable firewood.

### LAND REQUIREMENT

The work carried out at the Jivrajbhai Patel Agroforestry Centre, Surendrabag in Bhavnagar district has proved that the trees planted as High Density Energy Plantation give 30 per cent of the total bio-mass produced as firewood. It was further shown that there could be as much as 25,000 trees of eucalyptus or subabool per hectare and the survival rate could be 90 per cent or more.

The selective cutting of one-third of the trees can be started in the fourth year; one-third of the trees can be cut thereafter every year. The average weight of each tree was found to be 15 kg which means that 4.5 kg per tree would be available as firewood. Let us be on the safe side and reduce this figure to only two-third or a minimum of 3 kg of firewood per tree.

One half of this 3 kg of firewood or 1.5 kg would be thin wood which could be in general unsellable in the market.

Thus, we have

Number of trees per hectare = 25,000
Number of trees per hectare at 90 per cent survival = 22,500
Trees cut annually in 3-year cutting cycle (starting from fourth year) = 7,500
Unsellable firewood of 7,500 trees at 1.5 kg/tree = 11.25 tonnes/ha year
The area required to produce 68 tonnes per year of unsellable firewood = 6 ha
Average landholding in India = 2.3 ha
The total land of 42 farm families (av of 2.3 ha) = 96 ha
Per cent of land coming under energy plantation = 6.2 per cent

It is worthwhile noting that it needs 6.2 per cent of land to be diverted to agroforestry to produce sufficient quantity of unsellable firewood to meet the complete firewood requirement of the entire village. It should be underlined that the diversion of 6.2 per cent of land is not exclusively for unsellable firewood.

In the present case we have assumed that all small and marginal farmers who constitute 28 per cent of households of the village will use unsellable thin firewood. Once, they opt for border plantation of trees, they will produce thin unsellable as well as thick parts of firewood. Once they have better firewood available with them, they too will opt for thicker size of firewood instead of the thin one. So the actual requirement of unsellable firewood will come down. Moreover, by providing efficient firewood, the energy requirement can be reduced considerably.

The project visualises an integrated approach towards producing fuelwood, use of energy saving efficient firewood stoves and encouraging small and marginal farmers to use all types of firewood produced from their border plantation on their fields. It would be quite sufficient to plan raising energy plantation on 5 ha of land for 100 households in the initial stage, a figure which could be cut down further.

### HOW TO ACHIEVE THIS RESULT?

Out of 42 farmers in 100 households, 28 are small and marginal ones and 14 are other farmers. Normally, about two meters of land at the border of fields lie vacant. The small and marginal farmers should be encouraged to plant five rows of trees at a close spacing of 60 cm × 60 cm. Each farmer could thus plant 2,000 trees on 0.05 ha of his land at the border such that they produce sufficient firewood for themselves.

But let us assume that only one-half of the farmers join in this initiative.

Then

Land covered by 14 small and marginal farmers at the rate of 0.05 ha per farmer = 0.7 ha
Land covered by 7 other farmers at the rate of 0.6 ha per farmer = 4.2 ha
Total land under energy plantation = 5 ha

### THE EFFECT OF CEREAL PRODUCTION

The scheme visualises diverting five per cent of the land to agroforestry as an energy plantation with timber as a main product and fuelwood as a by-product. This will not involve any decrease in cereal production or any other crop currently grown because of the following reasons:

For small and marginal farmers, it becomes a border plantation on the land which was not used efficiently.

The border plantation will act as a wind breaker which will reduce the damage of wind, which could be as high as 10 per cent in most cases.

The planting of trees on the countryside will change the micro-climate of the area resulting in higher agricultural production.

With the tree cover spreading in the countryside, the prospects of better and well spread monsoon also could be expected. With regular well spread monsoon, the water table will come up opening prospects of raising a second crop on the land which otherwise can have only one crop. Agricultural production could thus be greatly improved.

This will help progressing towards achieving the national target of having green cover over one-third of the land.

### OTHER SUBSTANTIAL BENEFITS

We have begun this paper with assuring fuelwood supplies mainly because that is considered an emergency situation. But it should be underlined that in the composite programme proposed by us, the quantity of unsellable firewood forms only 1.5 kg or only 10 per cent of the total bio-mass of 15 kg per tree which will be available through adopting the new agroforestry strategy. Of the remaining 90 per cent, 80 per cent of the bio-mass is good saleable timber which makes tree farming a cash crop and the remaining 10 per cent is reasonably good and sellable firewood which can be sold in the urban and rural markets. As shown in our study[4] it will be producing per hectare nearly 90 tonnes of good timber (7,500 poles) which when sold as timber at a conservative price of Rs 5 per pole would bring Rs 37,500 annually to the farmers; a return which is as much as 5 times what he would have received under normal cultivation or Rs 30,000 at the present market price of firewood. The unsellable firewood supply is *in addition* to the sums cited here. Thus, the return to the cultivator arising out of this 90 per cent sellable wood (101.5 tonnes per hectare per year) are handsome indeed. It is therefore important to keep them in mind as constituting the central focus of our strategy.

### ENERGY PLANTATION UNDER RAINFED CONDITION

It has to be noted that High Density Agroforestry (HDAF) visualises use of fertilisers and waterings which may not be available at all the places. Thus, it has a limited scope. Vast areas do not have irrigation facilities. We have many areas where soil fertility is very poor. These areas can be categorised as wasteland, marginal and/or saline soils. We should plan raising energy plantation on such soils also, to make it applicable to all types of soils and under different rainfall conditions.

In such cases, we should not think of timber production. We should select suitable species that grow in such soils under rainfed conditions even.

### PROSOPIS JULIFLORA IN ENERGY PLANTATION

The growth of eucalyptus and subabool is appreciable in good soil under irrigated conditions but not so in poor soil and under rainfed conditions. Prosopis juliflora (locally known as gando baval or pardesi baval) grows very well in saline soils and wasteland under rainfed conditions, in semi-arid and arid conditions even. It does not require special care for raising as energy plantation.

It is extensively grown on the sea coast of Gujarat, Maharashtra and Andhra Pradesh. It is now found in the desert of Rajasthan too. Once raised, it soon spreads to adjoining areas. It has excellent coppicing characteristics. Thus, there is hardly any fear of survival against illicit cutting. It could become a reliable renewable source of energy.

### OTHER PROMISING SPECIES

Acacia tortilis is another contender for use in energy plantations. It is also known as umbrella thorn in Africa and Israeli babool in India. It supplies fuel to much of the arid and semi-arid parts of Africa and the Middle East. It is a drought resistant species that can be established under extremely arid conditions. Fuelwood plantations of this crop are being established in Gujarat, Rajasthan, Haryana, Tamil Nadu and Andhra Pradesh with success.

### PROSOPIS PLANTATION IN BHAVNAGAR DISTRICT

The massive planting of prosopis juliflora on marginal and saline soils near the sea cost in Bhavnagar district was undertaken by the Forest Department of Gujarat state with success. Through wind, cattle and floods, this has spread to many areas.

Prosopis plantations exist as a close block in 9,000 ha in four adjoining talukas of Bhavnagar district. A similar plantation on a big scale has also been established in the Kutch district of Gujarat.

### YIELD AS FUELWOOD

The bio-mass of prosopis has practically no timber value but has a high calorific value. Thus, all that is produced as a biomass is fuelwood, and becomes energy plantation in the true sense.

According to K S Rao and K K Bokil (unpublished report) one hectare of prosopis yields 31 tonnes of bone dry firewood per year. At Vatva in Ahmedabad district, Gujarat state, the annual production of firewood from prosopis (spacing 3 m × 3 m) was recorded at 25 tonnes per hectare per year under rainfed condition. Adopting better agronomical practice, a 25 per cent increase in yield can be easily achieved to amount to about 30 tonnes per hectare per year.

### AREA REQUIRED

In the case of irrigated plantation of subabool and eucalyptus, we have considered the unsaleable firewood as a major input for meeting the fuelwood crisis. It has been observed that the prosopis plantation in many areas, especially in Bhavnagar district, provides self-employment to many labourers. They derive their livelihood by cutting and selling of firewood to urban and semi-urban areas. While cutting this prosopis, they use the thin parts of their own home consumption.

Many farmers have adopted a crop sharing system in the case of energy plantation of prosopis in the area. The farmers raise prosopis plantation on their own fields and bear all the expenses of raising the plantation till it reaches the cutting stage. Once the plantation goes into cutting, agricultural labourers are given the contract of cutting, stacking and marketing of fuelwood. The net earning after deducting the expenses of transportation are equally shared by the farmers and labourers. While cutting the trees, both the labourers' families and the farmers' families get free firewood for their home consumption. They cannot afford keeping all the firewood for home consumption because the farmers have invested in raising the crop, and the labourers have to get money for the labour they have invested in cutting, stacking and marketing. We should therefore plan the yield to be two times the local requirements of fuelwood.

The fuelwood requirement for 100 household is about 110 tonnes per year. It is safe to assume that more than 10 per cent of this can be met from agricultural waste and firewood from public land. Thus, the fuelwood requirement for 100 households that should be met from the energy plantation would be about 100 tonnes per year. The energy plantation should thus, aim at producing 200 tonnes of fuelwood per year.

Taking a yield of 30 tonnes per hectare per year, the area under energy plantation comes to 6.7 ha or say 7 per cent of the total agricultural landholding of 100 rural families. Such an energy plantation can be raised on wasteland, marginal and saline soils. Hence the best fertile land need not be diverted to energy plantation. Part of it may be raised even on private land and part on public and panchayat land. The prosopis has very good coppicing characteristics and hence can be raised on public land even. Once the trees survive, more trees will come up through their being spread by wind, cattle and rain water.

To be on safe side, let us assume that 75 per cent of the fuelwood required is produced on private land and the rest on public land. This means that for 100 households, 5 ha of private land should be under energy plantation. The yield from energy plantation on public land may be half the normal yield. To meet with possible shortfalls the energy plantation on public land should be extended to twice the actual one, which means that 3.5 ha of energy plantation should be raised on public land and panchayat land.

In short the area devoted to energy plantation should be as follows:

| | |
|---|---|
| Land covered by small and marginal farmers at the rate of 0.05 ha per farmer possibly on the border | = 0.7 ha |
| Land covered by 7 other farmers at the rate of 0.6 ha per farmer | = 4.2 ha |
| Total energy plantation on private land | = 5 ha |
| Energy plantation or public land | = 3.5 ha |

### NET INCOME FROM ENERGY PLANTATION UNDER RAINFED CONDITION

| | |
|---|---|
| Total bio-mass per hectare per year | = 30 tonnes |
| Half to be sold and half for home requirement saleable firewood | = 15 tonnes |
| The price of firewood at year 1984 level (at farm site) | = Rs 300 per tonne |
| The total income to be shared by farmer and agricultural labour | Rs 4,500 per ha |
| Share of income per farmer | Rs 2,250 per ha per year |
| Share of income per labourer | Rs 2,250 per ha per year |

Quite clearly, the income is indeed high, particularly considering that only poor soil under rainfed condition is used for the purpose. Again, by providing an improved firewood stove fuelwood requirements could be halved. The area under energy plantation can also be halved.

### CONCLUSIONS

The rural poor cannot buy firewood. The problem of firewood shortage can be met by producing simultaneously both unsaleable and saleable firewood.

The problem can be solved by putting five per cent of land under High Density Agroforestry. This will result in self-sufficiency in unsaleable firewood in addition to a large quantity of saleable firewood for urban areas that can help in easing the fuelwood crisis in the cities.

In the case of rainfed plantations, five per cent of the private land needs to be brought under energy plantation in addition to small energy plantation on public land. This will produce twice the fuelwood required for home consumption. Thus, half will find its way to urban areas helping it reduce the fuelwood crisis in the cities also.

The energy produced should be combined with energy saving device by providing efficient firewood stoves in the kitchen. Providing efficient firewood stove should be given equal importance to raising energy plantation. If this is successfully carried out. the size of the energy plantation can be considerably reduced.

**MAHARASHTRA DOES IT AGAIN**

**RANKS FIRST IN IMPLEMENTATION OF 20-POINT PROGRAMME**

The 20-Point Programme is being vigorously implemented in Maharashtra to eradicate poverty, to secure social justice to weaker sections and to ensure bright future for the people. The State secured first position in the country for the second year in succession by achieving more than 100 per cent performance in each and every point of the programme during 1984-85.

Following are the highlights of Maharashtra's outstanding achievements:—

- Special assistance provided to 2.16 lakh below poverty line families under Integrated Rural Development Programme, of which 52,670 families belong to Scheduled Castes and 35,398 families to Scheduled Tribes.
- Financial assistance to over 2 lakh families belonging to Scheduled Castes and Scheduled Tribes.
- Rehabilitation of 319 bonded labour families.
- 327.37 lakh mandays employment provided under National Rural Employment Programme.
- Drinking Water Supply Schemes implemented on priority basis in rural areas, mitigating problem of 3,025 difficult villages.
- Additional 76,556 agricultural pumps energised and 1,194 Villages electrified.
- 5,284 hectares of surplus land distributed to landless labourers.
- 49,926 Bio-gas plants set up as alternative source of energy thereby exceeding the target by 200 per cent.
- 1,944 lakh trees planted.
- Maintained lead in implementation of family welfare programme by performing 5.65 lakh operations. Secured national award of Rs. 2.5 crores for the second year in succession Fulfilled the target of setting up 1,062 additional primary health centres under the Health For All by 2,000 A.D. Programme in 1983-84, well ahead by 10 years.
- Established 650 primary health sub-centres and 16 Integrated Child Development Blocks.
- For generating more employment opportunities 34,900 rural industries and small industries set up.
- Bagged National award for girls' education and adult education.
- Allotment of house sites to 17,144 rural landless families and financial assistance for construction of 24,629 houses.
- Three lakh slum-dwellers covered under Slum Improvement Programme.

**20-Point Programme for the Masses - Maharashtra on the forefront.**

# Assam Accord

THE Memorandum of Settlement on Assam appears to be a text rather in the line of holy texts of all religions, meaning all things to all persons and calculated to please everyone, and has indeed apparently succeeded in the short run in this objective. Such implaccable foes as the leadership of the Assam agitation and chief minister Hiteswar Saikia have welcomed the accord, though their interpretation of the terms of the Memorandum of Settlement naturally vary. However, given the fundamentally different perceptions of the basic issues in Assam on the part of the major protagonists, the present near-universal welcome of the accord and the accompanying jubilation perhaps reflect more a sense of relief that the days of agitation are over than anything else. For about the best thing that one can say about the Memorandum of Settlement signed in the small hours of August 15 by the Assam agitation leaders and senior officials of the Union and state governments in the presence of the Prime Minister is that it promises to bring to an end a period of extreme tensions within Assamese society. If the accord were to bring to an end, or even halt, the gathering tendencies towards further disintegration of Assamese society it would have achieved a lot.

From the very beginning the agitation on the question of foreign nationals in Assam was marked by a certain unreality about its stated objectives. For it should have been obvious to so sophisticated a group as the leadership of the Assam agitation and their advisers that the stated objectives of the agitation—the identification, deletion from electoral rolls and deportation of all foreign nationals who have entered the state illegally after 1951 (later modified to 1961 and deporation replaced by dispersal, though not formally)—were not in the realm of practical politics and were unrealisable even if the whole agitation leadership were to be transformed into the elected government in Dispur with power and authority. Hence right from the beginning there has been the need to articulate the aims of the Assam agitation in realistic and realisable terms, so that a basis for bargaining could be established. It has been only in the last one year or so, after years of agitation during which, apart from the incalculable losses of human lives and property and disruption of educational institutions and normal social relations, there has been a more generalised brutalisation of life, that those realisable and negotiable aims of the agitation have been, even if only implicitly, stated and pursued. This is an inexplicable aspect of the agitation that needs to be investigated.

Of the terms of the Memorandum of Settlement itself, leaving aside promises on the economy and culture of Assam, the only major concession made by the Union government has been in the matter of taking back the cut-off date from March 24, 1971 to January 1, 1966; and the commitment that that segment of illegal immigrants in Assam who entered the state between these two dates will be disenfranchised for a period of ten years from the date of their detection. Indeed, much of the hard bargaining that has gone on over the last year at highly publicised 'secret' parleys between the agitation leaders and officials of the Union government has been on this question. This concession is bound to create problems when it is sought to be implemented, apart from the inherent anomolies in it; for it is theoretically possible, were the elections to the state assembly and Lok Sabha to he held before the end of the year on the basis of the electoral rolls that were recently revised on the basis of the 1971 electoral rolls and are on the point of being finalised, for a foreigner to be elected as an MLA or MP and at some future date be detected as a foreigner and disenfranchised for a period of ten years. Already the West Bengal government and every political party in that state have expressed their opposition to the accord; as always on parochial questions, there has been a remarkable unity cutting across party and ideological lines on this question, though the national units of most of these same parties, barring the CPI(M), have welcomed the accord. But even without the parochial aspect of this opposition, one can see more rational grounds on which the accord may be questioned.

Indeed, much would depend on the construction and interpretation put on the unrecorded parts of the accord, especially those relating to the dissolution of the assembly and the modalities for the next polls. The agitation leaders have strongly denied they have accepted the revision of the electoral rolls based on the 1971 electoral rolls and thus for all practical purposes accepted the later cut-off date for the conduct of the coming polls; but these denials have not carried much conviction, as reports from Assam suggest, even with the agitation's own supporters. For, ever since the agitation leaders decided initially not to oppose the revision of electoral rolls based on the 1971 lists and later actually directed their cadres to co-operate with the revision work, they have in fact even if not formally committed themselves to accepting the rolls that are currently being revised, with the proviso that the revision has to be to their satisfaction. Some steps in this regard have already been taken by the election authorities and the Chief Election Commissioner's latest instructions to the state election authorities, while ordering a fresh revision of rolls in some 13 assembly constituencies where, the student leaders had complained, there was an 'unnatural' increase in the voting population, include a directive to refer to the National Register of Citizens (NRC), a document whose relevance or even authenticity the Union government had refused to concede all these years. This perhaps is a pointer, one among many, to the shape of things to come.

But the real problems for the leaders of the Assam movement will be those faced by any and every radical movement: the problems of transition from being leaders of an agitation against established authority to being leaders who, after their success, have to move on to the far more arduous task of translating the gains of the agitation into practical terms. For despite disclaimers to being 'political', the Assam agitation has been not merely over the presence of illegal foreigners in the state but the equally important and related political question—the feared (more realistic observers would say, accomplished) loss of political power following the fundamental demographic changes that have taken place in the state. The agitation has therefore been essentially a political one, though the terms of its articulation have been almost stridently 'non-political'. AASU itself, the leading and the most explicitly non-political of the organisations in the agitation, realised this dichotomy following its experience during and after the bloody elections of February 1983, particularly in the way in which the Hiteswar Saikia ministry, transparently the child of a fraudulent election, proceeded to establish its legitimacy at least in practice and, in its thirty months of existence, even succeeded in seducing away some important elements from the movement. Hence the resolve at the AASU-sponsored convention in Jorhat early this year to strive to bring together on a common political platform the existing regional parties in the state. But this task of building a new regional party or, in the convoluted phraseology of Jorhat, of "bringing the existing regional parties of the state on a common political platform" is turning out to be problematical. For, inconceivable as the prospect may appear, there are powerful and influential elements among sections sympathetic to the agitation (if not within the lower ranks of the leadership of the agitation itself) who, now that the problem of foreign nationals has been so 'brilliantly' solved by the Prime Minister, would like to steer the agitation leadership towards the ruling party, away from the confrontationist postures of the last six years. Indeed, the cries of 'Rajiv Gandhi Zindabad' along with cries of 'Hiteswar Saikia Murdabad' that rent the air when agitation supporters took out processions on the evening of August 15 and 16 were not merely the handiwork of agents provocateur or NSUI and Youth Congress elements opposed to Hiteswar Saikia masquerading as agitation supporters, as some anti-Congress(I) agitation leaders suggest.

Another problem, not unrelated to the above, that the agitation leadership has to tackle in the days ahead is of dissidence. For apart from the open disassociation with the Memorandum of Settlement expressed by three constituent units of the All-Assam Gana Sangram Parishad (Purbanchaliya Lok Parishad, All-Assam Tribal Youth Association and Young Lawyers' Forum), dissidence within the ranks too, now that the agitation has been formally withdrawn, has to be logically expected. It is to be seen how AASU and its colleagues will tackle these problems of victory which may indeed prove more formidable than the problems of struggle in the coming months.

## *World Bank and India*

### To Market, to Market . . .

THE Government of India has, not surprisingly, rolled out the red carpet for the President of the World Bank, A W Clausen, currently on a six-day visit to this country. The Prime Minister, the Finance Minister (at whose invitation formally the visit is taking place), the Industry Minister as well as the Deputy Chairman of the Planning Commission have all met him during his stay here. And he has been afforded an opportunity to publicly pronounce on different aspects of the Indian economy at a press conference. These pronouncements were mostly reassuring and even complimentary. He claimed to have been impressed by the Government of India's emphasis on modernisation of technology and while he thought the goals of the Seventh Plan to be rather ambitious, aiming at something more than what was readily achievable would spur the economy to greater effort. The World Bank group, for its part, would assist this country on an even larger scale in the Seventh Plan than it did in the Sixth Plan. Of course, given the constraints on IDA's resources, this would mean greater recourse to assistance from the World Bank (on near-commercial terms). The World Bank President did not apparently want to sound entirely pessimistic even on the prospect of assistance from the IDA. So he referred to the possibility of the IDA-VII replenishment, which now stands at $ 9 billion, being enlarged by another $ 3 billion, even though it is well known already that all hope of a supplemental fund of $ 3 billion for IDA-VII has by now completely disappeared. This was confirmed by one of the Vice-Presidents of the World Bank itself in Washington last month while releasing the highlights of the Bank's performance in its financial year 1984-85.

Be that as it may, the question is: has the World Bank President really come here to boost the morale of the government and the planners as they toil to produce a finished version of the Seventh Plan and to acquaint himself at first hand with what the government has been doing to improve the lot of tribals in Mirzapur district of UP? It is doubtful that such is the case. It is a fact, of course, that the World Bank is on the whole pleased with the direction of the Government of India's economic policies. Together with the IMF it may even justifiably claim some credit for steering the government in this direction. But it should not be surprising if the World Bank (like the IMF) is not entirely satisfied with the pace of change in the government's policies and if it believes that it is possible and necessary for the government to move more decisively, especially to further liberalise import policies. It is also likely that the World Bank has come to the conclusion that one major reason for the government's half-heartedness on this score is the fear of being landed in serious balance of payments difficulties. The World Bank's approach to allaying this fear would be to convince Indian policy-makers that larger current account deficits—which, to the World Bank's way of thinking, can only be a short-term development since, spurred by enhanced efficiency and competitiveness induced by a liberal import regime, export growth will soon catch up with the rise in imports—resulting from a relaxation of restrictions on imports can be readily financed if only the government would overcome its inhibitions about commercial borrowing in the international markets. The World Bank's latest annual confidential report on India is said to have put the desirable level of international commercial borrowing in the Seventh Plan period at $ 4.5 billion per year on average and held out the assurance that "given India's record of prudent borrowing in the past and the manageable foreign resource requirements for the future . . . the country should face no difficulties in raising the projected amounts in the commercial markets". It is not all that difficult to guess that behind the cover of the public relations exercises exuding satisfaction with the performance of the Indian economy, the principal purpose of the World Bank President's visit was to personally press the above message upon Indian policy-makers.

It is not a question just of what the World Bank considers good for the Indian economy. For A W Clausen the whole subject cuts somewhat closer to the bone. The Reagan Administration has made it very clear how it wants to see countries like India relying primarily on commercial loans to finance their development, with aid, both bilateral and multilateral, playing a supplementary role. It clearly expects the World Bank to use its leverage with these countries to persuade them to take greater recourse to commercial borrowing. Similarly, the large US and other multinational banks have been eyeing India as a prize client potentially and have been growing impatient at how slowly the potential seems to be materialising. India is by far the World Bank's largest client. If despite this the Government of India continues to act coy on commercial borrowing, this will hardly seem either to the US Administration or to the larger multinational banks like a commendable performance on the part of the World Bank. And this is something which Clausen cannot afford to be unmindful of, as his tenure at 1818 H Street NW, Washington, DC, draws to a close.

## *South Africa*

### Not Anti-Asian

SPEAKING at the Congress of the ruling National Party at Durban this week, the head of the racist Pretoria regime, P W Botha, declared that he was "not prepared to lead white South Africans and other minority groups on a road to abdication and suicide". Equal voting rights, he said, "would lead to domination of one [racial group] over the others and to chaos". Further, "destroy white South Africa and our influence and this country will drift into factional strife, chaos and poverty". The perverse logic of these arguments calls for no comment. Yet the US Administration has welcomed the speech as an 'important statement' and expressed the hope that "the steps President Botha has outlined will advance the end of apartheid". The reference is to Botha's statement that while white domination would most certainly not end, influx control, under which special permission is required by blacks to work and live in 87 per cent of the territory set aside for whites, coloured and Asians, was proving "outdated and too costly", implying that such control might be modified.

Even this relatively minor admission has been forced out of the racist regime by the black struggle which has gathered momentum since September last when the 'new' constitutional arrangements were enforced, providing for a tricameral parliament so as to give a veneer of political participation for the coloured and Asian people. These 'constitutional changes' were expected to provide a buffer between the blacks and the whites, though the 20 per cent turnout of Asians in the 'elections' which followed clearly showed that the changes did not enjoy much credibility among the people for whom they were meant. The black people's struggle, on the other hand, became more widespread, engulfing the trade unions. Also, there has emerged a movement for attacking African and other collaborators of the racist regime. The district councils were boycotted and black councillors attacked. White shops in black townships were boycotted and there have been attacks on Asian shops.

It is not true that the attack on Asians was an attempt to create a division between the blacks and Asians. The attacks merely spilled over from the neighbouring black townships into this area. And unlike in 1949 when the targets of black wrath were Indians, leaving 87 blacks and 50 Indians dead, this time only two Asians have been killed. More important, the Natal Indian Congress has said that the conflict was not racial since even black collaborators have been the objects of attack.

There is much basis for blacks to feel resentment towards Asians, especially Indians. The role of Indians in the rest of Africa shows that they have rarely tried to link themselves with the liberation struggles and indeed at times have behaved little differently from the predatory white rulers. In South Africa the racial laws discriminate against every racial group except the whites, but the blacks suffer the most. Besides, what is often held up as the commercial dynamism of the Asians or Indians is merely a gloss for usurious moneylending practices or market-place exploitation of the blacks. The presence of a small number of enlightened Indians (or Asians) is no basis for suggesting that the community as such supports the struggle against racialism. There is little reason, given this situation, for the disenfranchised and dispossessed blacks to have a sense of comradeship towards the Asians. What is however remarkable is that despite this objective basis for resentment there has been so little conflict between blacks and Asians, suggesting the political maturity of the black liberation movement.

## *Soviet Union*

### Grotesque Gesture

COME November, the USSR will be celebrating the 68th anniversary of its founding revolution. It is somewhat surprising that nearly seven-decade long practice has not yet succeeded in giving its state-craft a sophisticating touch. Witness, for instance, the recent award of a Soviet decoration to the Filipino dictator, Ferdinand Marcos, ostensibly for his, somewhat ambiguous, role as a soldier in the US colonial army against the Japanese invaders 40 years ago. The timing of the award is even more inapt than its citation.

For a long time, particularly since the murder of the liberal opposition leader Benigno Acquino on the tarmac of the Manila international airport in 1983, the world Press has been full of reports not only about the brutal repression and stinking corruption of the regime headed by the Marcos couple, but also the swelling mass upsurge for their overthrow. Not only is the armed struggle led by the National Democratic Front (NDF) steadily advancing, but moderate/liberal leaderships of various shades are also regrouping their forces for pushing the Marcos clique out. Even its embarrassed patron, the US Administration, is engaged in various manoeuvres and is drawing up alternative contingency plans for ditching Marcos in favour of some new regime with a less brutal and corrupt face.

A recently leaked top secret inter-agency study, prepared by members from the CIA, Pentagon, State Department and so on, notes that "depressed economy, the weakness of the Philippine military, and its abuse of civilians, popular fear and resentment of the military, and the government's inability to deliver economic and social development programmes" are factors contributing to the "continued steady progress" of the Philippine revolutionary movement. It warns against the danger of being "seen as favouring a continuation of the Marcos regime to the exclusion of other democratic (*sic*) alternatives". Indeed, the study recommends quite a sophisticated approach. It says:

> . . . while President Marcos at this stage is part of the problem, he is also necessarily part of the solution. We need to be able to work with him and to try to influence him through a well-orchestrated policy of incentives and disincentives to set the stage

All remittances to **Economic and Political Weekly.**

> for peaceful and eventual transition to a successor government whenever that takes place . . .

The study does not fail to emphasise that, political and diplomatic interests apart, "continued unhampered access to our bases at Subic and Clark is of prime importance".

What really inspired the Soviet government to resort to the grotesque gesture of honouring Marcos, apart from its known antipathy for the Maoist-oriented communist party of the Philippines which is heading the mass struggles against Marcos? A report entitled 'The Philippines at the Crossroads' recently published in the Soviet periodical *International Affairs* may provide a clue. After noting that "the difficult living conditions and the restriction on democratic rights and freedoms have forced the broad masses to social protest", the report says, "the country's leadership has revised its foreign policy . . . Attempts are being undertaken to reach a balance in relations with the USA, the line has been taken on the diversification of foreign policy relations and maintaining normal relations with all states regardless of their socio-political systems."

Is the Soviet foreign ministry really so naive as to take the counter-manoeuvres of the Marcos regime against the US moves all that seriously, to the extent of showing contempt for the swelling mass struggles against the dictator?

---

## BUSINESS

# In Search of Quick Fortunes

THE stock market has, of late, been increasingly in the news. This is scarcely surprising. The phase the market is currently passing through is indeed very extraordinary; it has really no parallel. Never before has the stock market moved so fast and for so long. Spectacular, staggering, phenomena can no longer be considered exaggerations to describe the upsurge in equity prices which is quite incomprehensible. The upswing really started about the middle of November and equity price indices have been scaling new peaks month after month. All the principal markets other than Bombay recorded new highs about the middle of the second week of August. Bombay lagged behind a little in that it could not improve upon its previous best mark made on July 22 though it came fairly close to it.

Since the beginning of the upswing in November. the *Financial Express* equity price index for Bombay has risen by 112 per cent and the all-India index by 104 per cent. According to the equity price indices compiled by the *Economic Times*, the regional index for Delhi has registered the sharpest rise since the end of December (184 per cent) followed by Madras (98 per cent), Ahmedabad (92 per cent), Bombay (91 per cent) and Calcutta (75 per cent). The rise since the beginning of the year far exceeds the total rise recorded over the preceding four years—1981 low to 1984 high—the Bombay index having moved up by 64.7 per cent and the all-India index by 47.7 per cent.

It is not only the meteoric rise in equity prices that makes the current bull phase extraordinary. Never before has the stockbroking community had to contend with such a wide range of margins—daily margins, daily automatic margins, overall margins, carryforward margins and ad hoc margins—which add up to a really heavy burden. Also, never before has the market been known to put up such a remarkably firm show in the face of exorbitant carryforward charges ranging, at times, upto 60 per cent (annual basis). Nor has the disparity between the yield on equity and fixed interest bearing securities ever been so very wide as it is at present. Never before has the stockbroking community had to put up with so much paper work to complete its daily business, resulting in considerable delays in delivery of shares, settlement and payments.

The unprecedented boom on the stock exchange has had its inevitable impact on the capital market which also has been displaying remarkable buoyancy. Rarely, if ever at all, have so many new issues been so heavily oversubscribed. Seldom have unofficial premiums on new issues ruled so very high, holding out the hope of fantastic returns for the successful applicants. Subscription to new issues has acquired the semblance of a gamble. Instances abound where applicants receiving full refunds have far exceeded the number of successful applicants. Whoever heard of a company raising from the public (NRIs included) Rs 270 crore in one shot? Reliance Textile has done it. Until a few years ago, the entire corporate sector could not raise so much money in a full year?

Perhaps never before has the boom on the Indian stock exchanges attracted so much attention abroad, not only from prospective non-resident Indian investors but also from banks. Michael von Clemm, Chairman, Credit Suisse First Boston, London, world leader in the management of Eurobond and floating rate note issues, has described the current boom in the Indian stock markets as a 'fascinating' development which the investment bankers abroad are studying eagerly. Clemm has also expressed the view that the growth of activity in the Indian stock markets could lead to foreigners investing in Indian securities and Indians doing so in the stocks of companies abroad. Chances of such a development in the forseeable future, however, appear very remote.

Unlike commodities, the rise in equity prices does not need to be viewed with concern so long as it does not endanger the solvency of the market which raises questions about the strength and efficiency of the organisational framework of the stock exchanges and the financial position of stockbrokers handling the business of their clients. The rise in equity prices should normally be welcomed as a buoyant stock market facilitates the raising of resources from the market for the growth of the private corporate sector.

The current boom on the stock exchange has been the subject of a lively debate in official as well as private financial circles. While there is a general agreement on the various factors contributing to the rising trend in equity prices, there are marked differences among market analysts in regard to the degree of emphasis on the different contributory factors and the manner of the market's response.

The vigorous upsurge in equity prices has been seen as reflecting the spurt in confidence in the government headed by Rajiv Gandhi and a renewed desire to invest. The boom which began with the hopes of a new economic order has got strengthened with every new policy pronouncement. The stock market sees in these policy pronouncements a major effort to rebuild industry's confidence in government and to make it a potent instrument for the development of the high profit areas of industry.

The stock market is convinced that the government is really earnest about providing a stable economic regime conducive to growth. Its firm conviction about the dawn of a new era for the private sector and the steady flow of encouraging corporate news have brought about a profound change in market psychology. Speculators have been quick to exploit this situation. Reports are that quite a good deal of speculative activity is supported by black money which is being deployed not only for the purchase of specified and non-specified shares but also for 'benami' subscriptions to new issues. To think that these transactions can be easily detected is to underrate the ingenuity of black money holders who have developed considerable expertise in running a parallel economy over the years.

With equity prices rising rapidly week after week and daily fluctuations often wide enough to cover a full month's normal range in the past, there has come about an enormous increase in outside participation in stock exchange dealings. Many a small fry has been drawn to the market for making a quick fortune. Shares are being bought and sold in a big way by people who have no knowledge of company activities much less their prospects. There seems little doubt that speculative mania has firmly seized the market.

As a healthy bull market makes headway,

the public participates more freely. Such purchases are generally made on hopes of selling out when prices are higher, but a day comes when there are not enough buyers to go around for all the stock that is offered. This marks the beginning of a secondary reaction. Any daily movement counter to the primary trend may be the beginning of a secondary reaction.

The technical position of the stock market has been suspect for quite some time. High carryforward charges point to an overextended long account. The sharp setback in equity prices on August 12 and the further break in prices two days later attributable mainly to substantial disinvestment by institutional investors could well mark the beginning of the corrective phase. It appears that the stock market balloon which had been excessively inflated by the air of optimism has begun to leak. Bulls could certainly pump in more air into the balloon but it may only have the effect of making the holes bigger.

## *Synthetic Fibres*

### Heading for a Fiasco?

THE government's new textile policy announced on June 6 aims at providing a boost to the consumption of man-made and blended cloth by lowering the prices of such cloth. Towards this end the policy statement proposes that "(a) creation of capacity by new units and expansion of capacity by existing units for production of synthetic fibres/yarn would be so determined as to realise economies of scale in order to reduce costs of production; and (b) fiscal levies on man-made fibres/yarn and on the intermediates used as inputs for the production of such fibres/yarn, shall be progressively reduced in such a manner as to facilitate absorption of increased domestic production so that the benefit flows to the consumer in the form of lower prices of synthetic and blended fabrics".

Manufacturers of polyester staple fibre (PSF) and polyester filament yarn (PFY), however, appear to be determined to defeat the government's objective of reducing the prices of man-made fabrics. According to the All-India Crimpers' Association, producers of PSF and PFY have raised their ex-factory prices by as much as 88 per cent since March 1984.

The government, curiously enough, has not shown much concern over this development. On the contrary, the Finance Ministry is reportedly examining proposals from the Commerce Ministry for reducing excise duties on PSF from Rs 45 per kg to around Rs 25 per kg and on PFY from Rs 83.75 per kg to around Rs 60 per kg.

However, against the background of the recent behaviour of PSF and PFY producers in pushing up prices, how does the government propose to ensure that the benefit of the reduction of excise duties is passed on to the consumers of blended textiles in the form of lower prices, which after all is the objective of the textile policy? If prices of cloth do not come down and the benefit of the lower excise duties is appropriated by the producers of fibres or fabrics, the government would have sacrificed a large amount of tax revenue to no purpose. Is the government in a position to prevent such a fiasco?

The current demand-supply balance seems definitely to favour the producers. The domestic consumption of polyester staple fibre and filament yarn has been on the rise. Domestic production of PSF during the first half of 1985 is placed at 22,000 tonnes as against 15,358 tonnes in the corresponding period of the previous year. The total output during the year is expected to be 45,000 tonnes while demand is placed at 60,000 tonnes. In the case of PFY, indigenous capacity is at present about 80,000 tonnes per annum whereas current demand is around one lakh tonnes. Domestic output of filament yarn has gone up from 25,000 tonnes in 1982-83 to over 55,000 tonnes in 1984-85 and is expected to increase further during the current year.

In view of the gap between supply and demand which exists, one way, in reality perhaps the only way, of disciplining PSF and PFY manufacturers is through imports. It is already evident that imports have, therefore, become the focus of intense lobbying. Citing the steep increase in prices by PSF and PFY producers, the All-India Crimpers' Association has made out a case for larger imports to save textile mills from being exploited by the fibre producers. Towards this end the Association has demanded the abolition of the anti-dumping duty. The duty had been imposed in November 1982, at the rate of Rs 15 per kg on PSF and Rs 9 per kg on PFY, ostensibly to protect domestic producers who have, as already mentioned, used the protection to raise prices.

Sensing that larger imports could pose a threat to their cosy protected market, producers of PSF and PFY have launched a counter-campaign raising a scare of dumping by foreign suppliers, particularly from South Korea and Taiwan. Specifically, the campaign seems to be directed at forestalling any move by the government to scrap the anti-dumping duty.

It is, however, difficult to take seriously the scare sought to be raised by PSF and PFY producers. This is because in addition to the anti-dumping duty, there is an import duty of 175 per cent and a countervailing duty of Rs 45 per kg on polyester staple fibre and an excise duty of 225 per cent and a countervailing duty of Rs 83.75 per kg on polyester filament yarn.

There can be no doubt on the whole that PSF and PFY manufacturers have been enjoying enormous protection. How can the new economic pundits in the government, who are constantly railing against the deleterious consequences of excessive protection, justify the extent of protection afforded to the producers of synthetic fibre and yarn?

## *Equipment Leasing*

### Use as Tax Shelter

FOR us in India it should be of interest what is behind leasing business, for leasing business has grown phenomenally in the past five years.

Let us face it. Basically equipment leasing has evolved as a tax shelter. This will be the case in India, as it is in countries with longer experience in this matter.

As everywhere, Internal Revenue in the US is engaged in a running battle with business firms in the matter of tax shelters in general and leasing in particular. And the US Internal Revenue has not fared too badly in its crusade against tax shelters. The Tax Court has virtually upheld every major shelter case, including those questioning the abuse of leasing for tax avoidance.

Recently, however, the Department has suffered a setback. Interestingly, this was in a case of computer leasing sponsored by none other than E F Hutton, the brokerage and financing firm which was recently charged with fraud running into a few billion dollars. A partnership firm, headed by one Thomas, bought $ 9 million worth of computers and leased them to corporations. Only $ 1.2 million was paid by the partnership, and that too not all in cash because part was paid in the form of signed notes. The partnership claimed deductions on the whole of $ 9 million. The Department disallowed the entire deduction saying the partnership never really owned the computers. The whole deal was considered a fabrication intended to transfer the deductions to high tax bracket individuals.

The court overruled the Department, called the transaction genuine and sustained the deductions on the grounds that (1) the computers were bought at a realistic price, and (2) the investors reasonably expected significant residual value, i e, when the leases would expire.

So equipment leasing can once again become a major tax shelter in the US because it combines what is referred to as valuable lock-in and deferred benefits, particularly now when, under the Reagan Tax Plan, tax rates are to be reduced and various incentives offered in the form of accelerated depreciation and investment tax credit are to be withdrawn. By investing funds now in equipment to be leased, i e, in advance of new Tax Plan coming into effect, the taxpayer can lock-in the rapid write-offs now available and also take whatever deductions are currently possible to take under today's tax rates. True, subsequent earnings will be able to claim lower deductions but then the tax rate itself will be lower under the Tax Plan.

What is feared in the US could well happen in India as well, where too the Finance Minister has not only lowered individual tax rates but also promised a phased reduction in corporate tax rates. The leasing companies will bear watching.

# A Moment of Correction?

**Romesh Thapar**

THERE may be divided views on the initiatives being taken to untangle the political knots in Punjab, Assam and Kashmir, but the relief is widespread that we are moving at last. What's more, Rajiv Gandhi has abandoned the old provocative posturings for wider consultation and what is being described by the coterie around him as 'open-mindedness'. All to the good when political life encourages abrasiveness and intolerance, even in Rajiv Gandhi.

There's no denying that it would be healthier to replace the personal equations of the PM with a more solid institutional frame. There is no reason why discussions with the Opposition should be confined to the parliamentary level, particularly when the ruling party commands massive voting power. To cope with continental problems like reservation policies, consultations with chief ministers are urgently needed. And they cannot take place in the National Development Council. We will have to move to the kind of Inter-State Council envisaged in the Constitution.

One can only hope that within the confidentiality of the PM's secretariat work has begun on this aspect of our functioning. Maybe, the evergreen L K Jha, now named an adviser on administrative reform, could address himself to this matter on a priority basis. He has enough experience to work out the mechanics of an Inter-State Council and to re-define the operations of other existing councils. The fear persists that in a fast-changing situation we move too slowly—yes, even with youth in the saddle.

Let me elaborate this. Rajiv Gandhi on his own, and with the assistance of the energised Foreign Office bureaucracy (even though it over-publicises itself!), might hammer out a realistic *detente* with our neighbours, but no amount of brainwave-ing in a few offices of the Government of India is going to produce an acceptable, alternative economic frame for this sub-continent now poised for a possible break-through. A number of sustained, institutionalised national consultations will be required, particularly if we desire to neutralise the verbose debate about socialism, its relation to the public sector, high-tech and the dimensions of a just and meaningful society. An occasional gathering of a bunch of MPs, headed by an inexperienced PM, is not the answer.

Rajiv Gandhi should be moving to some such conclusion because even within his own motley followers there are rumblings which could prove embarrassing. We've had occasion to comment on the critical undercurrents within the old guard of the Congress regarding the PM's economic free-wheeling, but even on the accord with Longowal there is reason to believe that various factions are far from reassured. Of course, these stirrings, suggestive of Rajiv Gandhi's own uncertain hold on his party, are indicative of the confusion, genuine and engineered, that prevails at this moment of correction.

Any ruler who aspires to intelligent rulership has to seek viable and respected institutional support systems. Jawaharlal Nehru understood this and allowed himself to be disciplined by institutional norms even though he could easily have ridden over them. Indira Gandhi, compelled to observe the rules of the game as laid down, spent a great deal of time and energy destroying the infrastructure built by her father—and, in her later years, fashioning the Congress Party into a formation cemented largely by corruption and criminality. It is this 'inheritance' that has to be transformed.

Depending on Akashvani and Doordarshan, as so many do these days, is an unsatisfactory business. It makes morons out of us, because none of the real issues get presented. Rajiv Gandhi can keep warning these servile electronic organs against 'image-building', but they know of no other gambit. After all, the programmers are aware that their young PM feels India is not ready for freeing the media—and who in terms of image-building, is for ever presenting himself to TV cameras?

Our politicians, young and old, are shit-scared of criticism. Rajiv Gandhi, too, judging from his parliamentary performance. We have a long way to go before we can stage the protest that British media organised around the censorship of the BBC. Those 24 hours of silence probably buried Margaret Thatcher's political future. The speed of the 'surrender' should be a lesson for our bureaucratic morons.

Somehow, in this phase of correction, we have to find a way to inform our people and involve them in the shaping of the correction. The stilted approach of the government-controlled electronic media, and the pussy-footing of a supposedly independent press in between investigating 'scandals', is reducing problem-assessment and solution-finding to rather narrow, middle class exercises.

Maybe, the matter needs 'opening up' through a pirate radio sponsored by oppositionist state governments or municipalities or even universities. And then, the Supreme Court could be requested to speak on our fundamental rights. Such actions become inevitable when governments assume divine rights.

I am convinced that unfettered, free-ranging, brutally frank debate on every issue that divides us, from the original terrorist defilement of the Golden Temple to the entry of the armed forces, from communal butcheries to caste wars *a la* Gujarat, from professionalised tax evasion to bank frauds, from black money to drug-peddling, and from smuggler activity to political funding, would create not disarray, but consolidation behind those values we have quietly forgotten. Rajiv Gandhi had better think again about his very private electronic agitprop, and stop the double-talk.

In such a situation no one really knows how policies are being forged—except, perhaps, the stock markets which are on their own heady rampage. Coteries are certainly at work. But don't ask questions about who is who, or what is the bureaucratic ambience, or do ministers get the responses they seek. The speculation is endless, particularly in the area of economic policy where our future is on the anvil. As for confused thinking, it is visible at every level. We are a worried people—that is, if you move out of five-starred drugging.

However, in a strange kind of way, the despondency of the first half of this year is dissolving. It is inexplicable in the context of the problems that are surfacing. They are awesome and we now lack the culture within which self-discipline grows. Maybe, some largely unreported moves by Rajiv Gandhi, as, for instance, the restoration of the seniorities of those police officers who investigated his mother and brother after the Emergency, and the appointment of independent judges like Rajinder Sachar as the Chief Justice of the Delhi High Court, are encouraging the people at large to see the need for a change in behaviour patterns, to grow up. Maybe.

But, the critical question at this moment of correction is, when will our rapscallion politicians see the need for change? This applies across the ideological divides, from Right to Left, and to all the other variations. I don't have to spell them out as we complete another year of Independence.

*August 9.*

## Indian Tube Company

INDIAN TUBE COMPANY's amalgamation with Tata Iron and Steel Company was approved by the Bombay High Court on August 1. The Calcutta High Court had passed orders on the amalgamation in May 1985. In September 1982, the Government of India had conveyed its approval to Tata Steel purchasing the holding of British Steel Corporation, UK, in the Indian Tube Company. Tata Steel then made an application, under the Monopolies Act, to the Central Government in May 1983 for amalgamation of the Indian Tube Company. Government's approval was received by Tata Steel in May 1985.

# Making Common Cause with Peru

### ISG

IN taking the oath of office as the newly-elected President of Peru on July 29, Alan Garcia Perez made a major announcement with regard to Peru's external debt. He announced that (1) Peru would like to renegotiate the outstanding of $ 14 billion external debt directly with the banks and creditors, and (2) until the negotiations for debt restructuring were completed, the country would limit its debt servicing to 10 per cent of its export earnings.

While disavowing any intention to bow down to an IMF-designed adjustment programme, Garcia did offer the assurance to launch an austerity programme of his own, a programme that would include severe restrictions on imports and controls on prices and on outflow of foreign exchange. That he meant this seriously, he demonstrated when he unfolded, within a few days of his inauguration, a number of emergency economic measures. These include a 12 per cent devaluation of the Peruvian currency, sharp increases of 30-40 per cent in prices of not only of gasoline but also food products, a 36 per cent increase in minimum wages to be followed by a freeze in both wages and prices and tightening of control on foreign exchange to restrict flight of capital.

That Peru faced serious difficulties with regard to its external debt has been known for some time. Peru has been in arrears in its payments to commercial banks. According to one estimate, Peru is currently in arrears to the tune of $ 450 million. When the US bank regulators met in June 1985, they put the US banks on notice that if the Peruvian position did not improve by the regulators' next meeting in October 1985, "the country can expect its credit rating to be downgraded". This means that the banks which have lent to Peru would then have to maintain larger reserves *vis-a-vis* their loans.

Peru has even otherwise been in a rather unenviable economic situation in recent years. Its gross national product has suffered a decline of 30 per cent between 1981 and 1984. According to the World Bank, per capita income in Peru declined by 17.5 per cent in just one year, 1983. In fact, Peru's per capita income declined by 0.4 per cent over the decade 1973 to 1982.

Export earnings, on which depends crucially a country's ability not only to import currently but also to service its external debt, have also been on the decline in Peru, as for most of Latin America. Its export earnings in 1983 were only 80 per cent of those achieved in 1981. The figure for 1984 is supposed to be lower by at least another six per cent at around $ 3.6 billion. Garcia's estimate for 1985 puts exports earnings at $ 3.1 billion. As against that, debt servicing liabilities will add up to $ 3.7 billion, including possibly interest payments of $ 1.5 billion. Even taking the whole of the past decade, Peru's debt servicing liability as a proportion of its export earnings must have been among the highest in Latin America.

When Fidel Castro argues that the external debt of the Third World in general and Latin American countries in particular has reached so high a level that it is simply unpayable, he is not exaggerating the problem. This is particularly so when it comes to countries like Peru. As a proportion of export earnings, Peru's external debt of $ 14 billion is not as high as that of Argentina and Brazil. But being a relatively small country and owing an amount that in absolute terms is not large enough to pose a major danger to the financial position of the foreign creditor institutions Peru is particularly vulnerable. It would, in normal circumstances, be liable to be hustled into debt restructuring and accompanying austerity programmes of greater stringency than bigger debtors. Mind it, even countries with massive external debts, such as Mexico and Brazil, are fast discovering how hard it is to abide by the arrangements they have entered into for restructuring their external debts.

Garcia is certainly not going as far as Castro to ask that Peru's debt, being unpayable, should be taken over by the creditor governments. But what he is clearly saying is noteworthy, namely that Peru's debt service liabilities are far beyond its present capacity and that therefore these liabilities need to be so rephased that it does not have to pay more than a reasonable portion—Garcia puts it at 10 per cent—of its annual export earnings. Also, and this too is very important to note, Garcia declines the intermediation of the IMF in negotiating whatever restructuring of Peru's external debt is called for with its creditors. For the country's present economic plight Garcia blames as much IMF's stringent rules as the overspending by his military predecessors. To quote Garcia from an interview he gave on the eve of his inauguration, "To follow the IMF path will only make Peru's economic situation worse. In the end we will neither manage to reactivate the economy nor will they collect a single dollar from us." Fidel Castro said more or less the same thing when he said that the leaders of the Latin American countries in debt were totally unwilling to lay upon the shoulders of their people the consequences of the IMF's recessionary policies and also sacrifice, in the process, economic development.

Two things have to be granted. Firstly, a country's debt servicing liability has to bear some relationship with its repayment capacity. Secondly, if under certain circumstances a country has incurred external debt beyond the level that it can service, the way out has to be such that it does not put the entire burden of the miscalculation—including the miscalculation involved in raising funds in excess of the country's capacity for repayment—on the debtor country. Unfortunately, the trend so far, under the leadership of the IMF, dominated as it is by a lobby of creditor countries led by the USA, has been completely to the contrary. Little allowance is made even for factors altogether beyond the control of the debtor countries, be it a decline in export earnings on account of a sagging world commodity market or enhanced interest liability on account of escalation in world money interest rates.

To say that on a country's export earnings depend on its import and debt servicing capacity is nothing new. Nor is there much new in saying that when a country's export earnings suffer a decline for reasons beyond its control, its debt repayment capacity gets impaired and that this has to be allowed for while enforcing the debt contract. Both of these are, in fact, very much embedded in the IMF's Compensatory Financing Facility (CFF) under which countries experiencing shortfalls in export earnings for extraneous reasons are entitled to temporary compensatory credit. The major problem with this particular facility is two-fold. Firstly, although entitlement to compensatory credit is linked to shortfall in export earnings, the actual amount of credit is tied to the concerned country's quota. No matter how steep the shortfall, the IMF assistance is subject to the quota-linked ceiling. In actual practice, as UNCTAD work on the subject has amply demonstrated, the IMF often uses its device of judgmental determination to scale down the shortfall itself in order to make it appear that its assistance is not too small. Secondly, the repayment obligation comes into effect even though the country concerned has not recovered fully from the shortfalls. These shortcomings of the facility notwithstanding, the point remains that the principle is recognised that decline in export earnings for reasons outside a country's control have to be specially provided for. If this is granted, it logically follows that when a country in debt experiences such a decline not only its capacity to import but also its debt-servicing capacity is bound to be impaired. Why should the country be held down to the obligation of a contract that it cannot fulfil given the deterioration in its circumstances?

Here, one must pause and take note of an argument often advanced in the past against any proposal to link debt servicing to export earnings. The measure it is argued, will be counter-productive because it would cause considerable damage to the creditor banks' reported earnings and, as a consequence, dry up new lending. Let us see what the experience so far demonstrates. As debtor countries have experienced difficulties in servicing their debts, the occasion has actually been exploited to hoist on these countries reschedulings which carry more stringent terms with regard to maturities, interest rate mark-up and other charges as *quid pro quo* for relief in repayments falling due in the immediate future. This is in addition to the policy programmes foisted on these countries, programmes which, as Garcia describes them, hardly ever succeed in reactivating the economy. The irony of the whole situation is that while so much song and dance is made of the need for debtor countries to follow appropriate readjustment policies, the countries, and people, who profess these programmes are unprepared to underwrite them by allowing debt servicing to be tied to the fruits of these programmes.

As for the danger of new lending drying up, the experience of debtor countries in recent years is that new lending to them has in any case more or less dried up. Fidel Castro has not pulled his figures out of a hat—he has taken them from the UN Economic Commission for Latin America—when he notes that in just two years, 1983 and 1984, there has taken place an outflow of net financial resources to the tune of $ 56.7 billion. According to an estimate of capital flight over the past three years, 1982-84, quoted in the *Wall Street Journal*, as much as Rs 100 billion is estimated to have left the shores of three major debtor countries of Latin America, Argentina, Brazil and Mexico.

Whether or not Garcia succeeds in having his way with his country's creditors, banks and their countries, there can be no doubt about the strength of his case. Will he be made to fight it singly or will other countries in Latin America and elsewhere in the Third World line up with him? The creditors are bound to resist Garcia to their utmost because in yielding to him they will be setting a precedent. But for precisely the same reason, should not the debtor countries make common cause with Peru?

---

## INTERNATIONAL AFFAIRS

# An American Thriller

### GPD

THE calculations that the American foreign policy planners make can sometimes set boring. They read like a bad mystery novel where no murder takes place and the detective is forever looking for the murderer. Orwell had written an essay 'The Decline of English Murder'. Going by what first Nixon and now Kissinger have told the Press it would appear that the desire for murder has moved to the banks of the Potomac. Except that the bad men do not oblige. It was first thought by Nixon (apparently for the fourth time since the Americans played their game in Hiroshima with the atomic weapon) that the Chinese would intervene in the Indo-Pak war and he could play with his toy. Now Kissinger tells us that there is no truth in it. That was a thought only for the living quarters of the President. Kissinger had thought, however, that the Chinese would intervene in the Indo-Pak conflict. This would then be followed by a Soviet attack. So Kissinger has told us that "it was my view, and it was also surely President Nixon's view, that we did not wish the Soviets to destroy China". So Nixon and his Secretary of State instructed General Alexander Haig to receive the message from the Chinese (which was promised) and then convey to the Chinese the US assurance of moving against the Soviet Union. The message never came. The possible thriller remained a thriller. Another Hiroshima was avoided.

The logic of this murder story which was not to be is bizarre. Country A and B go to war. Country C is expected to intervene there. If it did country D would retaliate against C. If that happened the US would undertake the responsibility of defending C against D. As one can see the US is the fifth character in this absurd play. Why should it think of dropping nuclear weapons as the fifth entrant to a basically local conflict? American power presumably makes a question like that irrelevant. It will keep the 'global equilibruim' even at the cost of the globe disappearing in the process!

It is obvious that absolute power not only has corrupted people in Washington absolutely; it has also made them sick beyond comprehension. Nuclear weapons, nuclear blackmail are for them a matter of game theory. The sickness of all this speculation and scenario-making speaks once again for the fact that the US is the only superpower in the world. In any event it was never a retreating power as the Chinese tried to persuade us at that time.

However, that is only one part of the story. The entire 1971 episode has come into focus again. It is interesting to see *once again* how the Soviet Union and China at different levels of involvement in the conflict have essentially prevented it from going beyond its natural, normal bilateral proportions. It does not require much expertise to know that the Sino-Indian relationship was an adversary relationship if not an actually hostile one. Yet it was noteworthy then and now we are getting its further confirmation that matters relating to India were always a little removed from China's overall global understanding and strategies. In short China was not interested in pulling Pakistan's chestnuts out of the East Bengal fire.

We had commented upon it at that time but it is perhaps worthwhile to recall the letter which Zhou Enlai wrote to Yahya Khan after Sheikh Mujib-ur-Rehman had declared an independent Bangla Desh. The letter, if we remember right, was written in April 1971. After saying the usual things about India, the Chinese Premier promised Yahya Khan that "we shall, *as always*, support you" (emphasis added). Now this turn of phrase was curious. Why as always? And what did it mean? The only meaning that could be placed on it was—'as in 1965'. Now that ruled out active military intervention. Moral and material support, yes; military intervention, no; the Chinese seemed to suggest. It made good sense. It will be true even today. The Chinese are not going to fight other people's battles.

The amazing aspect of this episode is really that Nixon and Kissinger did not see such a simple power reality. There is reason to believe that our policy-makers saw it. There would have been no 1971 war had our policy-makers not actually ruled out Chinese military intervention. They, of course, did not say so. Nor would they say it even now. But the power realities in South Asia tell their own story anyway.

The Americans did not see things in that light. No wonder Kissinger was disappointed that the expected message from Beijing never came. People blinded by their own nucelar power cannot see these things. Asian states have, one must grant, greater sophistication than these sabre-rattling upstarts of Western civilisation and as a consequence believe in politics as a continuation of war by other means rather than the other way round. Of late we seem to be out to imitate these worthies from across the Atlantic in our search for modernisation and one wonders if we might not lose some of our traditional wisdom. Nixon and Kissinger have done well to remind us how mad their kind of modernisation can be.

# Modernisation Drive

### Hansavivek

*TATA IRON AND STEEL COMPANY (TISCO)* has drawn up a five-year plan of capital expenditure of about Rs 1,000 crore, a major part of which will be devoted to new facilities to maintain and improve its steelmaking capability. This will enable it to rectify, after many years of neglect due to paucity of funds, some major deficiencies in its plant, such as the absence of a raw material yard and handling facilities, an additional sinter plant, more power generation, etc. With the addition of the bar and rod mill and certain modifications to the existing mills, the management hopes to maintain production for some years to come at the highest levels of plant utilisation. The company has initiated steps to implement the letter of intent for expanding its saleable steel capacity from 1.74 million tonnes to 2.10 million tonnes per annum. The Joint Plant Committee (JPC) has sanctioned a loan of Rs 80 crore to the company out of the Steel Development Fund for financing the rupee requirements of some major projects undertaken by it. These projects include schemes for modernisation of the facilities at the medium and light structural mills, improvement in infrastructural facilities such as a waste recycling plant, improvement of town services, etc. The company also proposes to approach the JPC for financial assistance of about Rs 300 crore to undertake other capital projects. The company has entered into an agreement with Korf of West Germany to set up a new company, subject to government approval, for the import of steelmaking technology which eliminates the use of coking coal and substantially reduces the necessity for power. At present, the size of such a production unit it restricted to about 3 lakh tonnes per annum, but it is hoped that higher tonnages might be possible in the near future. This will be a revolution in steelmaking in India and the future growth of the steel industry can be assured on a more viable basis.

The company has decided to utilise the slag, a waste material arising from the blast furnaces of Jamshedpur works, by adopting a well established process for the manufacture of portland blast furnace slag cement by mixing the slag with clinker made from limestone. For this purpose clinker manufacturing facilities are proposed to be set up at Maihar in MP which is close to the limestone deposits. The grinding and mixing units for the manufacture of cement will be located at Jamshedpur. The total capital cost of the project is estimated at Rs 106 crore which will be met partly out of internal resources and partly out of term loans to be negotiated with the financial institutions. The company was granted permission by the Department of Company Affairs to merge Indian Tube Company with it. Some procedures have to be gone through before the merger finally takes effect.

During the year ended March 1985, TISCO hoisted new peaks in production, sales and profits. Production of saleable steel at 1.714 million tonnes was 5.4 per cent higher than the previous year's 1.626 million tonnes. The turnover increased from Rs 781 crore to Rs 982 crore and with margins more than doubled gross profit expanded from Rs 63.15 crore to Rs 166.69 crore. Although provision for depreciation claimed more and tax liability was Rs 12 crore (nil), net profit amounted to Rs 84.74 crore compared to Rs 20.01 crore of 1983-84. Dividend has been stepped up by 4 points to 21 per cent. The distribution is covered 5.60 times by earnings as against 1.63 times previously. These results reflect the impact in a full year of the increase in selling prices from July 24, 1983 and further increases from June 22, 1984 and February 21, 1985. The new Chairman, Russi Mody, attributes the present profitability of the company to high performance as much as increase in selling of prices. "Had we operated our plant at the same level of capacity utilisation as the other plants, we too would have made a marginal loss", he adds. He also asserts that the increase in the price of steel in the last 15 years, including the recent one, is lower than in those of oil, coal, cement and power—all of which are important inputs in the build-up of steel costs. Mody tells shareholders, "Let no one be ashamed of high profits, honestly secured and re-employed in strengthening the company, and the national economy." The company's dealings with the government continue to be cordial, but Mody expresses a sense of disappointment at the interminable delay that still takes place in obtaining a decision even where the case for it is incontrovertible. Citing an example, he mentions a proposal the company made to the government in August 1984 to allow it to import 1.50 lakh tonnes of sponge iron which, with the addition of scrap, would enable it to produce an additional 3 lakh tonnes of steel, of which about 2.65 lakh tonnes would be billets which are in short supply in the country and would have to be imported at far

greater cost than sponge iron. He says although everybody in Delhi has welcomed the proposal in view of the saving in foreign exchange, but in spite several follow-ups, no decision has yet been conveyed to the company. Twice during the year there was a shortage of coking coal at the company's works due to a decision by the government not to supply coking coal to the company. Subsequently, the decision was revoked, but the government made it clear that the company must rely on its own collieries or on imports in future. The management has planned a massive investment in the collieries during the next 5 years to enable the company to attain 100 per cent self-sufficiency. After long drawn out negotiations with the Bihar government, an agreement on the ownership and management of the company's lands at Jamshedpur was signed. The lease between the state government and the company has not yet been signed even after one year since the agreement was reached. Mody says that a rapport has been established between the management and the workers of the Tata Steel Works, in the mines and collieries, and in various offices and stockyards throughout the country which "it would be difficult to find elsewhere in the world". He has assured the workers of his total commitment to their welfare and happiness consistent with the prosperity of the company. J R D Tata, who had been Chairman of the board for 46 years, has stepped down from the Chairmanship. He will, however, continue as a member of the board. The board has appointed R N Tata as Deputy Chairman and S A Sabavala as Vice-Chairman.

*ORIENT PAPER AND INDUSTRIES* has produced good results for the year ended March 1985 with an all round increase in production, sales and profits. Production of paper and board was 1,27,626 tonnes as against 97,109 tonnes in the previous year in spite of the "slowdown tactics, cessation of work and other obstructive activities" resorted to by workmen from time to time in some departments at Brajrajnagar mills in Orissa. Moreover, the Orissa State Electricity Board imposed restrictions on supply of power from November 1984 to June 1985 which adversely affected the economic working of the caustic soda plant there. Production of cement was also higher at 4,10,461 tonnes against 3,35,599 tonnes. Because of a major breakdown in the cement mill, there could not be any production for a couple of months from mid-December 1984 to mid-February 1985.

The company's sales amounted to Rs 122.97 crore compared to the previous year's Rs 85.54 crore and gross profit increased from Rs 8.18 crore to Rs 10.67 crore. Profit margins declined due to a further increase in the cost of chemicals, raw materials, salaries and wages, spares and other inputs. Net profit, however, expanded from Rs 2.88 crore to Rs 5.07 crore to cover the unchanged dividend 4.39 times as against 2.49 times previously. The directors point out that supply of bamboo and hardwood from MP and from the leased out forests in Orissa continues to be inadequate. Illicit fellings have affected the potentiality of forests adversely. The company had to purchase these raw materials from distant sources at a higher cost. While the company's application for renewal of the agreement for supply of bamboo for a further period of 12 years is pending, the Government of MP has informed that the quantity of raw materials to be supplied to the industry in the next 10 years would be gradually reduced. The company has been asked to raise industrial plantations of bamboo and hardwood species through a joint sector company to be floated by MP Rajya Van Vikas Nigam, a state government undertaking, as promoter and the company as co-promoter. The joint sector company will supply the produce first to the company and would sell the balance to others. The company is also negotiating with the Government of Orissa for industrial plantation of bamboo and wood to ensure steady supply thereof to the company's mills at Brajrajnagar.

The directors observe that the enhancement of the specific rate of excise duty by Rs 210 per tonne on printing, writing and kraft paper has had an adverse effect on the offtake in the otherwise slack paper market. The supply of white printing paper at Rs 6,400 per tonne continues to be far below the manufacturing cost. Consequent upon promulgation of an Ordinance by the Governor of AP validating the increase in the Mineral Right Tax on limestone from Rs 4.50 to Rs 40.50 per tonne, the company alongwith other cement manufacturers filed petitions in the Supreme Court. As per the interim order, all cement manufacturers in the state are required to pay 25 per cent of the enhanced tax on limestone and furnish suitable security for the balance to the state government pending final disposal of the matter. The company has purchased land in Haryana for the purpose of implementing the projects for manufacture of air pollution control equipments and heat and mass transfer equipments and components, for which it has received letters of intent from the government. The government has also approved foreign collaboration agreements for both the projects. The company received from Panafrican Paper Mills (EA), Kenya, Rs 137 lakh for technical know-how and services rendered and Rs 38 lakh being dividend on shares for 1983-84.

*INDIA CEMENTS* has drawn up a capital investment plan of Rs 25 crore for the next three years, apart from the modernisation programme to convert the present wet process in the Sankarnagar plant to a more fuel-efficient process. In the light of the results obtained at this factory, the company will take up the Sankari factory's conversion. On a representation made by the company, the derated capacity and the sickness relief to the Sankarnagar factory were continued in 1984-85. The company's representation for continuing the relief in the subsequent years is being considered by the government. In view of the modernisation programme contemplated by the company, it has also requested that the sickness relief be continued for a 5-year period, instead of on a year-to-year basis, to finance a part of the programme. IDBI has sanctioned a term loan of Rs 746 crore under the Project Financing Participation Scheme in participation with IFCI, ICICI, LIC and GIC in connection with the modernisation project at Sankarnagar and Sankaridurg. IDBI and UTI have also sanctioned financial assistance in the form of term loans/subscription to privately placed debentures.

The company has turned in good results for the year ended March 1985 with production, sales and profits all higher than in the previous year. The average daily limestone mined from the Sankarnagar quarries increased from 860 tonnes in March 1984 to 1,696 tonnes in March 1985. For a long time, limestone raising from the company's own mines at Sankarnagar averaged only about 800 tonnes per day and the company had to rely heavily on outside contractors, which dependence now stands reduced. Production of cement at the Sankarnagar factory was 7.66 lakh tonnes and that at the Sankari unit 6.19 lakh tonnes, against 5.94 lakh tonnes and 5.22 lakh tonnes, respectively, in the previous year. Sales amounted to Rs 96.28 crore against Rs 72.59 crore and gross profit was Rs 9.65 crore against Rs 6.83 crore. These figures show enhanced margins. With both depreciation and taxation requring more, the gap has been narrowed and net profit turned out to be Rs 4.63 crore (Rs 3.15 crore). Dividend has been stepped up from 16 per cent to 20 per cent and is still covered 4.72 times by earnings as against 4 times previously. During the year, the company spent Rs 5.35 crore on plant, machinery and equipment, both in the factories and mines to sustain the new level of operations. The company has been pursuing progressive policies in relation to its employees and has instituted several welfare measures for their benefit. The latest such measure is the 'own your own house scheme' which has evoked a very good response. Under the scheme, the company procures land, arranges housing loans and builds the houses, which on completion are given to employees on full ownership basis, the loans being guaranteed by the company and repaid by recovery from the employees in easy instalments. The company has already handed over 30 such houses to employees at Sankarnagar factory and 50 houses are under construction at the Sankari factory.

# Project Tiger and People

## A Report on Similipal

THE idea of selecting certain areas of the country for the development of a natural forest region free from human interference took shape in the early seventies. In 1973 Project Tiger was conceived. It was named Project Tiger since usually the free flow of nutrients through the complex web of nature in the forest ecosystems culminates in the emergence of the tiger. For in a natural habitat micro-organisms break up plant and animal residues to form humus which accounts for soil fertility. The resultant diverse vegetation conserves soil and enriches water. Predatory animals like tigers thrive on this kind of environment.

Initially in 1973-74 nine tiger reserves were established. Later two more were added in 1979 and four more in 1983. Each reserve has a core area of the project where the habitat is to be completely free from any interference with a buffer zone all around the core. As the number of reserves increased the total number of tigers, according to the 1984 census, has increased four times to become now almost a thousand. Besides deer, elephant, rhino, wild buffalo and other animals have also multiplied. Similipal is one of the earliest reserves established in December 1973. It is located in the Mayurbhanj district of Orissa.

Mayurbhanj district is in the north-east corner of the state at the trijunction of three states with Singhbhum in Bihar and Midnapore in West Bengal on the border. Most parts of the district consist of forests.

### BEFORE INDEPENDENCE

Till the time of independence Mayurbhanj was a part of the princely state of the Bhanjdeo Rajas. One of the few dynasties in the country to have an almost unbroken succession for nearly a thousand years, the Bhanjdeo kingdom virtually became a tributary of the British East India Company in 1812. But it was during the reign of Sri Ramchandra Bhanja Deo from 1890 that the state was firmly integrated with the economy outside. The discovery of iron-ore deposits in Gorumahisani in the north-eastern part of the state paved the way eventually for the establishment of the Tata Iron and Steel Company at Jameshedpur in the 1910s. It was also the period when more systematic exploitation of forests began in the district. Till then the exploitation of forests, which started in 1885 with the establishment of railways and mines in the neighbouring British administered province, was done departmentally with somewhat irregular leases to businessmen and traders. Moreover, the exploitation of forest produce was confined to the peripheral regions of the vast forest area of the state. The central core of the forest area known as Similipal itself was relatively untouched. Similipal served as the hunting reserve of the Rajas. But in 1906 the Raja entered into a contract with B Borooah and Company. The company was given monopoly rights on a thirty-year lease for a large area including Similipal forest. Meanwhile, Mayurbhanj State Railway came into existence connecting Baripada, the state headquarters, to the Bengal-Nagpur Railway. Borooah and Company's contract continued till the merger of the state.

It appears that prior to this contract, human settlements were there only on the frontiers of the central core of Similipal forest. Most of the people belong to the Bathudi, an Oriya tribe. The company for its own purposes encouraged human settlements even inside the forest, although the extent of such settlement is not very significant. That seems to be the period when the Kolhas (presently the majority in this part) and other Bihari tribes came and settled here. This was the period when a large influx of tribals from Bengal and Bihar came and settled all over Mayurbhanj. The Santhals became the largest tribe of the state. Most of the people settled here during what they call the 'Ramesh Bandobast', the first land settlement survey in Similipal forest conducted by Ramesh Chandra Ghosh in 1927. In fact the very names of many villages inside the forest indicate the migrant origin.

These changes affected both the social life of the state and the forest-based economy. But the interior forest area of Similipal itself was relatively less affected and it continued to be the pleasure hunt of the feudal kings. They organised hunting expeditions for the pleasure of both themselves and their guests and British masters.

After independence Maharaja Pratap Chandra Bhanja Deo signed the instrument of merger in October 1948 and on January 1, 1949 Mayurbhanj became a district of Orissa.

The district presently has a population of about 1.58 million. More than 45 per cent of the total geographical area of the district is covered by forests. With more than 58 per cent of its population comprising tribals, the district has the highest population of tribals in the state. The single largest group is Santhals who originated from the neighbouring Chota Nagpur region. They are followed by the Kolhas, Bumij and Bathudi tribes. Altogether there are as many as 46 tribes in the district. The overwhelming majority of the population is engaged in cultivation.

The central portion of the district is what is known as the Similipal area. The Meghasani hills, the highest in the region, form the southern extreme of the long Similipal hill range. The hill range, which receives the monsoon at its advent, influences the climate of Orissa, Bihar and West Bengal. The range is also the source of a number of rivers and rivulets. Budhabalanga, Gangahara, Sone and other rivers and 12 rivulets originate in Similipal. Some of them join Subarnarekha and Baitarani rivers. With an unusual variation in altitude from 30 metres to 1,000 metres Similipal has a wide variety of forests—from semi-evergreen to extreme dry deciduous forests. Similipal is also the abode of wild animals like the famous Khairi tiger, leopard, elephant, sambar, deer, python, hyena, etc. Thus this somewhat unique character of the Similipal forest as a natural habitat seems to have determined its choice as a National Park.

In 1956, Similipal was declared a National Park for conservation purposes and for the development of tourism. In 1972 the Wild Life (Protection) Act came into force. Orissa state made its rules under the Act a year later. In 1973 northern Similipal was notified as a National Park under the provisions of this Act. The new National Park area of 304 sq km became the core area of Project Tiger. The buffer zone around the core has been declared a sanctuary under the same Act. Both these legal provisions empower the government to take steps to prohibit or regulate human activity in the notified areas. Thus the total notified area (legal status: sanctuary) is about 2,750 sq km of which the core (legal status: National Park) was initially 303 sq km. Recently since May 1, 1985 the core has been extended to 800 sq km. Total area-wise it is the fourth largest tiger reserve in the country. And core area-wise, it is the fifth largest. A separate directorate of Project Tiger took over the management of the forest.

### ACCELERATED EXPLOITATION OF FORESTS

Meanwhile, the systematic exploitation of forests in Similipal which began with the Borooah Company continued unabated on an ever-expanding scale. Construction of roads inside the forest paved the way for it. From almost no roads in the beginning of the century, the interior forest has now about 900 km length of roads. The Similipal region contributes about 90 per cent of the district's forest revenue. Timber and firewood among the major forest produce and sal seeds among the minor forest produce are the chief sources of revenue in Similipal. The auctioning off of areas has been done more organisedly since the mid-sixties when the Orissa Forest Development Corporation came into existence. The revenue earned from timber and firewood was on an average Rs 3,500 per sq km of forest in Orissa. In Similipal it became Rs 12,000 per sq km. Jashipore in the local parlance became a timber town. Situated on the Bombay-Calcutta national highway, it became a transit point for forest produce en route to Calcutta, the headquarters of the trade. In sal seeds local contractors grew to be politically very powerful people. For instance, the most influential trader in the entire Western Orissa now was a small trader from Sambalpur who grew with the trade in sal seeds of Similipal.

Alongwith the legal trade, illegal trade also increased. Large scale felling of trees for commercial purposes took place. Besides in Similipal an organised trade in tuskers, animal skins, etc, also thrived. The increasing scale of both legal and illegal trade in forest products and animals over long years resulted in the growth of a section of forest officials who are closely involved in these operations. Thus among the vested interests that decisively influence Similipal now should be included a section of the forest bureaucracy.

Eventually in December 1979, a new organisation called Similipal Forest Development Corporation (SFDC) took over the production and trade of both major and minor forest produce in the buffer zones of Similipal. Initially SFDC eliminated all forms of middlemen. But in later years the middlemen came back in the form of mahants in forest villages, acting as middlemen between the corporation and the tribals. In April 1980 the complete prohibition of felling of trees for any purpose, already in force in the core area, was extended to the entire Similipal. But as the demand for forest products went on increasing, the market laws could not be controlled by such legal notices.

Consequently the deforestation process became accentuated. Timber, firewood and various other forest products are smuggled out regularly. An interesting feature here is that denudation is more in the uninhabited parts and less in the inhabited areas. The few villages inside Similipal are dispersed over a large area. A single village of very few households having no other human settlement anywhere around is quite common. In areas around the human settlements the presence of people effectively became a check on illegal trade. Finally, as an SFDC report puts it, "with the stoppage of felling of trees . . . organised theft from the forest has commenced" (page 7, "A Note on Future Management of Similipal Forest", SFDC, December 1983). Given the fact that the entire area is cordoned off and free entry is prohibited under the provisions of the Wild Life Act, such organised theft cannot take place without the knowledge and consent, if not the active involvement, of the forest officials. Hence the environmental degradation, a familiar phenomenon in other forest areas of the country, also affected Similipal. Simul (silk cotton trees) from which the region acquired its name, were the chief targets. Simul has a life span of over 400 years; yet no simul trees older than 100 years are now found in the forests. Thus Similipal itself has becom a misnomer.

The forest area of the district, which is 51 per cent according to the revenue department and 45 per cent according to the forest department, has been shown by satellite survey to be only 20 per cent. In the village Gurguria the patch of land which houses the Gram Panchayat office is still officially 'reserve forest'. This deforestation process led to afforestation programmes. A separate afforestation wing of the forest department is now actively engaged in the buffer zones. Under this programme totally new species are being introduced such as eucalyptus at Chahala, Sunajhari (Acacinauriculiformis), Chakunalas (Kesia) and others. The introduction of new species has serious implications for the environment.

### ENTRY OF PLEASURE-SEEKERS

The scenic beauty of the region coupled with the wild life also made Similipal an attractive place for tourists and other pleasure-seekers. Tourists need permits from the forest department to enter the area, but these permits seem to be issued rather liberally. Inside the forest there are a total of 15 rest houses. In the year 1984-85 as many as 560 parties constituting 5,000 people were issued permits from Jashipore alone. And Jashipore is only one of the five entry points to the forest. In addition to 'pure' tourists, the list includes a number of officials whose visit to Similipal has very little to do with their official duties. Thus the register at Jashipore reads like a who's who of Eastern India. It includes the names of the American Consulate General and the Governors of Bengal, Bihar and Orissa. The House Committee and the Public Account Committee of Orissa Assembly, the Board of Revenue (twice in one year), the Chief Justice, the Chief Secretary, top forest officials of all the three states and top officials of the police and other departments all visited Similipal. Evidently secluded Similipal has become the pleasure haunt of the elites in the region. According to the villagers alcoholic drinks and even womanising are a part of this tourism. There are also reports of poaching. The impact of all this seems to be devastating on tribals in the vicinity. A section of the tribals have become suppliers of the means of such pleasure to the visitors.

On the whole now there are traders of forest produce and smugglers of ivory and animal skins who operate through a chain. At the apex are the big traders and smugglers of both Orissa and West Bengal who are also politically very influential. Next in the ring are traders, especially Marwaris at Jashipore and Baripada, followed by mahants and mukhias of the villagers. The last are the villagers, some of whom are settled in the villages for these purposes.

From the government side there are four agencies which overlap one another. First there is the forest department which generally looks after the protection of plain forests and monitor forests to meet the requirements of the forest produce of local inhabitants. Large parts of Similipal come under the territorial division of the Karanjia forest division and a small part under that of the Baripada division. The SFDC is the sole authority for production and trade of all forest produce in the buffer zones (which is presently around 1,950 sq km). The Project Tiger directorate is in complete control of the core and is also in charge of manipulation of habitats in the buffer zones. Finally, a separate afforestation division looks after the afforestation programme in the sanctuary. Predictably the four agencies are at loggerheads with one another and are always willing to give, both officially and unofficially, information about how the other agency is responsible for all the ills of the region. Together they blame politicians and the people.

### NEW MOVE

Meanwhile, a new move to take the Similipal a 'National Biosphere Reserve' is afoot. Initiated by UNESCO under its Man and the Biosphere (MAB) Programme, the Biosphere Reserve Programme is intended to conserve representative ecosystems. It is aimed at providing natural conditions and long-term conservation of plants, animals and micro-organisms. The concept emphasises the need for conservation of entire ecosystems of suitable size, to ensure self-perpetuation and unhindered evolution of the living resources. It is distinguished from the concept of Project Tiger in its emphasis on research and scientific management. Instead of focusing on particular species like tigers or wild animals the emphasis is on the sum total of biological communities whose elements are interacting within a single life-zone. Already about 12 such zones have been identified for the development of Biosphere Reserves in the country. A seminar held at Baripada in May 1985, sponsored by the state-patronised Orissa Environmental Society, recommended that Similipal should be added to the list. The state bureaucracy, especially the forest department, does not seem to be in favour of the idea as it would mean Central take-over of the entire project. But we understand that the proposal is under the active consideration of the Centre's Department of Environment.

Meanwhile since May 1, 1985 the core area of Similipal has been extended from 304 sq km to 800 sq km. The decision to extend the core has become a controversial decision. For extending the area and thereby increasing the tiger population (which now numbers 65 in Similipal) would result in imbalances in the population between tigers and their prey animals. Consequently tigers would have to resort to human killings. In fact, a recommendation in the proposal of the project itself has clearly stated that "holding the tiger population artificially high levels . . . can have disastrous results for the habitat and its dependent fauna". The SFDC has throughout opposed the extension. Yet the government has gone ahead and extended the core area of the Project Tiger.

### IMPACT ON THE PEOPLE

It is against this background that one should see the impact of Project Tiger on the people of the region. The entire Similipal Sanctuary has about 2,750 sq km. It has about 75 villages with 40 villages in Karanjia, 15 villages in Baripada and 20 villages in Udala tehsils. Within this sanctuary the original core had only 10 villages but the extended core has about 25 villages.

But it should be noted that the impact of the project cannot remain only within the confines of the core or the sanctuary. Wild animals moving freely in the forest usually follow the streams and their actual mobility is determined by nature. Since the legal boundaries demarcated by the Wild Life Act are not enforceable on wild animals themselves, the people both in the buffer zones and the surrounding areas (what is called the cultural zone) should also be included for all practical purposes. In that sense the project affects 150 villages—110 in Karanjia, 20 in Udala and 20 in Baripada tehsils.

The average population in these villages is 200 or less. Some of the villages have as few as 10-15 people. Hence the number of people affected directly or indirectly by the project will be around 25 to 30 thousand. But within the core itself the population will not be more than 5,000. Since the forests are relatively virgin forests where large scale human settlements are of recent origin, the density of population is extremely low. In the core region it is around 5 persons per sq km.

An overwhelming majority of these people are tribals, with Kolhas and Bathudi being predominant. They are all dependent on agriculture, apart from irregular forest work. The cultivation is settled and not shifting cultivation.

Ever since the area has been notified as the National Park and Sanctuary, moves are afoot to evacuate the people. Since 1978 the government has issued evacuation notices to the villagers at least three times. But as yet they have not been enforced.

In the government's view the evacuation is necessary for four major reasons. Firstly, it is argued that the presence of human settlements in the vicinity of predatory animals is dangerous to the lives of people and cattle. One instance of a tiger killing cattle is often cited in support of this argument. But it should be kept in mind that the perception of man's relationship with predatory animals which informs the plains people does not govern the tribal's own attitude. Rare instances notwithstanding, the tribals do not view wild animals as a danger to their lives. This simple and yet profound difference in perceptions seems to be completely lost on the government.

Secondly, poaching by tribals, it is argued, is dangerous to wild life and would defeat the objective of the project. One instance of a tiger which killed cattle (the same instance referred to above) being killed by tribals in Uski village is often mentioned. Other than this there seems to be no general poaching by tribals of Similipal. But a major event every year called *Akhand Shikar* (continuous hunting) is the bone of contention between the people and the state.

## GROWING TENSION

The Santhals of Bihar celebrate the first day of the Vaishakhi month (usually in the second week of April) as Akhand Shikar day on which tribals go on mass hunting expeditions and present the meat of the animals to their community head. This practice got a boost in Similipal when the Rajas encouraged it and in the process also generalised it. Every year they used to lead a large mass of not only Santhals but also other tribal people in a massive hunting expedition. It almost became obligatory for the subjects of the king to accompany him. Since otherwise the tribals were prevented from hunting in the reserve forests of Similipal, for the tribals it became an occasion for hunting and enjoying meat. Thus during the Rajas' rule the ritual of the tribe got institutionalised on a larger scale. The practice has continued even after the Rajas. It is this practice that is now referred to as Akhand Shikar.

The forest department officials we met maintained that this killing expedition is harming wild life in the forest. They also point to the number of animals injured during the hunting. There seems to be a controversy about the precise period of Akhand Shikar. While some officials maintain that it is no longer confined to Vaishakhi day (known as Pana Sankranti in Orissa) but extends over a whole period of two months, others say it is only for one week. In any case the government is making determined effort to curb this practice. Given the vast area in which thousands participate in the hunting expedition, governmental efforts have had limited success. In 1982 the Jharkhand Mukti Morcha (JMM) championed the Pana Sankranti and attempted to assert the right of tribals for Akhand Shikar. Well known Jharkhand leader Shibu Soren was arrested along with a large number of people. This year, five battalions of the Orissa military police was mobilised. About 110 people were arrested and were charged with violation of the Wild Life Act read with the Indian Arms Act. They were produced before the sub-divisional magistrate who remanded them to prison. Two months later when the team visited the area they were still in the overcrowded Karanjia sub-jail awaiting trial.

The forest officials maintain that to prevent such expeditions it is necessary to evacuate the people. But the curious fact about Akhand Shikar is that contrary to the official view, Similipal tribals themselves do not seem to be participating in it. The people say that if they really want to kill wild animals they do not need an occasion like this once a year since the animals are easily accessible to them. The fear of evacuation seems to have put off any prospective hunters amidst them. In any case all the arrested people presently lodged in Karanjia sub-jail are from outside Mayurbhanj district. The Akhand Shikar, which by and large is the practice of tribals from outside, has now become the single major source of violent tension every year.

The government also feels that evacuation of human settlements in and around the core area will also eliminate illegal trading activities since the tribals are the source of supply of materials and labour for all such activities. Here the role of forest officials mentioned earlier is completely ignored.

But the major reason for the government's programme of evacuation is the idea that tiger reserves should be left without any human interference. Cultivation in such a zone will introduce new bio-chemical interactions which upset the natural equilibrium. Since the project conceives the area as a region where free flow of nutrients through the complex web of nature will help development of the natural ecosystem it should be free from any human interference. Hence, it is argued, the need for evacuation.

The people of the Similipal are dead set against evacuation. Some of the villages which have been issued notices have written to the government to that effect. A government pro forma seeking to find out the extent of land and properties people have and the compensation expected remained a dead letter. People simply refused to fill up the forms. Given their food and drinking habits and their culture and ways of living which are firmly rooted in forests and tradition, tribals feel insecure about any idea of leaving their places. Meanwhile government denotified some reserve forests in the newly irrigated Udala block to rehabilitate people. Some of the people were taken around the place. But the people remain unconvinced. They cite the example of the experience of tribals affected by the Hatigarh Irrigation Project in Keonjhar. Almost ten years after the evacuation, people there are yet to receive the compensation and in the new settlement areas many people, unable to adjust, have actually died. It is reported that in one single village alone more than 80 people died of starvation in these new settlement areas. Hence the people are in no mood to co-operate with the government in evacuation. Socialist Unity Centre of India (SUCI) whose MLA represents this area in the Assembly is opposing the evacuation programme and has held dharnas and meetings at various places.

## THE REAL CHOICES

The conception that representative forest areas of the country should be preserved for research and scientific purposes and for the maintenance of the ecological balance in the long range may have its validity. It is on this basis that the government is initiating moves to evacuate people in Similipal. But the actual execution of such a programme cannot be judged merely by its scientific validity. For the execution takes place in a given social and political environment. This environment is reducing the entire conception of conservation of forest, in which lofty ideas and rational principles are embodied, to choice between different interests.

Thus in Similipal the choice is not between no poaching and poaching but between gentlemen poaching by tourists and organised smugglers and occasional tribal poaching. The choice is not between no cultivation and cultivation but between large scale illegal denudation of forests and cultivation by tribals. The choice is not between preservation of the natural ecosystem and imbalances introduced by cultivation but between mindless pollution by dangerous new species under the afforestation programme and fertilisation of land by tribals. The choice is not between complete removal of human settlement and deforestation by tribals but between organised deforestation with the connivance of state agencies and limited deforestation caused by tribals. In the end the choice is not between an ecosystem without human interference and that with human interference but it is between interference by tribals and interference by smugglers, traders and pleasure-seekers. It is a choice between two sets of human beings.

It is this inescapable choice that is now shaping the emerging social tension in Similipal. But the manner in which the state is proceeding from a National Park, to Project Tiger with a core area of 304 sq km and then an extended core area and now the idea of National Biosphere Reserve, in disregard of the actual problems it is generating at field level, in disregard of the people and their perceptions will only intensify the tensions. Today the tensions are reflected only during the Akhand Shikar. But as the two sets of choices gradually take their shape, social tensions will only be accentuated and local people will be driven into hopeless corners. Hence there is immediate need for democratic intervention.

[With a view to understanding the problems intensified or generated by Project Tiger, a team of scholars investigated the complex issues involved. The team included Hutasan Purohit, Ashok Babu and C V Subha Rao. The above is the text of the team's report.]

# Police Terror against Landless Peasants

## A Report from Dehradun

**Navin Nautiyal**

**Bharat Dogra**

THE existence of big mansions of 'gentlemen' farmers side by side with the small huts of landless or near-landless peasants, unsure of the next day's meals, in the terai area of the Kumaon and Garhwal divisions in Uttar Pradesh has led to several sporadic movements for redistribution of land and other measures of social justice. The events in Tehri-wala village in Dehradun district have to be seen against this background.

This village, earlier known as Tehri Farm, is located at a distance of about 45 kms from Dehradun, a little away from the Dehradun-Hardwar road. The curious name of the village can be traced to the fact that the royal family of Tehri owned a large part of the land which was later sold to a powerful Seth. Over the years nearly half of this land has been purchased by poor migrants from the hills, displaced from their homeland by ecological ruin and other factors. The Seth, moreover, cornered a lot of village common land and started cultivating it for his own benefit. He also managed to avoid ceiling laws by getting the land registered in the name of a co-operative. Using his money power and high level political connections, the Seth has managed to avoid any action against him for encroachment on common land as well as for the breach of ceiling laws.

In mid-1983 a local organisation of the rural poor, the Bhumihin-Kisan Sangharash Samiti (BKSS) took the initiative in demanding the redistribution of this land, illegally occupied by the Seth, among the poor. On July 23, 1983, BKSS activists and supporters occupied the community land. The police was called in but the BKSS leaders convinced them that the land was earlier being cultivated illegally. On August 20, the BKSS activists further occupied the illegally held land in excess of the ceiling. In the meantime, due to the administration's attention being drawn towards this land by the struggle, demarcation operations had been undertaken which had further exposed the illegality of the previous ownership. A sizeable part of this land which was lying barren under the Seth's occupancy was now planted by the rural poor. On October 14, a procession was taken out in Dehradun by the BKSS activists and its supporters demanding that this land be properly redistributed among the landless and the poor. However, the administration took no action.

At the time of harvesting when the rural poor had already harvested the paddy crop, a police force from Rishikesh town was sent to these fields. Due to the united stand taken by the people no arrests were made, although later 31 activists were implicated in legal cases. A protest demonstration against this was held in Rishikesh on November 17.

On December 14 at the initiative of BKSS land was distributed among 200 landless or near-landless families, including 12 tribals who had been working as bonded labourers for the Seth for over a decade. On January 16, 1984, more land was redistributed among the poor.

On January 23 the police invaded the village and started destroying the standing crop of wheat. In the next four days, 66 persons were arrested, including several women. Several of them, including women, were beaten up indiscriminately. As a result of this beating one pregnant woman aborted and had to be sent to hospital from the jail.

Later the administration handed over the above-ceiling land to the horticulture department. However, villagers threw the demarcation posts into the Ganga river to protest against the denial of this land to the landless, in keeping with the established policy of the government. The police came again and this time 47 persons were arrested.

On May 23 there was an arbitrary lathi-charge by the police in the village. Some villagers were taken to the Seth's mansion and beaten up there. The police started coming to the village from time to time and threatening the villagers with arbitrary arrests. As a BKSS activist said, "the administration and its police were silent for decades when the Seth was illegally cultivating the land. When we tried to give the land to the poor under the government's own policy and programme, we were greeted with lathis and arrests."

However, after some time there seems to have been a change in the attitude of the administration and towards the end of 1984 such atrocities and threats stopped. Thus the year ended on a note of triumph for the villagers who had been able to bring under cultivation nearly 200 bighas of land. However, as administrative action accepting their occupation of this land has not been taken yet, they are still living an uncertain existence—nearly two years after their struggle started and after several sacrifices.

While appealing to the concerned authorities for the necessary administrative action in this regard, BKSS has also demanded that land meant for landless but occupied by vested interests in other neighbouring villages should also be distributed among the rural poor. Similarly, the demand for protecting the interests of villagers, such as those of Bapugram, who are being harassed by the forestry department, has been raised. Hundreds of villagers are facing eviction on account of arbitrary action by the forestry department.

Several long-standing problems of the landless or those having no security of the land being cultivated by them have not been satisfactorily settled by the administration even though the Mangal Dev Visharad Committee, several press reports as well as social workers have drawn repeated attention to these. The only encouraging sign is that some groups or parties close to the interests of the rural poor are trying to raise these issues but it remains to be seen how far they will unitedly struggle on these issues.

**SRI LANKA**

# Constraints on a Solution

### Qadri Ismail

SRI LANKA's ethnic conflict is thirty years old at least; it began in earnest only after the 'Sinhala Only' Act of 1956, which replaced Sinhala with English as the official language. The Tamils, deprived of an equal place in the national life, began their protests then. Sinhala chauvinists like to see the conflict as being centuries old; as being a relict from the first South Indian invasion of Sri Lanka. Thus they lionise their king Dutugemunu, the most famous 'Sinhalese' to defeat a 'Tamil' invader. All this is a selective and not entirely accurate interpretation of history. The Sinhala Buddhist identity as we know it today was a creation of the nineteenth century, part of the colonial legacy since it emerged inspired by and as a reaction to European nationalism.

It is such an interpretation of history which sees the Sri Lankan Buddhist people as being the race chosen by the Buddha to preserve the religion, that is the main mytho-psychological force acting on the people which prevents a settlement today. There is no historical evidence backing up these myths: that the Buddha ever came here; or that he died at the same time as the mythical father of the Sinhala 'race' landed here from India; or that he then bestowed his dying blessings on Lanka. The standard text of the Mahaparinibbana Sutta, the last sermon of the Buddha, makes no mention of this. The Mahawamsa, or the Great Chronicle of Sri Lanka, on the other hand, does. However, as many historians have noted, this was written by Buddhist priests not on the basis of facts but to legitimise their need to play a powerful role in ancient politics.

In an attempt to demystify the myths, something very necessary to create a humane and tolerant environment in Sri Lanka, several (Sinhala) scholars argued all this in the pages of the national press last year. They were roundly dismissed as being traitors to their 'race'. It would appear then that the Sinhala people, and therefore the Sri Lankan government which even if elected eight years ago still represents them, are not yet ready for an honourable peace. Their 'historical mission' would conflict with devolving power to the Tamils.

That is the context to the attack by the Liberation Tigers of Tamil Eelam on Anuradhapura in May this year, when 150 or so civilians, including Buddhist priests, were massacred. Anuradhapura was the ancient capital of Lanka, home of the sacred Bo tree (under whose parent, in India, the Buddha attained enlightenment) and the place where Dutugemunu won his famous battle. The daring attack and the killings were symbolically most effective: a violation of the Sinhala spiritual soul.

It is to be doubted whether the 'Tiger' guerillas ever foresaw the consequences of that massacre. Their intention was to prevent, once and for all, retaliatory attacks by security forces on innocent Tamils in the north whenever the guerillas successfully attacked them. The 'Tigers' failed here because the forces again retaliated. More disastrously from their point of view, Sinhala opinion, led by the Buddhist clergy, pressed for peace more or less at any cost and strengthened the hand, eventually, of Jayawardene. This led to him and Rajiv Gandhi being in a position to arrive at what appeared to be a workable compromise on a political settlement. In return for 'concessions' to the Tamils, Gandhi would break up guerilla camps in India. After Anuradhapura, he had the 'moral' right to do so; and if a settlement was reached, as seemed likely, he would have the political sanction too.

But the threat of more Anuradhapuras seems to have left the collective mind of the Sinhalese. Most of them are once again not talking peace. They are certainly against any 'peace' which would mean "giving something away" to the Tamils. This, after all, is sanctified Sinhala Buddhist country; how can (Hindu) Tamils hope to rule even a part of it?

Without the demystification of such a belief, without the spread and popular acceptance of modern human rights consciousness, there can never be a lasting peace in Sri Lanka. Jayawardene has promised peace by the end of the year. What he looks likely to do is to offer the Tamils regional autonomy on the Indian model within the framework of a unitary constitution, an offer they cannot (because of Gandhi) refuse. A leading Tamil lawyer told me this was impossible, that the problem cannot be solved without real federalism. But that is not likely to come about. And in another historical irony of the type that Sri Lankan politics is turning out to be full of, the government has decided not to put such a package before the people for their approval. Only last year it had argued, purely in order to deny the Tamils any 'concessions', that a referendum was absolutely necessary. Even more ironically, the TULF, which last year flatly refused to go along with the referendum call, now privately claims that a referendum is needed for the settlement to be permanent. But what Jayawardene seems likely to do is to carry through the settlement by force; being brutal, if necessary, with all dissenters.

This, of course, is not the stuff that real peace is made of. Without a public debate on the issues, preferably sponsored by the government, the Sinhalese are likely to be very suspicious. Here, the government has fallen into the pit dug by itself. The line it took till Anuradhapura on the question was that it would give nothing away to the Tamils. Here, it was loyally backed by the Sinhala press which, if anything, felt the government was not being tough enough with the 'terrorists'. Now it has to explain that devolution does not mean 'giving in' at all but, rather, granting the Tamils legitimate rights. Rather than do this, rather than admit its mistakes (if it sees them, in the first place) the government has decided to bull-

There are other areas of possible conflict. At the first round in Thimpu, the Sri Lankan delegation, led by Jayawardene's brother, merely reiterated proposals put before the aborted All-Party Conference in 1984—clearly a negotiating position. It is bound to return with further 'concessions', though one wonders whether it would make real ones like agreeing to stop colonisation of Tamil areas and granting regional governments police powers. It is also a moot point whether the government will recognise—eventually, that is, since it has currently rejected them outright—the four 'basic principles' that all six Tamil delegations at Thimpu felt cardinal for a settlement: recognition of the Tamils as a distinct nationality, recognition of their 'traditional homelands', recognition of the Tamil right to self-determination, and granting all Tamils in Sri Lanka citizenship. While Tamil and Indian opinion-makers have interpreted this as a sign that the groups are willing to settle within a united Sri Lanka (i e, to give up Eelam), the Sri Lankans argue that recognising these principles is tantamount to conceding Eelam. Presumably Gandhi, who is bound to be bouyed after settling the Punjab crisis, will force all sides to compromise. But there is no way Rajiv Gandhi, or any other foreigner, can ensure peace between ordinary Sri Lankans of different communities.

There is, too, the Muslim factor. They comprise 33 per cent of the eastern province but just 18 per cent of 'Eelam'; and in the event of the northern and eastern provinces being merged into a unit as part of a settlement, they feel they would lose any political status or influence. These fears have led many Muslim politicians in the east to think in terms of forming a Muslim political party, which will eventually happen, but has not so far solely because the pressures are not yet strong enough to eclipse petty grievances. When that happens, Sri Lanka's 'ethnic equation' will become more complex. Right now, the government is using the Muslim argument to deny the Tamils a region consisting of the north and east. While this is what the Muslims in the east desire too, that may not be all they desire. One of the significant non-issues of the conflict so far has been that of parity of languages, which was the prime issue of 1956. This is explicable since the TULF/militants are fighting today only the cause of Tamils in the north and east, where a regional government would be free to use the language of its choice. But there is also the issue of Buddhism being the state religion. At least one Muslim politician has told me privately that Sri Lankans—or rather, Buddhists—will have to get used to the fact that for a lasting solution to the (problems that may emerge in the) ethnic conflict, we will have to have parity of languages and religions.

But these are issues that will not even be broached at Thimpu. What we can at best hope for from the talks, then, is a (temporary) settlement, no solution. For permanent peace, we will have to create a Sri Lanka where all communities, just as much as all individuals, are truly equal.

# 'Holy' Alliance against Working Class

### Badruddin Umar

A NEW wage-scale was announced by the manpower and labour minister of Bangladesh on July 2, 1985. According to that announcement minimum basic wage of an unskilled labour has been fixed at Taka 560. In addition to this an allowance of Taka 288 will be paid on account of house rent, medical allowance, etc. Thus, according to the new arrangement an unskilled labour will get a total monthly wage of Taka 848. According to the old scale this total monthly wage was Taka 627. So with the introduction of the new scale there has been an increase of Taka 221 per month.

Before we go into the other aspects of the government wage policy it will be useful to consider the Noor Khan Commission recommendation in 1969 according to which the minimum basic wage for an unskilled worker was fixed at Rs 125 per month and the total wage inclusive of medical allowance, house rent, etc, amounted to Rs 155. If we calculate the rise in the cost of living with 1969-70 as the base year then it would be found that there has been an increase of 12 to 15 times. And from this phenomenal rise in the cost of living it will be quite easy to understand the extent to which the real wage has been depreciated. In order to keep the real wage at the level of 1969-70 it was necessary to fix the minimum money wage at Taka 1,800 per month. Instead according to the new wage-scale it has been fixed at Taka 848. Thus we find that even after the re-fixation of the minimum wage the real wage has depreciated by more than 50 per cent since 1969-70.

It may be mentioned here that the new wage-scale does not cover workers who are employed in private sector industries. The manpower and labour minister, while announcing the new scale, clearly stated that it did not cover workers who are employed in private sector industries and that the wages of the latter will have to be fixed through negotiation between the collective bargaining agents (cba) and the owners of such industries. In this connection he also said that the government had neither any responsibility nor any involvement in the matter of such industrial negotiations. Its only 'concern' was with the 180,000 workers employed in the nationalised industries. The remaining 1.5 million workers employed in the privately owned industries were thus excluded from the area of governmental intervention, giving a free hand to the owners of such industries.

Here it may be instructive to note that the agreement which was signed jointly by the Workers and Employees United Front (SKOP) and government representatives on May 21, 1984, also excluded the 1.5 million workers of privately-owned industries in spite of the fact that the latter participated in industrial strikes and in the democratic movement on a massive scale and quite powerfully. The other thing to note in this connection is that minimum wage for unskilled workers was fixed at Taka 455, more than a hundred Taka less than what has been provided now.

The 1984 May agreement was declared as a 'great historic victory' by the leaders of the SKOP, the leaders of 22 political parties which controlled SKOP, as well as the leaders of government. However, it soon turned out that the government was in no mood to implement the said agreement which provided for a wage increase and also for certain democratic and trade union rights of the workers. Thus the 'great historic victory' soon turned out to be a 'great historic defeat' and the SKOP launched a new movement for the implementation of the above mentioned agreement.

That a government can be so irresponsible as to throw away an agreement signed with such fanfare and after such a powerful working class strike movement which ran parallel to the democratic movement of that period may be a matter of a great surprise to many. But there was really nothing to be surprised about if we consider the circumstances in which the agreement was signed as well as the provisions of the agreement.

The agreement was signed at a moment when the working class actually emerged as the most powerful factor in the widespread democratic movement of the time and they were daily getting more and more militant. In fact, the five-point based movement which was only meant to pressurise the government for holding general elections on terms laid down by the 22 party alliance, started giving way to a kind of democratic movement which aimed at extracting very large economic and political concessions for the working people in general. The movement was being increasingly strengthened by the workers and the students who were putting pressure on the political parties to adopt more democratic and militant programmes.

This alarmed not only the government but also the leadership of the political parties which were at the head of the political movement at that time. And being thus alarmed the political leaders and their agents in the trade unions had no alternative but to surrender to the government. They were scared by the prospect of the trade union and democratic movement exceeding the limits set down by them and thus going out of their hands. The basic class interests of the leaders of the 22 parties and the men in government coincided and that made it possible for the 'brotherhood' to come to a solemn agreement which was signed on May 21, 1984. And this happened on the eve of a previously announced 48-hour general strike scheduled to be held on May 22 and 23. The strike was called off with the signing of the agreement.

Thus it is not at all difficult to explain why the workers of privately-owned industries were not covered in that agreement and were relegated to the 'goodwill' of the owners in the same manner in which they have been relegated now by the honourable minister for manpower and labour of the Government of Bangladesh. In fact, the leadership of the 22 political parties, the combination of 15 and 7, wanted and still want the political operations to be conducted within such limits as may not lead to any radical transformation of society and lay hands on their pockets. Thus they agreed to enhance the wage of workers of nationalised industries but were unwilling to do anything for at least a similar wage rise of workers of privately-owned industries. This was possible because the 22 political parties represent the interest of these owners of private industries and actually many of them directly own such industries. That the leadership of the 22 political parties and their trade unions included elements who acted as agents of the exploiting classes was proved beyond any doubt when two of them unceremoniously deserted the united front and became ministers in the important departments of commerce and information. From the leadership of the two trade union federations and two component political parties of a united front which was leading a broad-based democratic movement to ministership may seem to be a very exceptional performance. But such political conduct is nothing exceptional in Bangladesh today. On the contrary, this has now become the norm of political behaviour of the representatives of the new rich and the lumpen bourgeoisie of Bangladesh.

The present wage policy does not only reveal the very high rate of exploitation of the working class but also indicates the anti-productive character of the powers that be. This policy does not actually promote the cause of industrial development in this country. It may appear so from the favour which is being dished out to the industrialists. But it must be understood that this kind of favour, in fact, helps enrichment of industrialists at the cost of the industries which they are supposed to promote and organise.

It is not possible to go into the details of the methods which are being employed by industrialists for their private enrichment. But it can at least be mentioned that a very large part of their gains come from their purchase of machineries, raw materials, etc, and also through other manipulations. This causes considerable loss to the industries and such losses are sought to be covered by depreciating the wages of labour, by continuously increasing the rate of exploitation.

Thus the massive plunder which is now being carried on by the trading class of people in this country covers the industries. It is the same section of the bourgeoisie which has come to own the industries and indulges in the kind of practices which have been mentioned above. In their drive for more and more gains they are now set on a policy of killing the goose for the egg and in this pursuit of gains the bourgeoisie, both inside and outside the framework of power, has entered into a 'holy' alliance and is moving towards its historical destiny.

# Class Structure in Rural Bengal

### Anjan Ghosh

**Classes in a Rural Society** by Pradip Kumar Bose; Ajanta Publications, New Delhi, 1984; pp xv + 272, Rs 150.

RURAL society in India has been characterised by sharp inequalities. Village studies which constitute the staple of sociological research have highlighted primarily its caste elements. In his study Pradip Bose focuses on the rural class structure to explain the structure of rural society in West Bengal. It is based on a study of four villages in Birbhum and Purulia districts. The book developed from the author's doctoral dissertation, brings together data gathered through extended fieldwork in the villages between October 1974 and January 1976, with an additional month-long return to the Birbhum villages in March 1977 to cover the Lok Sabha elections.

Analysis of rural classes in Bengal though initiated early on by Mukherjee (1948, 1957) was eschewed by subsequent village studies which concentrated attention on the cultural aspects of community life and social integration (Sarma: 1955, Chattopadhyay: 1963). The problematic of classes in agrarian society receded into the background as sociologists contended that it did not 'correspond to divisions in rural society as perceived by the people themselves' (Beteille: 1974: 33). It was not until the impact of rural development programmes like Community Development Programme or the Intensive Area Development Programme, meant to alleviate rural poverty, was increasingly manifest in growing disparities and aggravated agrarian conflict that interest in agrarian class stratification was revived. Class cleavages among the peasantry was adduced to explain the tardy and highly skewed nature of agricultural development in Bengal (Danda and Danda: 1971, Bandopadhyay: 1975, Chakraborty: 1981). The crystallisation of agrarian conflict into militant peasant movements in different parts of West Bengal after the mid-1960s led by the Left parties also contributed to the renewal of interest in peasant classes. While on the one hand it led to enquiries into the mode of production in agriculture to ascertain the specific configuration of class conflict and class antagonisms in rural West Bengal (Bhaduri: 1973, Rudra: 1978), on the other it stirred interest in the study of peasant movements as the result of conflict of class interests (Dhanagare: 1976, Mukherji: 1978). A different perspective gained ground among sociologists as agrarian structure was 'defined in terms of relationship which exists between those who have command over land and those who operate this land by supplying labour power for productive activity' (Joshi: 1975: 204). Class relations were thus seen as germane to the agrarian social structure and attention on the processes of change in agrarian relations yielded a rich harvest of indigenous class categories like zamindar, jotedar, bargadar, adhiar, mahindar, etc (Beteille: 1974: 171-187, Xaxa: 1980). The relations underlying these terms defined the contours of conflict in rural society. In his book Bose forcefully highlights the structural nature of conflict among peasant classes in rural Bengal.

In his description of rural classes Bose follows the Marxist theoretical tradition exemplified by Lenin and Mao's analysis of agrarian class structure. The five classes which he distinguishes—landlords, rich peasants, middle peasants, poor peasants and peasant proletariat—are differentiated on the basis of landholding, exploitation of labour and the propensity to actually work on the land. Collective political mobilisation is taken as indicative of class consciousness. In the villages, Bose notices a 'close correspondence between caste and class' (p 44).

Discussing the economic attributes of class, the author provides a detailed enumeration of the elements of mode of production and distribution in agriculture for the four villages. As the principal productive resource, land is the real measure of prosperity in rural areas, substantial landholders not only acquire the other inputs of production like water from irrigation channels, improved seeds and fertilisers, they also possess the necessary draught animals and farm implements. This is confirmed by the data which Bose furnishes. Hence distribution of land is a definitive index of the nature of economic inequalities in rural areas. Landownership is more unequally distributed in the three Birbhum villages than in Tusugaon, the lone Purulia village. Among the Birbhum villages, disparity in landownership is most acute in the irrigated village of Kanchanpur where concentration of land in the hands of the landlords is accompanied by a high preponderance of agricultural proletariat (p 96). On the other hand in Tusugaon a greatly diffused pattern of landholding leads to the absence of landlords and the pre-eminence of middle and poor peasants. The number of agricultural labourers is also small in the Purulia village.

From his description of the economic structure of the villages certain changes in the nature of agrarian relations is evident. In the social composition of landlords the erstwhile high caste (Brahmins, Rajputs) landlords have increasingly been replaced by middle caste (Sadgope, Mahato) individuals, in the wake of zamindari abolition. These 'new climbers' (p 144) among the landholders prefer to exercise direct control over agricultural production. Hence unlike the absentee landlords of yore who let out their land to sharecroppers, they tend to cultivate with hired agricultural labourers working under their supervision. This has led to a decline in sharecropping and increase in the use of hired labour for cultivation. Even when land has been let out to sharecroppers, the *adhiar* (50:50 share) has been reduced to *Kisheni bhag* (33:66 share), thereby further impoverishing the lot of the sharecroppers. *Mahindars* or annual farm servants who were paid a lump sum in cash and kind are also being replaced by agricultural workers who though hired for the year are generally paid a daily wage of Rs 1.50. It is evident that the trend towards proletarianisation, though slow, is emerging in the Birbhum villages while in Tusugaon the polarisation process has been thwarted by the preponderance of middle and poor peasants. But notwithstanding the incipient process of proletarianisation in Birbhum, the content of social relations are not governed by capitalist norms and pre-capitalist forms of exploitation through usury and intimidation continue unabated.

Of the social aspects of agrarian relations Bose considers caste relations and the nature of family ties. Though he posits a congruence between high caste status and landownership (p 159) his own data does not suggest any immutable convergence. As has already been indicated above, the traditional high caste landlords have been displaced by enterprising middle caste landholders, thus fracturing the caste-class congruence. Another feature is the internal differentiation of the numerically preponderant castes. As a result caste identity has been fragmented in the Birbhum villages while its impact is greater in Tusugaon where the economic differentiation is less sharp. In the former, caste taboos and rules of pollution have been eroded but they are rigidly adhered to in the latter. A consequence of this has been the breakdown of the rank consensus among castes within the Birbhum villages allowing for equivocation and caste mobility. However, the fracturing of the caste-class nexus at the top is not present at the bottom of the caste scale. Thus '80 per cent of [the untouchables] are agricultural labourers' (p 159) embodying the homogeneity of their caste-class situation. Caste relations have undergone a transformation in the more class differentiated villages exposed to the influence of the market and political mobilisations. In the isolated village of Tusugaon it still maintains much of its traditional vigour. The attenuation of caste relations in the Birbhum villages, however, does not indicate its demise.

Family structures are not unrelated to caste-class position. Although the principle of endogamy in marriage holds undisputed sway, yet within its fold different classes have different considerations. The upper castes seek marriage alliances between families of commensurate economic standing. Secular considerations of land and property play a pre-eminent role in the choice of marriage partners from within the caste group. This narrowing down of the marriage field at times leads upper caste families to extend marriage links even to 'distant' villages. Generally this distance does not exceed a radius of 10 miles or beyond the same or adjacent police station. Only about 5 per cent of marriage alliances take place beyond a radius of 20 miles. This exemplifies the limits of the social world of the villager. For the lower castes and tribes this is further circumscribed. Among the lower castes the primary consideration for marriage partners is the 'capacity for labour' (p 165). Bride price which used to be paid among lower castes and tribes is no longer uniformly prevalent. While the tribals still retain the practice, among some of the lower castes like Bauris, dowry has already made its appearance.

Perusal of the data on family structure suggests the dominance of the nuclear family or its variant. There is no clear indication that only the economically better-off families prefer joint families. A number of factors including landholding, occupational diversification within the family, the number of working people in a family and the differences in their earnings, all contribute to determining the family structure.

In his discussion of the power structure in the villages Bose has largely confined his attention to the institutional domain of politics. His analysis of the role of panchayats shows how these ostensible vehicles of decentralised democracy had become moribund (this is before the Left Front came to power in 1977) and were entirely dominated by the rural gentry (*bhadraloks*). The lower caste-class interest was unrepresented in the panchayat and it was perceived as an institution of and for 'only *bhadraloks*, not us, the *chotoloks*' (p 206). Yet *chotoloks* did articulate their grievances especially during the turbulent years of the United Front ministry in Bengal during 1967-72. The peasant movements unleashed in those years in the Birbhum villages, specially the forcible occupation of vested lands and the harvesting of paddy from *benami* (illegal) lands under the leadership of the CPI(M)-dominated All-India Kisan Sabha left a deep impression on the poorer sections of the peasantry. Though lasting gains were few, it did temporarily imbue them with a sense of their own power. This short-lived triumph which was soon subverted by the machinations of the rural oligarchy created a sense of affinity with the CPM expressed with disarming candour by a peasant: 'We have no party; we support those who give us food. The CPI(M) did that; we support the CPI(M)' (p 215). Eight years after the Left Front came to power in West Bengal, the above statement might sound like a distant refrain, yet it provides a clue as to why the rural constituencies have remained the Left Front's main bastions. This heritage of agrarian movements has suffered considerable erosion in the successive years of its rule. Yet it was this which underscored its electoral victory in 1977. Bose ends his narrative with the coming to power of the Left Front in 1977. It would be interesting to pursue the analysis of changes in rural class relations during the intervening years.

In his book Bose provides a structured view of class relations in four West Bengal villages. The objective notion of class structure at times weighs down his presentation into a scrupulous description of class attributes. Though this enables him to counterpose the presence of class as an important variable of rural social reality, it also constrains his representation of class as embodying a consciousness of oppositional relationship. A greater attention to this process of power relations which though not absent is swamped by the immanent characteristics of class, would have greatly enriched his account of class structure. Considering that Bose adduces the Marxist method of class analysis what is surprising is the absence of a historical mode of analysis which could have highlighted the processes of class formation. In his conclusion the author posits the transitory nature of extant rural class relations (p 253). One is tempted to ask a transition to what? For the answer to this query may hold the key to a different form of class analysis of the countryside. The book is a significant addition to the literature on the class structure of present day rural Bengal.

MARXIAN THEORY AND THE THIRD WORLD

This collection of essays by eminent Marxian scholars, who have different theoretical perspectives, offers a thought-provoking analysis of the problems of Third World countries today and enhances our understanding of the historical-social structure of these countries. The contributors are: Hamza Alavi, Terrell Carver, John Clammer, Orlando Fals-Borda, Ben Fine, Miomir Jaksic, Tom Kemp, Cyril Levitt, Heinz Lubasz, Peter T. Manicas, Bruce McFarlane, Harbans Mukhia, Harold Wolpe.

The book is an invaluable reference tool for all scholars and others interested in the historical-structural problems of the Third World.

# Education and the Social Order

S Shukla

**Education and the New International Order** edited by J Veeraraghavan; Delhi Concept Book Co and National Institute of Educational Planning and Administration, 1983; pp 147, Rs 60.

THIS is a collection of papers in a seminar held in 1979, along with two papers by Johann Galtung and Louis Emmerij published elsewhere which were circulated to the seminar. Emmerij's paper is illustrative of the viewpoint of the non-radical Westerner who, however liberal or enlightened, does not recognise the fact of western or industrial nations' dominance over polity and economy as crucial elements in the world situation. Hence he asks Third World nations not to repeat the mistakes of the First, and brushes off as insignificant the Third World feeling that most such advice asks them to accept the second best in science, technology and learning which reinforce the current international inequality. Or, when he talks of recurrent education and flexible intermixture of work, education and retirement all through life. These are solutions which the prosperous West, with its unemployed alongside, can perhaps manage. But it is only misleading to disseminate them elsewhere. This was a singularly inappropriate inclusion in this volume.

Galtung, as expected, is incisive and accurate in his piece "Educational Disparities, World Politics and NIEO". Some of his basic points are: ". . . the higher the educational growth, the greater the disparity [within nations]" (p 76); ". . . the countries left behind . . . are trailing behind at a snail's pace, along the same track where at the moment the two Super Powers . . . are in leading positions" (p 76); and increasing disparities ". . . the most schooled countries and individuals increasingly distant from the less schooled countries and individuals" (p 77). Current Western dominance in economic, military and political terms has its educational counterpart in the educational systems training bureaucrats and capitalists. As the Western multinationals build subsidiaries in the Third World, education also trains their bureaucrats and capitalists "needed to staff the bridgeheads—from a Western point of view" (p 82). And these people have their Western counterparts as their models. Hence the push to increased disparities within the Third World. Some Third World countries may attempt a more independent role.

The case of China under Mao and the Cultural Revolution is special. It sought to introduce "educational sharing, not only economic sharing" (p 87) with "no sharp distinction between a well educated elite engaged in non-material work and production and the masses just enough schooled to read and follow instructions . . . elites would also engage in material production, on a rotation basis, and the non-elites would also be stimulated to a maximum of creativity and to participate in the design of production processes" (p 87). It reversed gear after Mao. Meanwhile, the West with its surplus of educated people even in a high-tech situation may go in for export of manpower to Third World in dominant positions or for a different model of education reducing the distinction between elite and mass education and a social movement to reduce the power of the centralising elites. The socialist countries might be less inclined to the latter on account of the less secure status of *their* elites.

Galtung speculates on many interesting implications of this situation in education clearly pointing out ". . . schools follow the social order, domestic and global and not *vice versa*; but the co-ordination is never perfect except under conditions of extreme autocracy . . . Gaps . . . will be among important sources of social dynamics" (p 89). But basically, he dispels illusions which discussions of new international order in international agencies and of education generally often seek to promote. Director Moonis Raza's "Introduction" similarly, though more diplomatically and even with some ambiguity and circumspection, points out "Yet the very need of NIEO arose from the perception that in the existing order such 'concessions' would never be given on an adequate scale or in time, that whatever would be offered would be a tale of too little too late. It cannot be otherwise" (p xiii).

Coming to the contributions actually made at the seminar, J D Sethi's inaugural address as (then) a Member of the Planning Commission again brilliantly brings out the features of dominance and inequality—inter as well as international—which characterise the world situation in economy, politics and education. His two important new points are "the developed countries [should] accept zero growth rate except that part which is the result of increasing productivity through technical progress . . . [and] allow a free flow at least of the educated persons across borders" (p 14). In their papers, Malcolm Adiseshiah's plea for egalitarian measures in education, J P Naik's for an 'alternative' or 'other' development and most of the other contributions share a common characteristic. The situation is bleak, even desparate, regarding dominance and inequality between nations and within them. It is getting worse all the time. But this recognition lurks at a subterranean level. Varying degrees of wishful thought and optimism are attempted and new educational or economic policy devices are explored so as to reverse this trend. Perhaps radical pessimism—or revolutionary strategies—which alone constitute proper responses are not appropriate to academics co-operating with an international agency (UNESCO) or governmental institutes like NIEPA. They have to be optimistic, 'constructive'. One does not find, therefore, in this volume as penetrating an understanding as is justified by the actual situation. But for Galtung's contribution alone and for the facts on the education-economy-polity-employment relationships, etc, in articles like those of Ramashray Roy and P R Panchmukhi, the book is useful.

# Scholarship on China
## Victim of Political Campaigns

Harmala Kaur Gupta

*Scholarship on China seems to have accepted that the series of events that have occurred in that country after 1949 are to be regarded as the outcome of a sharp and protracted struggle within the Communist party leadership over the path China's efforts at socialist reconstruction ought to follow: the Maoist path with its stress on revolution, or the Liuist path with its stress on the development of the productive forces. Scholarship dealing with the post-Mao period again betrays the same conscious, or in some cases perhaps unconscious, acceptance of the 'two-line struggle' argument. Thus while one section of scholars is busy arguing that a 'capitalist restoration' has occurred in present-day China, another section is involved in defending the revolutionary credentials of the new regime.*

*It is the contention of this paper that the so-called 'two lines' are really different approaches that the political culture allows at a particular point of time as equally legitimate for the solution of contingent and pressing problems. Thus, though the political culture is relatively stable and fixed this is not to say that (a) it does not have a flexibility of its own, or (b) is incapable of change. It has its time-scale and temporal cycle, but the process of transformation is neither an open-ended or multi-vocal affair, nor does it take the form of violent zig-zag-like swings from one extreme to another. Rather it represents a process of giving salience now to one aspect and now to another aspect of the political culture.*

### I

THE bulk of scholarship on China appears to have accepted in the main the Chinese version of events in China from 1949 to the present. That is to say, it is accepted that the series of events that occurred during this period are to be regarded as the outcome of a sharp and protracted struggle within the party leadership as to what path China's efforts at socialist reconstruction should follow: the Maoist path with its stress on revolution, or the Liuist path with its stress on the development of the productive forces.

Differences with the Chinese version, where they exist, are confined to such issues as (a) the set of terms to be employed to describe the combatants—'moderates *versus* extremists', 'pragmatists *versus* dogmatists', and so on; (b) the number of combatants involved—the Mao/Liu dichotomy some feel should be extended to include Zhou Enlai, Deng Xiaoping, Peng Dehuai and Peng Zhen, to name a few; and (c) the timing of the final break—the Civil War period, 1958 and the Great Leap Forward, or the Cultural Revolution.

Further attempts at modification include the suggestion that a struggle between lines should really be read as a struggle between political competitors for the highest post in the land. On the other hand, some argue for a broadening of the contours of the 'two-line struggle' argument to take into account the effects of mass consciousness, the compulsions of technology and the pressures of the world capitalist system on decision-making.[1] Arguing on the same lines, the term 'lines' is sought to be replaced by the term 'general tendencies' which it is felt can accommodate within it factors such as institutional differences of interest, patron-client relationships, and factional and coalition politics.[2] All such attempts however basically accept the existence of a 'two-line struggle' and all they argue for in essence is a more comprehensive representation of possible friction points and areas of conflict.

When we look at scholarship that deals with the more recent period in China, i e, the post-Mao period, we again come across the same conscious, or in some cases perhaps unconscious, acceptance of the 'two-line struggle' argument. Thus, while a section of scholars is busy arguing that a 'capitalist restoration' has occurred in present-day China,[3] another section is involved in defending the revolutionary credentials of the new regime.[4] Among the latter efforts, the most insightful, and one which deserves special mention we feel, is that of S J Noumoff who opines that in China, "Each successive major policy shift is conceptualised at a level of antagonistic contradiction *vis-a-vis* its immediate forerunner, rather than either legitimate differences which can only be mediated through practice, or the culmination of one period of development, which having reached the maximum of its contribution requires moving on to the next stage".[5] The question that naturally arises and which we believe is of paramount importance is: why are these legitimate differences portrayed as antagonistic ones?

The answer we feel lies in a recognition that the political culture of a society, far from being a malleable entity which can be moulded in any and every shape and direction, is fairly resilient and obdurate. This is a fact appreciated by Mao Zedong and others as far back as the period of revolutionary struggle, when they, while seeking to replace the old political culture with the new, were careful to evoke images and use language which had their roots in the past and with which the people could therefore relate, even though the content of these images and language was now quite different. What was true for the pre-revolutionary period is also true for the post-revolutionary period, and perhaps with even greater force. For the values, the ethics, the style, and even the rhetoric of the earlier period of struggle, which came to make up the political culture of the CPC, continue to exist in the later period and serve with equal force as legitimisers. It is not for the CPC then to ignore them or calmly brush them aside. It should therefore come as no surprise that in a post-revolutionary society such as China disagreements tend to be couched in the rhetoric of an earlier period of struggle and are therefore often portrayed as of a fundamental and irreconcilable nature. It is here that we believe the 'two-line struggle' argumentists among us China scholars err, for they tend to mistake the intensity of the language used for the intensity of the struggle itself. Thus legitimate differences conceptualised as fundamentally antagonistic by the Chinese leadership and media are accepted as such by China scholars who then go on to interpret events in China as the victory now of one line (the zig) and now of the other (the zag).

It is our contention, and one which we hope to substantiate in what follows, that the so-called 'two lines' are really different approaches that the political culture allows at a particular point of time as equally legitimate for the solution of contingent and pressing problems. Thus, though the political culture is relatively stable and fixed this is not to say that (a) it does not have a flexibility of its own or (b) is incapable of change. It has its time-scale and temporal cycle, but what we should like to emphasise is that the process of transformation is neither an open-ended or multi-vocal affair and nor does it take the form of violent zig-zag-like swings from one extreme to another.

Rather it represents a process of giving salience now to one aspect and now to another aspect of the political culture. A process which we see no more strikingly at work than in post-1949 China.

## II

Despite the different vocabularies used, a consensus exists among Chinese scholars on the question of what constitutes the essence of the two lines referred to above, the one associated with the name of Mao Zedong and the other with the name of Liu Shaoqi, or if you like, with Deng Xiaoping.

With regard to the former, the Maoist approach is portrayed as an attempt to evolve an autarkik model of growth, based on mass initiative and indigenous effort. Thus the stress on agriculture, light industry and heavy industry in that order, the location of industry in rural areas, the use of labour-intensive techniques and the eschewing of material incentives.

As regards the line associated with Liu, Deng, and others, it is depicted as seeking inspiration from the Soviet model, with its stress on the building of heavy industry, the use of capital-intensive techniques and material incentives, and the acceptance, if not actual encouragement, of inequalities—be they between different income groups, between different regions or between the town and countryside.

To put it in a nutshell, while the Maoist approach seems to stress the superiority of humans and human organisation over technique and technical organisation in achieving the goal of rapid economic growth, the Liuist approach appears to have greater faith in technique and technical organisation.

This way of looking at Chinese reality we feel is basically erroneous, for it ignores the fact that neither Mao nor Liu, in pursuit of high indices of growth, was willing to sacrifice certain shared revolutionary ideals and values which formed the corner-stone of the political culture that each had been instrumental in evolving, and which enjoyed widespread legitimacy in the eyes of the masses. Though it is widely acknowledged that the ideological principles and guidelines for action laid down by the CPC during the Yan'an period were responsible for assuring its victory first over the Japanese and then over the Goumintang, and continued to be employed in the post-revolutionary period, for some strange reason they are associated with the person of Mao Zedong alone. It is all too often forgotten that Mao's emergence as undisputed leader of the party at the Seventh Congress, held in 1945, was no overnight affair nor did it represent a simple personal triumph. For, though Mao assumed the top party post in 1935, it took some ten years for his 'line' to eventually triumph in the party. During this period Mao continued to face a formidable challenge from the returned students faction headed by Wang Ming, which given its Soviet connection, enjoyed fairly widespread support within the party. The consolidation of Mao's position went hand in hand with a growing realisation by the majority of the party leadership that in order to advance the revolution further, and emerge as victors, the CPC would have to make a fundamental break with its past which involved a repudiation of the Soviet Union's part in it as well.

The role played by persons in key positions in the party, such as Liu Shaoqi, in influencing the majority of the party leadership in this direction through a personal vigorous endorsement of the Maoist version of the party's past, and the need therefore to seek indigenous solutions wedded to Chinese conditions, cannot be underemphasised.[6] The 1942-44 Rectification Campaign was part of this process and it is therefore not surprising that its main aim was the 'sinification' of Marxism, which came to mean the propagation within the party of the CPC's new line associated with the leadership of Mao Zedong. Given this goal, the campaign was confined mainly to the upper reaches of the party leadership and excluded the masses, despite the fact that Mao had by then evolved the tactics of the 'mass line'.[7] It was therefore not by accident, but very much by design, that by 1945, with a little help from his friends, Mao emerged as undisputed leader of a united party. Despite the fact that the succeeding years leading upto victory were trying ones for the CPC, never once was this unity placed in jeopardy, based as it was on an understanding of the unique character of the Chinese revolution and on an acceptance of the principles and guidelines for action laid down by the CPC at Yan'an. The 1947-48 Rectification Campaign is an illustration of this and makes nonsense of the argument that while Mao sought to expose the party to the masses, Liu sought to keep them out of rectification.

The purpose of the 1947-48 Rectification Campaign was to further revolutionise the CPC's policy of land reform. It was anticipated that this would meet with resistance from certain persons in the party who had a vested interest in seeing that this did not happen, and so the masses were sought to be mobilised to assist the party in carrying out its task. What is of interest to us, in the light of our argument, is that the evidence indicates that both Mao and Liu were in fundamental agreement throughout the campaign. That is to say, both favoured bringing in the masses to 'rectify' possible rightist shortcomings within the party at the initial stage, and both were equally in favour of curbing mass enthusiasm later on.[8] A pattern which, if one looks at the post-1949 period, tends to persist and repeats itself with unfailing regularity till as late as the Socialist Education Movement (1962-1965).

## III

After the first few years of reconstruction (1949-1953), the CPC was ready to adopt a planned model of growth so as to accelerate its development. The model that was most easily accessible and acceptable, and which had already shown results, was the Soviet one, and it therefore came as no surprise that the First Five-Year Plan of the PRC was based on the Soviet model. Emphasis was therefore laid on the building of capital-intensive heavy industry, the use of sophisticated techniques and the adoption of rational systems of management, such as the 'one man' system of management in industry, which took into account the needs of specialisation and the division of labour. While the subsequent results in terms of rates of growth were no doubt gratifying, though of course not as high as for the earlier period of reconstruction, by the mid-1950s a sense of unease began to set in among the Chinese leadership. Not only did it appear that a certain amount of stagnation had set in in agriculture, but the organisational and ideological consequences of adoption of the Soviet model were now also being felt.

To be more specific, by the mid-1950s, the combined effect of the whole ensemble of organisational structures and practices which made up the Soviet model was evident most sharply in the decline of party organisation and the growth in its place of a bureaucratic system of administration. This was most clearly marked in industry, where the adoption of the one-man management system had resulted in a widening gulf between managers and technicians on the one hand, and workers on the other, with the party being relegated to the sidelines.[9] If, therefore, the basic principle on which the Chinese revolution rested, and on which there was a general consensus, namely the maintenance of the closest possible link between the party and the masses, was to be preserved, the party would have to act swiftly. That it did by abandoning the Soviet model and instead seeking a Chinese model of development which saw its initial expression in the Great Leap Forward (GLF). And not surprisingly, Liu Shaoqi among others, besides Mao, was one of the most fervent advocates of the new policy.[10]

The post-GLF period, we believe, despite the numerous differences that arose among the leadership over issues of timing, pace and method, did not dilute this quest for a Chinese model of socialist development. The entire leadership, including Mao Zedong, showed a rare and commendable flexibility in the series of adjustments to policy that they made in this period. Thus, contrary to the opinion that "The trouble was that Mao had laid down many different and contradictory sets of principles and did not always have the courage to do so firmly enough",[11] we opine that this very flexibility of Mao's, as of the entire Chinese leadership's, was a tribute to their courage and demonstrated their abiding commitment to a Chinese way, even if this meant revoking earlier policies or adopting policies that they may have initially rejected. It also we believe explains the often contradictory positions taken by Mao during the years of the Socialist Education Movement (1962-65). Initially, Mao advocated a mild approach wherein the masses would be subject to strict party control: "[Rectification] is to be conducted from within the party to outside the party, from top to bottom, and from the cadres to the masses",[12] but by mid-1964 he came down in favour of Liu Shaoqi's approach which, in light of the token rectification that had occurred so far, sought to radicalise the movement by sending in work teams from outside which would mobilise the masses at the local level to expose party shortcomings.[13] Subsequently, at a key series of meetings in December 1964-January 1965, Mao reacted to the problems created by Liu's approach—a high purge rate and resultant demoralisation within the party—by endorsing a shift back to the earlier more lenient approach of 1963.[14]

To sum up therefore, we believe that an approach which seeks to interpret events in China from 1949 onwards as a struggle between two or more fundamentally opposed tendencies or lines is basically incorrect. Our reading of events, based on available evidence, shows that the policies adopted during these years upto the Cultural Revolution though often contradictory, had the full weight of majority consent behind them. They represented an attempt to evolve a model of development which though not rigidly bound down by any golden rule and thus capable of accommodating diverse approaches, was firmly wedded to one cardinal principle: maintenance of the historically close link between the party and the masses. A principle which, as we shall argue further on, no leader of the party was willing to compromise. Thus, the dismissal of prominent partymen both during this period, and subsequently during the Cultural Revolution, and even after, did not occur as a result of disagreements over fundamental issues but were prompted by other considerations. We shall elaborate below.

After the first flush of the GLF, Mao was as involved, as was everyone else, in making pragmatic policy adjustments. He was also critical of himself for having made a 'subjective' estimate of steel production in the summer of 1958: "I was enthusiastic at that time and failed to combine revolutionary fervour and a practical spirit."[15] A look at the statements made by the so-called critics of the GLF at the Lushan Plenum, at which Peng Dehuai was accused of voicing fundamental opposition to the GLF, also shows that what was being demanded was no more than adjustments in existing policies and that these were consistent with what Mao himself had said in the preceding months: the need to tone down targets and avoid subjective estimates, restore planning and balance in the economy, give up backyard furnaces for producing iron and steel, reassert the socialist principle of remuneration according to work done, renounce ultra-egalitarianism, allow for the free play of market forces, and re-examine the question of the system of ownership within the communes. It is also worth noting that Peng's letter to Mao referred to the failure to properly implement GLF policies, and not to the policies themselves, as the source of China's ills.[17]

That fundamental differences over policy had little to do with Peng's dismissal is further affirmed by the fact that eventually Peng was attacked not for any fundamental disagreement with the party over policy, but for organisational indiscipline, i e, for having conspired against the party.[18]

As regards the dismissals of Liu Shaoqi and Deng Xiaoping, identified respectively as the number one and number two capitalist-roaders within the party during the Cultural Revolution, it is instructive that Mao's only reported criticism of them was that they had set up "two independent kingdoms" at the party centre[19]—an accusation that had been levelled against Gao Gang and Rao Shushi in the early 1950s and which had therefore sought their dismissal on organisational grounds. In fact, as late as early 1965, the basic shortcomings of party leaders at the Centre were not identified as ideological ones, but rather as behavioural and organisational ones—acts of corruption, exploitative behaviour, violation of discipline—born out of the position of power and prestige that they now enjoyed in post-revolutionary China.[20] As regards the leading core of the party, Mao's utterances on the eve of the CR indicate that he felt it was basically sound and that given a spirit of give and take shortcomings could be overcome and misunderstandings settled amicably.[21]

To sum up therefore, till the eve of the CR there is no evidence to indicate that the leadership was divided over fundamental issues of policy. That a section of the leadership under Mao's tutelage, subsequently, during the CR, for reasons of their own, sought to portray these differences as essentially antagonistic must we feel not blind us to the fact that *at the time they occurred they were not regarded as such either by Mao or by anyone else*. Disagreements identified were essentially of a non-antagonistic and manageable nature and were not seen to jeopardise the basic principles to which the CPC adhered in its attempt to build a modern socialist China.

Developments in the post-Cultural Revolution period offer further proof of this. For not only were attempts made to rebuild the party and curb the powers of the Red Guards and Revolutionary Committees, but many partymen identified as capitalist-roaders during the Cultural Revolution, were asked to come back and participate at all levels of decision-making. The most notable of these was Deng Xiaoping who was rehabilitated at the highest level of policy-making, without having to submit an apology or make a self-criticism, by no less a personage than Mao Zedong himself. Moreover, the fact that Zhou Enlai, who had argued for a cautious approach as early as the Great Leap Forward, and who was later one of the principal advocates of the 'Four Modernisations' Programme, continued to occupy the post of Premier throughout the years of the Cultural Revolution, and later, we feel, adds further weight to our contention that: (a) differences over policy were not in fact regarded as of a fundamental nature by the leadership, so that (b) attempts to portray them as such with reference to certain persons within the party, must be attributed to other factors, such as an attempt to eliminate potential claimants to power by those who sought to rule in the name of Mao.

Information available to us today, in official and semi-official publications from China, as well as the accounts of China, scholars who have visited China lately, about the programmes and policies being pursued by China's present-day leadership does we feel further call into question the basic assumptions on which much of contemporary scholarship on China rests.

To be more explicit, how is it we ask ourselves that even after the triumph of a line associated with Mao's adversaries, emphasis continues to be laid on the Maoist list of priorities—agriculture, light industry and heavy industry—in that order, with perhaps even greater emphasis on investment in agriculture and light industry than in the past?[22] Mao Zedong's well known commitment to the peasantry and his refusal to allow them to be 'squeezed' so as to finance development elsewhere, is nowhere more clearly reiterated than in Hu Yaoban's report to the Twelfth National Congress of the CPC where he states that to raise the standard of living of the peasantry and see that they enjoy the fruits of prosperity is the primary aim of the new economic policies.[23] Moreover, why has the Maoist policy of 'walking on two legs' been retained and reaffirmed by a leadership which we are told is committed to a highly capital intensive, technologically sophisticated, heavy industry oriented model of growth? Instead, we find a call being given to continue to build labour-intensive industries, using less sophisticated indigenous techniques, in the rural areas so as to bridge the gap between town and countryside, and thus prevent an influx of labour into the cities.[24] And again, what is one to make of the measures taken to decentralise the economy in a really meaningful way, so as to allow enterprises a greater say in their operations, subject of course to fulfilment of the state plan?[25]

As regards the party, attempts are being made to disengage it from the administrative system as well as from the management of economic units. It has been asked to leave the day-to-day running of the state to the government and its agencies, and neither is it to interfere in the business operations of economic enterprises.[26] The latter have been made responsible for their own performance and towards this end they have been instructed to implement a system of democratic management wherein workers supervise their leaders *via* a Congress of Workers and Staff, which will appoint a manager and give him the necessary operational authority for running the enterprise under the party's overall political control.[27] This way not only is it hoped that the retarding influences of bureaucracy will be kept under check within the party, but that those who have been given managerial powers will remain sensitive to the needs of the workers. The party thus is to restrict itself to the ideological and political realms alone, and has been given the high sounding task of ensuring that the general line of the party is properly adhered to at all levels.[28]

Material advancement it appears is to be matched by spiritual upliftment—thus being expert is not enough, one will also have to be sufficiently red.[29] As a first step in this direction, the work style of the party is being rectified with corruption, the misuse of position, and organisational indiscipline in particular, coming in for heavy censure. Rectification norms, it is stated, are to revert back to those established by the party under the leadership of Mao Zedong for the 1942-44 Rectification Campaign: the use of 'gentle breeze' methods aimed at 'curbing the disease in order to save the patient'.[30] And even though open-door criticism of party members by the masses is ruled out today, the setting up of Discipline Inspection Commissions (DICs), with more powers than they have ever had in the past, including the right of higher level DICs to directly impose disciplinary punishments on party members at lower levels,[31] shows that the leadership is serious about rectifying shortcomings within the party. In this regard it is pointed out that punishing guilty party members or waging a few political movements could not in the past solve deficiencies in party style.[32] And this in fact is the attitude that characterises China's present-day policy-makers, namely, that we must draw lessons from the past and analyse problems and suggest solutions in light of past successes and failures.

Which leads us to contend that China's present-day rulers are as committed to finding a socialist path of development suited to Chinese conditions as were their predecessors. A commitment which, as we have argued, had its roots in the CPC's experience of revolution, on the basis of which certain guidelines for action were drawn up at Yan'an, of which the most important was the tactic of the 'mass line' which sought to keep the CPC ever sensitive to the needs of the masses.[33]

## IV

In this section, we intend to more concretely illustrate our contention that the so-called zig-zags evidents in policy-making in China from 1949 to the present far from representing a struggle between two lines are a comment on the give of the political culture which, at a particular point of time, conferred equal legitimacy on more than one policy approach, provided it allowed the maximum possible participation of the masses in decision-making *via* the operation of the mass line. A study of the twists and turns that have characterised China's system of industrial management over the years we feel offers us an opportunity to observe this process at work.

As mentioned earlier, in the early 1950s, the CPC introduced the Soviet Union's 'one-man management' system of factory organisation. Under this system the sole authority for business operations was vested in a technically competent factory manager, and under his authority individual heads of shops and of production teams had unchallenged control of their units. Likewise the manager was directly and solely responsible only to higher echelon authorities. This reduced the role of the factory party committee,[34] whose secretary at best fulfilled only a consultative role. Neither was there any provision in such a system for worker participation in decision-making in the factory at any level. The consequence of such a system of vertical rule was the creation of highly bureaucratic structures (from which the party was not immune)[35] with a correspondingly high degree of concentration of authority in the hands of the industrial ministries.[36]

As the end of the First Five-Year Plan approached in 1956, CCP leaders became increasingly aware that the adoption of the Soviet model of factory management was leading to a situation where the gap between the party and the masses was steadly widening with the party due to its alienation from the policy-making process at the enterprise level, losing contact with the everyday concerns of the workers. Subsequently, an attempt was made to close this gap as it were by awarding party committees a greater say in policy-making at the factory level, while the opinions of workers were to be solicited in the drawing up of production plans.

The Eighth Party Congress held in 1956 officially accepted this change in policy which came to be known as the system of factory manager (director) responsibility under the leadership of the party committee.[37] What is important is that this policy basically signified a reaffirmation of faith by the leadership in the system of administration evolved during the Yan'an period which had relied on a dual system of information and command—one which went upwards in the administrative hierarchy as well as sideways.[38] Under this system not only was a lower ranking agency subject to one or more higher placed agencies, but it was also partially subject to another body at the same level of administration. In Yan'an the local party branch was often the local co-ordinating body in the administrative system. Such a system was characterised by a high degree of flexibility of command and relied on the principle of encouraging the highest possible level of mass participation.[39]

The new factory management system accordingly sought to combine party collective leadership with individual responsibility. Thus, though the extensive authority conferred on the factory managers by one-man management was now withdrawn, full individual responsibility for performance remained with them. There was now an attempt to draw a distinction between policy and technical decisions. If any matter related to policy, the manager had to bring it before the party committee for collective decision-making, but if the problem was of a technical nature, he could make the decision on the spot. His main responsibility was therefore operational—to assure the achievement of policy goals within the factory. The factory manager thus became more of a technician and was thrown into increasingly closer contact with the workers.[40] Collective leadership involved not only a lateral shift of authority (from manager to party committee) but also a downward shift of decision-making powers to lower level cadres.[41] While in this system, as can be seen, there was scope for differing interpretations of what constituted policy matters and therefore were the concern of the party, and what were technical matters and thus fell into the purview of the manager, there were two areas where the party enjoyed undisputed authority: personnel matters and formulation of the state plan.[42]

The lack of definition of what constituted policy and what constituted technical matters soon led to a blurring of distinctions, so that by 1958 the party was not simply a co-ordinator but had assumed full operational leadership as well. This was the feature of the Great Leap Forward strategy which sought to decentralise decision-making, which in effect meant that party committees at the regional level now made policy decisions and production teams led by party cadres carried them out. There was practically no industrial management worth the name during this period; there was little supervision and control and a final accounting was to take place only when the production period ended.[43]

Industrial management returned in early 1961, when in face of the chaotic conditions existing in the economy, in the area of financial accounting in particular, managers were asked to come back. They now went back to a system within which the ministries reacquired much of their lost power (power which they had enjoyed under the one-man management system and lost during the subsequent shift to collective party leadership). The economic power exercised by party-dominated provincial and district governments during the GLF period was on the other hand reduced, while in industry there was relatively greater autonomy for the factory manager compared to the earlier system of collective party management, though of course not as much as under the one-man system of management. The manager was given 'independent operational authority' by virtue of the fact that enterprise profit was now made a major criterion for success in Chinese industry.[44]

In the spring of 1964, in a move that Schurmann sees as amounting to the Centre assuming greater control over financial and commercial activity,[45] Beijing announced the setting up of 'political departments' in all branches of economic administration down to the basic level. The political departments were party organisations under the jurisdiction of a central department attached to the Central Committee. They were responsible to higher-echelon political departments, but also to local party committees. Their purpose it seems was to assure a more steady capital accumulation. This implied control over the enterprises' money and supply matters and to that extent a dwindling in the policy-making powers of the party committee at the regional and local levels.[46] A process dramatically speeded up by the Cultural Revolution which all but disbanded the party organisation at all levels.

The Cultural Revolution dissolved factory party committees and replaced them by entirely new organisations. These consisted of the workers' management teams, the Red Guards and the revolutionary committees (consisting of masses, cadres and soldiers of the PLA). Technicians were now integrated into the work brigades and the post of factory manager was abolished; while management became the responsibility of the revolutionary committee. Workers' management teams were to focus on orientation, inspection and investigation, and on ideological work, with the Red Guards acting as a control on them.[47] It appears that this was an attempt to avoid the consequences of decentralisation during the GLF, when, as we have mentioned earlier, decentralisation came to mean the centralisation of power in the hands of the party at the regional level. Instead effective power was now to reside in the hands of the Red Guards and later the revolutionary committees.

In 1969 new party committees were set up. It was now stated that the revolutionary committee was an administrative body, under the political leadership of the factory party committee, in charge of implementation of established policy, while worker management teams were to function as intermediaries between management and the masses, and to act as a control on the managerial bodies, as well as on party members and administrative departments.[48]

The more recent past has seen the abolition of the 'new born things' of the Cultural Revolution, including the '3-in-1 revolutionary committees'. Interestingly enough, however, this has not meant the institution of a system under which the factory manager assumes full responsibility and control. China's present-day leaders have made it clear that even though the manager is to assume responsibility for enterprise profit, which has now become a criterion for success in Chinese industry, he is to be supervised by a Congress of Workers and Staff. The latter, in accordance with relevant state stipulations, is to decide the principles guiding the enterprise's production and operation, its plans for production, for securing material supplies and for marketing products as well as other important matters such as business, accounting, labour use, wages and benefits. The Congress too has the power to dismiss workers and staff members, to elect or recall the factory director and submit the decision to higher authorities for the record, or for approval. When the Congress is not in session, a Standing Committee of the Congress exercises its functions and sees to it that adopted resolutions are carried out. As the administrative leader of the enterprise, the factory director nominates the deputy factory directors, chief engineers and chief accountant who are appointed by the Congress or its Standing Committee.[49] The role of the party is visualised as that of general co-ordinator and political overseer. It has the responsibility of seeing that general policy guidelines are adhered to at the level of implementation, that workers' interests are properly represented and that ideological purity is maintained. Decentralisation has now come to mean greater control by the enterprise over its economic operations, subject to the state plan and to the highest possible level of worker participation.

## V

A study then of China's system of industrial management from 1949 to the present shows that changes made in the system at different points of time have primarily reflected concern on the part of the leadership at the growth of such phenomena as bureaucratisation of the party and its steady alienation from the masses. It is thus no accident that the debates that occurred within the party during this period centred around such issues as the kind and degree of centralisation and decentralisation to be undertaken, and the proper relationship to be fostered between the Centre, and the regions and industrial enterprises.

Thus from a system which concentrated power in the hands of industrial ministries at the Centre, and in the hands of the manager at the level of the enterprise, by 1958, we have a situation where the concentration of power is now in the hands of the party at the regional level. The post-GLF years were characterised by attempts to steer clear of both extremes and thus 1961 saw power being restored to the manager of the industrial enterprise and to the Central ministries, while the power of the party at the regional level was correspondingly curbed.

According to Schurmann, on the eve of the Cultural Revolution there were indications of further centralisation of power at the expense of the party at the regional and enterprise levels, a process somewhat rudely accelerated by the launching of the Cultural Revolution which saw the party stripped of all policy-making powers and of operational responsibility. Effective power now lay at the Centre and in the hands of the new mass organisations. By 1969 the situation seems to have been somewhat rectified with party committees once again being set up and given some policy-making powers—a trend which was to gain momentum in the succeeding period.

1979 marked the beginning of yet more changes in the system of industrial management. The mass organisations set up by the Cultural Revolution were officially disbanded, while a process of decentralisation was set in motion aimed at correcting the over-concentration of power at the Centre and the regionalisation of the economy. What is important to note here is that when China's present-day policy-makers talk about decentralisation, they are not talking in terms of handing over control over operations to the party at the regional and local levels. Control over business operations is now to be transferred to the enterprises' management with the proviso that it will not reside in the hands of the manager but in a Congress of Workers and Staff.

To conclude, therefore, over the last few decades or so, it is not a zig-zag or pendulum like process that we see at work in China but, as we have tried to argue above, a process of constant readjustment which aims to build on each preceding stage so as to continue to accelerate the pace of growth and development, without however sacrificing the CPC's close and historic link with the masses from which it derives its legitimate right to rule.

**your enterprise and GIIC expertise work wonders**

GIIC expertise in promoting industrial projects equals your enterprising spirit.

That is how, GIIC's seven sponsored projects in joint and public sector have gone into production involving total outlay of over Rs. 65 crores.

Carrying forward the same belief GIIC has another 50 projects in different stages of implementation. All these projects involve a gigantic capital outlay of about Rs. 1200 crores.

Through these projects and the expertise of several entrepreneurs, GIIC is sure to develop key industries, vital for Gujarat and national economy. Almost all types of industries have been planned – engineering, electronics, chemical, petrochemical, pharmaceutical, plastic, cement and so on.

Virtually, GIIC backs every viable venture which you are confident of.

# Finance for Export of Manufactured Goods from Developing Countries

**Kalyan Banerji**

*This paper analyses the altered composition of the export basket of developing countries in South and South-East Asia. Thereafter, it proceeds to deal with financing issues that emanate from the curious feature of developing countries which are importers of capital having to cope with almost necessary export of capital arising out of sale of manufactured goods.*

MANUFACTURES are increasingly accounting for a larger share of total exports of developing countries in South and South-East Asia region. Support for financing exports has been deficient. This paper analyses the altered structure of export basket of developing countries in the South and South-East Asia region. Thereafter, it proceeds to deal with financing issues that emanate from the curious feature of developing countries, who are importers of capital, having to cope with almost necessary export of capital arising out of sale of manufactured goods. Focus is on a single region, *viz*, South and South-East Asia region.

## RISING EXPORTS AND INCREASED TRADE DEFICITS

During 1970-1981 developing countries in the region increased their exports ten-fold, registering annual average growth rate of upwards of twenty-five per cent. However, region's trade balance turned increasingly adverse from deficit of $ US 290 million in 1977 to deficit of $ US 19 billion in 1981. Doubtless, oil prices have been a major contributor to the rising trade balance deficit. Rising exports and increasingly adverse trade balance are evidenced in Table 1.

The growing adverse trade balance is all the more noteworthy when the region's increased share in total world exports is viewed. The region increased its share of world exports to 7.7 per cent in 1981 from 4.8 per cent in 1970. Data on this growth are presented in Table 2.

## COMPOSITION OF EXPORTS

Besides the remarkable export value level achieved by developing countries in the region, it is the composition of exports that attracts attention. Manufactured goods have been the most dominant element of exports. Nine developing countries in the region account for upwards of seventy per cent of the region's exports. Table 3 provides a snapshot picture of the increasing share of manufactures in the exports of the nine countries.

There is a notable difference in the composition of export between the large and small developing countries in the region. The difference lies in the fact that while some small countries have moved on to specialise in light manufactures, the larger countries have sought to diversify exports including capital goods. K goods refer to those goods that constitute the economic function of investment. K goods, therefore, cover essentially durable goods constituting the fixed assets for production, involving machines and equipment regardless of whether they are fixed or movable purchased for the purpose of production process. These goods are the result from the processing of metals.

Developing countries (China included) account for about eight per cent of the world production of K goods. This achievement in the 1970s is remarkable when compared to the fact that in the 1950s developing countries accounted for a negligible portion of world K goods production. In 1979, developing countries exported K goods worth $ US 22 billion, accounting for about five per cent of world trade in K goods.

Speed of development of K goods sector in developing countries of the region does reflect the level of development achieved as well as the development strategy opted. According to the stage of development achieved in the K goods sector, in the region, three country grouping can be derived. First group consists of China, India, South Korea, Singapore. In these countries, K goods sector besides producing a fairly wide range of standard equipment has also commenced manufacture of technologically complex equipment. In the second and intermediate country grouping may be classified Philippines and Thailand where production of standard equipment has commenced. The third country group consists of developing countries in the region where K goods sector is in a nascent stage. The first group accounts for a predominant share of K goods production and exports from the region. Countries in the first group have also made entry in export of technology and turnkey plants, *albeit* in relatively simple industries like textiles, sugar processing, cement, electrical generation and machine tools.

An additional dimension here is the direction of exports of K goods from developing countries in the region. Though data on this aspect is somewhat diffused, it can be stated that labour intensive K goods move towards developed countries and relatively capital intensive K goods move towards developing countries. Whilst recognising that only about eight per cent of K goods imported by developing countries originate in other developing countries, this level could be greater if financing support was available in good measure.

The period of credit extended in sale of K goods tend to be longer than in the case of other manufactured goods. Developing countries need increased foreign exchange earnings immediately to hasten economic growth and ease foreign exchange bottlenecks that have worked as a halter to growth by limiting the capacity to import intermediate and K goods of higher technology levels. One of the major constraints impeding the expansion of exports by developing countries in the region, particularly of complex K goods, is the limited ability to extend credit matching competitors from developed countries.

Two major structural changes characterise developing economies in the region. First, a decline in the share of agriculture and increase in the share of industry related activities in total output. Second, a shift in the relative share within industry between consumer goods and K goods including intermediate products. This trend of structural transformation means a faster growth rate in K goods than of industry as a whole.

## STRUCTURAL CHANGES

Altering composition of exports, manufactures accounting for increasing share, including K goods, in total export serves as some evidence of a continuing structural

TABLE 1: EXPORT GROWTH

| Year | Value of Exports (FOB) ($ US billion) | Annual Average Growth Rate (Per Cent) | Trade Balance Deficit ($ US billion) |
|---|---|---|---|

| 1980 | 144 | 27 | 7 |

change in developing countries in the region. Industrial revolutions of the past twenty decades in Europe and North America are being followed by industrialisation in developing countries, particularly in Asian and South-East Asian countries. Literature on this trend and on the changing pattern of comparative advantage is indeed large and growing.[1] Most developing countries view industrialisation as a centrepiece of economic policy. Together with agricultural progress, industrialisation is viewed as an integral part of economic development and structural change.

In a number of products, developing countries could step into markets so far served by countries which are developed and whose comparative advantage is shifting to more advanced products and technology.[2] As developing countries speed their process of industrialisation, the old industrial countries are moving on to deploy their capital and labour in the production of skill-intensive and technically advanced goods.

Through the 1960s the developed countries' manufactured imports from the developing countries grew faster than growth of manufactures in developed countries. During 1970-78, manufactured exports from developing countries to developed countries grew three times as rapidly as developed countries' manufacturing output.

However, structural adjustment is a gradual, slow process. In developed countries, it involves shifting resources from lower to higher productivity uses, exercising options to promote industries with high growth potential and maintaining a strong position in international trade. In the meantime, it can be expected that developing countries will experience increasingly severe competition and pressures in their endeavour to increase export of non-traditional manufactured and industrial goods. Amongst several aspects of competition, the terms of credit can be anticipated to be one of the key factors. It is in this area that developing countries need financing support in the face of competition and, almost imperceptibly, slow yielding of traditional supply sources of industrial goods. It must be added here that it is in lower technology goods that developing countries have acquired and are acquiring comparative cost advantage. Developing countries merit encouragement to export such goods as this will increase their capacity to export industrial goods and upgrade technology levels. Credit competition from developed countries is an enormous hurdle for developing countries.

TABLE 3: GROWTH OF SHARE OF MANUFACTURES IN TOTAL EXPORTS

### DISADVANTAGES OF DEVELOPING COUNTRIES

Competition is not only in price, quality, post-sales service, delivery schedule but also in the availability and cost of export credit finance. Manufactures, especially K goods, attract term credit terms. Such goods can hardly be sold in the international marketplace on cash terms. When goods are exported on credit terms, providing for repayment over a period of time, instead of cash payment upon delivery, export credit occurs. Whilst the exporter recovers, through his domestic bank, the value of goods exported, the exporting country has to sit out for many years for repayment.

For the exporting country there are at least three effects, emanating from term export credit, to cope with. First, accrual of foreign exchange earning gets postponed until repayment over a period of time is received from the overseas importer. Second, in the meantime, local currency in exporter's country enters the purchasing power stream, through local financing of exporter, pending realisation of export proceeds. Third, export term credit represents transfer of real resources from the exporting country to the importing country.

A developing country needs accrual of foreign exchange, soon after export occurs. It can ill-afford to postpone accrual of foreign exchange earnings related to exports. Not being capital surplus, a developing country when selling on credit, especially to a developed country bears a heavy burden flowing from the transfer of real resources that occurs when exports are made on credit terms. Moreover, companies in developing countries operate at rather low cash flow levels, most of production cycle being financed by bank credits. This can contribute to inadequacy of collateral to raise export refinance. Additionally, companies need some imported materials for production. Hence, the need for foreign exchange can arise from the start of production process. Postponement of foreign exchange accrual for an exporting country that is a developing economy can, therefore, hamstring its export capabilities, especially in the face of rising export volumes.

Several developing countries in the region have set up institutional mechanisms to provide export credit refinance. Most notable examples are South Korea, Singapore, Hong Kong and India. Published reports on South Korea show that the country utilises various sources to finance its export credit support programmes, including drawal of its foreign exchange reserves, commercial borrowing of Eurocurrency markets, discounting export paper covering especially sale of ships. Such sources are not available to most countries in the region.

Comprehensive data on the volume of export credits which developing countries are extending to finance their rising trade in manufactures is not available. Some indications are obtainable from reports that five developing countries (Hong Kong, India, Argentina, Israel, Spain) increased their insurance coverage on export credits from $ US 5 billion in 1975 to $ US 8.6 billion in 1978.[3] China has lately decided to enter the export credit business by providing low interest loans to encourage export of machinery and ships.[4] A number of other developing countries are also beginning to offer, or are planning to introduce, programmes for financing export of non-traditional exports, e g, Bangladesh, Philippines, Indonesia.

### CURRENT OPTIONS

Developing countries of the region can be categorised into two groups according to composition of their exports. The first group (Group A) consists of countries that export predominantly primary products. In other words, share of manufactured goods is low. The second group (Group B) consists of countries whose manufactured goods export accounts for a major share of total exports.

Consider Group A countries first. Credit is required during the production stage, upto the time of shipment. In most countries, domestic commercial banks provide the pre-shipment finance, under clearly designed pre-shipment financing schemes. There are, however, developing countries in the region where no such sector financing is available, e g, Nepal. Credit in the post-shipment period is needed to bridge the time required to receive export proceeds from the time of shipment. This varies from 90 days to 180 days. Such exports are short-term, traditional exports.

Short-term, traditional, exports can be refinanced in international markets through international banks. However, there are three factors that merit consideration. First, where the institutions or importing countries issue credit instruments covering short-term imports, such instruments can be discounted in international markets in the light of financial solvency of the creditors. In other cases, where the importer is not a developed country with a track record of credit-worthiness, discounting may attract a high cost especially when the credit-worthiness of the exporter has also to be weighed in. In the ultimate analysis, should the importing country not pay the export bill on due date, the discounting bank will claim recovery from the exporting country. In this context, the credit-worthiness of the exporting country is likely to influence the discount rate it attracts.

Second, the exporting country given its low per capita GNP, low debt repayment capacity, may either find it less than easy to get access to the international money markets or it may not welcome being seen in international markets attracting a high discount rate for short-term export paper.

Third, in many Group A countries, there is either absence of an institutional mechanism in the form of export credit insurance for short-term exports or the commercial banking system is not satisfactorily integrated to gain access with advantage to the international money markets. Where national export credit insurance is absent, it is possible that international banks may seek national government guarantee or its equivalent including guarantee from a bank outside the exporting country before discounting occurs.

Increasingly, Group A countries are likely to be involved in processing, marketing and distribution of their products. Again, with the spread of industrialisation, semi and finished forms of manufactured goods can be expected to gain significance for many Group A countries. Such exports may attract term credits. In the absence of an appropriate international refinancing mechanism, such exporting countries are likely to find it difficult to sit out for accrual of foreign exchange for corresponding periods of export credit extended.

Group B countries illustrate the institutional and financial requirements of non-traditional exports with some starkness. Such exports comprise products and projects that cover credit terms ranging from one year to three years and even longer terms between 3 and 5/10 years. Here the negative impact of delay in realising accrual of foreign exchange is evident on the balance of payments of a developing country. Moreover, in the production process of such products and project exports, there is a portion of imported raw materials and components for which there is immediate foreign exchange outflow. On the one hand, there is a deferment of collection of export proceeds, and on the other hand there is the need to pay cash for imports required for the production process. Where K goods are involved, the production process can be longer than the period over which proceeds are realised after shipment. Hence, both pre-shipment as well as post-shipment cost and credit availability determine the competitiveness of a developing country.

Where buyers of manufactured goods are developing countries and terms of credit are medium term, the placement and discounting of credit instruments, created by the buyer, in the international markets is difficult and, where possible, it attracts a high cost. This has particular relevance for trade among developing countries, when K goods producing countries can sell to countries that can profitably absorb such goods when appropriate credit terms are available. There is also an appropriateness of technology involved in such trade.

Income levels determine the type and quality of final products used in a country. The latter determines the character and level of K goods required to produce the final products. Developing countries produce K goods which are consistent with their factor endowments, especially skill endowments. Moreover, trade flows are likely to radiate outward towards proximate and similar markets. Since developing countries are more similar to one another, the implication is that a large trade, *ceteris paribus*, among developing countries is possible. Attractiveness of the latest technology from advanced countries coupled with attractive credit terms could be partially offset should international financing support for deferred exports be available. It could enable developing countries' endeavour to match terms offered by competition. Viewed another way, options in regard to supply sources could also meaningfully enlarge.

Evidence suggests that export of machinery to developing countries is a faster growing market. During 1972-76 the growth rate

of such exports to developing country destinations was in the region of thirty-nine per cent compared to an overall developing countries' growth rate in manufactures of about thirty-five per cent. It has been argued that if the present rate of growth in developed countries continues, then sustained growth amongst developing countries is attainable only with increased trade among developing countries.[5]

### A COUNTER-ARGUMENT

It can be argued that the rapid expansion of exports of manufactured and K goods, especially amongst the newly industrialising countries in Asia, has occurred in the absence of any international financing of such exports. Hence the expansion in export of manufactured and K goods has not been restrained for want of export finance.[6] This argument would appear to avoid the next question, *viz*, how has the increase in exports of manufactured and K goods, involving postponement of accrual of foreign exchange, been financed? One route has been commercial borrowing in international and capital markets, including access to the discount/acceptance market. This has been possible and is likely to be possible to a somewhat decreased extent only for a few newly industrialising countries. The other route has been to expend domestic currency and bear with some immediate outflow of foreign exchange for procuring imported raw materials and components required for producing export products. Thereafter, the inflow of foreign exchange earnings have necessarily to be waited for. The cost impact has two dimensions. One relates to the domestic investment foregone and the other is the domestic resource cost of foreign exchange earned. This could lead to a faltering of the growth of non-traditional exports when the needs of developing countries are compared to those of newly industrialising countries.

The international money and capital markets can hardly be depended upon by developing countries for refinancing deferred exports. Worsening of the external environment has also worsened the external payments position of developing countries. The current account deficit of non-oil developing countries increased to $ US 70 billion in 1981, seven times the figure for 1972. Repayments of capital borrowed in the past have risen and net lending to developing countries has decreased. The consequence has been a heavy debt service burden. Transnational banks have been reducing their exposure to developing countries, causing a curtailed access to capital markets. Besides the shift in relative weights of the private and official flows of finance in the international monetary system, the private financial flows into developing countries are declining. Hence, even for those newly industrialising countries who have access to international capital markets, it may not be easy to rely on foreign borrowing to support expansion of exports in manufactured and K goods.

Moreover, attitudes to lending to developing countries have to be recognised. Lenders stress capital adequacy and lending limit constraints experienced by banks. With the increasing attention that national regulatory authorities are devoting to 'country risk', the decline (intrinsic or notional) in the creditworthiness of borrowers in developing countries cannot go unnoticed. Hence the cost of commercial overseas borrowing to support expansion in export of non-traditional goods is likely to get costlier. Besides, such borrowing will be ranked as debts counting in debt-service ratio computation and country-limits applicable to lending.

### CONCLUSION

The critical payments deficits of developing countries call for a considerable increase in non-traditional exports. This means considerable increase in finance availability, particularly medium and longer term finance. Both the newly industrialising countries as well as the developing countries are likely to be placed between Scylla and Charybdis. Whilst access to international capital is not going to be easy for newly industrialising countries, diversion of increasing amounts of domestic investible resources or support through created local currency for expansion of non-traditional exports involving deferred payment terms will be increasingly difficult.

However, non-traditional exports have been buoyant and are likely to maintain the momentum. When industrialisation strikes root, the effort is to promote industrial exports. Apart from the beneficial externality effects generated by industrial exports, there are other benefits which merit mention. These are, improved capacity utilisation, economies of scale, motivation for technological improvements, possibly improved allocation of resources through competitive pressures from overseas. Additionally, debt-servicing capacity of a country improves and its ability to attract overseas lending increases.

In the early phases of industrialisation, most countries have tended to respond to lack of foreign exchange resource with efforts to replace imported manufactures with indigenous products. This has enabled countries with large domestic markets to build up considerable and fairly efficient machinery capacities. Most developing countries in the region are now looking to outward strategies, in varying degree, recognising the benefits of exports.

Developing countries in the region have reached a stage of buoyant exports of manufactures. Sales attract term credit repayment terms. Competition from developed countries who offer cheap credit terms through a mix of aid credit and export credit is keen. The process of developing countries stepping into production areas that are likely to be vacated by developed countries in the course of their structural adjustment process may be impeded if developing countries cannot find international financing for deferred exports. Support for financing exports has been inadequate.[7] A developing country can ill-afford to postpone accrual of foreign exchange. An international refinancing mechanism alone appears to be a solution to the apparent paradox of a developing country importing capital as well as exporting capital which occurs when it sells industrial goods on long repayment terms.

## Premier Vinyl Flooring

PREMIER VINYL FLOORING (PVF) is setting up a Rs 9.85 crore project for the annual manufacture of 5.5 million square metres of PVC floor tiles, floor coverings, sheetings and films, wall coverings and coated fabrics at Sikandrabad in Bullandshahr district of UP, a 'backward' area eligible for concessional finance from financial institutions. The company has entered into a technical collaboration agreement with Pegulan Worke of West Germany, Europe's leading manufacturer of PVC products with 24 factories in Europe and an annual turnover of DM 1,300 million. The main plant and machinery for the project has been imported from West Germany. All the raw materials for the project *viz*, PVC dioctyl phthalate (DOP), stablisers and calcium carbonate are available from indigenous manufacturers. Commercial production is expected to commence in September 1985. The company is making a public issue of 17.50 lakh equity shares of Rs 10 each, out of which 8.50 lakh equity shares have been reserved for preferential allotment to non-resident Indians and persons of Indian origin resident abroad. The subscription list for NRIs opens on August 24 and for the Indian public on August 28. The issue is being managed by the Merchant Banking Division of State Bank of India.

# Infant Mortality in India

## Level, Trends and Determinants

Leela Visaria

*This paper aims at a critical review of the available data on the level of and trends in infant mortality and of the associated differentials during the last quarter of a century. An attempt is made to identify the gaps in our existing studies where future research efforts may be oriented.*

*The paper begins by setting out an approach to the analysis of data on infant mortality. Following that the national and the state level estimates of neonatal, postneonatal and overall infant mortality by sex and rural-urban residence are reviewed. Attention is then focused on the available evidence on the contribution of various prenatal, natal and postnatal factors to infant mortality during different time period. This approach is adopted to help identify and assess the possible role of different intervention programmes.*

[This is the second part of the paper which is being published in three parts for reasons of space. The first part appeared last week and the third part will follow next week.]

### INTRANATAL VARIABLES AND THEIR IMPACT ON NEONATAL MORTALITY

SOME of the important factors causing high neonatal mortality in India and particularly in rural areas of the country are the place of delivery, the type of attendant and the practices followed with respect to care of the new born.

As indicated earlier in Table 5, neonatal deaths form more than half of the total infant deaths in both urban and rural areas. The proportion has not changed significantly during the 1970s or even with a significant decline in infant mortality.

A majority of the neonatal deaths are attributed to certain birth-related practices and can easily be avoided. The available literature both on the type of practices and on the epidemiological causes of neonatal deaths is examined to understand the correlates of neonatal deaths and the interventions which can help reduce them.

Table 13 shows for the country as a whole and for the 15 major states the SRS data on the distribution of births by nature of attendance at birth. Evidently, in the country as a whole only around 14 per cent of births take place in hospitals, nursing homes, maternity homes, etc. In rural areas the proportion is very low and increased only very little between 1970-72 and 1976-78 (from 6.4 to 7.1 per cent). In urban areas, the proportion of births occurring in institutions was relatively high; and it has steadily increased from 30 per cent in 1970 to 43 per cent in 1978. The proportion of births conducted at home by doctors or other trained persons such as nurses, midwives, etc, has remained around 10 per cent in rural areas and 23 per cent in urban areas. Overall the proportion of births delivered by trained practitioners in urban areas is thus 66 per cent and is about 16 per cent in rural areas.

More than 80 per cent of rural births are delivered at home by untrained dais or other untrained practitioners of this activity as well as by relatives and other family members included in the category of 'other'. In the 1970s there has been virtually no change in this proportion. In urban areas, the proportion of deliveries conducted at home by untrained birth attendants has come down from nearly half in 1970 to about a third during 1976-78.

The inter-state differentials in the type of attention and help available at the time of delivery are very large. At one extreme, are states like Jammu and Kashmir, Madhya Pradesh, Rajasthan and Uttar Pradesh where less than 10 per cent of the deliveries in rural areas are conducted by trained professionals either in institutions or at home, (the situation in Bihar is also unlikely to be any different, although we do not have any data from that state and from West Bengal). At the other extreme in Kerala, where even in rural areas 56 per cent of deliveries during 1976-78 were attended by trained personnel. The high density of population makes the rural-urban difference in Kerala relatively invalid but the neighbouring Tamil Nadu had the second highest proportion of rural births attended by trained personnel.

The urban situation in all the states is considerably better than that of rural areas, but there are large inter-state variations. In urban areas of Kerala, Tamil Nadu, Himachal Pradesh, Punjab and Maharashtra 75 per cent or more of all births are conducted by trained personnel. At the other end of the spectrum are Rajasthan, Orissa and Madhya Pradesh, where less than 50 per cent of urban births are attended by trained personnel.

These statistics reflect the uneven spread of medical facilities and their utilisation between states and they have some bearing on the level of neonatal mortality. However, Tamil Nadu with the second highest proportion of births attended by trained personnel did not report the second lowest IMR and therefore we need to understand the practices of traditional birth attendants (TBA) and their implications with the help of the data available from micro-studies.

Of course, a human infant can withstand substantially reduced level of hygiene as can be inferred from the fact that even in the worst circumstances, infant mortality has probably never exceeded 300-400 per 1,000 live births. And yet, it is suggested that this level can be brought down to a very small fraction of it, if births take place in hygienic conditions and certain level of medical care is available to the mother.

A majority of the rural births take place at home attended by village dais or other family members and the situation is unlikely to change over the next several years. The training of dais in some basic minimum hygiene and safe delivery practices has therefore been a key element in the programme of improving maternal and child health, almost since the Second Five-Year Plan. But the available evidence suggests that not all untrained dais follow unhygienic practices and not all trained dais practice asceptic methods only. Also, several of our urban hospitals fail to ensure asceptic conditions even in operation theatres. Contamination and infections are also not unlikely because of overcrowding, inadequate maintenance, shortage of personnel, etc.

Yet, according to societal or cultural norms, almost all over India, the actual event of birth is considered ritually impure. With this concept of pollution are associated several rituals to cleanse the woman and her new born. Time is an important variable in this process. Since the event of birth is ritually impure, women who handle the placenta and the cleaning up subsequent to birth, generally hail form low caste (such as barber) or untouchable communities or from the ranks of minority groups. They are otherwise socially not acceptable by the higher castes and are called only when the labour begins. The role and functions of dais are largely confined to the intranatal phase of the delivery, which includes delivering the child, cutting and tying the umbilical cord, burying the placenta and cleaning the new born and the mother.

The available data from two studies, conducted in rural areas of Chandigarh and Madhya Pradesh presented in Table 14 point to significant differences between the trained and untrained attendants in the practice of proper hand washing, and the knowledge and practice of asceptic handling of the newborn. In Madhya Pradesh, the trained dais did not use readily available instruments such as kitchen knives or even sickles for cutting the cord, but in Chandigarh there was little difference between the trained and the untrained TBAs with respect to the instruments used for cord cutting. Both categories used domestic scissors. In Chandigarh, the extent and nature of umbilical cord care differed between the trained and the untrained TBAs, and the former reported much lower incidence of neglect (no care) or use of ash of cow dung than the untrained TBAs. (Unfortunately, similar data are not available from the Madhya Pradesh study.) Further, training imparted to the TBAs has made them aware of neonatal tetanus. A large majority of the untrained TBAs were ignorant of tetanus, an important cause of neonatal deaths.

The data on mortality rates among infants by the type of attendant—trained or untrained—are difficult to find because without any distribution between early neonatal, late neonatal and postneonatal periods or cause of death, the effect of the type of birth attendance cannot be identified clearly. However, the results of a retrospective study in the rural areas of Kanpur and Etawah districts of Uttar Pradesh presented in Table 15, indicated three times the level of tetanus mortality among babies delivered by untrained birth attendants relative to the corresponding figures for babies delivered by trained birth attendants. Another prospective study in Karnataka has shown relatively small differences in the IMR among babies delivered by untrained and trained birth attendants. The IMR was about 20 per cent lower among babies delivered by trained birth attendants than among the children born with the help of untrained birth attendants.

As indicated above, delivery practices are important because the newborn, unless protected by certain immunities, are susceptible to certain infections, such as neonatal tetanus. Information on the pathogenesis of tetanus provides good insight into its correlates. Neonatal tetanus is caused by a potent toxin produced by clostridium tetani spores. These organisms are found in the soil which is rich in organic matter and in the gastro-intestinal tracts of domestic animals and human beings. These bacili are found in heavy concentration in tropical climates (optimal condition for growth is 35-38°C temperature). The usual site of infection among the infants is the umbilical stump. The toxin of cl. tetani acts directly on the central nervous system and causes muscle spasms and seizures. The symptoms appear 2 to 14 days after birth and death follows rapidly. Even in hospitals, the case fetality rate is very high. However, if the pregnant mother had been administered two doses of tetanus toxoid at least one month apart, and at least one month prior of delivery, the immunity passed on to the newborn, offers nearly 100 per cent protection against neonatal tetanus.

Table 16 summarises some of the major findings of a few studies on tetanus. Most of them are based on the neonatal tetanus cases admitted to various hospitals and the sample size is rather small. However, it is evident that umbilical stump was the site of infection and in a majority of the cases, either the cord was cut with unsterilised instruments or substances like ash of cow dung, butter ghee, etc, were applied to the stump. In two studies (one hospital based and one based on retrospective village data—Bhakoo (1976), Smucker (1980)), where it was possible to study other correlates of neonatal tetanus deaths, socio-economic status of the family was not at all an important explanatory variable. In the Uttar Pradesh study, the presence of large animals appeared a major source of tetanus

TABLE 13: PERCENTAGE DISTRIBUTION OF SAMPLE BIRTHS BY TYPE OF MEDICAL ATTENTION OF BIRTH, 1970-72 AND 1976-78

*Notes*: Institutional attention meant delivery in an institution like a hospital or PHC. A delivery attended by a trained person occurred in the home but was attended by a doctor or a trained dai, nurse or midwife. An untrained attendant at delivery in the home was an untrained village dai or other untrained professional functionary. 'Other' deliveries were attended by some relations and others excluding those named earlier.

spores contributing to high risk of tetanus which persisted from one birth to another in the family (Simons, *et al*, 1978).

The cause of death data are notoriously inadequate and the only effort at national coverage to estimate the level of neonatal tetanus mortality (as well as the incidence of poliomyelitis) was undertaken as a response to the WHO's Expanded Programme of Immunisation (EPI) in 1981-82. It has been estimated on the basis of this survey that in India between 0.23 and 0.25 million infants die due to neonatal tetanus every year, with significant inter-state differentials (Bhargava and Sokhey, eds, 1983). However, as shown in Table 17, the neonatal mortality rates based on this survey conducted in 1981-82 are so much lower than those based on the 1979 survey of the SRS blocks that one can hardly believe them as real. Even though the survey had a short recall period of upto four months and covered a very large sample (population of 250,000) its results seem questionable.

Yet, an interestingly high inverse correlation (−0.65) is observed between the per cent of neonatal deaths due to tetanus and the estimated per cent of pregnant women who have been immunised with tetanus toxoid. The percentage of pregnant women covered in the states of Bihar, Rajasthan and Uttar Pradesh is very low and consequently the proportions of deaths due to neonatal tetanus are quite high. If the EPI is effective and achieves its goals, many of these neonatal deaths can certainly be prevented, with a clear impact on the IMRs of these states as well as of the country.

Accepting the SRS estimate of the birth rate of 34 (including Bihar and West Bengal) and making a rough adjustment for fetal wastage during the last trimester of pregnancy, about 21.4 per cent of pregnant women were given anti-tetanus vaccination during 1981 (Table 18). This estimate is only slightly lower than the figure of 24 per cent estimated for 1982 by Henderson (Henderson, 1984).

A similar exercise of states shows that among the 15 major states, the percentage of pregnant women given anti-tetanus vaccination during 1981 varied between a low of 3.4 per cent in Bihar and 9-11 per cent in Rajasthan and Uttar Pradesh to a high of 41 per cent in Maharashtra and 48 per cent in Gujarat. (Kerala with the lowest IMR had a tetanus coverage of about 38 per cent, the third highest in the country.) Unfortunately, the SRS-based neonatal mortality rates are not available for years after 1978 and therefore, it is not possible to assess the impact of the programme on inter-state variations in neonatal mortality attributable to tetanus. However, insofar as the immunity against tetanus lasts longer than for a few months, the impact of the programme can be expected to be cumulative.

The government programmes of training dais have been accompanied by the distribution to the trainees of safe delivery kits. However, the replenishment and maintenance of these kits involve an organisational effort that has been proven beyond the capacity of our district and block-level administration. To overcome this limitation, some MCH programmes have introduced an innovation of supplying a disposable safe delivery kit to the pregnant woman herself, who has an interest in preserving it and ensuring its use. According to Banoo Coyaji of the KEM Hospital, Pune, such safe delivery kits cost no more than about Rs 1.50 (US $ 0.13 at the current exchange rate) per piece, even including the cost of irradiation and round-trip transport between Pune and Bombay (*Source*: an oral discussion). There is considerable scope for further experimentation with this promising idea, which can bring about a basic change in the level of cleanliness and hygiene around a delivery. Similarly, some research in Chandigarh has highlighted a widespread practice in Haryana of giving top priority to the burial of placenta, considered a pollutant, at the cost of the needs of the newborn, whose difficulties with respect to breathing, etc, get attended to only after the placenta has been disposed of (*Source:* an oral discussion with S K Bhargava). Presumably such practices can be modified through an educational programme.

It is often suggested that the training im-

*Sources:* 1 The Chandigarh data are from: Bhakoo D N, S K Garg, K C Aggarwal and A N Gupta, 1976, 'Socio Epidemiological Study of Neonatal Tetanus', *Indian Pediatrics*, Vol 13, No 7 (July), 545-552.
2 Madhya Pradesh data pertain to the Rewa Division of the state and are from: Mathur N B, A K Gargye and V J Rajput, 1983, 'Knowledge, Attitude and Practice of Perinatal Care Amongst Traditional Birth attendants (Dais) Trained *Vs* Untrained", *Indian Pediatrics*, Vol 20, No 11, 837-842.

parted to the TBAs should enable them to identify difficult and complicated cases, so that they can refer these cases to the primary health centres or similar facilities near them. Such an extention of the role of TBAs is a new concept because usually the dais are not contacted prior to the onset of labour. Also, the available transport and communication facilities often make it virtually impossible for the complicated cases to be taken to a referral centre or for a trained ANM or a doctor to be called to handle a difficult delivery. The high density of population in a state like Kerala, with its excellent transport and communications network, facilitates attention by a trained person to a much higher proportion of deliveries than elsewhere in the country. Perhaps, an expanded role of the trained birth attendants is possible only in a framework of antenatal care including relevant health education, anti-tetanus vaccination and prophylaxis against both anaemia and malnutrition.

## BREAST-FEEDING AND OTHER PRACTICES

Apart from the anti-tetanus vaccine and a safe delivery, proper nursing of the newborn seems likely to have an important influence on its survival. As has been highlighted in the recent international literature, breast-feeding enhances child survival by transmitting to the infant, along with nutrients for growth, certain immunity-raising elements which can help fight the high infection load found in an environment, where the replacement foods are not ordinarily free from contamination. (Breast-feeding also tends to delay the resumption of menstruation and thereby elongates birth interval, which in turn enhances child survival.)

The mechanism through which breast-feeding affects child survival is quite well understood. But not many empirical and comparative studies are available to identify the distinct effect of breast-feeding on infant and child mortality, from among several simultaneously operating factors.

Medical research in India during the last 15 years has paid considerable attention to infant feeding and rearing practices. Several hospital or clinic based studies have ascertained the actual practices from the mothers of the infants or women attending the clinics as "out-patients". A few field studies have also been conducted both in rural and urban areas.

Most of the studies relate to small samples which may not be truly representative of the populations. However, taken together, these studies provide valuable insights into certain important beliefs and cultural practices related to the onset of breast-feeding after birth, the kinds of prelacteal feeds administered to the newborn, the age at which supplementary foods are introduced and their content, the general awareness about cleanliness, the duration of breast-feeding, the

weaning practices, etc. They highlight the scope and/or the need for a health education programme that can make an important contribution to raising the survival of children. The Indian empirical studies of the subject show lower morbidity among breast-fed infants compared to those who were partially breast-fed or not breast-fed at all. This is particularly true of diarrhoea, the most common cause of illness among young infants (Idris, 1981, NIN, 1982).

Table 19 summarises the major findings of several studies. Apparently, although breast-feeding seems universal, in a majority of the community studies, it is initiated at least 24 hours after birth and often after 48 or 72 hours; valuable colostrum is discarded. Interestingly, however, in the three tribal groups in Himachal Pradesh, Madhya Pradesh and the Nilgiris (Tamil Nadu), the new born were breast-fed within 6 to 12 hours after birth.

Women continue to feed their children for upto 24-36 months, and do not introduce supplementary foods very systematically. After about six months, when breast-milk cannot be adequate for the growing child, children are given supplementary milk (generally diluted with water because undiluted milk is considered a "heavy" food), and other foods which are essentially carbohydrates. Staples such as rice are believed to be light and easily digestible by the infants. Further, although the available studies do not report it, at least in rural Gujarat, there seems to be no practice of mothers feeding semi-solid supplementary food to the babies. Children start eating solids more or less regularly, only when they can eat by themselves. Quite probably many of the rural mothers do not have the time available to the upper class urban women to feed each child, and instead find it easy to breast-feed the child. (It has even been reported that women prolong breast-feeding because it gives them much needed respite from the daily arduous chores.)

Since in a large proportion of population breast-feeding is not initiated upto 1 to 3

TABLE 19: PERCENTAGE DISTRIBUTION OF INFANTS ACCORDING TO THE AGE IN HOURS WHEN BREAST-FEEDING COMMENCED—A SUMMARY OF VARIOUS STUDIES

days, the newborn are given some prelacteal feeds. As indicated in Table 20 these prelacteal feeds consist of some herbal concoctions, called 'gutti' in several parts of the country, often mixed with ghee or honey or even castor oil. This feed is believed to cleanse the infant's system. Plain water with honey, sugar or jaggery and in urban areas with glucose is a normal prelacteal feed. Occasionally, before the flow of breast-milk is established, one part of cow or buffalo milk diluted with 2 to 3 parts of water is also given. Hardly any studies indicate whether water used to prepare these feeds is boiled or not. If the water is well boiled, these prelacteal feeds may be fairly innocent and not likely to cause any ill effects.

The problem, however, arises with the manner in which these feeds are given. Often a piece of cotton or a rag is reportedly dipped in the feed and drops are squeezed in the baby's mouth. The standard of cleanliness being minimal at best, one wonders that the infant mortality rates are not higher than reported. Presumably, the human infant has a tenacity to survive and it begins to develop the requisite immunities at an early age. Another important finding points to a higher proportion of anaemic, malnourished and low weight infants among the partially breast-fed and fully "top-fed" infants older than 6 months in rural and lower class urban children compared to fully breast-fed children of the same age group and belonging to the same socio-economic status groups. It reflects the fact that the supplementary food given to the children is neither sufficient in quantity nor nutritive enough in relation to the requirement of the children. Mothers lack the knowledge of child's requirements. This was indicated in some of the studies cited in Table 20. It is a part of the overall poverty syndrome, although mere knowledge will not provide the resources to secure the necessities of life for children.

**(To be concluded)**

## Bombay Paints and Allied Products

BOMBAY PAINTS AND ALLIED PRODUCTS, which showed satisfactory working results for 1984, has reported about a 23 per cent increase in sales for the first half of the current year as compared to the corresponding period last year, even though its business has been affected by the disturbed conditions in Gujarat and Punjab. According to the Chairman, R R Hattiangadi, payments to and provision for employees includes an additional liability of about Rs 11 lakh for 1983 and 1984 in accordance with a settlement arrived at with the employees' representatives in March last. In view of the increased licensed capacity during 1984 and the enhanced productivity now assured by the employees, the company can look forward to increased profitability in the coming years. Meanwhile, the directors are considering various schemes for rationalisation and expansion of the company's activities. This may necessitate more working capital and accordingly the board's borrowing powers have been increased to Rs 5 crore. The company is awaiting approval of the concerned authorities to its proposal for the issue of bonus shares in the proportion of three shares for every 10 shares held.

DISCUSSION

# 'Garibi Hatao': Elements of a Strategy

S Sarath

NILAKANTHA RATH (*EPW*, February 9) has made an interesting analysis of the 'garibi' issue and the relevance of IRDP to the 'solution' of the problem of poverty in rural areas. M L Dantwala (*EPW*, March 16) has made a set of central comments whereas Indira Hirway's comments (*EPW*, March 30) underscore the importance of total planning and a central agency for implementing the plan. This note seeks to provide cross-lighting of the basic issue from another standpoint. Part I of the note is on general concepts, Part II on an algebraic analysis which is intentionally simplistic and Part III on a numerical quantification of the algebra using either data presented by Rath and Hirway or information commonly available.

## I

It may be considered useful to start with terminology. What are the basics? Not only that poverty exists but that the only available measure of that poverty is money, i e, the difference between the notional monetary value of the total consumption at existing levels and the corresponding notional value of the desired levels of consumption. On the next logical question of what ought to be the unit for measuring consumption, the individual or the family, it is the latter that is more in accord with reality. Hirway has also made this point. Production and consumption are shared daily and regularly within the family without any formal tokens of exchange; rather, the family bounds are defined by this very statement. The primary consumption gap of the 'poverty' of the family is essentially consumption of food (nutrition). The poor family that starves (partially or fully) in a village with a good access road and dispensary is no different, on this basic requirement, from the family that starves in an inaccessible village with no medical facilities. The 'quality of life' or the total consumption in a village with good social infrastructure is certainly higher than in one without such infrastructure. But the quality of hunger is the same in both. Therefore consumption of food should be the first concern of relief of 'garibi'.

It is not clear whether the definitions of 'poverty line' in government documents or other literature provide any weightage for services relating to hygiene, education and health, but it does not appear that any consideration is given. Facilities such as roads which are commonly used are in almost all cases owned by the state, i e, financed and maintained out of taxation or by the issue of currency, and not out of 'dividend earning' savings or loans. Therefore these facilities do not impose any productivity norms for capital 're-formation' and for the growth of individual family incomes. While such facilities may be helpful in the efforts of a family to increase its income, these facilities in themselves cannot generate additional cash income for the family. This note therefore limits the term 'consumption' to food and the term 'income' to the income available for nutrition.

Accordingly, the first requirement for alleviation of poverty is an increase in the disposable cash income for the family to enable it to consume more food. The term 'cash' is preferred to 'wage' as the term 'wage' conjures up some other visions extraneous to the theme, e g, of the worker's organisational relationship, norms of work, output, etc.

On this understanding there cannot be disagreement with Rath when he says that cash income should be improved. Hirway suggests better co-ordination with NREP with the same objective in view. There need be no doubt whether food will be available if cash is available. The answer to this question today is 'yes', i e, the reduced nutrition of the poor is not the result of a physical shortage. The state of the godowns of the FCI is indirect proof of the quantitative margin of production over consumption.

It is evident that income-earning economic activity (employment) could be in the areas of production of goods or services. Employment would be sustained only if the goods or services produced could be 'sold' and the costs 'recovered'. In the writer's view the basic issue for relief is the feasibility of 'sale' in the simple sense of exchange of goods or services for cash. Employment in the creation or maintainance of community facilities in rural areas should in essence be treated as 'sale' to government agencies in any of their myriad forms. In the Indian context, wells, drains, roads, schools and health have necessarily to be provided free, i e, an increase in the level of consumption or 'sale' of final output at no cost. Therefore, as brought out by Hirway, these activities cannot be self-sustaining. In theory, assuming that funds are regularly forthcoming on a 'reasonable' scale, then 'free' services can grow at a corresponding reasonable rate. The extent of benefit in employment to the target groups will then be set by funds and efficiency of implementation (efficiency including sincerity or honesty or whatever) and local skills available.

This idea can be further expanded. If, for instance, a village in a block is selected for investment in a particular type of better living facilities it would be sensible to train most of the requisite local identified manpower in the group of skills needed. This training could be given as part of TRYSEM programmes. (The 'S' in TRYSEM will be superfluous in this case.) Import of labour could be kept down but cannot be eliminated. Even granting all this perfection in planning and implementation some fluctuations in manpower, particularly unskilled, will occur between the phases of construction and after completion of construction. Some of the higher skills may also become redundant. Continuing employment will call for continuing investment in upgradation of services. If, at the same time, equality of development over large geographical areas is also to be an objective, the programme is bound to falter, as in any realistic assessment, it is evident that the funding of such development will be done principally through deficit financing and not through a more direct route of agricultural tax on large holdings. The newly created assets would at best contribute indirectly to the growth of the economy and would not enable sustained additional 'nutrition' which is taken to be the first requirement. Employment programmes launched by the state for creation of community assets could at best serve as a specific short-term relief of poverty by a depreciation of currency in other hands, without providing sustained income for additional nutrition for the simple reason that such assets primarily improve the quality of life ('consumption' in a very general sense) and do not form the capital base for recurrent 'saleable' production.

This does not mean that creation of jobs in such activities should not be attempted. Certainly it has to be done but it should be seen as only one component in improving the incomes of the rural poor, with self-employment in the traditional pattern also playing a role. The two approaches are not mutually exclusive but complementary.

The unresolved issue is whether, and if so how, self-employment can be generated in a reasonable time on a large scale and in a manner that would ensure that the 'sale' value of goods or services so produced far outstrips the currency injection needed to initiate the programme.

As the local community cannot afford such goods or services, the end product or service selected should be 'saleable' to buyers who can afford them and are prepared to buy them—i e, in the towns and cities.

It is necessary to make a short digression here before coming back to the main theme. It is this writer's perception that, using metaphorical terms, the urban areas function as a mutually supportive network of nodes with trailing roots, floating on a sustaining broth of 'subsidised' food supplies, the subsidy being the poverty of the landless and other rural poor who are not paid wages that would be adequate for off-season nutrition. While the exchanges within the urban net take place at rates of proper commercial equivalence, the exchanges with the rural sector are distorted in favour of the urban areas and the large holdings. One may cite as illustration the benefit to urban areas from food subsidies with reference to procurement price and the benefit to large holdings from fertiliser-price subsidies.

Changes in the susidies of either commodity do not affect in any significant measure the rural poor, and they continue to be where they were. The situation in respect of energy is very similar. The 'urban' investments in irrigation, electricity, oil or fertilisers (all of which are energy forms—dams, canals being potential or kinetic energy, and fertilisers being chemical energy) enable higher production and the private benefits from such 'urban' investment decrease with the size of holding. The larger holdings have large benefits and the very small holdings have insignificant benefits and the landless draw no benefits (sometimes energy investments reduce the income of the landless). This situation has to be seen as a part of the problem of employment in rural areas.

In this view we then have three necessary elements of a projected 'solution': (i) production of saleable goods or services by the rural poor, (ii) organisation of the sale of such output in urban markets at 'commercially viable' prices, and (iii) facilitation of use by the rural poor of investments in energy. The appropriateness of appropriate technology should be measured by the effectiveness of the technology in meeting the three requirements simultaneously. On the premise that such technological devices ('black boxes') exist, some other linked factors of wage employment may be briefly examined. For example, should the 'black boxes' be private-owned or should they be set up by the state for free use by the poor? If employment has to be sustained, private ownership and sale have to be accepted. Otherwise, the much dreaded percolation losses will occur. The state subsidy, if any (less than 100 per cent), should be on the cost of the device to the point at which the individual device could become self-supporting to provide a profit to the owner and 'wages' to the 'employees' and also, if possible, provide for a pay-back of the subsidy.

The 'black box' or device should process either material which is locally available or add substantial value to 'imported' materials. Further, the varieties of products should be such as to permit adequate total volume of sales without saturation in the area within which transport is feasible. As such a system will continue to confer financial benefits to the existing power structure without depriving the poor, there is a good chance that the schemes if taken in hand will survive. On similar reasoning the energy requirements of the process or 'black box' should not demand high levels of power. Preferably, the requirement per unit should be of the order of 2,000 watts on thermal devices and about 500 watts on dynamic devices. Such a level enhances the need for human inputs, while eliminating most of the drudgery, and helps to keep the capital costs low. Further, if energy is the prime factor in production and solar devices could be developed, one basic input would be almost 'cost free'.

With this statement of the 'bounds for system design' one can see the need for major and fundamental revision of the technological and commercial objectives. Geographical advantages to competitors in towns if any will have to be offset by administrative controls, e g, by a mix of licensing and excise, in addition to capital subsidies through excise rebates for rural installations. Though it may be held that state intervention *per se* reduces economic efficiency, administrative intervention is the only recourse within the existing structure to alter the direction of the thrust of development.

And finally, a note of optimism before proceeding to algebra. No claim is made that products and devices exist which meet these conditions. But there is no doubt that these can be identified and developed. More of this in Part III.

## II

From the approach developed in Part I, it is possible to reformulate the discussion on the utility of IRDP/NREP, etc, in terms of the scope for utilisation of available funds for stepping up consumption at the level of a single family. Also, for the purposes of algebraic analysis no distinction is made between straight subsidy and 'wage-employment' on common-user works such as roads since in either case the continuity of income is dependent on continuity of external fund flow and not on the family's readiness to work on process equipment provided to the family.

*Symbols:*

(1) Total funds available (Rs): F
(2) 'Percolation loss' under subsidy schemes (ratio): k
(3) Net funds available (Rs): F(1−k)
(4) Number of families involved (no): N
(5) Subsidy per family (Rs) if all the available funds are used on subsidy: $\frac{F(1-k)}{N}$
(6) Desirable level of nutritional consumption per family (Rs): D
(7) Actual level of consumption per family (Rs): L
(8) Satisfaction factor through subsidy (ratio): $\dfrac{\frac{F}{N}(1-k)}{D-L}$

Now let us assume that some funds are transferred to provide technological assets.

(9) Fraction of funds transferred from subsidy to technological assets (ratio): p
(10) Percolation loss in creation of technological assets (ratio): q
(11) Reduction in subsidy per family (as pF has been transferred (Rs) $\left.\right\}$ $\frac{pF(1-k)}{N}$
(12) Installed cost of technological assets (Rs): pF(1−q)
(13) Cost of material, etc, before processing (includes inventory and marketing cost) (Rs): C
(14) Sale prices of materials process (Rs): S
(15) Added value at point of sale (Rs): A = S−C
(16) Income per family: $\frac{A}{N}$
(17) Ratio of added value to capital: $r = \frac{A}{pF(1-q)}$
(18) Ratio of added value to input cost: $g = \frac{A}{C}$

This income should preferably be more than or should at least offset the 'loss' in subsidy.

$$\text{i e, } \frac{A}{N} \geqslant \frac{pF(1-k)}{N}$$

$$\text{or} \quad A \geqslant pF(1-k)$$

This increase A in value of C should be achieved by use of technological assets of cost pF(1−q), i e, substituting for A from item 17.

$$rpF\,(1-q) \geqslant pF(1-k)$$

$$r(1-q) \geqslant 1-k$$

$$\text{or} \quad \frac{r(1-q)}{1-k} \geqslant 1 \qquad \text{(Equation 2)}$$

It should easily be possible to fulfil this condition. In almost all cases r will be much greater than one whereas both k and q will be less than one. The percolation loss q in creation of technological assets will in all probability be significantly less than k, i e, 1−q > (1−k). In the extreme ideal case where both q and k are zero, the added value is naturally equal to r times the capital.

The conclusion is that diversion of funds from subsidy to creation of productive assets is well worthwhile—a conclusion that does not require algebra!

The new satisfaction factor s′ may be expressed in terms of

$$s' = \frac{s\left(F(1-k)\,(1-p) + rpF(1-q)\right)}{N(D-L)}$$

$$= \frac{F(1-k) + 1 - p + rp(1-q)/(1-k)}{N(D-L)}$$

$$= s\left(1 + p(r(1-q)/(1-k) - 1)\right)$$

from Eq 1

$$= s\,(1 + px) \text{ where } x = r(1-q)/(1-k)$$

The essential condition for the validity of the scheme is that r(1 − q)/(1 − k) is $>$ 1. Therefore x is $>$ 1. Hence s′ is greater than s, or, the satisfaction under the new scheme will be higher. (As an extreme ideal case where percolation losses are zero (k = q = 0) and the entire sum is diverted to technological assets, i e, p = 1, satisfaction s′ ideal becomes r times s ideal.)

This simple equation (2) is a ready measure of the degree of appropriateness of various technological devices so that the choice could be made on the extent of fund diversion from subsidy.

### III

(1) Total funds (Rs) crore: 260 app/annum subsidy + 561 app/annum bank advance 821 crore app/annum.

*Source:* Table 1 of Rath: Averages per annum Funds F (portion as subsidy) = Rs 260 crore

(2) Percolation loss (k): 0.2
*Source:* Rath. NABARD survey shows an overall leakage of 20 per cent. State Bank of Hyderabad reports 32 per cent leakage.

(3) Net funds available in subsidy: Rs 208 crore.

(4) Number of beneficiary families (N): 27.27 lakh

(5) Subsidy per family: $\frac{26000}{27.27} \times 0.8$ = Rs 762/annum

(6) Desirable level of consumption (by definition of poverty line): Rs 3,500

(7) Actual level of consumption: Established by deriving the percentage of persons going above poverty line *vis-a-vis* subsidy. Refer Rath's paper for details.

Rs 900 per beneficiary lifts approximately 6.6 per cent or 1/15th of the target above poverty line of Rs 3,500, i e, 1/15th of the population is at a level of Rs 2,600 pa. Taking some as close to total destitution, the class groups of population by income are approximately 0-175/176-350/351-525/etc, and the average is about Rs 1,312 and the average shortfall is then Rs 3,500-1,312 = Rs 2,288, say, Rs 2,300. This is a very gross approximation in the absence of other data.

(8) Satisfaction level = $\frac{762}{2300} = 0.34$

(Explanation: This does not mean that 34 per cent are satisfied. It only states—subject to the assumption that the unbridged shortfall for the entire 27.27 lakh of identified rural poor is about 2/3 or Rs 1,518 per head—if the entire shortfall for 27.27 lakh is to be met by subsidy the requirement is about Rs 414 crore every year, i e, about 150 per cent more than the IRDP programme. If the entire 42.5 million are considered, the figure moves to near to Rs 6,450 crore per year.)

(Caution: These figures are derived from the assumptions already stated and only give a broad perspective of the size of the problem and not its dimensions.)

(9) Fraction of funds transferred to creation of productive assets for making 'saleable' goods (p): say 0.3 or 30 per cent

(10) Percolation loss 'q' is say 0.15 or 15 per cent. A lower figure than loss in subsidy as potential for monitoring is better.

(11) Reduction in subsidy per family: 762 × 0.3 = Rs 228.6

(12) Installed cost of assets: 260 × 0.3 × 0.85 = Rs 66.3 crore

(13) Required generation of added value for distribution to the beneficiaries of the subsidy: 228.6 × 27.27 = 62.34 crore

(14) 'r' (ratio of added value to capital): $\frac{62.34}{66.3} = 0.94$

i e, the required ratio of added value to capital is less than 1. In practice this value would exceed 1.

(Caution: This ratio relates to capital and does not include cost of materials.)

Let us say that families be grouped in units of 7, i e, each family gets the use of the device for one day in the week. For 27.27 lakh families roughly 4 lakh (27.27/7) groups are to be considered. Each family has to generate Rs 228 per annum in let us say 45 working days instead of 52 days available. Amount to be generated per day is 228.6/45, say Rs 5. The cost available per device is Rs $\frac{66.3 \text{ crore}}{4 \text{ lakh}}$, i e, approximately Rs 1650.

Can we or can we not develop a device for Rs 1,650 which will enable a family to add sale realisation of Rs 5.00 to any material available to them after working for a whole day? Or taking that the unit works for 8 hours a day and there are larger groups of 50 families, cannot we develop a device costing Rs 13,000 approximately which adds Rs 5.00 of value per hour? As a technologist, I find no difficulty in this.

To validate this with reference to the cost of material one has to consider some typical cases of possible application.

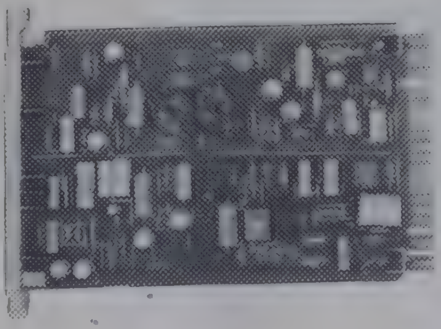
The point sought to be made is that technological requirements are to be defined in terms of economic objectives required to be achieved under the stipulated constraints.

## Indo-Gulf Explosives

INDO-GULF EXPLOSIVES is coming to the capital market on August 20 with an issue of 10.50 lakh equity shares of Rs 10 each to raise a part of the finance required for its Rs 6 crore industrial explosive project being set up in a backward area near Jhansi in UP. Out of the issue, 2.50 lakh shares are reserved for preferential allotment to non-resident Indians. The issue for NRIs opened on August 12. The company has got an industrial licence for annual manufacture of 10,000 tonnes of slurry explosives and 35,000 tonnes of NCN and ANFO blasting agents. These explosives are widely used by the mining sector, that is, coal, copper, iron, zinc, phosphate, manganese, limestone, lignite. Besides, these are also used in the construction of roads, dams, bridges, deepening of rivers/wells and demolishing of buildings. The company has been promoted in the assisted sector by two qualified and experienced entrepreneurs, S K Garg and B K Agrawal with UP State Industrial Development Corporation (UPSIDC) and Pradeshiya Industrial and Investment Corporation of UP (PICUP). Both Garg and Agrawal, had held senior positions with leading research and management organisations in Canada and USA over a number of years before promoting this company. The project has been set up in technical collaboration with Transocean Gulf Oil Company, USA, a division of Gulf Oil Corporation (Gulf Oil). Gulf Oil is one of the ten largest corporations in the world and has about 30 per cent share of the explosives market in USA. The Government of UP has provided land to the company at a nominal cost. The plant has been erected and commissioned and is undergoing trial production. According to Garg, Chairman and Managing Director, the demand for explosives has been growing and there has been a demand-supply gap of about 17,000 tonnes per annum of slurry explosives and blasting agents. The gap would continue to widen further in the coming years as the demand for coal is expected to grow double-fold to meet the needs of the large sized super thermal power plants to be set up during the Seventh Plan. The company does not foresee any problem in marketing of its products. Another feature of this project is that it has the largest licensed capacity of explosives in the country. The break-even point is estimated at 30 per cent. The company has set up one plant for the manufacture of 10,000 tonnes per annum slurry explosives near Jhansi and is in the process of setting up several satellite plants of a total capacity of 35,000 tonnes of explosives located at large sized consuming centres of the coalfields/mines. The company is confident of achieving 40 per cent capacity utilisation at its Jhansi plant in the first year itself, which would ensure a substantial revenue in its operations. The capacity utilisation of the order of 60 and 70 per cent is expected to be achieved in the second and third year of operations, respectively, which would ensure high profitability and growth of the company. Investors in the company's equity shares will be eligible for tax benefits under Section 80 CC of Income-Tax Act. The shares of the company will be listed on Delhi, Ahmedabad and Bombay stock exchanges. The issue is being managed jointly by Industrial Credit and Investment Corporation of India (ICICI) and Citi Bank, N A.

**Here's one way you can stop communication on an HBB Power Line Carrier Communication System.**

**The surest form of electronic communication today. Only HBB has made over 1,000 IC based units of these highly advanced systems, used for Electricity Boards, Railways and others.**



Electronic technology has grown in the last few years. And fast. So have we.

Take our work with power line communication. Until we introduced an alternative, the only link between power stations and sub-stations and between each power station was the P&T telephones. But Power Line Carrier Communication Equipment uses the power lines themselves to transmit messages. As long as the line stands, the message gets through. Even when the line breaks, the antenna effect carries the message.

We started with sets imported from BBC Brown Boveri, Switzerland. Began to manufacture our own transistorised versions in 1970. And our latest equipment is made with ICs. They consume less power and are even more reliable.

And naturally in great demand. Here and abroad. We've just delivered the 1,000th IC version carrier set.

All our products are made with the latest technology from BBC, Switzerland. Not just carrier sets. Equipment for data logging, telemetering, process control.

At HBB we're developing the future. Today.

**HBB is Power Line Carrier Communication in India.**

Change is permanent

Change is the essence of growth, an edict of management.

And, in today's world, the choice before an organisation is not between 'change' and 'no change', but between managing the change and being managed by events.

Change, when consciously imposed from within, opens up new opportunities, new avenues of growth. Paradoxically, the process of change is, and has to be, permanent.

This is the philosophy behind the changing role of MMTC — from a mere canalising agency to an international trading house.

Change, to MMTC, has meant putting its expertise in bulk buying and selling to larger purposes of national growth.

Like opening up global markets for India's small scale entrepreneurs. Adopting new strategies like Third country trading, Three-way trade, Joint ventures both in India and abroad, Equity participation abroad in sources of raw materials as well as in basic inputs.

Entering the arena of non-canalised items — ranging from importing PVC resins and mercury to exporting diamonds and graphite electrodes.

Improving customer service by decentralising operations, streamlining the distribution system and setting up Customer Service cells.

Reorienting the organisation to meet new challenges — through long-range planning, computerisation, systems reappraisal and organisation restructuring.

And this change already reflects in MMTC's performance. Non-canalised exports registered a fourfold increase in the first half of 1984-85, while the year's turnover is poised for a threefold rise. A record quantity of fertilisers was imported, at the right time, resulting in an all-time high foodgrain production and substantial savings in foreign exchange. Long-term contracts worth millions of dollars have been concluded for iron ore exports. For the first time, a counter-trade deal has been finalised with Zimbabwe for importing Asbestos against the export of engineering goods — an important step towards diversification and growth.

All this has led to increased employment opportunities which now exceed half a million and generated a new industrial and economic prosperity.

Yes, change is permanent. A philosophy chiselled in the minds of everyone at MMTC, the cornerstone of its success.

## REPORT ON BLACK MONEY

Spanning the horizons of progress...

With experience of over 30 years in building rail and road bridges, crossing most major rivers in India, HCC has covered over 44.2 Km in concrete & prestressed concrete. The story does not end here... The country's longest bridge across the Brahmaputra — 3495 m — is fast taking shape.

**HCC's record overseas includes over 30 road & rail bridges in Iraq.**

HCC's turnkey capability encompasses substructures too — piers & well foundations, sunk pneumatically to depths upto 60 m in clay and alluvial soil.

Speed & efficiency are the watchwords of HCC, which has built several bridges **simultaneously** to meet stringent deadlines!

*Always ahead, always on the top...*

# Uneasy Portent in Punjab

THE assassination of Sant Harchand Singh Longowal on August 20 is undoubtedly a major setback for the process of restoration of normalcy in Punjab initiated with the signing of the Memorandum of Settlement by the Government of India and the Shiromani Akali Dal on July 24. But it cannot be taken as indicating that the signing of the agreement itself was an infructuous act from which no useful results could be expected. It is true that Longowal had been unable initially to secure the support of prominent Akali leaders like SGPC president Gurcharan Singh Tohra and former Chief Minister of Punjab Prakash Singh Badal for the agreement. However, in retrospect it would appear that these leaders withheld their support not so much because they found the terms of the agreement unacceptable as because they were unsure how the agreement would be received by the Sikhs in Punjab. Against the background of the deep revulsion among the Sikhs over Operation Bluestar, the indiscriminate arrest, torture and imprisonment of Sikh youth all over Punjab by the security forces and the mass massacre of Sikhs in Delhi and other places which followed the assassination of Indira Gandhi, they had perhaps calculated that the whole process of holding negotiations with the government and coming to an agreement with it would not be approved of by large sections of Sikhs. This, it would appear, proved a miscalculation. Available reports during the brief period of less than a month between the signing of the agreement and the killing of Sant Longowal definitely indicated that the agreement had been welcomed all over Punjab or at the very least greeted with relief. The United Akali Dal of Baba Joginder Singh, despite being bitterly critical of the agreement, failed to mobilise any popular opposition to it. It was perhaps a reassessment of the people's response to the agreement which led to the reconciliation of Tohra and Badal with Longowal, said to have been achieved just hours before the latter's assassination.

While the government-Akali Dal agreement, even without Sant Longowal to guide the Akali Dal, constitutes a viable basis for the restoration of normalcy and peace in Punjab, it is difficult to be as certain about the government's wisdom in rushing through with the elections in the state. Despite the known reservations of the Akali Dal, the government fixed the elections for September 22 and Longowal's assassination has now persuaded it to postpone them by just three days to September 25. More worrisome is the government's possible reason for hastening with the elections. If it is true, as has been suggested, that the government's objective was to spring the elections on an unprepared Akali Dal riven with differences over the settlement with the government and with disputes over leadership, then clearly the portent is ominous. This is so because the last thing Punjab needs just now is an acrimonious election campaign with the Congress(I) and the Akali Dal going hell for leather for votes and seats. Such a campaign will run every risk of becoming communal and reopening still raw wounds and thus giving the terrorists, who seem right now to be relatively isolated, just the opportunity they are waiting for. The sense of responsibility which the leaderships of the Congress(I) and the Akali Dal exhibit will thus be crucial, as will be their ability to enforce codes of conduct on their respective cadres during the electioneering. On both counts there will be grave doubts.

The other factor which will determine whether next month's elections will consolidate or disrupt the basis for peace laid by the government-Akali Dal agreement is the government's success in containing the terrorists. Longowal's assassination exemplifies the potential for havoc of a relatively small number of hard core terrorists who precisely because of the drying up of popular sympathy and support for them will be increasingly driven to desperate actions. It is amply clear by now that the so-called combing operations of the army and the rest of the security forces after Operation Bluestar were as counterproductive as they were brutal and actually succeeded in driving Sikh youth in sizeable numbers into the ranks of the terrorists. It is to be seen whether the government can now mount a far more selective and far more professional effort to keep the terrorists in check during the coming month or so before the elections.

## *Languages*

### Neglect of Urdu

THE memorandum of understanding on Punjab signed by the late Harchand Singh Longowal and the Prime Minister provides for the Central government to "take some steps for the promotion of the Punjabi language". Accordingly, the Central government is said to have addressed letters to the concerned state governments urging them to encourage Punjabi. This is to be welcomed. Some similar action is called for in respect of Urdu. Admittedly, the position of Urdu is somewhat peculiar. Apart from the fact that Urdu and Hindi are closely allied, there are practical difficulties since Urdu is not a language spoken by a majority of the people in any particular state or a large enough region within a state. The popular view of Urdu as the language of the Muslims (much as Punjabi has come to be regarded as that of the Sikhs) is another complicating factor.

The Government of India had issued a statement on Urdu in July 1958 which said, *inter alia*: "Urdu and Hindi are very closely allied and may be considered as basically the same language. But it is true that Urdu has certain distinctive features, apart from the script . . . and differs not only in literary style but to some extent in its vocabulary from Hindi. Urdu has grown up in India as a variation of Hindi, being influenced by various cultural currents that came to India from other countries. But it is essentially a language of our country, and its homeland is India. The Constitution has recognised this basic fact by including Urdu among the national languages mentioned in the Eighth Schedule of the Constitution . . ." And yet, despite repeated assurances and promises, Urdu has lagged behind. Some states, such as Andhra Pradesh and Bihar, have made some efforts at promoting Urdu. However, it is UP which has the largest Urdu-speaking population in the country and there the state government has failed to provide the necessary encouragement to the language. This is brought out by the recent controversy over the UP Official Language (Amendment) Bill, 1984.

The state government had promulgated a number of ordinances according Urdu the status of second language, but it could not muster enough votes to get the bill passed in the legislature in the face of opposition from within the ruling Congress(I). Significantly it was a cabinet minister in the state government, Vasudev Singh, who spearheaded the opposition to the bill in the legislature. Opposing the bill, Vasudev Singh alleged that "by according Urdu the status of the second official language in the state, politicians would be indirectly encouraging separatist tendencies". He also questioned the secularism of those who wanted Urdu to be given second language status. The Congress(I), however, chose not to take any action against Vasudev Singh for his open defiance of the party's policy on this question.

The UP government's indifference to Urdu is reflected in the fact that there is now not a single Urdu medium school in the whole of UP at the secondary level. The UP High School and Intermediate Board decided as far back as in the early fifties not to grant permission for teaching of Urdu beyond the intermediate level. Despite this, Urdu could be learnt as a subject till 1983-84. But the new school syllabus in the state now does away with even this possibility since those who choose Urdu forefeit the opportunity to learn English or another national language. The new syllabus makes either Hindi or Sanskrit the first language and one of the languages included in the Eighth Schedule of the Constitution (which includes Urdu) or any European language (in effect English) can be chosen as the second language. Over the years, the number of Urdu teachers had declined from 30,000 in 1959-60 to only 5,000 in 1970-71 and has no doubt come down further since then.

Urdu has suffered as a result of the view that as a language it is closely akin to Hindi. In fact, however, the progressive sanskritisation of Hindi has enlarged the difference between the two. The impulse for this sanskritisation is, interestingly enough, provided in Article 351 of the Constitution which states: "It shall be the duty of the Union to promote the spread of Hindi language, to develop it so that it may serve as a medium of expression for all elements of the composite culture of India and to secure its enrichment assimilating . . . the forms, styles and expressions used in Hindustani and other languages of India specified in the Eighth Schedule and by drawing whenever necessary or desirable for its vocabulary *primarily* on Sanskrit and *secondarily* on other languages" (emphasis added).

The supporters of Urdu do the language a disservice by associating it with Muslims. However, the responsibility for this association rests primarily on those who are opposed to Urdu and who have carried on a vicious campaign characterising every demand on behalf of Urdu as communal or as pandering to the minorities. It is this opposition that has succeeded in associating Urdu with the minorities, so much so that a wide section of the Muslim population has accepted that the demand for Urdu is their demand and that the neglect of Urdu by the government has been partly responsible for their own backwardness. The only way in which the issue can be de-communalised is by according Urdu the status that is legitimately its.

## *Industrial Research*

### US Feels the Pinch

FUNDING of research by private companies in various autonomous institutions devoted to education and research has been the done thing in the United States. In fact, most major US universities and research institutions are private institutions and financed out of resources privately raised.

In recent years, however, research institutions in the US are beginning to attract funds from foreign companies, and this is raising eyebrows. Funding from foreign companies usually takes the form of project finance. Typically, a company, foreign or domestic, provides project finance in return for licence to market the results. The company may also get the right to put its own workers in the university or its research laboratory alongside the academic/research staff. Of course, each deal is separately negotiated and no two deals are necessarily similar.

The emergence of foreign companies as a major new source of project funds for US universities and research institutions is raising questions. Aren't they gaining access to American technology and that too at 'bargain basement prices' as a *New York Times* correspondent puts it? Although a business firm may provide for the equipment and staff directly required for a research project, it is very often the research support provided free by the institution through the faculty and vast infrastructure that is crucial to the success of the project and yet such support is hardly paid for by the firm. Of course, this is as true of a domestic firm as of a foreign firm. But in the former case the fruits of research remain, and are availed of, at least initially, within the US.

The universities, however, complain that without foreign funding it would not be possible to take up several projects. In fact, the support of foreign funds has become so important that the universities are prepared to agree to almost any terms that the foreign firms ask for. Even patent rights to the fruits of research are being given away.

That foreign funding has assumed quite sizeable proportions can be seen from the fact that MIT maintains an office in Tokyo to keep contact with firms interested in 'sponsoring research'. Almost a quarter of the $ 32.5 million that business firms contribute to MIT's sponsored research comes from foreign sources.

Companies find it simpler and cheaper to underwrite university research. For a fraction of the cost they themselves would incur, they can own the results of research. Foreign companies go to the US for research in areas where the US is most advanced. As an executive of a major computer company is said to have remarked, "The Japanese can thus take our technology and ship it back to us in the form of low cost products". With the trade deficit with Japan likely to approach $ 50 billion in 1985 and US computer firms facing hard times, thanks largely to Japanese competition, this mounting concern about technology transfer through sponsored research is understandable.

## *Communal Riots*

### Crimes without Punishment

FORTY persons accused in the Ansaribaugh communal massacre case were acquitted by the Kalyan Special Court (Riots) Judge K D Kochargaonkar on August 20. At least 26 persons had been burnt alive on May 19, 1984 in Ansaribaugh in what was the most gruesome episode of the communal riots in Bhiwandi near Bombay last year. The acquittal of those charged with the crime once again confirms that conviction and punishment are exceptions in respect of those indulging communal rioting and killing.

The Ansaribaugh case has also brought out why this is so. While recalling that the Ansaribaugh massacre had been "most gruesome and heartrending", the special court judge was constrained to say that "evidence is totally lacking and insufficient. There is in fact no iota of evidence to drive home the guilt of the accused." Against 30 of the accused, the judge pointed out, the prosecution had not "uttered a single word". Four of the accused had been nabbed on the spot and six others had been identified as having indulged in violence and arson. Despite this and the fact that the prosecution had more than a year to prepare its case, it failed to produce an "iota of evidence".

This is not, however, surprising if past practice is any guide. The Justice D P Madon Commission of Enquiry that had inquired into the earlier communal riots in Bhiwandi, Jalgaon and Mahad in Maharashtra had passed severe strictures against the special investigation squads set up to investigate the riots. It charged them with acting in a partial and biased manner against the minority community and with being indifferent to prosecuting Hindus accused of having been involved in the riots. Similarly, the Report of the National Police Commission (1981) made a study of prosecution and disposal of cases registered in connection with serious communal riots at three places in 1967 and 1970. It found that of the 211 cases reported, in only 56 cases were the accused chargesheeted and of these again only 16 resulted in convictions. An analysis of the convicted cases showed, according to the report, that "these were all simple cases in which the accused were actually caught red-handed on the scene of the riot". The Union Home Minister informed Parliament in December 1983 that out of 71 cases relating to communal rioting decided in 1982 only 11 had ended in convictions. In 1982, it is worth mentioning, there had been 474 incidents of communal violence in which 238 persons had lost their lives and 3,025 had been injured, according to the same ministry.

In the immediate aftermath of every communal riot, government spokesmen, from the Prime Minister down, condemn those responsible in the strongest language and proclaim their determination to see that the most deterrent punishment is meted out to them. There is much talk of the guilty being brought to book speedily and summarily and about setting up special courts for the purpose. However, what actually happens, once the immediate political pressures generated by communal violence has abated, is exemplified by the Ansaribaugh massacre case.

## *Sri Lanka*

### Putting Pressure on Tamils

*M S S Pandian writes:*

THE Eelam militants are apparently no more wanted in India. The Union government wants them to accept whatever Sri Lanka is prepared to offer and pack off from here. The portends have been there for some time. The responsibility for dealing with the Sri Lanka Tamils issue has been taken away from G Parthasarathy, who was apparently not acceptable to Colombo, and entrusted to the Foreign Secretary, Romesh Bhandari; under the ceasefire agreement the guns of the Tamil militants were forced to go silent, while the Sri Lanka government expanded its armed forces in the Tamil areas; the Indian government put pressure on the Tamil militants first to participate in the Thimpu talks and, then despite the Sri Lanka government's violation of the ceasefire agreement, to continue with the negotiations.

The decision to deport A S Balasingam, the chief spokesman of the Liberation Tigers of the Tamil Eelam, and S C Chandrahasan, convenor of the Organisation for the Protection of Tamils of Eelam from genocide, is a logical culmination of this trend. The government has let it be known that the leaders are being deported because of their reluctance to respond to Rajiv Gandhi's call to the militants to meet him, but that does not seem to be the whole story. The deportation of the Tamil leaders has been naturally welcomed by Colombo.

Even as the second round of negotiations was on in Thimpu, the Sri Lankan army and armed Sinhala civilians are reported to have butchered in cold blood more than 300 Tamils in Trincomalee district. And in Thimpu itself, the proposals offered by the Sri Lanka government in the second round of the talks were little more than what the Tamils had rejected earlier—limited autonomy at the district level without bringing the Tamil-dominated northern and eastern provinces together. The package of 'additional powers' offered to the Tamils by Hector Jayawardene consists essentially of the authority to issue licences to open beef stalls, shoot stray dogs, castrate bulls, vaccinate cattle and construct public lavatories. The militants' reluctance to meet Rajiv Gandhi has to be seen against this background. However, a few hours before Balasingam was detained for deportation, it was decided at a meeting of the Eelam National Liberation Front presided over by Balasingam himself that the Tamil leaders would meet the Indian Prime Minister.

If Delhi seeks to impose an agreement on the Tamils or deprives the Tamil militants of a foothold in India, the immediate possibility is that Sri Lanka will be plunged in a civil war. Following the deportation of the Tamil leaders from India, the Sri Lankan President J R Jayawardene has already declared that he is prepared for a war with the Tamils. A civil war will be a tragedy for Sri Lanka which is already battered by recurrent communal violence. It will also make the already pro-US Sri Lanka government more dependent on Washington. The Tamil militants are conscious of the international ramifications of their struggle. In a recent publication of the Eelam People's Revolutionary Liberation Front entitled 'Ceasefire and Negotiations', it is reiterated that the resolution of the Tamil question in Sri Lanka and peace in the Indian Ocean are inseparable.

Any delay in finding a lasting solution to the Tamil question in Sri Lanka will also have its repercussions in Tamil Nadu. It will give teeth to the Tamil chauvinist forces in

the state. Hand-written posters that have appeared on walls in Madras following the order to deport the Tamil leaders read: "If Tamil Tigers are sent back, Tamil Nadu will secede from Indian Union". In a reaction to the deportation, students in different parts of the state abstained from classes and detained trains, which has led to indefinite closure of the educational institutions in the state.

## BUSINESS

# Floating in Imported Oil

THE vegetable oils market scene presents an interesting study and throws up issues which merit serious consideration. The behaviour of oilseeds/oils prices contrasts sharply with the overall behaviour of commodity prices. The official wholesale prices index for 'all commodities' shows an increase of 5.5 per cent during the 12-month period ended August 3 but the index for oilseeds is down by 14.2 per cent, for edible oils by 17.9 per cent and for inedible oils by 20.7 per cent. Going by spot quotations in Bombay on August 22 and a year ago, castor oil is down by 33.5 per cent, mahuva oil by 18.9 per cent, cottonseed oil by 14 per cent, kardi oil by 14.5 per cent, linseed oil by 12.5 per cent, groundnut oil by 7.4 per cent, sesame oil by 6.3 per cent and rice bran oil by 4.5 per cent.

The market has not experienced anything like a seasonal rise this year. official pronouncements hinting at a cut in edible oil imports have had no noticeable impact on market sentiment though oil prices did harden a little about the middle of August. Inquiries with knowledgeable market men reveal an interesting contra-seasonal phenomenon. The pressure of supplies has seldom been so large at this time of the year and nor has trade/consumer offtake ever been so poor.

The vanaspati industry is said to be having a particularly tough time. Despite the fact that 55 per cent of its oil requirements are being met by STC at the highly subsidised price of Rs 9,500 a tonne which really works out to Rs 8,500 after allowing for freight and sales tax refund, most manufacturers complain that their operations have been rendered uneconomic as they are unable to market their product at the stipulated prices. A tin of vanaspati is said to be available at Rs 16 to Rs 18 below the permissible retail price of Rs 264 (15 kg). Because of the slack offtake, several units have been obliged to curtail their production. From a high of 81,000 tonnes in March, vanaspati production has gradually come down and the figure for August is mentioned around 58,000 tonnes.

Talking to a cross-section of informed persons intimately connected with the oilseeds trade and industry has been quite a stimulating exercise. All kinds of explanations have been offered for the continuing weakness in vegetable oil prices. Increased indigenous production during 1983-84 and 1984-85 and massive imports of edible oils during these two-years have resulted in abundant supply which has made a profound impact on the general market psychology. Indigenous production of edible oils during 1983-84 and 1984-85 is placed at 30 lakh tonnes and 32.5 lakh tonnes respectively. Edible oil imports during 1983-84 (crop year) totalled 16.34 lakh tonnes and the figure for 1984-85 is mentioned around 16 lakh tonnes.

The record supply of imported oils and increased production of rabi oilseeds—rape/mustard seed and summer groundnut—have minimised the impact of the seasonality factor. Hoarding of stocks has ceased to be profitable and it has also become very risky because of the scare caused by official pronouncements to deal effectively with the menace of black money. The marked decline in offtake, especially of vanaspati, is attributed mainly to the fact that stocks normally carried in the trade pipeline have shrunk to negligible proportions of late. Another factor contributing to the decline in offtake of vanaspati is the relative cheapness of refined oils inducing bulk consumers —hoteliers and halwais—to switch over from vanaspati to refined oils. Last year, vanaspati was much cheaper than refined oils—Rs 10 to Rs 15 a tin (15 kg); currently, refined oil is cheaper by over Rs 40 a tin at the wholesale level.

The point has also been made that while the per capita availability of 6 to 6.5 kg of fats per annum appears very low in terms of the generally accepted nutritional standards, the general behaviour of edible oil prices suggests that the supply of 46 lakh tonnes of edible oils a year is quite adequate to satisfy effective demand in the conditions obtaining at present. This is an indication of acute poverty among the masses.

While bemoaning the fact that vegetable oils in India have long been quoted well above international prices and that the Indian consumer has to pay more for edible oils/fats than his far more affluent counterpart abroad, many knowledgeable observers of the oilseeds economy think that viewed in the context of other commodity prices, oilseeds prices are on the low side. It is argued that going by the index numbers of wholesale prices (1970-71 = 100) the index for oilseeds stood at 295.3 during the week ended August 3 whereas the 'all commodities' index stood at 365.2, the indices for other items being primary articles 345.9, food articles 334.1, pulses 465 and manufactured products 347.3. It is said that the relative movements in prices are not conducive to greater effort at increasing the production of oilseeds. This, of course, assumes that prices are a major constraint on production which is questionable. It is however significant to note that cottonseed oil which is currently quoted around Rs 12,800 a tonne fetched about the same price in August 1981 while the vlaue of the rupee has depreciated quite considerably over the years.

There is a general agreement among informed observers of the oilseeds economy that no major breakthrough in the production of oilseeds is likely unless the government reduces drastically imports of edible oils to a level which is just adequate to meet the requirements of the public distribution system, imports only those oils which are the cheapest and which are not produced indigenously, stops supply of imported oil to the vanaspati industry and removes all curbs on the use of indigenous oils as well as on vanaspati prices. It is also considered necessary to generate adequate surplus from the sale of imported oils to finance programmes for stepping up domestic production of oilseeds to minimise/eliminate dependence on imported oils.

The south-west monsoon has by no means been very favourable for oilseeds. Prospects of kharif oilseeds production reaching last year's level are rated rather low. Much would depend on the weather conditions in the weeks ahead. Production is likely to register a sizeable decline if the monsoon withdraws by about the third week of September.

## *Paper Industry*

### Capacity without Output

THE paper industry has been passing through a prolonged period of crisis on account of declining capacity utilisation and rising capital and operating costs. A few large and some 35 small paper mills have downed their shutters. Many units are in the sick list with a precarious financial position.

Till 1979-80, the paper industry in India was in good shape and whatever it produced was sold at remunerative prices. Thereafter, its fortunes have witnessed a steady decline. The main reason for the crisis facing the industry at present appears to be the haste with which the Union government encouraged the creation of new capacities through the setting up of a large number of small paper mills by import of second hand machines at a concessional rate of import duty.

The objectives of encouraging the setting up of mini-paper units were no doubt laudable, namely, (1) dispersal of industrial units, and (2) utilisation of non-conventional raw materials for producing paper, such as bagasse and other agricultural residues, to overcome the shortage of conventional raw materials. Between 1978 and 1984 over 170 small paper mills were set up all over the country. However, most of these mini-paper mills were bedevilled by technical snags right from the beginning which neither the government nor the financial institutions could foresee. In their enthusiasm to import second hand machinery at 50 per cent of the prevailing rate of import duty, most entrepreneurs ended up importing obsolete machines which was little better than junk.

To add to the problems of these entrepreneurs, the optimistic estimates of the Agriculture Ministry regarding the supplies of agricultural residues turned out to be unrealistic. With a large number of small paper units competing for the available raw materials, the prices of straw and other residues have jumped by 200 to 300 per cent over the last few years.

Not surprisingly, while there has been an impressive growth in the installed capacity of the industry during the Sixth Plan period (1980-85), the growth in output of paper and paper board has been much slower. The Planning Commission had fixed the capacity target for the year 1984-85 at 20.5 lakh tonnes and the production target at 15 lakh tonnes. However, while the installed capacity of the industry increased by 85 per cent from 12.65 lakh tonnes to 23.49 lakh tonnes over the Plan period, production increased by only 27 per cent from 10.60 lakh tonnes to 13.50 lakh tonnes over the same period.

The Planning Commission had estimated the demand for paper and paper board at 15.40 lakh tonnes for the year 1984-85. Though the actual growth in demand was a little less than this, mainly on account of rising paper prices, demand exceeded domestic production necessitating imports worth around Rs 20 crore per annum during the past few years. These imports could have been avoided with better capacity utilisation. While the installed capacity registered an impressive increase, the capacity utilisation of the industry declined from about 80 per cent in 1978 to 60 per cent in 1984. The small non-integrated paper mills have done much worse than the large integrated mills in respect of capacity utilisation.

A study conducted towards the end of the last fiscal year by the Central financial institutions clearly revealed that the units which have been set up in the past decade based primarily on agricultural residues and recycled waste paper with investment ranging from Rs 5 crore to Rs 8 crore and production capacity of around 30 tonnes per day have not been doing well. Barring a few of these, the rest have not been able to service their borrowings and have been forced to repeatedly seek moratoria for repayment of principal and interest. In many cases, the institutions had to provide a wide range of reliefs to keep the units alive.

The Industrial Development Bank of India (IDBI) which conducted a study of the performance of small paper mills has identified the causes of their poor performance. These include poor utilisation of installed capacities on account of equipment bottlenecks, high costs of coal, power shortage and problems connected with procurement of raw materials.

It must be admitted, however, that the setting up of a large number of small paper units based on agro residues has helped in increasing the capacity and production of paper in the country significantly without increasing the pressure on scarce forest resources, though this has been achieved at a high cost. The share of large integrated mills in the production of paper which was around 80 per cent in 1973-74 has gone down to about 54 per cent in 1984. In absolute terms, while the annual production of integrated mills has increased from about 6 lakh tonnes to 8 lakh tonnes per annum over the last decade, that of small paper mills has gone up from 1.6 lakh tonnes to 7 lakh tonnes per annum over the same period.

The role played by the small paper mills is evident from the fact that even the existing large integrated paper units have been facing scarcity of forest raw materials. To make available the basic raw materials at reasonable prices and to relieve pressure on depleting domestic sources, the Finance Ministry has totally exempted from customs duty import of wood chips for making pulp required for manufacture of paper and paper board. The duty on wood pulp has been reduced to 30 per cent. Even with all this, the raw material supply position of the industry is far from satisfactory.

This, coupled with technological obsolescence, has brought down the capacity utilisation of integrated paper mills as well. Of the total installed capacity of 23.49 lakh tonnes, about 11.73 lakh tonnes is accounted for by the large units. Of this, a capacity of 9.73 lakh tonnes is, on an average, 50 years old and badly in need of modernisation. The industry maintains that the sharp fall in profitability does not allow the units to generate the surpluses required for modernisation. Because of their precarious financial position, most of the units have been pleading for exemption from the government's Paper Control Order under which they are required to supply 25 per cent of their output in the form of white printing paper to the educational sector at controlled prices. The burden of supplying about 1.4 lakh tonnes of white printing paper for the educational sector now falls on less than half the large units since quite a few units have stopped supplying this paper by obtaining stay orders from High Courts and some others have obtained exemption from the government as they are in the sick list. They have pointed out that the current controlled price of Rs 6,400 per tonne paid by the government is about Rs 2,000 per tonne less than the cost of production estimated at Rs 8,400 a tonne.

To overcome the twin problem of shortage of white printing paper and growing sickness among paper mills, K L Chugh, the Chairman of the Indian Paper Makers' Association has suggested that the present Paper Control Order be scrapped. Instead an additional excise duty be levied on all producers to subsidise supplies to the educational sector. This will give the mills freedom to choose the product-mix best suited to them. This will also help in ensuring better capacity utilisation and improved performance.

---

## LETTER TO EDITOR

# West Bengal and Multinationals

ASHOK RUDRA's article 'Jyoti Basu and Multinationals' (July 27) highlights succinctly the inward looking, non-participative stance of the leftist intelligentsia of West Bengal. Sadly for the state, these diehards dearly hold on to the outdated precepts of a dogma rendered sterile by the efflux of time and economic realities.

Unlike the Rudras (and let's add the Mitras as well), Jyoti Basu is an elected representative of the people and is answerable to them. I don't believe that the swelling ranks of the educated unemployed in West Bengal can any longer put their faith in a doctrine which has signally failed in creating jobs for them. People like Ashok Rudra and Ashok Mitra represent the pre-World War I brand of communism, which is difficult to come by in the land of its birth, the Soviet Union, or the China of Mao Tse Tung. Gorbachov and Deng Xiaoping will have nobody but themselves to blame if things go wrong, but in West Bengal in India, the last bastion of Marxist anachronism, we have the Centre to blame for the state's economic negativism and its sheer lack of initiative.

The point that people like Jyoti Basu have to face is what can be done, given the tremendous growth that is taking place elsewhere in the country, in order to set right the state's power houses, its factories and jute mills and revive the climate of production and investment in West Bengal to generate incomes and employment. How did Ashok Mitra desert his post to undertake a lecture assignment from Western capitals and not from Moscow? Quite obviously on his own terms. I wonder why Ashok Rudra should find it wrong for Jyoti Basu to invite multinationals to seek investment in the state on his own terms.

The days of cashing in on past history are over. If the Bangalis do not help themselves, West Bengal will continue to be a laggard.

I also went through the text of Jyoti Basu's speech referred to by Rudra. Among other things what came through was Jyoti Basu's concern for the deprived people of the neighbouring states seeking shelter in West Bengal and his remarkable concern for the unity of the country. Basu runs the government of West Bengal without forsaking the principles of modern Marxist philosophy of distribution of wealth and alleviation of poverty. I do not know what Rudra does. Does he have any responsibility whatsoever? More people of the state must rise to support the Jyoti Basus of the CPI(M) to neutralise the Rudras and Mitras who seem to be transfixed in a dogma that has outlived its utility. West Bengal must launch a crusade to save itself from such men and not from the MNCs. Do the MNCs lack avenues for investment so much that they are dying to come to West Bengal?

# Which India Concerns Them?

### Romesh Thapar

VARIOUS visiting foreigners, described in Indian English as VIPs and VVIPs, who in their persons still represent a kind of splintered viceroyalty for India—Clausen of the World Bank, for instance—should attempt a more realistic exposure to conditions over here before they start passing instant compliments on the performance of the economy. Otherwise, I am afraid, they are merely repeating parrot-like the statistical concoctions served up by their fawning report-writers. In fact, better still, they should keep their mouths shut in public like good bureaucrats.

No picture of India finds a proper focus unless one is queued up for anything upto an hour at the airport as clue-less policemen check passports (they hate the job because there is no 'over and above' earning). Thank goodness the health check has at last disappeared for entry into this land of escalating pollution. Then, the long wait and the rushing around for baggage which starts appearing on two separate moving belts. And the walk through the green channel where almost everyone's bags are opened. Our continental chaos is captured here in microcosm.

A glance at the red channel would reveal a host of poorly-clad and terribly harassed labourers from the Sheikhdoms in the Persian Gulf trying to get their large cassette-recorders and rubber mattresses(status symbols in our villages) through with the minimum of penalties—yes, the same labourers who send home something like Rs 2,000 crore every year in foreign exchange to maintain the solvency of India. No Finance Secretary has attended to their very visible plight.

By now, Clausen of the World Bank would at least have shed his euphoric diplomatic postures. He would be touching the inefficiencies which reduce us to a capacity utilisation of under fifty per cent. A drive through our messy traffic, and may be over annually rain-damaged arterial roads around the proud capital (built by corrupt Congress contractors) would shatter his peace of mind and puncture his notions about the revolutionary role of automobiles or what we call 'people's cars'.

Socialism in action. A five-starred suite in a five-starred marbled hotel with a flunkey for every wish. Conferences in the sprawling secretariats of the Government of India where officers are seldom 'in their seats', always in conference, and where files move only if you have the necessary suction—which, incidentally, the World Bank has because of the over-paid jobs, assignments and consultancies it has to offer to those who matter. And receptions in the evening where anyone who is anything in the hierarchy parades before this bit of continuing viceroyalty. Cost per head? Worth probing.

I have it on the most reliable authority that by the time the local satrap of the World Bank has completed his term, and is packing up for the next fruitful challenge, all members of the senior bureaucratic hierarchy, almost without exception, have lobbied for a job or assignment, even a de-briefing! We are for ever being lectured to about the 'foreign linkages' of every dissenting group in this country, from social work to civil liberties, and usually the background papers are prepared by these same supplicants to the World Bank, to the IMF, to the United Nations and its agencies etc, etc. Ironic, isn't it?

We haven't sophisticated this business of misleading foreign visitors, VIPs or VVIPs, like the Chinese. There, the routes of visitation are demarcated, even to the toilets specially equipped and deodorised for foreigners. Here, Clausen of the World Bank should take a trip unannounced to some of our power-stations. When a Japanese study team did this a few years ago, they left marvelling that any power was produced in the chaos they saw.

I will not ask anyone to taste the 'culture' of our telephone and electricity offices, of our numerous networks of government harassment, of our crowded lower courts, of our uncaring hospitals, and of the office-boys without whom no work would be done. But the World Bank should get a 'feel' of the Reserve Bank where with a certain studied nonchalance you can be asked 'to sign legibly' and then have a magistrate attest the signature. It is babuism run riot. We survive because our patience is infinite. Hinduism has done this to us.

This is not a plea to give visiting dignitaries 'the real treatment' in the sprawling slums of India—where, you know, poverty programmes never reach—but an attempt to curb the stupid public relations exercises which mark these occasions. We have to grow up and face the squalor and trauma to which we have condemned ourselves by our lack of social consciousness. And we have to educate these dignitaries about the gut problems of growth, about which, incidentally, they know next to nothing.

If we are into an economic correction, then this aspect is very much a part of it. The breakdown of minimum norms and disciplines is the direct result of the management system refusing to assert itself. I use the word 'management' deliberately because this is how the ruling coterie thinks. Everything is management. If that is so, let's see some interventions across the board—and sackings for those who do not perform, *a la* the Supreme Court judgment which has caused such alarm in the corridors of the secretariats.

Clausen of the World Bank should acclaim our very belated decision to cancel the open general licence on automobiles because we need mini-buses for this country, not cars. And he should urge the re-definition of these licences to support rapid transit systems. He should hold up as a model the decision to introduce an air taxi service and urge, in the interests of efficiency and productivity, competition *within* the public sector airlines, banks, insurance companies, steel units and similar monoliths. And he should warn against an amoral, free-wheeling private sector with its embedded corruptions.

This is unrealistic, of course. The World Bank would be 'cut off' by Reaganomics. What is sought is stability for foreign investment and markets for discarded technologies, mostly junk. There is no one around in any strength in the global network of economists and such like to crack this old frame of thinking, and to show how the attitudes popularised in the developed world are actually heightening the crises in countries like India—and, for that matter, even China. If there were, they would soon get the signals to remove themselves.

The handling of the Indian economy demands tough commitments to alternative models not favoured by the givers of loans, aid and assistance. We will have to tread warily to build the sovereignties which once marked our effort to lift this country out of the petrified conditions in which colonialism left us. We do have the skills and resources. We are wanting in a management sense—yes, whether it is politics or economics, productivity or punctuality, lavatory order or traffic control, clean environments or maintenance norms, or quiet disciplines.

At some point, probably when the ruling coterie faces the crucial test of decentralising decision-making and implementation, a lot of persons will have to be put on an official, non-violent 'hit-list', if I may use this rather overworked expression. And no status-building gunmen will be provided for protection. We are saddled with too many non-performers, baggage that governance and management can certainly do without. But, alas, they are the servitors of those other non-performers, the politicians in power, the corrupters pretending to fight corruption, black money *et al*. Who will 'hit' them?

*August 16*

# Ban on Information

### A G Noorani

"COULD the government deny the press access to all public institutions and prohibit interviews by all government employees? Could it find constitutional footing by expanding the ban to deny access to everyone?" Justice William Douglas's questions were obviously rhetorical. He was emphatically denying the state's right to impose a ban on information by simply asking public servants not to give any information to their masters, the public, through their surrogates, the press. He was well aware of this possibility though he considered it most unlikely in the United States. The possibility remained: "A state might decide that criticism of its affairs could be reduced by prohibiting all its employees from discussing governmental operations in interviews with the media, leaving criticism of the state to those with the time, energy, ability and inclination to communicate through the mails."

This was said over a decade ago and the proposition seems utterly unexceptionable. But what Justice Douglas thought unlikely in the United States is now becoming common in India. Now is the time to stop this nefarious practice—forbidding public officials from talking to the press. Such a ban is unconstitutional.

But such bans are coming into vogue. Tamil Nadu imposed one in 1981 and Gujarat followed suit recently without much protest by the press. The *Indian Express* of June 16 reported the Gujarat government's ban in details:

> Firstly, the government instructed the city police control room not to give any information to the press. Since April 22, when the city police revolted and indulged in an orgy of violence, the control room has become 'silent'.
>
> The police control room advises newsmen to talk to the public relations officer for any information. Secondly, instructions were given to all the police stations and senior police officers not to talk to reporters.
>
> Then the government opened a control room at the Circuit House annexe manned by the personnel of the Information Department. It was from this control room that the government doles out information to the press about the daily law and order situation.
>
> Since the information given out to the press at these official briefings was found too inadequate, the reporters used to get details about incidents of violence and arson from hospital and civic sources.

Even a person like Vasant P Sathe, no lover of press freedom, was moved to criticise Tamil Nadu's ban. On November 14, 1981 at Madras, he gently criticised the Tamil Nadu government's order restraining its officials and employees from furnishing any information to the press, AIR, and Doordarshan. The Minister for Information and Broadcasting said that the Central government believed that officials must share information fully with the press so that there is no misunderstanding on any issue. However, he had not studied the state government's order as yet, he said, and would convey the Centre's views on it to the state government after he had done so. But he could not understand the need for the order. The context in which it had been issued was not known. "I believe that information must be shared fully. Holding back information leads to greater complications than sharing it. Information must be shared at the highest level and fully so that there is no misunderstanding", he said in reply to persistent questions from pressmen. It is, of course, entirely a matter of opinion whether the government he was then serving and is serving today practises the principles Sathe formulated.

What is not a matter of opinion is the citizen's right to know. Information is not a gift in the bounty of the state. It is in fulfilment of the duty which the regime of the day owes to the people.

The right to know is an integral, indispensable part of the fundamental right to freedom of speech and expression which is the very basis of democratic government. Of what avail is the right to speak if information is withheld or suppressed? The US Supreme Court has at various times used various phrases to describe this right—'right of access', 'right to gather information', etc. It has ruled that "without some protection for seeking out the news, freedom of the press could be eviscerated".

But, let alone 'protection for seeking out the news', what we have come up against is deliberate obstruction in the quest for news culminating finally in the closure of the sources of news—the officials. As Justice Stevens put it, "an arbitrary interference with access to important information is an abridgement of the freedoms of speech and of the press protected by the First Amendment", which embodies the constitutional guarantee of that freedom.

These observations were made in 1980 in the Richmond Newspapers case where the US Supreme Court ruled that the right of the public and the press to attend criminal trials is *inter alia* protected by the First Amendment. This ruling is of great persuasive authority in India. On July 29, a Division Bench of the Calcutta High Court upheld the right of press reporters and press photographers to cover the mayoral election. A reporter and photographer each of 18 leading newspapers, news agencies and periodicals were permitted to cover the event from the balcony of the municipal building. The court made this order on a writ petition filed by *Ananda Bazar Patrika* challenging the ban imposed by Prasanta Sur, the Minister for Urban Development.

The ruling applies also to Parliament and to state legislatures. The Speaker's authority regarding accreditation of press correspondents is subject to fundamental rights. It is not a privilege but a regulatory power and its exercise is open to judicial review.

APPOINTMENTS

**Centre for Studies in Social Sciences**

CALCUTTA

Invites applications for temporary Fellows, initially for a period of 2 years, in the pay scale of Rs. 700-40-1100-50-1300-60-1900/- plus other admissible allowances. An applicant must have a good Post-graduate degree in any of the disciplines of Economics, Geography, History, Political Science, Literature, Sociology, Social Anthropology. Selected scholars would be expected to conduct their research in one of the following broad areas: Problems of the Indian economy; Political economy of underdevelopment; Women's studies; Modern Indian History (political, social, economic and history of ideas); Economic and social geography; Urban studies; Political theory; Indian politics; Social and cultural structure in Eastern India; Problems of ethnicity in India; Social bases of culture in Modern Bengal.

Applications with detailed curriculum vitae, comprising academic qualifications, research and teaching experience and list of publications with names of three referees and a short research proposal may be sent to the Registrar, Centre for Studies in Social Sciences, Calcutta, 10 Lake Terrace, Calcutta - 700 029, by September 20, 1985.

# Whom Will Union Carbide Blame Now?

### ISG

AFTER the disaster in its pesticides plant in Bhopal, Union Carbide, the American multinational which owns the plant, closed its methyl isocyanate (MIC) operations in the United States for several months. MIL is the gas that leaked in Bhopal early last December, killing at least 2,500 persons and causing severe, long-term, injuries to an estimated 200,000 and more.

At a place called Institute, near Charleston, West Virginia, in the US is located one of the Union Carbide plants that processes MIC. On August 11, a small cloud of toxic gas escaped from this plant, causing injuries to 135 residents who had to be treated for eye, throat and lung irritation. The gas that leaked however was not MIC but aldicarb, which, though listed in some industry reports as a carcinogen—a substance that can cause cancer—is said to be far less toxic than MIC.

Several questions have been raised, and the debate in the US is bound to build up. Whether it would ultimately result in more effective protection of the people and environment than the reviews undertaken after Bhopal is for future to tell. But some of the facts that have come up in the immediate wake of this gas leak should not go unnoticed in India, for Bhopal was blamed by Union Carbide on Indians, workers or saboteurs.

Firstly, the company claimed to have spent something like $ 5 million on installing improved safety measures in this particular plant and gave repeated assurances, on resuming the plant's operations after a five-month shut down after Bhopal, that the plant was safe. Among the safety measures newly installed were a computerised system to track the flow of toxic chemicals through the plant and a siren that would warn residents in the neighbourhood whenever gas was about to leak.

Secondly, while before the plant was reopened in May 1985, it was supposed to have been examined by a team from the Federal Environmental Protection Agency (EPA), it now turns out that the team went largely by what impressions the company scientists and engineers fed them with. According to the manufacturer of the computer system which was installed to monitor the leaks in this plant, the system was not even programmed to predict the path of the particular toxic gas, i e, aldicarb, which leaked on August 11. The computer manufacturer alleges that Union Carbide never provided the critical data or indicated that "they wanted aldicarb oxime programmed into the computer". Only three chemicals, MIC, the Bhopal killer, phosgene and chlorine were programmed into the computer system.

The shocking part of the disclosure by the computer manufacturer is that the computer system installed in the plant depends critically on human inputs on such basic questions as what kind of chemical is leaking when the leak began and what kind of equipment is involved. Only then does the system tell you whether or not the leaked gas is going to spread out or be localised. Essentially, the system consists of a microcomputer hooked to a meteorological tower with three or four sensors to detect temperature and wind direction. The manufacturer describes it as the 'basic model' costing just about $ 80,000. A more sophisticated version would have cost Union Carbide "several hundred thousand dollars", as the *Wall Street Journal* quotes the computer manufacturer. So clearly, even for an MIC leak, were that to occur in the plant, the computer system would get activated only after it is told manually that the leak had occurred. It would not get triggered off automatically by the leak.

So questions are bound to arise about the genuineness of the safety system that was installed during the course of the five-month shut-down of the plant. Evidently, the sum of $ 5 million purported to have been spent on the improved safety system is a dishonest public relations gimmick. But how was it that the officials of the federal agency could so easily be duped into saying they were satisfied with the safety system that they actually saw in place? Was it sheer ignorance on their part or something more which led them to ignore (a) that a gas like aldicarb was not even covered by the computer system, and (b) that the computer system was not geared to the automatic detection of leaks?

Thirdly, Union Carbide's own officials are now being quoted as blaming both the design of the processing system and its operating problems as the causes of the leak. They are cited by the *New York Times* as saying that "the size of pipes and valves was a key ingredient of the Bhopal disaster". As chemical experts put it, many pipes and valves are not designed to handle chemicals where, as in major accidents, temperatures and pressures rise rapidly. "A lot of sizing has been more or less by the seat of the pants", one expert is quoted as saying. This raises major questions about the basic design of the processing plant itself. It would appear that in the design of the plant sufficient attention was not paid to safety factors. And there is no evidence that in the alleged outlay of $ 5 million on improved safety measures, the company paid much attention to rectifying the weaknesses in the plant design. But if outside experts, i e, those outside of Union Carbide, knew of the tendency on the part of the chemicals companies not to provide adequately for the safety factors in plant design, why were these doubts not raised after the Bhopal disaster? The only explanation can be the feeling that it could not happen in the US. Now it has happened—though not on as grim a scale as in India.

In Bhopal, Union Carbide's defence has been that everything was perfect with its plant and safety devices. If anything went wrong, the fault lay with the men operating the plant. Either there was human error or sabotage. It was a case of giving the dog a bad name and kicking it. Indian workers had erred, if one of them had not actually indulged in sabotage. Whom will Union Carbide blame for the gas leak, less deadly no doubt, in its plant in West Virginia?

These questions and many others are bound to be raised as the matter of the gas leak is fully investigated. Will the enquiries lead to appropriate action? Can a major multinational like Union Carbide, which has demonstrated utter insensitivity to the human costs of inadequate safety measures, be made to abide effectively by safety requirements and not get away with subterfuges like the ones it concocted for its plant in West Virginia? We, in India, ought to be watching with interest.

---

## Bharat Strips

BHARAT STRIPS is setting up a Rs 14 crore project for the manufacture of thin non-ferrous strips in a backward area of Medak in AP with a licensed capacity of 2,000 tonnes per annum, with the latest technical know-how from Sundwiger Eisenhutte and Technica-Guss of West Germany. The company will turn out precision strips of international standard for the first time in India. These strips are used in industries like automobiles, defence components, communication and other ancillary industries. For decades, there has been a gap of 8,000 tonnes between demand and supply, which has been further widened with the entry of new automobile companies like Hero Honda, DCM Toyota, Allwyn Nissan, Swaraj Mazda, Maruti, Ind Suzuki, Kinetic Honda, etc. The company does not envisage any difficulty in marketing its products. The company has been promoted by R C Gupta in association with APIDC and APEDC. It expects to achieve 60 per cent of the capacity in the very first year and declare a reasonable dividend. The break-even point is estimated at 45 per cent of capacity. The production is expected to go up to 75 per cent in the second year and to 90 per cent in the third. The company will come to the capital market with a public issue of 24.60 lakh equity shares of Rs 10 each at par in September this year to raise a part of the finance required for the project.

# The Unwanted of Assam

### GPD

RAJIV GANDHI is surely going at problems in a manner befitting the twentyfirst century. He is also going at them in a computer-like manner. Press the button and the necessary accord will flash itself on the screen. The Assam accord is in keeping with that style. There was high drama and tension in the capital throughout the night of the 14th and 15th of August. Those who frequent that charming near-European looking city tell us this. We have it on good authority. It is not as though some stories were made out for the Press, these friends tell us. The details of the accord were, in fact, being thrashed out till the early hours of the morning. Which were these details which needed such a last-minute sorting out we wondered, but these friends declined to enlighten us on that score. Anyway, as all of us heard the dynamic, young Prime Minister telling us, the accord on Assam has been reached. One more problem has been got out of the way.

The agitators in Assam have got what they wanted. It would have been surprising had they not. The national Press was sympathetic to them. Everybody from Atal Behari Vajpayee to various kinds of ultra-left intellectuals had decided that the AASU and AAGSP were right. How and why were then redundant questions. Rajiv Gandhi and his advisors knew this and decided to go along. You want some poor (yes, they are incredibly poor) Bengalis, specially peasants, to be thrown out or, at any rate, disenfranchised? OK, so be it. The human rights people are with him on this. Some of our radicals thought that all this was the rising question of nationalities. Let an Assamese-speaking peasant get at a Bengali-speaking one and you will have a rise in nationality-consciousness! Religious bigotry and chauvinism were being dubbed as nationality aspirations. Rajiv Gandhi has merely tread the path made ready for him by his every 'revolutionary' and the 'human-rights' opponents. It is difficult to see what he or his party could have done when the entire media, all sworn enemies of the Congress, some secular opponents of 'the Hindu backlash' which was seen by them in the Congress electoral victory, had given blatant chauvinism and communalism such authority and respectability. Rajiv Gandhi merely decided to go along. He had no choice. But what Assam-champions do not realise is the fact that in so doing he has called the bluff of those who thought that the Congress was behaving communally or that politics in only Punjab was being communalised. Readers of *EPW* are particularly familiar with some of these positions. Anyway, the Assam chicken have come home. The Congress(I) naturally hopes that they will come to its Banyan tree to roost; not an altogether unrealistic expectation, one must say.

What is this accord? By what law of the land do you disenfranchise people? And why should a bureaucrat sign an accord involving disenfranchisement of the people? What happens to the children born to people who have come here after 1971? Will they be thrown into the Bay of Bengal as well, assuming that is our secular, liberal view of the Assam problem? Can I be disenfranchised even after I have voted in two elections or more because an agreement has been reached between some leaders of an agitation and a secretary to the government? What is the moral or political or even cultural basis of this agreement? How is it democratic or, more fundamentally, how is it human?

A host of such questions remain and will remain unanswered. But the overwhelming impact of the Assam accord is that it is essentially anti-minorities. The tribals and the Muslims are going to be its victims. Let us remember also that this time it is the opposition parties and the liberal intellectuals who have pleaded for such a gruesome assault on the minorities. Unfortunately these minorities do not have spokesmen in Canada or the United States. Had they had that privilege, many of our liberals would sing a different tune. Perhaps for the neo-Brahmins of the liberal establishment short, dark minorities do not matter. What is worse is that they do not even have any 'independent' left supporters. The result is that they do not even get a word of sympathy in our media and the people who get beaten defending them do not figure among the one hundred and eight or whatever number of leftists who matter according to the various glossy magazines Bombay seems to specialise in producing.

Nevertheless the question remains. Where will these people go? It is idle to believe that they would return to Bangla Desh. General Ershad has no more sympathy with them than, shall we say, Rajendra Singh, the general secretary of the RSS. This means that they will be uprooted from the land and made to wander the whole of India in search of food and shelter. Rajiv Gandhi will have to be ready to go to war with Bangla Desh if he seriously wants to send them back to Bangla Desh. He does not and cannot.

What will the accord then have achieved? It would have established the principle which Bhrigu Phukan and Mohanta and others have been struggling for: that Assam can have only as many non-Assamese Muslims as the caste-Hindus of Assam deem fit. It should be obvious even to the meanest intelligence that, but for a token number whom Rajiv Gandhi might persuade Ershad to take back, they are going to stay here in India. So why can't they be there, in Assam that is? The reason is not only the future of the Assamese language and culture; there is also the fact that the immigrants happen to be Muslims (and not just Bengalis). So the Assamese culture is threatened. Its Hindu character is threatened.

It is sad but true that Bal Thackeray's argument in Bombay-Thana-Bhiwandi is not very different. Consciously or otherwise we have seen an accord which implicitly accepts that migration into a province from outside can and should be controlled. There would have been really no quarrel with Bhrigu Phukan and his comrades if it were possible to send the immigrants back, lock, stock and barrel, into Bangla Desh without threatening and, if need be, resorting to military operations against Bangla Desh. So in actual practice what Phukan and his comrades have achieved is that the Assamese shall decide (through the AASU that is) who will live in Assam. The argument can extend itself to other parts of India and, thanks to our liberals, revolutionaries will be a saleable proposition as well. This is the net result of this accord. This accord, for no fault this time of the Congress(I), is a step (small or big one will have to wait and see) towards communalisation of Indian politics. Bangla Deshis must be already worried about the accord. It was time some others here were worried too.

## Suvarna Cements

SUVARNA CEMENTS, promoted by technocrats V C Brahmanna and associates with the equity participation of APIDC, is setting up a mini-cement plant to manufacture 66,000 metric tonnes per annum of ordinary portland cement. The plant is located at Mellacheruvu village in district Nalgonda of Andhra Pradesh. The total cost of the project is Rs 865 lakh. The plant is expected to be installed and commissioned for trial production by September 1985. The company is coming to the market with a public issue of 15 lakh equity shares of Rs 10 each at par. Out of the total issue, 6 lakh shares are reserved for preferential allotment to non-resident Indians/persons of Indian origin resident abroad, with full repatriation rights. Under the present policy of the Government of India, mini-cement units are allowed to market their entire production free from price and distribution controls. The board is headed by retired Chief Justice of AP High Court, Challa Kondaiah. The company's shares will be listed on Hyderabad and Bombay Stock Exchanges. The investors are eligible for tax benefits under Sections 80 CC, 80 L and also wealth tax benefits. The issue is managed by Canara Bank's Merchant Banking Division.

# Competition Getting Keener

**Hansavivek**

*TATA OIL MILLS COMPANY's* Chairman, D S Seth, has announced his intention to step down, after the annual general meeting on August 29, as the Chairman and Director of the company "to be able to cope with numerous tasks and situations and to reduce some of my increasing burdens and responsibilities". It was in early 1973, recollects Seth, when J R D Tata was still the Chairman that he was called upon to get more actively involved in the affairs of Tomco and, as Vice-Chairman, take over the leadership of the company. This was at a time when crippling losses, which threatened the very survival of Tomco, were seriously apprehended and the company's joint venture project in Malaysia, Unitata, was on the verge of being aborted. Later, in June 1982, when Tata insisted on stepping down as the Chairman, the board did Seth the honour of appointing him as the Chairman of the company in succession to Tata. Looking back, Seth derives some personal satisfaction as not only the adverse trends were quickly arrested but the company registered record post-tax profits in four years and Unitata emerged as perhaps the country's most successful joint venture abroad. But for the strike in 1979 the company's progress would have been even more satisfying.

During the year ended March 1985, the company increased its sales from previous year's Rs 155.02 crore to Rs 177.85 crore and earned a gross profit of Rs 9.89 crore against Rs 7.70 crore. The profit, however, includes long-term capital gains of Rs 2.77 crore on sale of investments. The company's profit arising from its operations was thus actually lower at Rs 7.12 crore compared to previous year's Rs 7.70 crore. Net profit was Rs 5.02 crore (Rs 2.28 crore). The unchanged dividend of 20 per cent was covered 3.76 times against 1.70 times previously. The decline in the company's operating profit was accounted for by higher wage bill largely due to increases in dearness allowance, increase in interest burden because of sluggish sales, higher fuel costs and, for a major part of the year, very high prices of non-edible oils used in soap making. Moreover, the soap industry witnessed fiercely competitive conditions. Widespread shortage of power and molasses, particularly in Tamil Nadu, restricted the growth of the animal feeds business. The company's trawling operations continued to be in the red. Attention is being focused on shrimp acqua culture in which the company has gained some experience. The management hopes that this business can gradually build up into a commercial operation. Since, for want of export orders, the soap plant in the KFTZ is idle, the company finally succeeded, after prolonged delay, in obtaining government permission for bringing in the raw materials from Kandla into the domestic tariff area for use in the company's factories. This will help in liquidating the funds that had remained locked up in the inventory of raw materials at Kandla.

Unitata recovered the ground that it had temporarily lost and is once again doing extremely well. The business of this company is being re-organised and re-structured without adversely affecting or dislocating the present working and the necessary approvals of the Malaysian authorities are still awaited. Tomco has brought down its holding in Lakme to below 25 per cent of the share capital to facilitate its deregistration as an MRTP company. Industrial Perfumes, in which the company holds 32.6 per cent equity, has earned a post-tax profit of Rs 42 lakh in 1984 against Rs 35 lakh in the previous year. F A Mehta resigned as a Director of Tomco with effect from May 28, 1985. The directors have appointed H N Sethna as a Director and Deputy Chairman of the company from May 30, 1985. Sethna, who retired as the Chairman of Atomic Energy Commission, is widely known as an eminent scientist and administrator.

*J K SYNTHETICS (JKS)* is further expanding its activities. It has entered into an agreement with Bihar State Industrial Development Corporation(BSIDC) for putting up a joint sector project for the manufacture of nylon-6 filament yarn with an annual capacity of 6,000 tonnes per annum. The total cost of the project is estimated at around Rs 60 crore. The project will be implemented by a new company. BSIDC will own 26 per cnt of its share capital and JKS 25 per cent. Financial institutions and the investing public will be able to subscribe for the remaining 49 per cent. JKS's own polyester filament yarn project is being implemented in two phases. The first phase commenced trial production in March last and the second one is expected to be implemented during the current financial year. The polyester staple fibre project is also expected to be operational during the current year. The government has taken on record

* 15 months. + Includes capital gains realised on the sale of investments amounting to Rs 2.77 crore.

the company's technical collaboration agreements in respect of acrylic fibre project. The company is making arrangements for raising external resources from financial institutions, commercial banks and the public. The project may go on stream by March 1987. The prospecting work for the proposed cement plant at Shambhupura in Rajasthan has been taken in hand and the leased limestone area is being developed. Further land is being acquired. The project may fructify by the end of 1987. The one million tonne cement project at Sidhi in MP may commence production during 1988. The company has got a letter of intent for expanding the capacity of nylon tyrecord by 2,000 tonnes per annum. Steps have already been initiated for implementing the project which is likely to be on stream by March 1987. The company has also secured a letter of intent for production of polyester industrial yarn with an installed capacity of 2,000 tonnes per annum. The management is scouting for appropriate foreign collaboration and intends to implement the project expeditiously.

During 1984, the company substituted Suppliers Credit for import of plant and machinery for the polyester filament yarn project by a foreign currency loan from a consortium of banks syndicated by the State Bank of India, Singapore, for DM 31.47 million (equivalent to approximately Indian rupees 12.80 crore). The changeover has resulted in a substantially lower incidence of interest. The company issued 15 per cent secured (Sixth Series) non-convertible debentures of Rs 12 crore, which were allotted on April 1, 1985. It proposes to issue 15 per cent secured redeemable debentures of Rs 12 crore to meet part of the capital cost of installation of waste recovery, energy conservation, balancing equipment, etc, at the company's synthetic fibre and yarn plants at Kota and 15 per cent secured redeemable debentures of Rs 75 crore for financing a part of the capital cost of the company's new projects for manufacture of acrylic staple fibre and nylon tyrecord and of modernisation and installation of balancing equipment for its cement activities. The company also proposes to raise foreign exchange loans equivalent to approximately Rs 37 crore from financial institutions and by way of external commercial borrowings for financing a part of the cost of the new acrylic staple fibre and tyrecord projects and captive power generation projects. The company has produced good working results for the year ended March 1985 with a gross profit of Rs 34.07 crore against Rs 16.47 crore in the preceding 15 months following a turnover of Rs 269.04 crore against Rs 177.83 crore. These figures show significant widening of margins. With depreciation claiming more and also tax liability Rs 3 crore against nil, net profit is Rs 684 lakh compared to a mere Rs 3 lakh previously. Dividend has been stepped up from 10 per cent to 15 per cent, which is covered 1.71 times by earnings while last year's distribution was made entirely from past reserves.

*INDIAN ORGANIC CHEMICALS* is widening its horizons. It has received recently three letters of intent for (1) increasing the capacity of its polyester fibre plant at Manali in Tamil Nadu from 12,200 tonnes to 30,000 tonnes per annum, (2) undertaking manufacture of 3,500 tonnes per annum of polyester filament yarn also at Manali, and (3) manufacture of 2,500 tonnes of french fries and allied products in Raigad district of Maharashtra. All these projects are estimated to cost Rs 55 crore and are intended to be financed partly by issue of 15 per cent non-convertible debenture of Rs 25 crore. The company intends to further diversify into the electronics and electricals industry, particularly the computer field.

The company has turned in impressive working results for the 25th year ended March last. Gross profit has expanded from the previous year's Rs 5.23 crore to Rs 14.88 crore following increase in turnover from Rs 50.45 crore to Rs 80.93 crore. These figures reflect a substantial widening of margins. Although provisions for both depreciation and taxation have taken away more, net profit is Rs 7.86 crore compared to Rs 2.19 crore. The board has stepped up dividend by three points to 18 per cent which is covered 5.35 times by earnings against 1.80 times previously. Besides, shareholders are being offered free shares on a one-for-two basis by capitalising Rs 4.16 crore out of the reserves. A major contribution to these good results has come from the Manali unit which registered encouraging growth in output, sales and profits. With the commissioning of the new plant in March 1984, production of polyester fibre reached a level of 12,153 tonnes with the new plant adding 5,274 tonnes. The increased import duty on foreign manufactured fibre and the excise concessions provided to polyester blended yarn had the desired effect on offtake of indigenously manufactured fibre. The company sold 12,437 tonnes of fibre and achieved the distinction of producing and selling more fibre than any other unit in the country. The management is continuing efforts to optimise the productivity of the new plant as well as the old one. A modern energy-efficient system, developed through own R and D efforts, for continuous drying of polyester chips has been commissioned in one section of the plant.

The company has planned to put up a plant for the production of polyester filament yarn. The company's capital cost would be lower compared to any of the grassroot plants which may come up, because the process know-how is its own and it has established polymerisation capacity to manufacture adequate quantity of chips for filament yarn. The plant is likely to be ready by 1987-88. The Khopoli unit had to operate for another year under difficult conditions, as shortage of alcohol affected production and sale of most of the alcohol based chemical products. The sale of plasticisers was affected to some extent on account of disruption in economic activity in the Northern region. The production and sale of benzyl products remained normal. The profits of this unit were marginally better than those of the previous year. During the year, a benzyl alcohol continuous hydrolysis plant was commissioned. Its initial start up problems are being attended to. A plant with a capacity to produce 400 tonnes per annum of benzyldehyde is under erection and commercial production is likely to commence by the end of September 1985. The R and D department at Khopoli is engaged in developing the processes for manufacture of drug intermediates and various other chemical products.

*NODURON FOUNDERS MAHARASHTRA (NFM)* is coming to the market with an issue of 12.25 lakh equity shares of Rs 10 each at par. The company has been promoted by V B Ghate and his associates in the joint sector with SICOM and WMDC for setting up a plant for the manufacture of 7,200 tonnes per annum of sophisticated ductile iron castings and semis. The company has entered into technical collaboration agreement with SKET-GISAG, Leipzig, one of the largest foundries and foundry equipment manufacturing organisations in Europe. The project has been set up at village Bebedohal in Pune district of Maharashtra at an outlay of Rs 730 lakh, NFM will be one of the most modern foundries incorporating technological excellence in equipment such as pressure chamber technology for nodularisation from SKET-GISAG, Autopour, most modern pouring technique from Sweden in a non-captive foundry and horizontal continuous caster for profiles from Germany. The board of directors includes eminent industrialists like N A Kalyani of Bharat Forge as Chairman and H K Firodia of Bajaj Tempo. According to Ghate, Managing Director, with the advent of a boom in the automobile industry, the demand for quality ductile iron castings is expected to grow at a much greater rate. The company does not anticipate any problems in selling its products. The size of the project, excellence of equipment and technical collaboration have also given great export potential to the project. Substantial firm export enquiries covering over 30 per cent of its production are likely to materialise. Substantial orders have been confirmed by the indigenous industry also. The break-even point for the project is 40 per cent of production capacity. Investors will be entitled to 80 CC and Wealth-Tax benefits. The issue is being managed by the Merchant Banking Divisions of the Industrial Credit and Investment Corporation of India and Bank of India.

## NEW DELHI

# Empty Talk of Poverty Programmes

**BM**

THERE has been an abrupt revival of concern with poverty alleviation on the part of the Prime Minister. This is quite a contrast to the earlier exclusive trumpeting by him of grandiose plans for high-tech modernisation. The change in tune is traced by some to the feeling inside the Prime Minister's own entourage and the ruling party as a whole that populist gestures were necessary and should not be dispensed with if erosion of the mass base of the party is to be avoided. The lip-service to socialism at the first meeting of the AICC a few months ago over which Rajiv Gandhi presided was widely believed to have been prompted by the establishment becoming aware of this feeling inside the party. It is now being advertised that the week-end visits of the Prime Minister to tribal areas have really stirred him to face the reality of grinding poverty in the country and awakened him to the need to do something to alleviate the condition of the poorest of the poor. But before he embarked on his inspection tours of tribal areas, Rajiv Gandhi had begun already to talk of revising the poverty alleviation programmes of the government in order to make them more effective.

The interest shown by the Prime Minister in poverty alleviation programmes received wide publicity when he adressed a meeting of the consultative committee of MPs attached to the Planning Ministry where he reiterated the widely disputed official claim that already at the end of the Sixth Plan the number those below the poverty line had been brought down to 37 per cent of the population and that the percentage would be brought down to 10 per cent by 1994-95. The Prime Minister began his tours of the tribal areas after this meeting. It is also reported that the Prime Minister has disapproved of the draft of the Seventh Five-Year Plan prepared by the Planning Commission because it does not put adequate emphasis on poverty alleviation programmes and the planners have been asked to make suitable changes in the draft. The climax to all these reports came with the Prime Minister's address on the solemn occasion of the Independence Day in which he proclaimed that the government's policy and plans would be geared to benefit the poorest sections of the people and that the framework of the Seventh Plan would be modified to make poverty alleviation its major plank.

All that is being said about poverty alleviation and modifications of the Plan to that end sounds very impressive. But it may be easy enough for the political leaders to talk glibly as may suit their whims and fancies about modifying development programmes and imparting to them novel features and qualities. The professional planners, on their part, are bound to find themselves in a very awkward position when they are called upon to produce a credible and feasible plan on that basis and fit it into the overall policy-frame handed down to them by the political leadership. The official planners in Yojana Bhavan have already produced the draft of the Rs 180,000 crore Seventh Plan. The sectoral allocations have been made in the draft Plan after elaborate consultations with the Union ministries and the state governments. As it always happens, the planners were in no position to entertain all the demands of the Union ministries and the state governments for financial allocations and they had to apply drastic cuts. The sharpest cuts have been in outlays for industrial infrastructure in the public sector and for poverty alleviation schemes.

### A MYSTERY

In their plan-making exercises the planners had to reckon with the resources in sight for the Plan and the additional resource mobilisation effort which the Union and state governments would be able and willing to undertake. The position in this respect is admittedly not comfortable, The Union Finance Minister, meanwhile, has been going about promising with gay abandon a fiscal policy which would, in his words, be growth-oriented rather than geared to revenue collection. It is also fatalistically accepted that severe limits on resources available for investment to strengthen industrial infrastructure in the public sector and for expenditure on the expansion of social consumption and mass welfare programmes have to be taken for granted. There is no hesitation in the Finance Ministry about the need for the private sector to enlarge its resource base and role in the growth process. The Budget for the current year, the first year of the Seventh Plan, made outright cuts in financial allocations for poverty alleviation programmes even while generous fiscal concessions were given to those in high income brackets and the corporate sector. This was justified with commendable conviction. Subsequently, however, additional allocations on a sizable scale have been made for industrial infrastructure in the public sector. There is talk now of providing more money for poverty alleviation. How exactly additional resources will be found for all this remains a mystery.

There is no indication from any reliable quarter about the steps that are proposed to be taken for mobilisation of more resources for either the Plan in the public sector as a whole or for the poverty alleviation programmes particularly. The Prime Minister only made a general remark in his Independence Day address that the government would take steps to reduce administrative expanditure and spend more for the benefit of the poor. But this is easier said than done. The facts contradict the Prime Minister's proclaimed intention. Improvements have been made and more are proposed to be made in salaries and emoluments of government employees, especially in the upper echelons of the administrative hierarchy. Cuts in subsidies have been ruled out. Interest charges and rentier incomes are swelling in response to the Union government's fiscal policy of raising revenue in the market by paying interest instead of taxing incremental income and wealth of the rich. Increases in expenditure on the law and order machinery and the armed forces are regarded as not only inevitable but even desirable. The relentless increases in non-plan, not development expenditure of the government are similarly taken for granted.

The question of poverty alleviation cannot, of course, be viewed as a problem merely of financial allocations. Poverty alleviation, if it is adopted honestly and seriously as an objective, requires structural changes and an integrated design of economic growth and social change. The Prime Minister, it seems, has yet to grasp the implications of his promise of poverty alleviation, especially in the rural areas. But even if structural changes in the development process are ruled out as being not within the realm of the possible given the entrenched socio-economic and power system and poverty alleviation programme remain a matter of juggling financial allocations, there seems to be no prospects of anything worthwhile being done in the face of what is called the resources crunch. This is only emphasised by the modifications proposed in the Integrated Rural Development Programme. The emphasis is on more strict selection and larger subsidies to selected beneficiaries by reducing the coverage of the programme so that there would be no increases in the total expenditure on the programme.

### STARVATION AMIDST PLENTY

But what is most glaring is the utter inability and unwillingness of the government to use the available surplus foodgrains as a real resource for development through a massive food-for-work programme, not even in those areas where starvation deaths are taking place. During his visits to tribal areas in Orissa and Madhya Pradesh, the Prime Minister could simply not have missed the desperate condition of the people, in spite of the most cynical attempts to cover up the ugly reality.

It is standard official policy never to admit starvation deaths. The Orissa Chief Minister, therefore, did the usual thing when he refuted reports about starvation deaths in the wake of the Prime Minister's visit to Orissa. He admitted with customary cynicism deaths in the drought-stricken areas from gastro-enteritis, a stomach ailment. He was not bothered that hungry people trying desperately to hang on to life by eating whatever might be available, including poisonous leaves and wild flowers, fall victim to many diseases before they die. The Prime Minister too had to observe the same rule on starvation deaths. Though he is very proud of saying that he does not care for conventions, he had to fall in line and go so far as even to write a formal letter to the Congress(I) Chief Minister in Orissa to express his appreciation of the efforts of the state administration to stave off "extreme hunger" through public distribution and feeding programmes in the tribal districts. He called for intensification of these efforts and streamlining of arrangement for more regular supplies by improving the administrative machinery.

But the public distribution system with its coverage essentially limited to the urban areas and industrial centres is relevant only for those who can purchase their food needs at fixed issue prices. The system is certainly of help in protecting consumers from the ravages of the black market in conditions of scarcity, provided they have enough purchasing power to purchase the grains. That is why the public distribution system works well only in the metropolitan and industrial areas and its functioning in remote rural and more particularly tribal areas is not and cannot be effective or efficient. As regards feeding programmes which Rajiv Gandhi has mentioned in his letter to the Orissa Chief Minister, the reference evidently was to stray relief kitchens, presumably set up in a hurry for feeding hungry people in some places at the time of the visit of the Prime Minister. There is no mention anywhere of large-scale food-for-work programmes in the drought stricken areas on the required scale. The performance of the Janata government on this score was far more imaginative and meaningful. But the Prime Minister has been making only passing references to the willingness of the Central government to consider releasing wheat to enable wages in kind to be paid to the rural poor and to members of the Scheduled Castes and Tribes employed on work such as forestry and soil conservation, etc. But there is still no plan to use the available large food surpluses held by the Centre at a high cost as a real resource for a well-planned expansion of the food-for-work programmes to boost socio-economic development by building real assets in the economy and generating employment and incomes in society. The Prime Minister has merely offered to consider releasing some of the food held in stock by the Centre for relief purposes to a limited extent.

This state of affairs would appear to be extraordinary when incerases in production and productivity of foodgrains in the last two years have generated a large marketable surplus over and above the requirements of the buffer stock needed for security and stability in lean years. It is not fortuitous, however, that exports from the foodgrain stock have been thought of as the preferred way to bring down the stocks to economically manageable levels. It is not fortuitous either that there is considerable gratification in government circles and the Food Ministry in particular that with successive bumper crops and a large buffer stock the commitment to public distribution is shrinking. There is no intention to widen the coverage of public distribution. On the contrary, the present condition is considered very appropriate for enlarging the share of private trade in the foodgrains market. Not the public distribution system but private trade is to be relied upon to more efficiently arranged supplies in scarcity and high income areas. The move to sell wheat from the buffer stock to private trade testifies to this. The thinking seems to be that if large sections of poor people, especially in the countryside, find it impossible to get foodgrains from either the open market or the public distribution system because of lack of purchasing power, so much the worse for them. The government seems to hold that its responsibility ends with those who can make purchases at the present level of issue prices of foodgrains from the public distribution system as it is operating in the area of its coverage. The prime responsibility of the government, it is taken as axiomatic, is to ensure that the producer secures the right remunerative price for that part of his produce which he wants to sell. The machinery for procurement of all grain offered at the fixed procurement price is, therefore, kept in trim and in full working order at all times and a huge subsidy from the exchequer is provided for this purpose. This has led the government to purchase all grain offered at what is called the 'remunerative procurement price' even if the stocks have swelled to 30 million tonnes and may grow bigger still.

### FOLLOWING THE MARKET PRINCIPLE

The reason for the reluctance to launch a massive food-for-work programme and expand the public distribution system in foodgrains stems from the anxiety to ensure a profitable domestic market for the surplus producer. This is considered very important from the point of view of the commercial principle, as much in the case of agriculture as industry. The food-for-work programme and public distribution of foodgrains can disturb the captive market of the surplus farmers and improve the bargaining position of the agricultural workers in particular and the rural poor in general. The ability of the surplus farmer to exploit the open market during the lean season and depress wages of farm workers is threatened when an efficient food-for-work programme is underway.

A new quality has indeed emerged in the conception and framing of foodgrain production, pricing, procurement and public distribution policies. This flows logically from the operation of the new agricultural strategy and falls neatly into the overall economic policy and approach. The question of domestic consumption is, therefore, being tackled strictly in terms of market criteria and effective demand. The public distribution system must function on a viable basis for the viable sections who have purchasing power. The producer of the marketed surplus must be assured of a remunerative price and his surplus secured on that basis for meeting effective demand in the domestic market and for export to the extent it is feasible and necessary. The principles governing commercial agriculture which is being promoted with so much diligence for the last 15 years under the banner of the new agriculture strategy are at last beginning to assert themselves in the wider context of a liberalised, market-oriented economy. Relief measures when urgently required may, therefore, be considered in order. But using foodgrains or other surpluses as a real resource for development in which the mass of the poor and the unemployed can be involved has to be frowned upon as upsetting the commercial and market principle.

Way back during the Great Depression in the early thirties, reports that oranges had been thrown into the sea because there was no market for them were interpreted as the signal that a system of production which could be so starkly in conflict with the well being of the people had played itself out and could not last and must indeed not be allowed to last. The situation at present in India is becoming even more untenable and unacceptable when in the midst of the drum beating about the green revolution and burgeoning foodstocks, foodgrains have to be stored at a great cost and some of the stock may even be allowed to rot in the midst of starvation deaths. The hectic search for export outlets for the surplus grains even at a loss only adds poignancy to the situation. The empty talk of special poverty alleviation programmes in these conditions is indeed sickening.

# Romance and Reality of Traditional Agriculture

**Bharat Dogra**

WHILE the government's agricultural development efforts continue to be based on propagation of high-yielding varieties (HYVs) grown with large doses of chemical fertilisers, there has nevertheless been a revival of interest in traditional agricultural systems and methods. The wisdom, specially avoidance of waste, of the traditional agricultural practices has been upheld on the basis of records of such practices going back to the last century, if not earlier. Side by side or within this trend, the virtues of natural farming against the chemical and machinery based farming of the green revolution type have been stressed. Indeed some writers have gone a step further and stressed natural farming to the extent of there being no tillage. In this context Masanobu Fokuoka's work (and his book "One Straw Revolution") and smaller experiments in India have been much discussed. Needless to add, after the Bhopal tragedy, the questioning of the necessity of agri-chemicals, and more specifically chemical pesticides, has received an additional impetus, although again this does not seem to be reflected in official thinking.

This emphasis on the wisdom of traditional agricultural practices has been welcomed for at least two reasons. Firstly, an alternative, successfully practised in earlier years, to the green revolution technology brought from Western countries has been presented at a time when dominant thinking on agricultural development is to regard the green revolution technology as the only line on which progress can be made. To establish that this is not so and that alternatives more compatible with our resource-base exist is itself an achievement. Secondly, instead of emphasising merely the wisdom of specific farming practices, the concept of the traditional farming system as a harmonious system in which agriculture, animal husbandry, tree growth, etc, are very well integrated, avoiding all waste and in fact feeding on each other's waste, has also been presented. This is contrasted with the Western model where these various farming activities are separately developed, necessitating a lot of expensive cash inputs and causing a lot of unnecessary wastage which countries like India can ill afford.

At the same time as recognising the importance of recent attempts to throw light on neglected aspects of traditional agriculture, it is important also to point out some shortcomings of these afforts. Generally, while drawing attention to the various painstaking and effective traditional agricultural practices, it has somehow not been found necessary to describe also the social relations within which these practices flourished. Where these practices followed by small peasants cultivating their own land, or by tenants cultivating the land of other landowners, or by hired workers receiving a daily wage, or by bonded labourers, or else was there collective ownership of land? In some writings, not only are these aspects neglected but instead there is so much concern for even the small details of traditional farming practices and so much effort is spent on establishing some not-so-crucial aspects of natural farming, that these writings invite the allegation of considering these issues as the ultimate, the final, the most important issues of agricultural development. This, of course, is totally wrong. The main issue in agricultural development in India, and indeed in most other countries, is the pattern of land ownership and operation and it is basically in this area that the battle against poverty and hunger has to be fought.

While considering this most important issue, several questions are thrown up. If we are convinced that the existing landownership and operation pattern has to be changed, then what are the alternatives to it? Do we want a land of small peasant proprietors, or do we want collective agriculture? What criteria will be followed at the time of redistribution of land? Answer to these important questions will have to be searched, and probably different answers will be food for geographically different areas like the fertile plains, the desert areas, the hilly areas, etc.

The question of technology will be closely related to these choices. It is here that the re-discovery of the wisdom of traditional agricultural practices may prove important because at least a path different from the green revolution technology (which apart from being expensive and ecologically unsound makes us dependent on imperialist interests) is shown to exist. But then the relationship of various agricultural practices with the land and labour relations within which these will be implemented has to be kept in mind.

Their suitability has to be examined not in isolation but in the context of the particular type of the egalitarian land ownership system that one has in mind as being the most suitable. When this is done, the exercise of re-discovering traditional methods to suit future needs becomes at once more

Chains of Servitude
bondage and slavery in india
Utsa Patnaik
Manjari-Dingwaney (eds.)

'No other society in the world is perhaps as burdened by the memories and material survivals of its ancient past, as is the Indian; anachronistic precapitalist social relations and ideology form an incubus on the new society painfully attempting to chart a capitalist path of development.'
— from the Introduction by Utsa Patnaik

The essays in this volume bring together diverse aspects of bondedness and exploitative employer-labourer relations, particularly among the rural population.
The first section traces the historical roots of slavery and bondage through ancient, medieval and colonial India.
The second section is an overview of some contemporary aspects of bondage and includes five case studies in contemporary Indian agriculture and crafts—all five reveal the inextricable link between bondage and destitution.
The third section examines the law in the pre and post-independence period, and its limitations in dealing with the problem of bonded labour. An exhaustive bibliography of material on slavery, indentured labour and bonded labour supplements the research and analysis of leading social scientists; and the experience of political activists

384 pp/hardback Rs. 150.00/paperback Rs 70.00

exciting meaningful.

Researchers working on appropriate technology in agriculture, animal husbandry soil-conservation, etc, will do well to specify whether they keep in mind a highly unequal society while making their recommendation or whether their devotion is to finding technological answers for an egalitarian society which they hope will come into existence one day. If nothing else, research carried on with this perspective will at least keep in focus the real issues, and emphasise also that technological solutions are no substitutes for political ones.

# How the Other Half Dies in Bombay

**Malini Karkal**

ACCIDENTS are defined as unplanned and unintended events. However, the incidence of accidents is definitely indicative of the social, psychological and physical environment they occur in. Besides, the attitude and reaction of those in whose surroundings the accidents occur are dependent on the value or importance that is given to the victims of the accidents.

Data on medically certified causes of deaths of women show that at the national level 8.1 per cent of the deaths are by 'accidents and injuries'. In urban areas of Maharashtra the percentage is 9.5, and for the Greater Bombay it is 6.6.

Details available for urban Maharashtra in general and for Greater Bombay in particular provide the shocking detail that 34.2 per cent of accidental deaths in urban Maharashtra and 64.9 per cent of those in Greater Bombay were due to 'burns'.

Data from rural Maharashtra are available for a smaller sample and detailed analysis is not possible. Even then these too show that 6.5 per cent of the deaths were by accidents. Burns constituted a comparatively small percentage (1.7 per cent). However 'drowning' was reported as a cause for 2.3 per cent of the deaths.

Further revealing are the data on the age distribution of victims of accidental deaths in urban areas. These are presented in Table 1. The Table shows that the highest (80.3 per cent) percentage of deaths by 'accidents' are in ages 15 to 44. Considering only those women who were in age groups 15 to 44 it is seen that 24.7 per cent of the total deaths in urban Maharashtra and 24.6 per cent in Greater Bombay were by 'accidents'. Those by 'burns' were 18.9 per cent in urban Maharashtra and 19.3 per cent in Greater Bombay.

It is therefore seen that in urban Maharashtra and in Greater Bombay almost every fourth woman who dies in ages of 15 to 44 dies by 'accidents' and one in five dies by 'burns'. For younger age groups of 15 to 19 and 20 to 24 these proportions are one in three by 'accidents' and more than one in four by 'burns'.

Details available for Greater Bombay on marital status of the women who died by 'burns' are given in Table 2. As seen from these data 61.3 per cent of the women in ages 15 to 19 were 'never married'. Thus problems with in-laws cannot be the only cause of these deaths due to 'burns'. The environment in the parents' homes is also unwholesome for women to feel happy and secure.

All the dead bodies of the victims of accidents were subjected to post-mortem and the certificates were issued by the Coroner. It is however a pity that not a single of these certificates gives a cause that can provide even a minimum of a hint of how these accidents were caused. The certificates invariably mentions vague causes such as 'fractured skull, 'toxemia of burns', '80 per cent burns', etc.

This pattern of high incidents of deaths due to accidents has been seen for the past several years. It is a pity that no notice of this colossal waste of human life is taken by any forum. What makes the situation gruesome is the large numbers of those who met with accidents, had been burnt, but did not die. Many of them must have been disfigured or maimed and left to face the social and psychological consequences.

It will be inhuman if the high incidence of deaths due to burns is brushed off by saying that they must have been caused by kerosene stoves and nylon sarees. First, girls in ages 15 to 19 today wear dresses rather than sarees and mostly of cotton. Cost of nylon dresses is much higher than that of cotton ones, unlike in the case of sarees, since the thickness that is required for dress material makes nylon more expensive. Secondly, accidents taking a heavy toll of life and yet going unnoticed can only happen when the victims are women. If even one-tenth of this figure were reported for workers in any industry, the situation would have attracted far greater attention and there would have been immediate search for corrective measures.

Maharashtra, a state where women are said to be having a better status, and Greater Bombay, a metropolitan area where otherwise women are known for their leadership in social and welfare activities, present a picture which should disturb any sane individual. One wonders what must be the kind of life that is led by women and how anyone can expect these women to contribute to programmes that are meant to be for their own welfare or for the welfare of their children.

Table 2: Per Cent Distribution of Deaths by Burns by Age Groups and by the Marital Status of the Women—Greater Bombay, 1984

| Age Group | Never Married | Married | Other | All |
|---|---|---|---|---|
| 15-19 | 61.3 | 38.7 | — | 100.0 |
| 20-24 | 12.7 | 87.3 | — | 100.0 |
| 25-29 | 7.6 | 92.4 | — | 100.0 |
| 30-34 | 2.9 | 97.1 | — | 100.0 |
| 35-39 | 7.0 | 93.0 | — | 100.0 |
| 40-44 | 9.1 | 84.9 | 6.0 | 100.0 |
| 15-44 | 18.7 | 81.7 | 0.2 | 100.0 |

Table 1: Per Cent of Total Deaths of Women Caused by Accidents and by Burns

| | Age Group | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | <1 | 1-4 | 5-9 | 10-14 | 15-19 | 20-24 | 25-29 | 30-34 | 35-39 | 40-44 | 45-49 | 50-54 | 55 + |
| Urban Maharashtra | | | | | | | | | | | | | |
| Accidents | 0.3 | 4.8 | 11.6 | 12.4 | 36.4 | 31.5 | 28.5 | 21.7 | 16.5 | 12.2 | 8.8 | 7.5 | 3.8 |
| Burns | 0.2 | 2.2 | 4.0 | 5.7 | 29.0 | 26.9 | 22.8 | 14.7 | 10.8 | 7.6 | 4.1 | 3.0 | 1.3 |
| Greater Bombay | | | | | | | | | | | | | |
| Accidents | 0.6 | 3.6 | 10.9 | 21.0 | 34.4 | 34.3 | 28.3 | 21.0 | 15.7 | 10.3 | 7.9 | 5.2 | 2.2 |
| Burns | 0.3 | 1.5 | 3.2 | 11.9 | 28.4 | 28.5 | 24.1 | 16.5 | 9.7 | 5.0 | 4.0 | 2.3 | 0.7 |

# Knowledge in Search of Mammon

## Higher Education in Britain

**George Joseph**

**Burjor Jal Avari**

IN few areas of public policy is the petty bourgeois (or poujadist) mentality of Margaret Thatcher's government so marked as in higher education. In this area too the ethos of the shopkeeper has taken over: its products are to be valued in terms of pounds and pence. At a time when higher educational institutions are still reeling from the blow that depleted their numbers and placed stringent financial constraints on their activities, they are being increasingly pressurised to take their wares into the market place. A new brand of salesmen is emerging, for whom quality of scholarship and consideration of needs of students are less important than the marketability of their products and the excess capacity to be filled. The Third World is a particularly convenient hunting ground for these salesmen. Their main interest is in attracting students in those disciplines where domestic recruitment has been curtailed by government diktat or by falling demand among those who have an eye on the shrinking job market.

Since 1975, first under the Labour government, and, after 1979, under the iron monetarism of Margaret Thatcher, universities and colleges have suffered massive cuts. At the same time their room for manoeuvre has been restricted by the increasingly onerous burden of overmanning, a legacy of the Robbins-induced expansionist policies thrust upon them in the sixties, and the debt charges incurred by an ambitious building programme during that period. A personnel stripping exercise initiated about five years ago provided a temporary relief to a number of universities, but those who remained found that their normal parameters of operation were drastically curtailed by the financial pressures. It is against this background that British universities and colleges, long renowned throughout the world as centres of knowledge and learning, are now encouraged to go out into the market place in search of funds and students.

Some of the products on offer, especially those aimed at the innocent and the gullible in the Third World, are of uncertain value. Courses in English as a second language are offered by private institutions to wealthy Arab students, charging exorbitant rates; high technology and expensive chemical or fuel based courses are on offer to students from economies where food production is of paramount importance; and Africans and Latin Americans are invited to register for postgraduate courses in Development Studies. It is the last of these courses which raises certain issues of concern. A ragbag of sociology, anthropology and economics, they have attracted wide interest among many who are in search of satisfactory answers to questions regarding poverty, inequality and oppression endemic in many poor countries. But what is not immediately evident is that, contained in this amorphous area of study, there is a Eurocentric bias born out of Western-oriented cultural value systems and frames of reference, taught in many cases by people who have never set foot anywhere beyond Europe and its cultural dependencies of the USA, Canada, Australia, etc. Those who receive this form of education will in many instances return to their countries of origin even less competent to tackle the real nuts and bolts of development and burdened with the intellectual and cultural baggage which offers them strong vested interests in maintaining the privileged status of 'foreign-returned or foreign-recruited' development experts.

But then the welfare and well-being of the sending country is unlikely to figure prominently in the consciousness of those who are trafficking in this type of education. Deals are struck in hotel rooms, promises are made which cannot be kept, and standards lowered to allow entry into certain courses, with little compunction about the ethics of the matter. For behind this blatant commercialism lies a conviction that the recruiting nation has an overwhelming superiority in the production, evaluation and dissemination of all kinds of knowledge. This unique form of Western ethnocentrism is often applied to people whose historical and material circumstances have been different and who, if they at all need help, need something different.

It is possible that a few countries in the Third World may have seen through this form of unequal exchange, but hardly any have even begun to take effective steps to counter this tendency, since the vast majority of the countries are governed by people who are hostages to values and prejudices generated by a Western-oriented education. Often the ruling elite lacks that basic confidence necessary to view problems of poverty and malnutrition as requiring home remedies and not foreign expertise of an unknown quantity. The colonial mentality still runs deep through the ruling classes of societies that were once part of the European imperial fabric; and one particular aspect of this mentality is a sad chase after paper qualifications for their own sake. British universities and colleges are not unwilling to capitalise on this desire, and sales talk about the courses offered is pitched towards accessibility rather than quality.

There are two major dimensions to the acquisition of skills and training which all Third World countries need to confront. First, they have to repair the great damage to their economy that population pressures on existing resources, deterioration of the quality of agricultural land and the pattern of inequalities generated by the present world economic order, have brought about. This means in most part restoring the balance between the rural and the urban, between cultivation of food and non-food crops, and between individual enterprise and bureaucratic direction. Second, they have to seek answers on the type of education that would promote the restoration of the balance. It is unlikely, however, that the answers will be found from an education based on artificially-imposed European cultural values which ignore the strengths and potentialities of the indigenous cultural traditions. In this connection, the examples of Russia and Japan may contain some useful lessons.

Today both these countries have reached a level of development which, if not wholly on a par with that of the West, is approaching the Western scale. They have both consciously adopted or copied particular Western models of modernisation in order to accelerate their rate of development, but they have done it on their own terms. They have made discreet and conscious choices, and only that which has suited their particular needs and environments has been accepted. When Peter the Great sent Russian students to France and Britain in the early 18th century, his intention was that they should learn specific skills, in such areas as naval construction. There was never any question of duplicating the Western industrial model 'in toto'. This policy was followed all through the pre-revolutionary period of industrialism and development under the Tsars. The Revolution of 1917 set into motion a vast number of ambitious development projects, but foreign involvement was deliberately kept minimal. In the early 1930s Stalin acknowledged that Russia was a hundred years behind the West, but his remedy did not include the sending of Russian students abroad. A limited number of foreign engineers were allowed into the country to work on the Five-Year Plan projects, but they were strictly supervised and were not allowed to set themselves up as 'development experts'.

Japan's modernisation began with the opening of the Meiji Era in 1868. The Emperor Meiji was keen to get his countrymen involved in learning about the West and its skills. He started an ambitious secular education programme, one component of which was the training abroad of scientific and technical personnel in specific skills like textile technology or marine engineering. Thousands of Japanese students were sent to Britain, France, Germany and USA all through the late 19th century and early 20th century, and they returned with valuable knowledge gained. In spite of the unfortunate aspects of later Japanese history, particularly between 1931 and 1945, Japan emerged at the end of the day with its identity intact, its genius fortified, and its culture not at the mercy of foreigners. Japan retained control over its own destiny. It did not allow the West to dictate the intellectual terms for its modernisation trauma.

Before Third World countries accept any more offers of courses of study from British universities and colleges, even if aided by British government finance, they must first ask themselves the following questions:

(1) What are the skills needed at their present level of development? Are these skills absolutely vital to acquire?

(2) Can these skills be acquired at home or not? Has enough note been taken of people at home whose expertise may have gone unrecognised?

(3) If there is no facility at home, which country abroad would offer training which represents value for money. Would another Third World country be a better place for such training?

(4) Once the skills are acquired, can one assure sufficient job satisfaction to withstand the attractions of work in the economically developed countries?

Upon the answers to these questions should depend the decision to respond to the high-pressure educational salesmanship now emanating from Britain.

## BANGLADESH

# House of Cards

### Badruddin Umar

SHUFFLING and re-shuffling the Presidential cabinet has now become almost a daily exercise in the Peoples Republic of Bangladesh. During the course of this shuffling political commodities desert the opposition alliances and join Janadal under the thin cover of a would-be pro-government united front, ambassadors are drafted as ministers and ministers are sent out as ambassadors, portfolios frequently change hands to suit the needs of political machinations and good-for-nothing new advisors are taken in for the sake of expediency. The Presidential cabinet thus appears like a pack of cards on the palm of an individual with whom rests all political initiative and who stands as the most effective dispenser of favour to political riff-raff of all descriptions.

This 'success story' of the martial law government would not have been possible without the practice of wide-ranging corruption and without a deep-rooted crisis in the bourgeois opposition. The electoral alliances of the opposition political parties demonstrated their bankruptcy quite conclusively when they failed to realise the extent to which they were able to carry on their bargain with the marital law administration and transgressed their political limits as electoral alliances by boycotting the general election proposed by President Ershad. That precious nothing would really have been achieved by the people through such an election is true and cannot be disputed. But what is not true and what can be disputed is that it was possible for the bourgeois opposition alliances to achieve anything more through the kind of general election which they were asking for. Moreover, the hollowness and bankruptcy of the said opposition became quite clear when, after boycotting the proposed general election, they could not provide any alternative programme for a resistence movement and lay low. In the meantime, the hands of Ershad held out the carrot and the stick and these started dangling before the bourgeois opposition leaders with great possibilities. The carrot led to desertions from the camp of the bourgeois opposition and the stick made it impossible for the 'militant' election boycotters to launch any kind of movement on the basis of a political programme.

The 21-point programme which the 15-party alliance announced on October 14, 1984, and the nine-point programme which was announced by the seven-party alliance on the same day remained paper documents from the very beginning and nothing was done by the opposition alliances to organise the people on the basis of such programmes. On the other hand, they were all the time madly shouting for the acceptance of the five points which were described by them as the quintessence of any democratic programme in the country. It is, therefore, no matter of surprise that the raising of the stick worked on them and they lapsed into a kind of political imbecility. And in this state of imbecility the only 'political' activity of the leaders of the glorious bourgeois opposition parties has consisted in making acrimonious charges and counter-charges against one another leading to actual and possible splits and multiplying the number of the political parties of no consequence.

Apparently this has created a very favourable situation for the martial law administration. By now the political party of the present martial law administration, Janadal, has started taking shape and by the time the proposed general election is held at the end of this year or at the beginning of next year, this party will be able to deliver goods for the present administration much more effectively than it could do if elections had been held as earlier proposed by President Ershad.

On the other hand, the bourgeois opposition parties to the martial law will have to participate in the election which is now being proposed by the administration and they will have to do so this time on the terms of the latter. The facts of the political developments are such that if the said political parties, particularly the more important ones, try to boycott the next election then they will split further and face virtual liquidation.

Can these developments be regarded as lasting achievements of the powers that be and can it be said that in the ultimate analysis these achievements are not self-defeating? This point will be quite clear if we consider the fact that the decay and disintegration of the bourgeois opposition is indicative of the decay and disintegration of the entire bourgeois economic and political process. In other words, these developments hold out no real promise and bright future for the existing system itself.

Those who are now deserting the opposition alliances in order to join President Ershad's cabinet are not the best and the ablest of them. On the contrary, the 'magnetic attraction' of the carrot is drawing just the other variety who are now being charged with the responsibility of running the present administration. President Ershad is building his house with these cards and it cannot have a future any different from that of the proverbial house of cards.

NOTICE

1. It is hereby notified for the information of the public that Reliance Industries Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval for the establishment of a new undertaking for the production, supply distribution or control of 1.5 million Nos Glass Shells for TV tubes and 5 lac Nos. of Colour TV Picture Tubes. In the first instance with an estimated annual turnover of Rs. 1150 Million Other particulars of the proposed new undertaking are as under:

A) Name of the proposed undertaking · The proposed undertaking will be a unit of Reliance Industries Limited

B) Name(s) of person(s) or authority/authorities proposing to establish the new undertaking Where it is a body corporate furnish details of its management structure together with those of proposed undertaking Reliance Industries Limited a body corporate managed by the board of Directors consisting of · a) Shri Dhirubhai H Ambani–*Chairman & Managing Director* b) Shri Ramniklal H. Ambani–*Joint Managing Director* c) Shri K Gopal Rao d) Shri Jayantilal R Shah e) Shri Mansingh L. Bhakta f) Shri R V Madhava Rao–*Nominee Director of G I C* g) Shri Ramesh U. Pai h) Shri Natvarlal H. Ambani–*Executive Director* i) Shri Rasiklal L Meswani–*Executive Director* j) Shri Mukesh D Ambani–*Executive Director* k) Shri Anil D Ambani–*Executive Director*. The proposed undertaking will be a unit of the applicant body corporate and will be managed by the same

C) Capital Structure of the applicant person or authority and of the proposed undertaking as on 31st December, 1984 a) Authorised Capital–Rs 850 million b) Issued and Subscribed Capital–Rs 519.7 million The proposed undertaking will be a unit of the applicant body corporate and therefore will not have a separate capital structure

D) Proposed location of the undertaking In Uttar Pradesh.

E) Brief outline of the cost of Project, the Scheme and Source of Finance The Project Cost of new undertaking is estimated at Rs 2010 million, including the cost of land civil works plant, machinery equipments etc This is proposed to be financed through own resources loans issue of debentures, shares etc

2 Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India Shastri Bhavan New Delhi within 14 days from the date of publication of this notice, intimating his view of the proposal and indicating the nature of his interest therein

# The Tripura Riots, 1980

## Problems of Marxist Strategy

**Ranajay Karlekar**

**[Born in 1942 Ranajay Karlekar died prematurely in April 1983.**

**Ranajay had written this piece for *Economic and Political Weekly*, but it had never been sent to the editor. The manuscript was discovered among his papers and has been prepared for publication by his wife.**

**A brilliant teacher of English literature at Jadhavpur University, Ranajay was a charismatic figure in the classroom and outside. His interests ranged widely from sophisticated speculation on ideology, literature and politics to concrete details of politics and society at the grassroots level. JB.]**

TRIPURA has vanished from the headlines; to journalism it has lost its topicality. The time for a mere narration of facts and events is gone; but the need for analysis is still urgent. For the roots of the problem still remain; for, the diffusion of a generalised consciousness of blood, fear, sinister and irrational forces, serves ruling class ideology, and reinforces passivity and bureaucratic manipulation. And to the extent that the left evades rigorous analysis and self-criticism, based on concepts of class and class struggle, it compromises with ruling class ideology, and restricts itself to short-term, ad hoc, opportunist adjustments.

That is why this analysis is not concerned with a massive accumulation of data, nor with lurid tales of conspiracy. Reaction and imperialism will always seek to exploit any linguistic, communal or ethnic division, to subvert class struggle. This is to be expected, so there is no point in whining or ranting about it. Besides, such large scale, bloody mass convulsions are not generated out of thin air. There is always an objective social and historical basis. And that is what revolutionary science must understand, must clarify. And since this objective social and historical basis is not something external to the communist movement, the primary practical-critical question is: What went wrong with communist and democratic strategy?

In Tripura, this question acquires special emphasis. For unlike in Assam, Mizoram, or Meghalaya, Communists in Tripura had their main base within Pahari society, for more than two decades. For unlike Assam Tripura, till very recently, had no record of direct communal violence.

The basic realisation informing this analysis is simple: the blurring of clear, bold, class-perspective, and evasion of class struggle, is bound to endorse the channelisation of spontaneous social-economic-cultural discontent into revivalist, chauvinist, reactionary and primitive forms of expression. There is today widespread criticism of the mechanistic opposition of class struggle to struggles based on nationality, or even caste. But underlying this criticism there is often a loss of confidence in classical Marxist-Leninist premises regarding class struggle. This forgets, and is itself conditioned by, the fact that the mechanistic application of class concepts is itself a product and symptom of either revisionism or left deviation, i e, of the absence of a ruthlessly objective, scientific class strategy, of the subjection of revolutionary class-consciousness and organisation to domination or infiltration by bourgeois or petit-bourgeois ideology. To the extent that this happens, the objective tendency of the ideology of left and communist movements will inevitably be—irrespective of personal intentions—either towards compromise and convergence with ruling-class ideology, or towards abstract utopian positions.

I do not at all wish to obliterate the very real differences between revisionism and reaction. There is no doubt about the historical fact that almost thirty years of Congress rule allowed and connived at the most ruthless exploitation and expropriation of the Pahari people. And amongst the poor masses of Tripura, it is also reasonably clear that a section of the Tripura Upajati Juba Samity, the Amra Bangali, and rowdies associated with the Congress(I) were the worst exploiters and organisers of communal sentiment and violence. But, as stated, my focus is on the problems and failures of Marxist strategy. This analysis will therefore work its way through a critique of the objective ideological character and tendency underlying left and communist assumptions; reactions and attitudes that inhibit the growth of a revolutionary scientific perspective, and self-conscious dynamic class initiative within mass movements. In doing so, this analysis will do an extent reflect the point of view of the Provincial Committee of the CPI(M-L); because, though its strength is still inadequate and unevenly developed, wherever it *is* strong, riots either did not take place, or were curbed, diverted, defeated, through active political struggle.

In this struggle, in Dakshin Maharani, Asharambari, Kashipur, Reshambagan, Ishanpur, Shabajpur, Machhima, Bagmara, Durlabhnarayan, Khaschoumohoni, Morabari, Charilam ... the entire local leadership, and a large part of the strategic leadership, came from day labourers and poor peasants, both Bengali and Pahari. More, this struggle did not stop at the organisation of class-popular resistance, but in many areas developed into a mass movement against hoarding and black marketing; and in one place at least (Dakshin Maharani) into a programme for cultural exchange between Bengalis and Paharis, initiated by the local peasantry. And all this was accomplished before the government machinery had regained any semblance of control.

At the root of this achievement is the fact that the work of the CPI(M-L) has shaped a group of revolutionary intellectuals and organisers, mostly day labourers, some poor peasants, whose creativity, maturity, and capacity for self-reliance within the most complex and various situations, this observer has not seen equalled, at least in Tripura. The CPI(M-L) has many problems to solve; but already in Tripura it represents the highest development of class consciousness and organisation, and therefore provides the most advanced vantage point for a critical analysis of the left and communist movement in that state.

### IDEOLOGICAL LOGIC OF CPI(M)'S RESPONSES

If we look at the ideological logic of the CPI(M)'s responses to the Tripura situation, both at the immediate topical level of statements and interviews, and at the level of more considered formulations of objectives and strategies, certain definite tendencies are clear: (1) An unwillingness to recognise the fact that the riots had an objective, internal basis and achieved a mass character. (2) An unwillingness to see Pahari society in its specificity, in terms of its internal dynamic and differentiation. (3) A complicity with the passive, uncritical, stereotyped aspects of mass consciousness—those aspects most conditioned by the hegemonic influence of the ruling classes. Let us work through a few representative examples.

Take Nripen Chakravarty's statement: "... It will return to normal. There was no mass participation in the riots, which involved only the youth with support of students" (Interview, *Contour*, June 22, 1980). This embodies a reaction which is already a partial psychological compromise with the kind of self-deception, half-truth, evasion and fantasy that allows communalism to survive. A revolutionary strategy seeks to mobilise the active, self-critical, rational forces in mass consciousness; it stands to gain everything by an uncompromising confrontation with facts, with objective reality. Instead, Chakravarty sanctifies smugness and passivity. The ideological impulse of his statement is to divert attention away from internal structural causes of the crisis. In fact, it pre-empts a total critique of the social basis of communalism. All responsibility is transferred to a handful of scapegoats; and this is ultimately an act of class compromise and evasion of a revolutionary class-view of a social crisis.

In Tripura, communal sentiment achieved for a while a spontaneous mass basis and and support; and it still poisons mass consciousness. The government was impotent, paralysed, unable to mobilise popular initiative. Progressive political leaders either hid or fled their areas; fled not only from rioters, but from the anger and clamour of the masses, from the cries of the victims. At places, peasants associated with left parties were swept into the riots. Political workers of left parties were left helpless, bewildered, without any real leadership. The police force was split along communal lines. Many Pahari policemen joined the rioters and militants with their arms, and a substantial number of Bengali policemen either let the rioters have their way, or actively incited and encouraged communal violence.

All this has to be faced with complete clarity; all this the masses, especially the rural poor, know as experience. And lies will only deepen apathy and confusion. Why, even at the end of September, known rioters were strutting through the streets of Udaipur, though their complicity with the police was common knowledge. And many Pahari families were unable to return to the city out of fear. In Maharani, a large group of policemen, led by Ratan Daroga (OC) of Tainani Thana, ran amuck setting fire to huts, beating up peasants. Later in an effort to break the growing strength of popular resistance to the riots, the same officer led a bayonet charge on a local peace committee meeting, killing a CPI(M) worker, Gobinda Jamatiya, on the spot, and severely wounding others, one of whom died later. The riots did involve people other than the "youth and a few students" and Chakravarty's self-deception is itself the symptom of a disease.

Next, take a critical look at Chakravarty's appeal to the people of Tripura, available as a Bengali pamphlet printed by the Provincial Committee of the CPI(M) and entitled "No More Blood: Isolate the Rioters from the Masses": " . . . hundreds and hundreds dead, wounded and hospitalised, thousands and thousands uprooted, destitute; how the killers have been born on 'Tripura's sacred earth', how they have 'become strong' and how they have succeeded in dealing democracy a great blow, need to be illuminated." Illumination follows. The riots, says Chakravarty, are a conspiracy to restore 'Zamindar-Mahajan Raj'; they constitute a massive attack on democracy, on the CPI(M), its leaders, workers, sympathisers.

The assumption that Zamindar-Mahajan Raj had been overthrown is interesting. It also explains how the social content and meaning of the riots can be reduced to a conspiracy against a party, the CPI(M). Throughout the appeal, democracy is in effect equated with the CPI(M). The whole emphasis is on what the CPI(M) had done for the people; the speech does not record a single instance of people's initiative or resistance.

To see the riots as primarily an attack on the CPI(M), its workers and sympathisers is a heartless simplification. True, CPI(M) workers were attacked; but the majority of the victims were simply poor, ordinary Paharis and Bengalis. As stated earlier, persons associated with left parties were swept into the riots at places; and the ranks of the Tripura Upajati Juba Samity include many who once gave their loyalty to the CPI(M). In fact the TUJS had grown mainly at the cost of the CPI(M), by taking away large sections of not only the youth but also the poor in general from the CPI(M).

Chakravarty next asks why, in spite of a massive and continuous influx of Bengali refugees, were there no communal riots in Tripura? Because, he says, the red flag flew in the hills and jungles among Upajati brothers and sisters, carrying the promise of class unity, communal unity, class struggle; because the Upajati masses have 'received education from the red flag'; as a result, no one could ever generate any ruptures in Pahari-Bengali, Hindu-Muslim, solidarity.

What follows is a tale of conspiracy that amounts to a total explanation of the riots—how the Congress tried to set up in the late fifties, the Adivasi Congress under Sneha Kumar Chakma, with its call for eviction of Bengalis, how the CPI(M) fought for the just rehabilitation of Bengalis, how during and after the Indo-Chinese war, with communist leaders in jail, the Congress aggravated Pahari-Bengali tensions, how the TUJS was born at this moment, how the TUJS was given a lakh of rupees by the Central leadership of the Congress to defeat Comrade Dasrath Deb Barma, how the king and the Congress are the main patrons of the TUJS, how the Congress allowed it an arena for political development, how its leaders conspired to procure 'foreign help', how it won two seats in the 1977 elections with Congress help, how it is involved in intimate political collaboration at every level with the Congress and the Amra Bangali, how it and the Amra Bangali are 'twin brothers', etc, etc.

Well, the facts about the Adivasi Congress and the period of the Indo-Chinese war are historically true. Chakma later joined the Congress. What I would like to emphasise is that it becomes clear from the second page, if one reads carefully, that the appeal is not primarily to class consciousness and class unity, but to the separate self-interests of two communities, two electorates; and this appeal is kept adroitly compartmentalised. The red flag among Paharis assured communal peace, and when the Adivasi Congress called for eviction of Bengalis, the CPI(M) fought for 'just rehabilitation'.

Things become clearer on p 6 where we have an apologia addressed clearly to Bengali sentiment: Those who now blame the CPI(M) and Dasrath Deb Barma for generating trouble by demanding the Autonomous District Council Bill, have they forgotten that the Debar Commission and other Congress leaders were for the 'formation of a still more powerful committee? That the most urgent pressure for the stoppage of land transfers and for the return of transferred land came from the Congress government at the Centre? Why? Because there are such special provisions in the Constitution for Upajatis. Both Morarji Desai and Indira Gandhi had expressed acceptance of the logic of the District Council Bill.

We see a whole tangle of opportunist, ambivalent insinuations here. Bengalis are given a quick look at the threat that the Congress might have given a more powerful body. The CPI(M)'s Bill has the authority of the Constitution plus the support of both Indira Gandhi and Morarji Desai behind it; and even the Centre's concern is traced to Constitutional scrupulousness. But the same Congress is also the cunning conspirator for the return of Mahajan-Landlord Raj, and the ruthless expropriators of the Pahari people as well as the major patron of the TUJS. But all this is subordinate to the manoeuvres of real politik.

Immediately after this parade of Constitutional solidarity, the TUJS is quickly positioned at the other 'secessionist' pole. They had accepted the ADCB as a trick to hide their 'anti-Constitutional' activities; as soon as Assam, Meghalaya, Manipur, Mizoram, raised the 'kick out foreigners' demand, the TUJS immediately fell into line. This complicity with Bengali sentiment and the opportunist balancing of the electorate reaches forms more degrading to class consciousness and unity on pp 4 and 5: Some people say that if the CPI(M) and Comrade Dasrath Deb Barma had not 'bothered their heads' about the 4-point charter of demands of the Upajatis, this heart-rending riot would not have occurred; this notion is false. For who will deny that the Upajatis were becoming destitute, not even getting enough work breaking stones for roads? If the CPI(M) and the Gana Mukti Parishad had not adopted any programme to 'save' them, the Upajati masses would have moved faster into the influence of the TUJS. Comment is really superfluous. This is the opposite of any clear stand based on a nationality's self-respect and rights. At best it is an appeal to the enlightened self-interest of charity. Objective reality forces its way into that give-away phrase about the *Upajati masses* and once more brings us to the glaring contradictions at the heart of this text. If the TUJS is throughout a manipulated puppet, there is no real recognition of its indigenous basis. If Tripura had been kept free of communalism because of the massive strength of the red flag and the 'red forts' among the Pahari masses, and because of the strength of the class unity built on this basis. How then could a conspiracy by puppets, without any mass basis, wrench the whole social fabric? No one, we are told, had ever been able to generate fissures in this strength and unity. But there is nothing in Chakravarty's historical analysis that explains why the Adivasi Congress failed to divide the Pahari masses or to stir communalism, and why the TUJS succeeded, at least partially, on both counts. Why, with communists in jail and with state power at every level helping the earlier conspiracy, it failed; while the present conspiracy succeeded, with communists at least in partial control of state machinery. Why, in fact, the Adivasi Congress was more of a puppet and had less substantial indigenous basis than the TUJS.

Obviously we have to look for historical and social differences arising out of the internal development of Pahari society and of the communist movement within that society. We have to look for objective conditions, for failures in class strategy within a nationality, that intensifed and activated, however temporarily and partially, the influence over the masses of a chauvinist section of the indigenous elite. But there is nothing in Chakravarty's perspective that even recognises such questions; and since a proletarian strategy needs the sharpest, most specific recognition of every force and institution working within a society, the simplification and evasion of history and society in this perspective is far from proletarian. Let me bring the ideological character of Chakravarty's view of Pahari society into sharper focus. He asks: How do you explain the same slogans—independent Tripura, independent Mizoram, independent Nagaland, independent Manipur? Where has this slogan come from? Who raises this slogan? There has to be a common centre. (In reply to questions about 'foreign hand', 'agencies fomenting trouble', Interview, *Contour*, June 22, 1980). Again, on June 14, Chakravarty showed newsmen ten-inch long incendiary sticks of obvious foreign manufacture which had been tied to arrows fired at Bengali houses. He read excerpts from documents listing 'extremists' and said that money from abroad had been channelled into Tripura through New Zeland—Rs 7,00,000 during 1978 and Rs 1,40,00,000 during 1979. (Report on a press conference, New Delhi, June 23-July 6, 1980.) At least some of the money referred to is that of the Baptist Church. I will add to this a quote from Chakravarty's appeal 'No More Blood': "The Upajati Juba Samity's propaganda was extremely Bengali hating: The Bengalis are Hindus, therefore quickly Christianise the tribals. Don't wear dhotis and sarees like the Bengalis. Don't use the Bengali script. Don't get your pujas done by Bengali priests. Don't go to Bengali Durga pujas . . . " (Incidentally, his attack on Amra Bangali's communalism though loud and clear, does not pay the same detailed attention to language, texture, attitude.) Anyway, let me analyse these 'samples' together, isolating anyone for special attention when necessary.

### MANIPULATION OF STEREOTYPES

The approach is familiar, familiar because its emphases, weapons, techniques share a common character with ruling class manipulation of stereotypes. They play on vague yet strong fears, fantasies, suspicions, preconceptions. They drew upon a stock imagery of faceless, lurking agents; alien, sinister missionaries. Insinuations, and apparently 'hard' facts, are theatrically, rhetorically juxtaposed, while clear definition and identification is avoided. In spite of differences of context, I do not find any qualitative difference between the insinuations of the first statement and the reactionary 'common sense' which says: Look, so many communal riots at the same time, therefore, obviously a common centre and a foreign hand; but we will leave you to draw your own conclusions. The area of compromise that defines itself here, between ruling class and petit-bourgeois ideology, is complex and cuts across much apparent differences. Chauvinism, national parochialism and communalism thrive on a suspension of critical thinking and fidelity to fact; they dissolve and flatten out all sense of structure and concrete discrimination simplifying reality and reducing real people, real societies, concrete contradictory situations, into a kind of luridly highlighted amorphousness. How are the implications of the 'Marxist' thinking we are looking at fundamentally different? There is no effort to sharpen consciousness of concrete history. Extend the logic of such attitudes a little further, and the objective tendency is towards convergence with the kind of view that sees the Naga, Mizo and other movements as emanations from a single malevolent source.

It may be said that the focus here is on the TUJS and the Church; and that after all, there is some evidence of links between various movements in the North East. This will not do. The first concern of revolutionary science is to precisely relate such phenomena as the Church and TUJS to the structure and history of Pahari society. Whereas the primary emphasis of the point of view we are now examining rules out—in fact subverts—such precise knowledge. And unscientific attitudes to the TUJS and the Church, reflect the character and logic of a distorted view of Pahari society. An emphasis on 'external' links that obscures the real, concrete history of the nationalities of the North East, will inevitably endorse a ruling class view of 'national integrity'. Let us take a look at the facts.

The Church in Tripura follows a policy of conversion. It does so in many other places, and its success in Tripura is only marginal. No clear evidence of its involvement in the communal riots exists. The Left Front government has been compelled to modify and shelve its allegations. The Church is socially weak, historically a comparative late-comer. Some 89.5 per cent of Tripura's population is Hindu, a Hinduism often enmeshed with pre-Hindu tribal forms and customs. An exotic and rather marginal group of Pahari women militants derive their name from an indigenous cult of Kali. Hinduism is tied up with structures of domination and status within Pahari society; for example, the Reangs, ethnically more negroid, have an 'untouchable' status. The main leaders of the TUJS are Hindus, and there are strongly conflicting attitudes towards the Church within the TUJS. Marxists are not supposed to make an allegorical monster of the Church. The general international alliance between the Church and imperialism should not blind revolutionary science to the fact that there are different churches, to contradictions within institutions, to contradictory trends within Christianity, and to its acquisition of specificity from special social formations. The opportunist and distorted emphasis in the CPI(M) State Committee's last statement should now be clear. It simultaneously equates the TUJS with Christianisation and exploits Hindu fears. I do not seek to soften emphasis on the communalism of the TUJS, but I do wish to emphasise the CPI(M)'s evasion of the task of freeing mass consciousness of communalist stereotypes.

As for the Church, what in fact has been its significant role? The Baptists have worked on the development of a Roman Kakbarok script; something the communists themselves should have done, had they been interested in communication and development at grassroots level. It is only of late that the CPI(M) and the Upajati Ganamukti Parishad have agitated for the recognition and development of Kakbarok, and now the Left Front government has schemes for its promotion. But in this too one wonders why a political issue should be made of the Roman *vs* Kakbarok script. Why not let the choice emerge democratically from Pahari society?

In Tripura, as in the case of other major Indian nationalities, missionary education has contributed to the production of an intelligentsia, a new generation of educated elite—volatile, unstable, opportunist, strong in injured pride, in political and social ambition. Bargaining, changing alignments, making deals, combining terrorist and opportunist impulses, this elite could be instructively compared with the educated elites found earlier within comparatively dominant and 'mainstream' Indian nationalities. A proletarian strategy covering this elite would be on stronger scientific ground if it attended to its internal basis and character, and to its relationship with the socio-economic structure of Pahari society. To the fact that settled agriculture is fairly well developed, landlord-moneylender exploitation strong, and class differentiation sharp. The leadership of the TUJS is an amalgam of landlords, mahajans, rich peasants, and this new generation of missionary-educated elite. The CPI(M)'s evasion of such a view and strategy betrays its own class basis, and involves a drastic distortion and simplification of historical and political reality. The TUJS's intimate relationship and collaboration with the Congress, in effect its total manipulation by the Congress, is emphasised; but the complexity, unevenness, and vacillations of its political alignments are defined out of existence. In fact it is denied any historical evolution, any changes in tactics. It is true that in the sixties the Congress encouraged the formation of the TUJS. It is also true that though the TUJS appropriated the popular slogans of the Gana Mukti Parishad, yet for quite some time—as long as communist mass strategy did not make glaringly opportunistic compromises—its influence was limited to a few pockets. It is true that the TUJS has met, bargained with, and allied itself with the Congress. But it is also true that the TUJS has met, bargained with, and informally allied itself—in spite of sharp differences—with the CPI(M).

Dasrath Deb Barma in his speech to a democratic convention organised by the Upajati Mukti Parishad in 1974 (available as a state government pamphlet: 'Strengthen United Democratic Struggle in Support of the Four Demands of the Upajatis') draws attention to the TUJS campaigning that both the Congress and the CPI(M), the white caps and the red caps, are alien Bengali organisations. It is true that the Emergency saw an intensification of the expropriation of Paharis, and that both the CPI(M) and the TUJS gained from the anti-Congress wave in the 1977 elections. It is also true that the CPI(M) in its pre-election campaigns pledged support to the Pahari demand for the Sixth Schedule, and withdrew this support after coming to power. After this, in 1978, the TUJS built up a movement in support of the Sixth Schedule that gathered formidable mass strength, and was poised to set up a parallel administration in many areas. During this movement there was no incident of communal violence. More, this movement began to generate a spontaneous populist socio-economic content, and a tendency towards radicalisation of the rank and file. It was at this stage that the TUJS leadership struck a deal with the Left Front, accepting the limited, essentially municipal autonomy of the Autonomous District Council Bill, and explaining to its cadres that at least a step forward had been taken, that a pause was required before a higher phase of struggle. In fact the TUJS leadership had learnt its lesson from the spontaneous tendency towards radicalisation that its movement had generated, and would in future concentrate on a more chauvinist motivation and programme. But the intensification of chauvinist and communalist tendencies was objectively also a reaction to the growing communal aggressiveness of Amra Bangali through 1978-79. The Amra Bangali (main organising force; the Ananda Marg) in fact gained mass support primarily in areas where the Bengali peasant's fear of losing land was strong. It was this fear that helped Bengali landlords and rich peasants to mobilise the middle and poor peasantry against the Autonomous District Council Bill. Therefore, to project the TUJS as merely a co-conspirator and twin brother of Amra Bangali is again an evasion of socio-economic reality. Only an uncompromising class line towards both the questions of nationality and land, the two being intimately related, could have isolated the TUJS and the Amra Bangali, sharpening the issue of class leadership within the Pahari nationality and demonstrating the class basis of communalism within both communities. Instead, the CPI(M) offered the Bengali peasant cash compensation (meaningless in a depressed economy like Tripura's) and its main machinery for land transfer and redistribution was an untransformed bureaucracy; there was no real involvement of mass organisations. This reliance on bureaucracy itself has a class logic: the rich can afford bribes,the poor cannot. The CPI(M-L) in contrast, called for and built up a vigorous class front in its own areas. It supported the Pahari demand for the Sixth Schedule unequivocally, but did not shirk clear class differentiation regarding return of Pahari land and compensation. Its slogan was "Not one Kani [almost a bigha] to Pahari jotedars and mahajans; not one Kana [bit] compensation to Bengali jotedars and mahajans". It called for joint Pahar-Bengali peasant committees for supervising land re-allocation operations; insisted that the Bengali peasant should be given land and not cash in compensation, and that he should be involved in the process of choosing new land. It empirically demonstrated that given a class line, a land pool for such purposes did exist, reminding the CPI(M) of its earlier, now forgotten slogan that "Man was greater than the forest" (referring to the historical fact of the systematic expansion of reserve forests that uprooted Paharis from the land they once cultivated, a fact once intensely deplored by the CPI(M)).

### UNDERSTANDING OF RIOTS

This testing of the CPI(M)'s ideologically simplified and distorted view of Pahari society against concrete history, helps clarify the difference between the proletarian outlook and some other ideology. The primary question is whether we see the riots as an objective consequence of internal tensions and of the failure of class struggle to cope with and harness these tensions or as a progeny of mere external manipulation, mere puppetry. This latter view, which is essentially the CPI(M)'s, in effect sees Paharis as an amorphous, undifferentiated mass, triggered by external and conspiratorial mechanisms. It definitely does not reflect a proletarian point of view that works from within Pahari society. It is neither informed with a strong urgent sense of a nationality's specificity and identity, nor with a sense of internal contradictions that a revolutionary class perspective would entail. It carries the externalised, 'from above' view of a superior elite. Ideology reflects class; and usually a shift away from class struggle.

This is not to dismiss external influences and links. Yes, there is some evidence of links between the TNVP and the Mizo and Chakma rebels; and the TUJS is 'allegedly' linked to the Forum of Hill Regional Parties of NE India. Such links amongst sections of oppressed nationalities are natural, and should be seen analytically. Why should Marxists go out of their way to charge them with an obsessive, criminal significance? There will be various kinds of meetings, contacts, exchanges of experience, know-how, and even plans of co-ordination. Yet there are also specific and clear differences between Mizoram and Tripura for instance, or between Tripura and Meghalaya. In fact when Deb Barma argues against the Sixth Schedule, in that compartmentalised context, he strongly stresses such historical and social differences. Also, there is no evidence of any systematic, high level and large scale foreign technology or help in Tripura. The spasmodic, short-term nature of the violence, in spite of the mass momentum it generated for a while, argues against that; nor would the class basis of the TUJS sustain or allow a long-term mass strategy. In fact one of the reasons for its present increased alienation from the poor Pahari masses is precisely that; it could offer no socio-economic programme, no long-term 'social' plan or organisation. It exposed the Pahari masses to violence and destitution, but had no solutions to problems of food, shelter, survival. Again, the weapons used were overwhelmingly traditional weapons of the peasantry; fire-arms were relatively rare—most of those seized were country-made muzzle-loaders that Paharis have been making for a long time. Chakravarty's incendiary sticks are cloth-packed explosives that can be tied to arrows. They could have been supplied as finished products, or equally possible, some Paharis could have made them, having been given the know-how. Unless of course one's point of view is identical with the standard bureaucratic underestimation of a people's resourcefulness. To repeat, I do not exclude external influences, but insist that these are subordinate to the development and pattern of internal socio-historical forces; externals assume importance and impact according to the logic of objective conditions and alignment of class forces, according to the dynamic of the internal contradictions of people and society. This is to see external influence as involved in real contradictions, real relationships, with specific social formations. Such 'links' and 'hands' as are dramatised so compulsively, are secondary. The principal contradiction is within Tripura's social structure, in its internalisation of the logic of the dominant economic system. It is interesting to note that the CPI(M) not only avoids a class-differentiated picture of Pahari society, it does not, or cannot, differentiate itself clearly from the TUJS in terms of such a picture. The CPI(M) State Committee and Dasrath Deb do not define and place the TUJS in terms of its indigenous class basis; it is 'right wing', it likes the Congress more than the CPI(M), but it is primarily a 'puppet' and a personification of 'communalism' and 'conspiracy'.

## 'FROM ABOVE' VIEW

We need now to turn to Dasrath Deb to see how this 'from above' paternalistic view can be internalised in the consciousness of a Pahari elite. We see clearly why the CPI(M) cannot differentiate itself from the TUJS in ruthless class terms; because both are elites, seeking to control Pahari society as a homogeneous base, as a constituency, from the top. The difference is that one elite must stake itself exclusively on Paharis, and the other must prove itself to be the only force capable of balancing Pahari and Bengali 'self-interest'—with a minimum cost to stability, order, 'national interest'. Before I analyse Deb's text, let me outline the four demands its title refers to: (1) Cancellation of the Congress sponsored Tripura Land Reform and Land Revenue Act (1974 Amendment) that invalidated the earlier provision for a Tribal Reserved Area. (2) Formation of an Autonomous District Council. (3) Development of Kakborok as a medium of instruction and an official language. (4) Return of all Pahari land illegally transferred since 1961.

Dasrath Deb's programme is one of diffusing and containing the tensions and pressures created by a history which he admits only to edit and dilute. The history is one of massive, continuous proletarianisation and national expropriation: "Twenty-seven years of continuous Congress rule has rendered a large portion of Tripura's tribal people landless; and through the expansion of reserved forest land into areas traditionally used for Jhoom cultivation, without providing alternative means of livelihood, a massive number of tribals have been turned into a landless proletariat to provide cheap labour for the rich." He tells us how the Congress government intensified expropriation of Paharis—how its 1960 Tripura Land Reform and Land Revenue Bill quitely suppressed the Maharaja's earlier provision for a Tribal Reserved Area, and how only under Communist pressure, the then Home Minister, G B Panth, agreed to the inclusion of a limited legal guarantee against alienation of Pahari land, though he refused to include any clear delineation of the Tribal Reserved Area; how in spite of this large-scale expropriation and alienation continued; and how in 1974, the Congress-sponsored amended Bill sought to remove the earlier legal guarantee, as well as the provision for a Tribal Reserved Area, and changed the date from which transfers of Pahari land would be held illegal from February 14, 1961 to January 1, 1969; how the 14th Report of the Minority Language Commission indicts the Tripura state government for complete violation of Constitutional guarantees for protection and development of minority languages.

Yet this fact of proletarianisation through national oppression does not lead to any programme of proletarian struggle, any sharpening of the question of proletarian leadership of the struggle of the Pahari masses. It has no intrinsic relation with his analytic scheme or reformist programme. References to revolutionary change and class struggle are gestures introduced only to be postponed to an indefinite, diffuse future. Yes, the District Council Bill will provide no fundamental solution to the 'Tribal problem'; it will provide them with 'opportunities for limited participation', in a 'limited endeavour for the development of the tribals' and this will be a valuable gain, until the present social system is transformed. Throughout the speech the enemy is identified primarily as a party, the Congress, and only very marginally as a class or classes, as a social structure. On p 22 he in fact says "only the Congress government is responsible for this entire situation". The objectives and needs of the struggle are formulated in terms of the need to end Congress rule, and to build democratic unity against "the Congress government's conspiracy to rob the tribals of their constitutional rights". The democratic unity of Pahari-Bengali working people, students, youth, middle class masses is mentioned but kept very amorphous; differentiation in class terms is evaded. In fact there is absolutely no emphasis on class differentiation within Pahari society (a process in actuality intensified by national oppression). There is no concept of a class-front as the vanguard of a joint Pahari-Bengali mass movement. As a logical corollary of this, the appeal for Pahari-Bengali unity is essentially a balancing of two separate electorates; there is an added appeal to the interest of 'settled inhabitants' both Paharis and Bengalis, but essentially Bengalis are told that when Dasrath Deb, in the fifties and sixties, raised the demand that all fresh refugees should be sent outside the province, this was in the interest of the 'permanent' 'already' settled inhabitants, both Pahari and Bengali. Thus segmentations that deliberately evade class-differentiation are made a focus of self-interest. The whole appeal for the rights and aspirations of Paharis is couched in negative, defensive terms. They are bound to lose in unequal competition with people of an advanced society. The last twenty-seven years have proved that (p 24). They should be careful not to take any step, make any comment, that might generate hostility in the minds of the democratic and working people of the "State's largest group of people", the Bengalis. The whole emphasis is on the Paharis as a less-developed, inferior people, naturally excited, apprehensive for their survival, restless (p 20). The Bengalis should therefore see that it is in their interest to placate and defuse this situation. Bengalis are offered a bargain we are now familiar with: in any other state such a drastic conversion of original inhabitants into a minority would not be possible, but for communist influence among Paharis 'unpleasant incidents' with long-term effects could have taken place (pp 20-21). It boils down to this: Paharis are told, "get the Bengali's on your side, and you can be sure of valuable, limited gains". And Bengalis are told, "Look, if you don't allow limited concessions and give limited support, explosions might take place". This is clearly not an outlook that focuses on social contradictions fearlessly to define a strategy that can harness the energy generated by them towards revolutionary change.

## IDEOLOGICAL BASIS OF INCONSISTENCIES

Dasrath Deb's editing of Tripura's history has peculiar inconsistencies; the ideological basis of these now becomes clear. We are told that a little before Tripura's formal incorporation into the Indian Union, when Tripura was already under *de facto* control of the Indian government, "an initial effort towards construction of Tripura's Tribal Reserved Area started" (p 2). Later there is strong, eloquent emphasis on the historically evolved status and logic of Tripura's pre-Partition mixed society (p 18). There is eloquent praise of the socially, economically progressive role of advanced Bengali culture in Tripura's development; this included everything: trade, commerce, settled agriculture, implements, utensils, techniques and administration (almost 100 per cent of the royal government's employees from peon to minister). I am in complete agreement with this emphasis on the objective role of Bengali culture as an agent of modernisation; this itself is obviously a part of the larger, controlling logic of colonialism (which aspect Deb omits) and of a socio-economic system that exploits and sharpens uneven development. The problem is that this is integrated with Deb's introduction of a strange, historical split: After 1947, expropriation and conspiracy, and before that an historically evolved mixed society. Does historical evolution stop after 1947? The ideological function of this is however clear. One is to legitimise Deb's limited demand for autonomy rather than a separate state; but the more important function is to observe the continuity of class struggle in Tripura. On one hand, the focus on class exploitation and polarisation within Tripura is muted, and on the other hand one's whole attention is fixed on the ending of Congress rule, i e, on winning elections. All this is quite consistent with Deb's pious hope that elements of suspicion that linger in 'sections' of the 'mass-mind' (both Pahari and Bengali) will be eliminated through patience and an idyllic communal harmony achieved without too much conflict. A Marxist would have emphasised that the social basis of communalism and national oppression can only be destroyed through united class struggle of the Pahari and Bengali masses, that this means intensified polarisation on a class basis within the Pahari and Bengali peoples. As competing elites both the TUJS and the CPI(M) have different interpretations of, and solutions to the 'tribal problem' or the nationality question. Dasrath Deb presents Pahari society with a programme of rational, secular, progressive, bourgeois reformism—which of course is definitely preferable to the chauvinist elite. But what is the social basis for such a programme? Because Pahari society, though sharply differentiated in class terms, has not the objective economic basis as yet for a modern bourgeoisie. The answer is, I think, the CPI(M). The CPI(M) as representative of the advanced, progressive aspects of Bengali culture, as an agent of modernisation, helping the production of an indigenous educated elite. What we have here is a petit bourgeois elite and organisation operating as a kind of substitute progressive bourgeois within Pahari society; an organisation whose ideological basis did not and could not, generate proletarian leadership.

It does not appear strange therefore that Dasrath Deb's 'history' does not include any analysis of either the insurrection he led in the late forties and early fifties; or to the massive uprising of 1942-44 led by Ratan Moni Reang, which uprooted the royal government from large areas in South Tripura. Revisionism must have a short memory. And besides, all events pre-1947 have been relegated to a realm of historically evolved 'normalcy'. Tripura's Pahari society has a rich tradition of peasant struggle and creativity. So Deb's historical perspective on the modernising role of advanced Bengali culture remains inadequate, because it does not, cannot, internalise the fund of ideas, myths, experience, which this tradition embodies, and use them as tools of proletarian struggle and consciousness.

The difference in the way poor Paharis think and talk about Dasrath Deb and Ratan Moni is interesting. Dasrath Deb commands wide respect for his revolutionary past. Paharis also feel proud of his educational and cultural achievements—his skill with the English language for instance. But Ratan Moni: He is one of the people, of the soil, their own man. His exact origins are obscure; but he is surrounded by legends that vest him with near-magical powers. The Reangs are the most oppressed, the poorest among Pahari groups, and they are formally untouchable. But Ratan Moni transcends all that. He is a legend close to the heart of all Pahari groups and the uprising he led was not limited to the Reangs, but had wide and deep support of poor Pahari masses. It is also significant that his insurrection developed independently of Communist influence. Looking back, it seems clear that the revolts and the discontent of the forties had an objective national content as well as embryonic proletarian impulses. Long before 1947, the Paharis were being reduced to a minority. Around 1930 they were roughly 70 per cent of Tripura's population; by 1941 they were down to 48 per cent. The king was a vigorous ally and servant of the British Empire. The brutality of his army was a major source of discontent for the poor Pahari masses; as was his extortionate taxation and his land conservation policy. Another probable source of the discontent that fuelled the peasant revolts was forced conscription during the Second World War. The Tripura royal family took pains to differentiate itself from its own people, seeking to overcome any smell of a tribal king that might linger, and building marriage alliances with other famous royal households, e g, Gwalior. The king did nothing for Kakborok; Bengali was the language of state and education. Rabindranath was a regular guest of the royal household (the inspiration of his 'Rajarshi' and 'Bisharjan' came from such contacts). The king actively promoted Bengali culture, and gave strong encouragement and incentives to Bengali settlers in city and countryside. Simultaneously, there was a sharp, growing economic and also cultural polarisation among the Paharis, especially the numerically predominant Deb Burmas and Jamatias. The Pahari economic and cultural elite, the Choudhuris (chiefs) and the Pahari administrative elite gained from, and were the main internal supports of intensifying landlord and commercial exploitation.

The economic and cultural domination of Bengalis thus coalesced with and sharpened the modes and structures of feudal exploitation within Tripura, and in this it reflected the objective logic of the growing incorporation of Pahari society into the dominant socio-economic system—its penetration by commercial capital and intensification of landlord exploitation. Given the colonial agrarian and land revenue system, the expansion of settled agriculture and trade was profitable to Tripura's ruling elite; and this ruling Pahari elite and the Bengali elite were closer to each other than to the oppressed rural masses of either community. Already, "before its incorporation into the Indian Union, approximately 1,28,016 'destitute peasants' searching for fertile uncultivated land, had found refuge in Tripura" (*Sphul Kailasahar Tripura*, No 4/80). During Ratan Moni's uprising, the deprived Pahari masses did not identify them as the enemy. There is evidence of the poor Bengali peasantry's passive support to this struggle. The uprising was directed against the king and his government. The king was simultaneously the main agent of national oppression, and the dominant internal class-enemy. We have already emphasised the co-existence of an objective national content and embryonic proletarian impulses in the uprisings of the forties. This reflected the process which merely accelerated after 1947, of the simultaneous progression of nation oppression, internal social differentiation and proletarianisation of a large section of Pahari peasantry.

For Communists participating in, or leading the struggle of the Pahari masses, it was not a question of choosing between what we have tentatively called its objective national content and its embryonic proletarian impulses. The primary task of Communists is to develop and consolidate, within the broad exploited masses, the social leadership of the proletariat. The precise historical situation then in Tripura was that neither the nationalist nor the proletarian trend had developed, become self-conscious. Communists do not go out of their way to develop still unconscious national struggles; they concentrate on building the class leadership of the proletariat within mass movements, and if in spite of this the national question achieves independent significance and mass basis, communists are then in a stringer position to adopt and implement a proletarian strategy towards it, and to combat chauvinist and communalist trends, and to force it towards revolutionary social change. Without such an orientation, so-called mass lines are bound inevitably to backfire. As the Tripura Riots so tragically demonstrated in 1980.

---

## CIFCO Finance

CIFCO FINANCE, an integrated finance company with an equity base of Rs 4 crore, is being promoted by Champaklal Investment and Financial Consultancy (CIFCO), reputed private sector merchant banker. CIFCO and its associate stock broking firm, Bhupendra Champaklal Devidas, are well established in stock-market operations and financial consultancy. Being the only Indian company with two overseas joint ventures in UK and Sri Lanka, CIFCO is known internationally and is in the forefront of non-resident investment. According to Bhupen Dalal, Chairman, the new company will bring to India, for the first time, a number of innovative schemes. Apart from the profitable leasing and hire-purchase activities, which will allow the company to gear up its working capital by accepting deposits upto ten times its net worth, the company will also act as a Discount House. It will develop the Bill Market Scheme outside the banking system, whereby genuine trade bills will be discounted and rediscounted. For a fee the company will selectively lend its name as an 'Acceptor'. The company also has plans to provide venture capital and financial backing to technocrats and entrepreneurs, with a view to disinvest at a profit after nursing the company in the initial stages. CIFCO Finance will also actively participate in underwriting and sub-underwriting business as well as act as portfolio managers and investment advisers. CIFCO Finance will be entering the capital market with a public issue of 24 lakh equity shares of Rs 10 each at par sometime in October 1985.

# Report on Black Money

### J C Sandesara

**Aspects of the Black Economy in India**, National Institute of Public Finance and Policy, New Delhi, March 1985 (mimeo); price not stated.

## I

## Preliminaries

THE black economy study of the National Institute of Public Finance and Policy, New Delhi has been in the limelight for long. Earlier when it was in progress, we wanted to know when the study would be completed. When it was completed, we wanted to know when the report would be released. When the report was released, it received further publicity on three different grounds, one of which was that only a handful of copies were available and this complaint is perhaps valid even today. The second reason is that one of the authors of this report has expressed publicly views and opinions on some findings and suggestions of the report which are at variance with those embodied in the report, but which are not there in it. A third reason is that the report has made far-reaching suggestions, and these seem to go well with the general thinking, and with some measures already adopted on the basis of that thinking, of the government for about a decade, but which has received added thrust after the inauguration of the present government. Indeed, in terms of attention it has received and may yet receive, the report may not lag much behind the Five-Year Plan reports, the Finance Commission reports or the Union government budget papers!

This review is based on the mimeographed copy of the report. The printed words on the cover mention conspicuously "Draft Report", and the report does not contain Appendix 3 entitled "Black Income Generation in the Sugar Industry: A Case Study (Forthcoming)". Thus, this is not a final and complete report. However, it is all that is available. It is also unpriced. Further, there is no insertion anywhere of phrases such as "for private/limited circulation only", "not to be quoted/reviewed", etc. In view of this, we take it that the report is quasi-final and quasi-complete, if not final and complete; and also that if and when the final and complete report is available, it would be more or less the same as the report under review. We crave the indulgence of the sponsors and undertakers of this study as also of our readers for basing this review on such a report.

The responsibility for the views expressed in the report, as claimed in the preface, "belongs to the Director and staff of the Institute, and more particularly to the authors of the report". The staff and the authors of the report as named are many, and therefore, here we refer to them collectively as the Institute and not by names.

This study was sponsored by the Central Board of Direct Taxes, Department of Revenue, Ministry of Finance, Government of India. The 'tentative terms of reference', were:

"(i) to identify the important sectors of the economy in which black money is generated;

"(ii) to examine the causes and conditions that give rise to and/or facilitate the generation of black money;

"(iii) to study the methods employed to generate black money and the channels through which concealed income is invested and spent in other ways;

"(iv) the methods employed to convert black money into white money;

"(v) to attempt a broad estimate of the volume of black money generated;

"(vi) to undertake any regional or sectoral surveys that may be required in connection with the above".

Of 'particular importance' was the fifth term of reference.

As the chapters are not ordered systematically as per the terms of reference, it would be helpful to suggest a matching, admittedly rough, of the two. The first term of reference is dealt with in chapter 11 and the second in chapters 9 and 10; the third and the fourth terms are also in chapter 11; the fifth term is in chapters 2 to 5 and 13, and the sixth in chapters 6 to 8. While this description exhausts the terms of reference, it does not give a complete account of the contents of report. There are two appendices detailing and explaining the points having a bearing on the fifth term of reference. The first chapter is introductory. But more importantly, the report has two more chapters: chapter 12 on economic consequences and chaper 14 on policies. It may be added that these two areas were not assigned to the Institute specifically or even vaguely, as is some times done through such phrase as "any other matter incidental or related thereto". Yet, they have been dealt with in the report—the former "to give some qualitative flavour of the issues involved" and the latter "for the sake of completeness".

This review may well be presented under the sections of Estimates, Case Studies, Other Terms and Other Areas, covering in that order the fifth term, the sixth term, other terms and the areas not covered by the terms of reference.

## II

## Estimates

The Institute begins by drawing attention to the loose use of the phrase black economy, and draws particular attention to the differences in the meanings of black income, black wealth and black turnover—all phrases used to denote black economy. The focus of the report, for estimate purposes in particular, is on black income. It is defined as "the aggregate of incomes which are taxable, but are not reported to tax authorities". The alternative definition is referred to as unaccounted income, and it relates to "the extent to which estimates of national income and output are biased downwards because of deliberate, false reporting of incomes, output and transactions for reasons of tax evasion, flouting of other economic controls and related motives". The Institute has given primacy to the former definition.

In view of the fact that the phrases such as black income, unaccounted income, unreported income, etc, are used generally interchangeably with more or less the same connotation, the Institute's labellings of black income and unaccounted income to the above definitions is not happy, and they are likely to be a source of confusion to some readers.

The Institute describes the various approaches to estimation of black income, and reviews critically the more studious estimates. The approaches and the names of such estimators (in brackets) are: Fiscal (Chopra), Monetary (Gupta and Gupta), Physical Input (Gupta and Mehta), Labour Market (—), National Accounts (Ghosh, Bagchi, Rastogi and Chaturvedi). A numerical review of these estimates shows that almost all of them show a growing quantity of black income relative to national income as well as in absolute terms. These statistics support the general impressions on this subject.

Readers of *EPW* and the *Journal of Income and Wealth* may remember having seen the above estimates in some of their recent issues. In fact, the relevant chapter on the above estimates is based on the paper published in *EPW* (December 3, 1983) under the name of one of the authors of this report.

The Institute's own attempts to estimate black income may be summarised under three sub-heads.

(i) *The Tanzi Method:* This method is a specie of the group of monetary methods. In view of a number of conceptual, substantive and practical limitations, some special to India in the context of its application, the Institute has refrained from committing itself to any particular estimate on that basis.

(2) *Estimates, 1975-76 and 1980-81:* The Institute puts its judgment on the fiscal approach as best suited for its purpose. Here, black income relates to "income which should have been declared to the tax authorities, but was not". The method followed by the Institute is essentially an "extension and refinement" of the method used by the pioneers/predecessors—Kaldor, Wanchoo Committee and Chopra. The official Na-

tional Accounts Statistics, the National Council of Applied Economic Research's Survey Statistics, and the All-India Income-Tax Statistics constitute the foundation stones of the Institute's estimates. While the basic exercise is limited to 1975-76, the results are extrapolated to get an estimate for 1980-81.

It must be stated that the Institute's work for the basic exercise for 1975-76 is not only by far better than its work on any other term of reference of the report, but it is also better than the work of any previous estimator. The phrase "extension and refinement" used by the Institute in this context does not indeed convey even the flavour of the Institute's work. The imagination and the ingenuity, and the skills and the efforts which have gone in blending basically different types of statistics for the purposes of estimation are all truly remarkable. Also, it is for the first time that underestimation of national income is corrected for arriving at more realistic estimates. The estimates are thus solidly based. Indeed, it would require more ingenious, more widely based and more painstaking studies before the Institute's estimates are displaced or replaced by other estimates. However, since such skills and resources which are necessary for such studies are not easily available, it may be said safely that the estimates of the Institute would continue to command credibility and respect for quite some time. In the introduction to the report, the Institute writes: "Given the unusual nature of the enterprise, we will rest content if, in the reader's judgment, we have accomplished two goals: first, that we have improved on the work of previous researches in this field; and second, our methodology, assumptions and data are clearly spelt out so that those who follow us can improve on results with the benefit of better data, more acceptable assumptions, and perhaps, more refined methodologies." We have already given our opinion on the Institute's performance on the first goal. As to the second, the Institute's cards that matter are all, or almost all with the most notable exception of Appendix 3, clearly on the table, that is in the report. The Institute has, therefore, reasons to be more than content on both the counts. Indeed, with this work, the enterprise of estimating black income in India may have outgrown its infancy stage.

In view of the widespread interest in the estimates of the Institute, we may devote some space to them. The estimates of black income given in Table 1 are based, among others, on the assumption that national income estimates are accurate.

We may also give estimates for overview which are based on the highest estimates (case III) presented in Table 1. Further assumptions built-in are that the official GDP requires an upward adjustment by 10 per cent, and that half of this 'increment' accrues to earners in the form of tax-avoided income, and that 10 per cent of the relevant public expenditures are 'siphoned off', and three-quarters of this amount accrues to people with taxable incomes. Table 2 gives the relevant data.

(3) *Global Estimates: 1975-76, 1980-81 and 1983-84:* The global estimates are presented in a far away chapter (13, as the above estimates are in chapter 5). A further point to be noted is that this chapter is sandwiched between chapters 12 and 14 on Economic Consequences and Policies, and both of these subjects as noted above, are outside the terms of the Institute.

One of the special features of the global estimates is that they relate to the latest year, 1983-84 (considering the fact that the report is dated March 1985, it is the latest year in the real as well as the statistical meanings of the word), alongwith estimates relating to 1975-76 and 1980-81 also. The second feature of these estimates is that they are more widely based than the estimates for 1975-76 and 1980-81 reviewed above. For these two years, the estimates include additionally estimates of income from possible under-declared value of immovable property, from leakages from public sector and private corporate sector investments and through under-invoiced traditional exports. Accounting from these sources boosts up the estimates of black income to Rs 9,958 to Rs 11,870 crore in 1975-76 to Rs 20,362 and Rs 23,678 crore in 1980-81, constituting 15 to 18 per cent and 18 to 21 per cent of GDP at factor cost in current prices.

The 1983-84 estimates assume that the black income proportion in 1980-81 is constant (18 to 21 per cent), and is applicable to GDP at factor cost in current prices in 1983-84 (Rs 173,420 crore). On this assumption, the Institute gets absolute values of black income of Rs 31,326 to Rs 36,418 crore. To these are added black incomes from illegal transactions pertaining to import licences and imported goods, and from smuggling of gold in that year (Rs 118 and Rs 250 crore). Thus, for 1983-84 the global estimates add up to Rs 31,584 to Rs 36,786 crore, or 18 to 21 per cent of GDP at factor cost in current prices.

Before moving to the next section, two things may be noted here. First, a consideration of various biases, exclusions, and other relevant factors supports the view that on balance these estimates are tilted on the low side. Second, like the estimates and impressions of others, they also point to a growing size of black income relatively to white income as well as absolutely over time. We will have an occasion to refer to the second point in the last section.

## III

## Sectoral Studies

The report contains three sectoral/regional studies: one on sugar industry, the other on real estate and the third on public expenditure. In each study there is a vivid description of the sources and mechanisms of generation of black income, a clear exposition of the methodology employed to derive estimates of black income, and the estimates/guestimates of black income for each sector for varying numbers of years and the limitations of the numbers so arrived at. The three chapters which present the case studies also provide many valuable insights to the reader.

Judged by the empirical base of these studies, the sugar industry study is by far the best as it is done very comprehensively. The real estate study is based on data rela-

TABLE 1: ESTIMATES OF BLACK INCOME, 1975-76 AND 1980-81

| Item | Case I | Case II | Case III |
|---|---|---|---|
| (1) Tax-evaded income (Rs in crore) | | | |
| 1975-76 | 2,467 | 2,654 | 3,741 |
| 1980-81 | 4,839 | 6,704 | 9,813 |
| (2) As per cent of GDP at current prices and factor cost | | | |
| 1975-76 | 3.7 | 4.0 | 5.6 |
| 1980-81 | 4.2 | 5.9 | 8.6 |
| (3) As per cent of assessed income | | | |
| 1975-76 | 58 | 62 | 87 |
| 1980-81 | 68 | 95 | 139 |

TABLE 2: ESTIMATES OF BLACK INCOME—AN OVERVIEW, 1975-76 AND 1980-81

| Item | 1975-76 | 1980-81 |
|---|---|---|
| Tax-evaded income (1 + 2 + 3; Rs in crore in (1) to (6)) | | |
| (1) Case III of Table 1 | 3,741 | 9,813 |
| (2) Adjustment to (1) to possible underestimation of official GDP | 3,318 | 5,713 |
| (3) Illegal transfers from public expenditure | 900 | 1,683 |
| (4) Subtotal (1 + 2 + 3) | 7,959 | 17,209 |
| (5) GDP at factor cost at current prices | 66,370 | 114,271 |
| (6) Assessed income (adjusted for undercoverage) | 4,278 | 7,077 |
| (7) (4) As per cent of (5) | 12 | 15 |
| (8) (4) As per cent of (6) | 186 | 243 |

ting to the cities of Delhi, Bombay and Madras of which the Delhi data are the best. The public expenditure study is based on judgments formed from a perusal of a number of previous researches and from informal interviews conducted by the Institute. While no particular sanctity may be attached to the numbers suggested by way of the size of the black income generated, the numbers may be taken to suggest (a) that black income is sizeable and (b) that it might be growing relative to the total income, in each case.

It is difficult to establish the cause-effect nexus, at least in relation to the consequential numbers on estimates which emerge from these studies. All the same, we note below one important conclusion on each case which the Institute offers in these studies.

(1) *Sugar Industry*: "Perhaps the most important and intriguing result of our analysis is the absence of any clear-cut relationship between the estimated time-profile of sugar output evasion and the varying extent of controls over sugar prices and marketing."

(2) *Real Estate*: "The evidence on the efficacy of the capital gains taxation concessions, introduced in the 1977 Finance Act and pertaining to 1978-79, in reducing undervaluation is mixed."

(3) *Public Expenditure*: "It is widely believed that the scale of leakage from public expenditure is substantial and growing (in proportionate terms) over time. Our own informal interview information is consistent with this view."

We will have an occasion to refer to the first two of the above conclusions in the last section.

## IV

## Other Terms

We now go to the other, the first four, terms of reference which are dealt with in chapters 9 to 11. The terms relate to identification of sectors, causes and conditions, methods and channels of black money, and devices to convert black into white. These terms are studied on the basis of the earlier works, interviews and secondary and primary data.

As to causes, the Institute lists the following:

(1) the level and structure of taxation;
(2) the effectiveness of tax administration;
(3) controls on economic activity;
(4) general laws and regulations;
(5) political finance;
(6) governmental spending;
(7) standards of public morality; and
(8) inflation.

The hypothesis in general is that black income generation varies inversely with (2) and (7) above and directly with others. The discussion on 'Deterrence of Tax-Evasion: Theory and Practice' concludes that while legal provisions for tax detection are adequate, there are weaknesses in implementation and administration. Thus, the weak efficacy dilutes the inverse tendency of cause (2). Mention must be made here of the very illuminating discussion on taxation, especially the one on deterrence of tax-evasion.

Among the most important sectors/activities of black income generation as per response to the questionnaire issued to Commissioners of Income-Tax, in that order, are: capital gains on real estate transactions (both land and buildings), large-scale manufacturing, film industry, smuggling, under/over invoicing of foreign trade, income from professions and income from construction. Among the methods of black income generation are complete or partial suppression of gross receipts followed by exaggeration of expenses, undervaluation of assets and *benami* business.

Consumption is to the fore as regards the use of black income, especially of salary earners and self-employed professionals. The most important forms in which black wealth is held, in that order, are: undervalued real estate (commercial and residential land and buildings), undervalued stocks in business, gold, silver and other precious metals, *benami* financial assessments, undisclosed holdings of foreign assets and diamonds and other gems. Finally, the Institute describes the methods of converting black income and wealth into white. Among the methods listed in order of importance are: *hawala* loans, distribution of money among friends and relatives with no or less tax liabilities, showing of non-agricultural incomes as agricultural incomes, receiving of gifts, purchase of foreign exchange in black and getting it remitted as gift, etc.

While these descriptions by no means exhaust the items covered, they do seem to cover the major items under each. However, the value of the responses in terms of the percentages presented in the Tables in this chapter is limited by the fact, as acknowledged by the Institute, that the respondents belonged to a relatively homogeneous group of senior officials. It is possible that on a wider and varied coverage by status, occupation and industry of the respondents, if ever it can be done satisfactorily, the ordering under each, namely sectors/activities of black income generation, forms in which black wealth is held and methods used to convert black into white, may turn out to be different from the one presented in this chapter.

## V

## Other Areas

A number of issues dealt with in the chapter on Economic Consequences of Black Economy, as the Institute has acknowledged, have been discussed elsewhere by others, in the sources cited therein. Among the consequences discussed in this chapter include: (1) misinformation about the economy; (2) impact on the fiscal system; (3) implications for resource allocation; (4) consequences for income distribution; (5) implications for monetary policy; and (6) some wider issues. Here, while there may not be much gain for the reader familiar with the literature on this subject, he may find the discussion on (3)—implications for resource allocation—quite illuminating.

The last chapter deals with the policies for scaling down black income generation. As some of the policies—tax related matters—have already been dealt with in chapters 9 and 10 of the report and to which a reference was made in Section IV of this review, what follows is restricted to other policy issues.

The chapter begins with a brief review of the measures deployed to curb black money. The measures include demonetisation, voluntary disclosure schemes and special bearer bonds. The discussion points to the paltry results of these measures and accounts for the same, a highlight of which is that the measures did not blunt the edge of the underlying causes of black income generation. The follow-up discussion is founded on the remedial measures to blunt the edge, and is focused on changes in economic and related policies, policies designed to promote integrity and improve honesty in administration, measures designed to bring down the amount of black wealth currently held, and policies relating to administration and enforcement of taxes. These measures, it is suggested, should be initiated in that order. It is not possible to cover here all the details of these measures. However, there is perhaps space to pick some on which we have specific observations to make.

(1) The Institute is clear and categorical regarding the role of the top in the task of scaling down black income. It says: " . . . it must be emphasised that no measures are likely to succeed unless at the highest level there is determination to root out black income or at least to bring it down to tolerable proportions and the top political leadership at the Centre and the states observe high standards which they can exhort the population to emulate. Thus, the first requirement for tackling the black income generation is clean administration at least at the level of political authority and top senior servants."

On this point we may consider two propositions. One is the view which is embodied in the above quotation, that is that the spirit of the society is created from the top, and the character of others is a reflection of the character of the rulers. In this view, the responsibility rests with the government so that if the government is competent and honest, others would also be so. The other view is that the character of the rulers is a reflection of the character of others. In this view, the responsibility rests with others so that if they are honest and conduct their relations with government correctly, that spirit will be reflected in the government also. There is clearly some wisdom in both of these views. Tax compliance requires basic honesty on both sides, and the honesty of one influences that of the other. Perhaps the former view is more relevant in the short-run, and the latter in the long-run. There is little discussion of the latter in the report. In this connection, a discussion of the measures such as to inculcate right values among the population at all levels, continuous vigilance and activism in an organised way at various levels by voluntary agencies and groups, etc, would have made for a complete account of the subject in the report.

(2) The Institute has advocated substantial reductions in rates on various major taxes and to peg them to 'reasonable levels'; alongside, it has recommended the simplification of tax structure. It has also recommended reduction in the complexity and the number of controls and the greater rationalisation in the controls that remain.

It may be conceded that in the absence of regulations, controls and taxes, there would perhaps be no black income. (But there could be other, perhaps worse, consequences, to which however, we would not like to stretch our present discussion.) All the same, even in the limited context under discussion, the following points would have to be kept in view. Government of a poor, democratic country like India has to operate on many fronts—to promote growth with egalitarianism as well as in the traditional areas such as maintenance of law and order, defence of the country against external invasion, etc. Here the impact of governmental activities should not only be experienced and felt but also be conspicuously visible in the short-run. For this, the government requires, among other things, resources, a framework of regulations, controls, etc. Second, reduction in black income has not so far been declared to be the sole or even the top priority objective, so that one has to consider the trade-off between this objective and the other objectives which guide the policies and measures. Third, should reduction in taxes and controls following loose compliance by citizens and poor implementation by administrators build expectations of further reduction, there is a danger that the citizens may comply with the laws and regulations that remain loosely with a view to providing grounds to the government for still further reductions.

In view of this, we entertain the fear that the policies for still more forceful and all round thrusts in this area as advocated by the Institute may tilt the applecart of the Indian society and polity excessively in favour of the more well-to-do at least in the short-run. It may be wise to have detailed critical reviews after some time of the policies and practices which have been initiated recently and a view taken in the light of this review before the government goes further along the lines advocated by the Institute.

(3) The Institute has suggested perimitting companies/business houses to make donations to recognised political parties out of after-tax profits; and to supplement them by state funding of election expenses at least in respect of Lok Sabha and state Assembly elections.

Both of these are good suggestions of which the first has already been accepted and implemented. An additional suggestion offered here is that recognised political parties must be required by law to publish their financial statements annually and on particular occasions as after elections, detailing their assets/liabilities, income/expenditure and sources/uses of funds.

(4) Among the measures to bring down the amount of black wealth currently held, the Institute offers two suggestions. One: Creation of a National Fund for elimination of slums with a seed capital of Rs 100 crore or so from the Central and the state funds. The Central government may then float debentures with maturity of 7 to 10 years and 8 per cent interest. It further suggests that no questions should be asked as to the source of funds and that the value of debentures and interest thereon could be liable to wealth-tax and income-tax but exempt from gift tax. The immorality of black money is sought to be neutralised by using this fund for the amelioration of the conditions of the citizens living in slums. The other suggestion relates to black wealth held in the form of real estate, bank and company deposits, debentures, shares, etc. The holders of this wealth may be required to pay income-tax at the rate of 50 per cent on the estimated income from these assets during the previous financial year, and the wealth so declared would become liable to wealth-tax from the year of declaration.

First, the terms of the bond are rather attractive on balance, and there is little element of punishment. Second, there may be equally, if not more, worthy causes for which such funds may be used—or for which more funds can be procured—for example, making drinking water available or available more easily in the villages, caring for the poorest of the poor in the villages by giving relief/employment, health care, etc. Third, a thought worth pursuing in this connection relates to mopping up black income/wealth for such causes/areas which the contributors hold dear with/without their names being tagged to them. The well-off are known to contribute generously for establishing/maintaining water houses, buttermilk houses, rest houses, health centres, dispensaries and hospitals, schools and colleges and so on, especially when they are located in or around the native place or the places of usual residence/work of the donors. It may be possible to attract more black money funds by such bonds if they are cause- and/or area-specific. In case of a large scale response the government may even think of cutting its own funds from such causes/areas and utilising them for other purposes. Fourth, it must be remembered that the suggestions here are of a once-for-all nature and, therefore, non-declaration must be followed by strict enforcement and punishment without fear or favour. If this is not done, it may make for loose compliance with law in the short-run with a view to benefiting from possible concessions which those concerned may expect the government to offer when it is prepared to come to terms with black income/wealth in future in a more lenient manner.

## VI

## Concluding Remarks

How does the Institute fare on the various terms of reference? And how do the studies thereon add up as a report? The first question can be answered briefly on the basis of what we have already said. But since we have had no occasion to reflect on the second question, we may answer it less briefly.

The quality of work which has gone into the study of the fifth term of reference on estimation is by far the best (Section II). This is especially true of the estimates of black income for 1975-76. Next in quality are the studies made in response to the sixth term of reference (Section III). This is especially true of the case study of sugar and also, though to a lesser extent, of that of ubran real estate. Then follow in that order the studies for the other terms of reference (Section IV) and for other areas (Section V).

We answer the second question in the following way. Concepts, definitions, approaches, assumptions, methodologies, statistical findings, limitations, substantive findings, values and prejudices have all been by and large clearly stated at the appropriate places in the report. So it is possible for the reader to agree or to disagree with the points and views quickly, or to attempt to come out with alternatives and/or follow up on these.

However, we do not find ourselves at ease on a number of occasions, when we try to put two and two together. We may list here three points in particular.

(i) Some of the suggestions on policy are made generally, without special studies having been conducted towards those ends or without detailed and careful scrutinies of previous works on the subject (for example, the suggestion on suitable adjustment in the value of the rupee).

(ii) In some cases, although the Institute's own main case studies specially conducted for this report do not permit the drawing of specific conclusions, the Institute has done so drawn these conclusions, perhaps in a general way or on the basis of the studies/impressions of other researchers and knowledgeable persons. (For example, the study of the sugar industry in the context of the report's plea for reduction in the complexity and number of controls; the real estate study in the context of its plea for substantial reductions of various major taxes.)

(iii) General impressions, estimates of other researchers and the Institute's own estimates all point to growing black incomes through time, relatively as well as absolutely. Although the Institute's own estimates relate to 1975-76, 1980-81 and 1983-84, the impressions of the Institute and of others, and other estimates relate to years from 1960-61 to 1979-80. While one cannot establish even very roughly the cause-effect relationships quantitatively on this subject, it would seem that at least some factors which may account for black income growth operated less vigorously during 1975-76 to 1980-81 (largely the period of Emergency under the Congress government and the period of the Janata government) than during the earlier period. Thus, for example, in general during that period inflation was lower, tax compliance was better, and controls were fewer than during the earlier period—and yet black incomes continued to grow during this period. These tendencies have to be accounted for. It is possible to argue that although the movements of the factors referred to above were weak, they were still in the directions conducive to black income growth; or that other factors such as decline in morality exerted a more powerful impact than before so that on balance they did not make much difference to the growth of black incomes; or that had the former factors operated more strongly during the latter period, black income levels would have been still higher. Not that there is an answer, much less an easy or a satisfactory answer, to such 'ifs', but a serious consideration of the various factors with reference to the directions/changes in quantities in the context of black income growth where it could be done, *albeit* roughly, was warranted in the report.

Greater attention to and more thorough analyses of such points as made above, especially with reference to the linkages, in the report would have left less room for critical comments by readers like this reviewer in response to the second question posed in this section.

---

## REVIEW

# Secularism and Society

### Romila Thapar

**Secular Values for Secular India** by P C Chatterji; Manohar Book Service, New Delhi; pp xi + 348, Rs 175.

THE term secular, in origin, concerned the world other than that controlled by the Christian Church and implied a polarity between the two. It referred therefore to that which was initially beyond the purview of the Church and implicitly to the changes of these areas of reference with the gradual reduction of the functions of the Church by the extension of law and the civil code and of ethics derived from sources other than religious codes. In the evolution of this word has been included various dimensions which in the European tradition referred it to the common or uneducated people and professions, and to articulations which were not sacred. More recently the word has been used particularly with reference to ethics and morality not deriving from religious sources but from humanism, rationality and theories emphasising the well being of society. Added to this is specifically the question of secular education. Both these trends have coincided with the extension of legal, civil and constitutional rights and practices.

These definitions are pertinent to Chatterji's opening chapter in which he raises the question of whether there may not be a confusion in the Indian concept of secularism and where he attempts to lay bare the implications of the term. Does the Indian definition place greater stress on the coexistence of all religions rather than the more fundamental question of whether it is necessary to break with one's religious tradition if one owes allegiance to secularism? One may suggest that in the Indian context perhaps secularism is viewed differently by the various religious groups. Where there is a church or the equivalent thereof, the European experience of the term becomes pertinent. But in those religions where there is an absence of a church or there is a weaker sense of institutionalisation, as among a number of Hindu religious groups, secularism requires another kind of consideration. Such religious groups have had strong social identities and legislate social norms. They are caught between either identifying themselves with a monolithic 'Hindu' religion which is now being propagated for the first time on a large, political scale, or opting to drop the religious identity of social norms and adopting *in practice* (and not just in theory) a common civil code. Chatterji maintains that the very concept of the secular state does violence to the major religions of India because they prescribe on all aspects of life.

The essential qualities of a secular state according to Chatterji are that the state guarantees freedom of conscience in matters of religion to all citizens, that there is no discrimination between individuals on grounds of religion implying an equality of all before the law and finally that the state is not concerned with and therefore does not interfere in matters of religion. He then goes on to consider the views of earlier authors on secularism and the Indian state and discusses the question of whether India is a secular state or a jurisdictional state; whether government interferes in religious matters under the guise of social reform; and whether the absence of a common civil code weakens secularism. He considers whether the assertion that religion be reduced to private practice and belief is a western concept and therefore foreign to Indian culture, is arbitrary. That the question of secularism relates not just to political and social concerns but is basic to political and moral philosophy as well is well-argued. Secularity is part of the debate on the degree of individual freedom.

The Indian problem as has been generally conceded is more complex than most since it involves substantial bodies of people practising various religions—unlike Europe where there was in essence only one church. In India the relationship between various religions as affected by legislation has also to be considered. If the Constitution introduces a prohibition on cow slaughter, should there also be one on the availability of pork, and to carry it to its logical conclusion the state might then also be asked to legislate on *jatka* and *halal*. If the state only legislates a ban on cow slaughter, because of the religious sentiments of what is described as the majority community of Hindus, then this shows partiality towards one religious group, which strictly cannot be regarded as secular legislation.

Legislating on religious matters or the ignoring of these by the state involves the question of whether morality and ethics require a religion. The centrality of ethical values in religious forms in the past were largely because religions endorsed and legitimised these values if one accepts that the social face of religion was closely tied to social aspirations and needs. Only when the legitimacy of the Constitution and the civil code is seen to override all others will legislated morality be acceptable. Possibly when this happens in India secularity will also become evident.

The discussion on the ideal of religious morality tends to be somewhat selective and theoretical. His description of Hinduism draws largely from Vedantic Hinduism. It may be possible to argue that Vedantic Hinduism as an ethos pervades a large segment of caste Hindus (although even this is debatable) but the level at which secularism becomes important, that is, the routine of life and social custom and practice, varies greatly among Hindu sects. Given this noticeable traditional variance in practice, should the state legislate on such things or ignore them completely? In earlier periods Indian states often accepted a laxity in civil codes and left various social segments to work out their own practices. But that was a hierarchically ordered society in which both religious and social practices were evaluated in giving a hierarchical position to a social group. If equality of status is the aim and the equality of all before the law, then the law has also to be equally applicable to all: a point to which Chatterji quite rightly gives the appropriate emphasis. A civil code would seem to be a better solution since it would prescribe the minimum. Chatterji points out that the alternative in India if there was a religious state would have to be a Hindu state since the majority of the population is Hindu: but the Constitution even as it exists did not envisage this and was drawn up for a secular state.

Chatterji's plea for the alternative ideal to the religious, that of taking the human personality as a whole is persuasively argued. This would require a premium on tolerance, social justice, economic welfare and the equality of all before the law. Tolerance, writes Chatterji, is more than just a practical necessity. It is the key to a new way of organising society. For him it derives from a healthy scepticism about what constitutes truth and insists on equal respect for individuals and the co-existence of alternate ways of life. But, he adds, freedom is circumscribed by the integrity and security of the state. However, this would imply a greater closeness to the Constitution and its values than is evident these days. Most religious texts support tolerance, but the practices of their followers frequently belie this value and the reality lies in the activities of religious groups and less in their texts.

Social justice draws on human equality and respect for others. Even though persons are not of equal intrinsic value they are worthy of equal minimum respect. This again emphasises the equality of all before the law and the equality of opportunity. The implications of social justice are tied into economic welfare. In this discussion Chatterji could have considered the notion of economic welfare in the religions of India more fully. Economic welfare as envisoned in a secular state would emphasise a different set of factors. It is also relevant to keep in mind that the major religions, whether Semitic or Indian, evolved in a context where social and economic inequality was taken for granted and was the recognised idiom. Where some religions emphasised ethical or morality equality it was often as an antidote to social inequality which they could not or did not wish to change.

Equality before the law has witnessed some of the turmoil in recent years over the question of reservations for Dalits and Other Backward Classes. Are the inequities of the past to be taken into consideration and a policy of reservation to be followed or is there to be a strict adherence to observing the equality of all before the law? There is also the problem that the law is not value-free. It is often fashioned in favour of those social group who are in power or are the potential inheritors of power. And even if the laws do not endorse discrimination, the practitioners of the legal profession may not be above discrimination.

In discussing the problems and perspectives for secularism in India in the final section of the book, Chatterji ranges over a number of features which have been discussed recently. For example, does the development of a scientific temper assist the process of secularisation or does science make claims and demands which are unacceptable? Fortunately, unlike some others who have commented on this question Chatterji does not confuse science with technology since he has enough training as a philosopher to recognise and understand the difference. Ultimately he thinks it is better to stress rational enquiry rather than science *per se*. Science without a scientific attitude can result in absolutism. Chatterji regrets the growth of obscurantism and ritual in recent years. In a sense this is not unexpected in a condition of social crisis and change. What is to be regretted even more is that the supporters of these act as pressure groups on social action. There is also the problem of minority groups within minorities banding together under the banner of conservatism and preservation of identity, denying fundamental rights to their members through an ex-communication of those who do not obey their highest religious authority—a case in point being that of the Bohra community. At another level the hostility against the backward classes are continues unabated. Chatterji quotes the official figures for crimes against the Scheduled Castes and Other Backward Classes and provides the information that between 1974 to 1982, the registered occurrence of crimes against these communities have doubled and possibly if a margin is allowed for instances not registered the increase may be greater. Further, seventy per cent of these crimes have occurred in Uttar Pradesh, Bihar and Madhya Pradesh.

Chatterji also provides figures on Hindu-Muslim communal riots with a record high of 1,170 incidents in 1964. Although the number of incidents had declined between 1964 and 1983, the numbers of those killed and injured in each year have gone up from 1,277 in 1972 to 3,680 in 1983 (and this excluding Assam). These again are official figures and the actual numbers may therefore be in fact much higher. Chatterji also analyses a few major riots and frequently the causes relate to economic competition, the hold of *goondas* and the underworld on society and the corruption of the administration and police, where there is an attitude of unconcern to say the least. (In more recent cases there have been accusations of complicity apart from unconcern.)

Unlike most earlier studies on secularism in India which deal with specific aspects relating either to law or religion, P C Chatterji's book seeks to cover the major areas which are involved in the question of secularism, from moral philosophy and the nature of the state to communal riots. It succeeds in effectively making the point that secularism impinges upon some and enters deeply into other aspects of all our lives. It also poses the choice between a religious state and a secular state in no uncertain terms. Perhaps what is even more important is that he feels the urgency of emphasising an alternate value system.

STRUGGLE FOR THE CITY

Migrant Labor, Capital and the State in Urban Africa

Original essays consider the uses made of urban industry by capital and the state in Africa. Why Africans sought jobs in cities, how they adapted to cities, and the relationship of work to urban structure are discussed in essays that deal with 19th and 20th century topics.

Each of these essays builds on original, sophisticated research in order to describe more accurately the interaction between migrant African workers and both the state and capitalist urban structure.

# 'Rational Choice' Marxism

## Some Issues of Method and Substance

**John E Roemer**

*In seeking to provide micro-foundations for behaviour which Marxists think are characteristic of capitalism, the tools par excellence are rational choice models: general equilibrium theory, game theory, and the arsenal of modelling techniques developed by neoclassical economics. With rational choice models, Marxian economics has made a good deal of progress in explaining mechanisms which lie behind otherwise apparently teleological claims.*

*The author outlines an agenda which 'rational choice' Marxism can set in order to answer two important questions which challenge its methodological premises. In rational choice Marxism (1) where is there room for class struggle? and (2) where is there room for the social formation of ideas, for the formation of the individual by society?*

### I

THESE comments address some issues of method and some issues of substantive research. With respect to method, I think Marxian economics has much to learn from neoclassical economics. With respect to the substantive research agenda, I think it is the other way around, in many instances.

I do not think there is a specific form of Marxist logic or explanation. Too often, obscurantism protects itself behind a yoga of special terms and privileged logic. The yoga of Marxism is 'dialectics'. Dialectical logic is based on several propositions which may have a certain inductive appeal, but are far from being rules of inference: that things turn into their opposites, and quantity turns into quality. In Marxian social science, dialectics is often used to justify a lazy kind of teleological reasoning. Developments occur because they must in order for history to be played out as it was intended. Thus state actions are explained by their effect of propping up existing regimes; capitalism foments racism and sexism among the working class because those ideologies weaken working class power and strengthen capitalist power; schools mis-educate working class children in order to maintain bourgeois power. All of these consequences may be true, but they cannot be demonstrated by appealing to the 'historical roles' that must be played by the entities 'state', 'capitalist class', 'working class', 'capital'. For example, an honest Marxist must come to grips with the skeptical argument that competition will eliminate racist discriminatory wage differentials paid by profit-maximising capitalists, in the usual competitive model; if divide-and-conquer is in fact a capitalist phenomenon, the argument for it must be a good deal subtler.[1] The existence of unemployment cannot be explained by the needs of capital to maintain a pliant working class with a large industrial reserve army, when in a competitive economy there is no agent who looks after the needs of capital.

That is: Marxian analysis requires micro-foundations. In broadest strokes, neoclassical and Marxist visions of the capitalist economy differ in that the former sees competition as bringing about an efficient allocation of resources, while the Marxist view has the same invisible hand floundering. Crisis, gross inefficiency, alienation, exploitation, and the like result. The neoclassical model of a competitive economy is not a bad place for Marxists to start their study of idealised capitalism. What Marxists must provide are explanations of *mechanisms*, at the micro level, or the phenomena they claim come about for teleological reasons. In a sense, the problem is parallel to the one bourgeois economics faces in providing micro-foundations for macro-economics.

There is a more benign (and supportable) interpretation of dialectics. Jon Elster characterises dialectics as the unintended consequence of rational action, more specifically, the sub-optimal allocations resulting from individual optimising behaviour.[2] The standard example is the prisoner's dilemma; generally problems of public goods provision and situations characterised by externalities have the property that the invisible hand fails. Elster claims that Marx thought most processes under capitalism were characterised by this sort of problem, and hence the 'dialectical' result that optimising agents end up in a sub-optimal solution. The famous theory of the falling rate of profit is a case in point: in an attempt to raise their individual profit rates, capitalists introduce technical change which in the new equilibrium lowers all their profit rates. Now Marx's specific reasoning in the theory was wrong, but it exemplifies dialectics as the failure of the invisible hand.

Thus both Marxism and neoclassical reasoning have their respective vices with respect to teleology. Neoclassical economics suffers from a panglossian attitude towards the consequences of individuals' uncoordinated behaviour; Marxism, while not teleological with respect to the consequences of market activity and individual behaviour, asserts that in the big picture, history pushes itself on to more glorious societies, as described in the theory of historical materialism.

In seeking to provide micro-foundations for behaviour which Marxists think are characteristic of capitalism, I think the tools par excellence are rational choice models: general equilibrium theory, game theory, and the arsenal of modelling techniques developed by neoclassical economics. This method is a great contribution in the intellectual history of the last century. Against this position the accusation can be levied that the tools were developed to apologise for the rising bourgeois order, to justify capitalism, and hence their use necessarily taints the results with a bourgeois pallor. This argument is a functionalist one of the type I criticised. If Marxists wish to impugn the intellectual unbiasedness of rational choice models, they must show precisely where the dirty work is being done. What hypotheses should be changed? In what sense is the characterisation of rationality wrong? There are some trenchant criticisms of rational choice models. They are not coming predominantly from the Marxian quarter, but from the cognitive psychologists, who are showing that people do not behave rationally in a variety of ways.[3] When the new cognitive psychology is fully integrated into economic theory, a new micro-economics will emerge, which may look quite different from neoclassical economics.

With rational choice models, Marxian economics has made a good deal of progress in explaining mechanisms which do lie behind otherwise apparently teleological claims. Micro-foundations for the formation of class can be provided by using more or less standard general equilibrium models, and class can be related to exploitation in a way that is quite classical.[4] Mechanisms can be provided which explain why racist pay differentials persist although it is in the interest of any individual greedy capitalist to unravel them, contrary to what the Chicago school of *laissez-faire* would claim. With respect to explaining the persistence of unemployment in capitalist economies, there are a variety of models constructed at the micro level, though credit for them does not go mainly to researchers who call themselves Marxist. The study of technical change and the labour process has been a rich one; and the approach of postulating individual profit-maximising agents has explained a good deal of the forms of technical change and labour control that might previously have been ascribed to the blind hand of capital.[5]

So I believe the programme of applying neoclassical tools to studying what might be called Marxian questions has been productive. There do remain, of course, some key differences in the use of these models. I would single out, for example, taking agents' preferences as data. Neoclassical economics, being primarily concerned with positive description, usually (though not always) postulates individual preferences as given. I think this postulate is more than methodological: it is ideological and flows from the dictum 'cogito ergo sum'. Marxism reverses the Cartesian epigram, and asserts that people's preferences are in large part the consequence of social conditioning. This is an important consideration, *if* one intends to use rational choice models for describing welfare, for making normative judgments about the consequences of rational activity. Rational choice models should be used to develop a theory of endogenous preference formation. A materialist psychology is necessary to derive preferences from endowments and history. This is an example of a specifically Marxian question, which will eventually be solved using standard tools.

For by adopting its usual position of hegemonic individualism (that the individual is taken as given), neoclassical economics tends to confound two diads which should not be joined together: (1) preference *versus* choice, and (2) choice *versus* welfare. People do not always choose what they prefer—this distinction, which might seem nonsensical has been made compelling by the work of the psychologists;[6] and people do not always choose or prefer what leads to their welfare because their preferences have been formed under conditions of inadequate opportunity, have been warped, more generally, by capitalist society. Together, (1) and (2) imply that neoclassical welfare economics stands on very weak ground; they imply we cannot easily draw welfare conclusions from observing individual choice. It does not follow that social choice theory, an admirable piece of rational choice architecture, is useless: quite the contrary. It is a theory of how people might or might not be able to design consistent and democratic aggregations of their choices, which is a social engineering problem. It is not, however, *necessarily* a theory of the impossibility of achieving some kind of welfare optimum in a democratic setting. As an alternative to welfare economics, which bases its admittedly weak conclusions on the given preferences of individuals, Marxism proposes what appears to be a normative concept of exploitation as a measure of the welfare of members of a society.

As to substantive agenda, Marxism makes two great contributions: its theory of the relationship between property rights, technical change, and class struggle (a positive theory), and its claim that capitalism suffers from unnecessary alienation and exploitation (a positive and normative claim). The first of these contributions is summed up in the various theses of historical materialism. The modern reconstruction of historical materialism is a theory of the determination of technical and institutional change.[7] Many gaps must be filled in, and to do the filling, I would call upon rational choice models. One big question is the formation of preferences of the historical actors—in particular, preferences which lead to collective action (class action) which is so important for the theory. A theory of ideology formation is needed.[8] Perhaps ideology is an institution which cuts transaction costs of various kinds; or perhaps ideology should be conceived of as a set of satisfactive rules which an agent adopts to limit his own feasible set. Another question is to decide precisely where class struggle should be fitted into the general equilibrium model: does it determine preferences, or endowments, or is it a bargaining technique in a non-competitive model? There are other possibilities. While the question comes from historical materialism, the solution must be conventional. If class struggle is as important as Marxists say it is, and as I believe it is, there must be a way of putting it properly into an economic model. There is, now, a theory of class formation based on individuals who optimise with given preferences and endowments; the next step is the sociological one of proposing a theory for why members of the same class should overcome the collective action problem in the way they sometimes do, and what effect their concerted action can then have on the equilibrium—does it work by changing prices, endowments, preferences, production functions?

## II

In this Section, I outline an agenda rational choice Marxism can set to answer two important questions to which I have referred which challenge its methological premises. In rational choice Marxism:

(1) Where is there room for class struggle?
(2) Where is there room for the social formation of ideas, for the formation of the individual by society?

These questions arise as a challenge since the rational choice model assumes the maximisation of utility subject to constraint. There are immediately two problems with understanding class struggle. First, class struggle is characterised as breaking constraints; second, class struggle, and collective action more generally, is usually thought to be irrational from the individual's point of view. So it would seem the rational choice paradigm cannot admit class struggle. I argue this is not the case; class struggle is ignored by neoclassical economics because of its emphasis on a particular solution concept, competitive equilibrium. With respect to the second question, it seems clear that the individual must first be defined, his preferences must exist before the analysis starts, for one to be able to use the rational choice method. Hence: where is there room for the social formation of the individual?

To answer these questions, consider a very general description of the historical process, a materialist description. There are two categories of interest. $R_t$ is the full description of technology, institutions, and ownership relations at time t, the conglomeration of the classical Marxian productive forces and economic structure. The second category, $P_t$, is a list of all the people and their preferences at time t. These people, of course, own things (which are described in $R_t$), but it is useful to separate the subjective element which is in P from the objective element which is in R. Historical progress is the consequence of two processes, called the *solution process* and the *preference formation process*. At time t, there is constellation $\{R_t, P_t\}$ which gives rise through some solution process, to production and distribution of goods, invention, new institutions, and so on. These come into existence at the next time period, (t + 1). Thus we have a process

$$\{R_t, P_t\} \rightarrow R_{t+1}$$

Neoclassical economics has studied one special case of this solution process: the competitive equilibrium solution, where each agent has negligible power, accepts all signals from the environment as unmalleable by him, and maximises his utility (given in $P_t$) subject to the constraints he faces from his property endowment and the given institutions. This process gives rise to an equilibrium allocation which is described in $R_{t+1}$. But there are other solution processes which can be described.

The second important process is the social formation of preferences: members of a new generation are born each time period (let us say), and their preferences are formed by the state of the world into which they are born. The generation born at time t matures at time (t+1), when it becomes the generation engaging in economic behaviour; its social formation is consequently from the environment $R_t$ existing at t, and the preferences of its parents. This can be schematically represented as:

$$\{P_t, R_t\} \rightarrow P_{t+1}.$$

Very little work has been done to understand the preference formation process.

Thus individuals are formed by society, and these individuals react rationally to their environments to produce tomorrow's environment, which in turn produces individuals who think somewhat differently from before, and react in their environment to bring about yet a new equilibrium.

This is a reasonably general materialist history. It is more general than classical historical materialism, which contains many claims which may or may not follow from the above description—such as, that the social relations of production last only so long as they do not fetter the further development of the productive forces. To analyse that issue, one would have further to articulate $R_t$. The above model includes historical materialism as a special case.

This model also includes the neoclassical paradigm as a special case. Neoclassical economics is characterised, in the language of this model, by two special assumptions. First, the solution process studied has been the competitive equilibrium process (until very recently); and second, more importantly, there is no preference formation process. P is taken as constant through time, a constant 'human nature'. There is a certain distribution of preferences in each generation which is essentially unchanged. What changes are the constraints people face, which bring about varying behaviour: but there has been a fundamental antagonism in neoclassical economics to thinking of P itself as formed by R.

If P is taken as constant, then P is seen as the prime mover in history. P sets in motion the sequence of $R_t$s, and hence our present world $R_{1984}$ is a consequence of the exercise of an unmalleable human nature throughout the ages. Some Marxist interpretations make the opposite error, of underestimating the role of P. Thus, some Marxists say, the preference formation process is more correctly described as

$$R_t \rightarrow P_{t+1}$$

The preferences of this generation are almost wholly a product of their material conditions (or, as I have written above, of their material conditions last year). Were this so, one could eclipse the role of preferences entirely and describe history as a sequence $R_0 \rightarrow R_1 \rightarrow R_2 \rightarrow \ldots$ At each stage there is a micro-process of the formation of preferences; people interact with their environment and bring about a new environment. But we can drop the people and the preferences out of the picture, since they are caused by their environment, and we are left with the evolution of modes of production, with the preferences of agents playing only a passive role. This approach is associated with explaining the evolution of property forms and productive forces without reference to individual decision making. Perhaps with a good enough understanding of the preference formation process, one could indeed represent the evolution of $\{R_t\}$ in this way, with no reference to $\{P_t\}$; but one would miss the *explanation* for why history happened the way it did.

There are, therefore, two hyperbolic positions: the idealist position views history as derived from a constant P, and thinks of the mode of production R at a given time as a consequence only of the minds of people; and the vulgar materialist position thinks of the mode of production evolving independently of minds as preferences $P_{t+1}$ are determined by $R_t$ in the previous state.

Where is rational choice methodology to be used in understanding these two processes? I think in both of them. We have, as I have said, the one major example of a solution concept in the solution process

$$\{R_t, P_t\} \rightarrow R_{t+1}$$

given by neoclassical equilibrium theory. But there are other rational responses people might have to their environment, given their preferences $P_t$, than to act as price takers and environment takers. They might try to influence their environment, to bargain, they might not accept the terms of trade as given. In fact it is often rational not to do so. The classical case is of a monopolist, who does not take the price as given, but realises he can change prices and make greater profits. This gives rise to another solution concept, monopolistic competition. Or, if we have monopolistic elements on both sides of the market, there is bilateral monopoly, or bargaining. Now class struggle can be viewed as a kind of bargaining. Class struggle occurs when many agents in the working class, for example, learn to organise and act as one unit, so they can effectively set up a bilateral monopoly against capital. Of course, the situation can be more complicated: there can be all kinds of factions, and so perhaps it is n-agent bargaining. The point is class struggle is a method of carrying out bargaining, and bargaining is as good a solution concept as competitive equilibrium—in fact, in many cases, it is much more appropriate, more rational. The question has still to be asked: what makes coalition formation possible? How can workers overcome their individual self-interest, overcome the free rider problem, and engage in class struggle? But I take the answer to this problem also to lie in rational choice analysis. One must understand, at the level of individual preferences, what causes a person to cast his lot with a class despite the possible penalties and costs, when his standing on the sidelines would not weaken the class struggle, and the internal gains to him would be no smaller. We do have some answers to this question, at the level of rational choice theory: for instance, that people derive pleasure from co-operating with others whom they feel are as exploited as they, if together they can win, and indeed, that they would derive less pleasure from 'letting history pass them by'. There is a bond from common oppression which makes people want to fight if they think others too will fight. Class struggle can emerge rationally as part of a solution process. Neoclassical economics has avoided the study of class struggle not because of its rational choice method, but because of its emphasis on the competitive equilibrium solution process, which is not always appropriate. Indeed, modern neoclassical economics has seen an explosion of interest in game theory the last decade, in which bargaining solution processes are studied in great detail.

I have little to say about the second process in the historical scheme, the preference formation process. There, too, rational choice models will be used to build a theory of the social formation of the individual. It seems studying the question of preference formation requires postulating some apparatus of meta-preferences: a person has a variety of preference profiles he can 'choose' to have, and given the information in his environment, including the constraints he faces, he 'chooses' an appropriate conception of welfare. There will be expectations upon a person by the rest of society, given the place he occupies in $R_t$, which will direct him to order his options in certain ways. A person born into the Rockfeller family will maximise his satisfaction by choosing to remain a capitalist, by and large. It is more accurate to say that culture chooses a person's preferences for him. But culture can be understood as ideology, and if there are rational foundations for ideology (as I mentioned earlier) then the process of endogenous preference formation can be seen as a rational choice. The social formation of the individual can be explained while at the same requiring that society be understood as the consequence of many individual's actions.

## III

With respect to what might be called welfare economics, Marxism highlights exploitation and also alienation. There has been much recent work on exploitation, and the modern concept looks considerably different from the classical one: for instance, exploitation need not be defined using the concept of labour values, an antiquated tool which does not hold up against modern standards of generality and rigour. Exploitation, rather, should be conceived of as an injustice in the distribution of income resulting from a distribution of endowments which is unjust.[9] To demonstrate the nature of that injustice, political philosophy must be called upon: what Marxian economics can do is work out the allocative consequences in terms of economic variables of an unjust distribution of property (which might include property of various kinds, alienable and inalienable). Here, I think, there is less ground for agreement between Marxists and non-Marxists than in the theory of historical materialism: for the underpinnings of the disagreement are not questions of positive history, but of philosophy concerning what constitutes a desirable or just society. The sharpest form of the political debate on this question is between Marxists and libertarians, on questions of self-ownership, inheritance, and various kinds of rights. It is not at all clear how analytical Marxists will differ from non-Marxist philosophers like Ronald Dworkin, John Rawls, and Amartya Sen, who may be more vigorous in their opposition to utilitarianism and welfarism than are certain Marxists.[10] I mention this simply to indicate that the lines drawn between contemporary analytical Marxism and contemporary left-liberal political philosophy are fuzzy. This indicates there is a common core, yet to be elucidated.

The Marxist belief—and I call it that, rather than theorem—is that exploitation of important kinds can be overcome by a change in property relations, by socialism. The experience of existing socialism of the last 60 years has forced Marxists to be much more interested in electoral politics and markets under socialism than their counterparts were a generation ago. To what extent can markets be used to implement a regime in which alienation and exploitation are attenuated? Oscar Lange, the Polish Marxist who was perhaps the first economist of the twentieth century to embrace roughly the combination of neoclassical methodology and Marxist research agenda which I have outlined here, was optimistic. The question is very much open. Lange said that Marxist economics is the economics of capitalism, and bourgeois economics is the economics of socialism.

The Marxist ethical view of capitalism comes not from economic models, but from history. In that view all class societies are characterised by the expropriation of a surplus from a large class of direct producers by a small class of property holders. The bourgeois view of history is, in contrast, that each factor earns its appropriate return. Each view represents, I think, a *possible* world, and hence I think consistent models can be constructed to formalise the insights of each view. For that reason, it is not useful to criticise neoclassical economics for its possible inconsistency (which is what the so-called Cambridge controversy was about); the criticism must be, more fundamentally, of the view of history which neoclassical economics models and reinforces. By building axiomatic models, in particular, rational choice models, which represent the Marxian view of history, we do two things: first, we learn more about the mechanisms that may explain history, which is the purpose of any modelling exercise; and secondly, we show that a Marxian view of history is consistent and rigorous as well. If consistent models can be presented to capture two different historical world views, then one must choose between them on the basis of which better describes actual history. But if only one historical worldview is studied in a rigorous and axiomatic fashion, there is no contest. In sum, I do not think models are the fountainhead of one's ethics; I think one's view of history implies the models one builds, and if the models are good, they will clarify the ethics whose root lies in the actual history.

## IV

According to this outline I can distinguish rational choice Marxism from neoclassical economics in at least these ways. Marxism holds:

(1) a commitment to the malleability of human preferences, to the social formation of the individual;

(2) that the neoclassical theory of welfare economics is weak and misleading, because of the non-autonomous formation of preferences;

(3) a commitment, based on a certain reading of history, to the importance of collective action and power in solution processes; in particular, class power and class action, but more generally nationalist power and perhaps religious power. In competitive equilibrium theory, no one has any power.

(4) a belief in the injustice of capitalism, and the transiency of it, which flows from a historical worldview, based on the evolution of forms of property.

What is lost with rational choice Marxism is, principally, teleology. One cannot assert that those things happen which are optimal for the preservation of the capitalist system; or, on the contrary, that the system will destroy itself. Perhaps these events may happen, but the mechanisms at the level of the preference formation and solution processes must be shown to bring them about. The heritage of Marxism, as an idea, is a set of powerful descriptive insights. These descriptions must not be assumed true, but rather shown to emerge as theorems in models whose postulates are elementary and compelling.

## Notes

1 Roemer (1979) presents a model in which the rational strategy for individual capitalists is to pay discriminatory wages to black and white workers of equal skill levels.

2 Elster (1985), Chapter 1.

3 See the collection of papers reprinted in Kahneman and Tversky (1982).

4 A summary of this work is given in Roemer, 'New Directions', in "Analytical Marxism" (Cambridge: Cambridge University Press, 1985).

5 The books by Braverman (1974) and Edwards (1979) are prime examples of this approach.

6 See Tversky (1980).

7 See, for a summary of this approach, Cohen 'Forces and Relations of Production, in "Analytical Marxism" (Cambridge: Cambridge University Press, 1985).

8 North (1981) presents a theory of ideology. Roemer (1985) presents a model in which ideology emerges as a rational strategy in a game. Schotter (1984) shows how ideology can also emerge strategically in a game situation.

9 See Roemer, 'Should Marxists be Interested in Exploitation?" in "Analytical Marxism" (Cambridge: Cambridge University Press, 1985).

10 Rawls (1971), Dworkin (1981), Sen (1980) each present theories of justice as equality in which utility is not the concern. Welfarism, a term coined by Sen, is the position that social welfare should be taken to be measured by some function of the utilities of members of the society.

# First Decade of Coal Nationalisation

## Crucial Test of Performance

**A B Ghosh**

*A growing rate of output of coal was the primary objective of the nationalisation of coal mines. What has been the achievement of the public sector in the coal industry? And at what cost?*

NATIONALISATION of the coal industry was achieved in two stages. The first stage was initiated by the Ordinance providing for the taking over of the management of 214 coking coal mines on October 17, 1971 plus 12 coke oven plants on December 27, 1971, and finalised by the Coking Coal Mines (Nationalisation) Act 1972 passed by Parliament on May 1 receiving the assent of the President on August 17. The second stage began with the Ordinance providing for the taking over of the management of 711 non-coking coal mines on January 30, 1973 completed by the Coal Mines (Nationalisation) Act 1973 which received the assent of the President on May 30, 1973. The entire programme thus took a year-and-a-half.

The coking coal sector received priority in this programme, as steel, the base for industrial development, requires coking coal for its growth. However, the latter's increasing use by non-steel industries, since independence, pressed heavily on its limited resources emphasising the urgency of its conservation. Bharat Coking Coal Limited, a new government company was set up on January 12, 1972. It became a subsidiary of SAIL in March 1973 remaining under the administrative control of the Department of Steel till the formation of the Department of Coal under the Ministry of Energy in October 1974.

The objective of nationalising the non-coking coal mines was to ensure rational and co-ordinated development of coal production, and promotion of optimum utilisation of coal resources consistent with the growing requirements of a planned developing economy and also because internal resources of the private sector could "contribute little to the investment effort required" ["Working Group on Finance for the Coal Industry", 1972 Report, Para 6.7]. Non-Coking coal mines came under the ownership of the Coal Mines Authority Limited, a public undertaking set up on June 14, 1973. Coal India Limited was established on November 1, 1975 as a holding company to take charge of coking and non-coking coal mines and washeries. The scheme of nationalisation provided for payment of compensation to previous owners alongside of transfer vesting to the Central government their rights, titles and interest free from all incumbrances.

The crucial test of the performance of a business is its financial health. Though 1973-74 was the first complete financial year after full nationalisation, it cannot be taken as a base year, as, unrecorded output of the private sector could not be fully incorporated in the records of the nationalised industry by the end of the year. 1974-75 not only incorporated this to a large extent, but was also the first complete year in which all constituents of CIL, which became the holding company in 1975/76, were included. So we have selected 1974/75 as our base for the financial test.

A growing rate of output was the primary objective of nationalisation. What has been the achievement of the public sector? And at what cost? The relevant data for a measurement of the performance of the nationalised industry is provided by columns (4) and (7) of the Table.

Between 1951 and 1971, for the Coal Industry as a whole the annual percentage rise in OMS in underground, open-cast and overall categories were 2.4, 8.5 and 4.6 respectively; between 1974-75 and 1981-82 for CMAL/CIL the corresponding figures were 0, 19.2 and 4.6. The comparative superior position of the open-cast category records the achievement of the objectives of the different Five-Year Plans ending with the draft outline of the Sixth Five-Year Plan 1978-83 containing the statement, "New open-cast mines are expected to contribute about 50 per cent of additional production" (Para 10.3). The stress laid on open-cast mines was due to the difficulties in increasing the rate of production from underground mines, acceptability of inferior coal by the power plants and the relatively lower cost of production of coal from open-cast mines (Third Five-Year Plan Chapter 27, Para 25).

The relatively lower rate of growth in production from underground mines is a cause for concern, for huge investment in the industry has been made since nationalisation. During 1951-71 for the entire industry the annual average percentage rise in paid-up capital and output were 58.7 and 5.8 per cent respectively whereas in CIL for the period 1974-75 to 1981-82 the corresponding data were respectively 69.7 and 5.5 per cent. Also the percentage rise per annum in loan finance was 209.2 in the post-nationalisation period compared to 3.2 in the pre-nationalisation period. Further, "at the end of December 1982, 99 coal mining projects were under implementation (all these projects cost Rs 5 crore and above) with a total sanctioned investment of Rs 2,339 crore and ultimate capacity of 150 million tonnes per annum of coal production. A large number of these projects have slipped up by one to five years" (Sixth Five-Year Plan Mid-Term Appraisal 11.21). It is, therefore, not surprising to note that the rise in the financial loss percentage per annum in the post-nationalisation period was 161.5 whereas the private sector always made profits between 1951 and 1971.

This profit/loss situation reflects the relation of prices and costs in the industry of which wages constitute more than sixty per cent. And it is pointed out in some quarters that the percentage rise in the two periods in earnings and output does not support the plea that losses in the industry after nationalisation were due to a rise in wages. Despite the higher percentage rise in earnings compared to prices, profits before nationalisation were positive in all years. Between 1975-1981 the lower percentage rise in earnings compared to pithead values was associated with growing losses. So, the popular charge is that losses in the industry since nationalisation are not so much due to rise in wages as maintained by the establishment but to some other factors obstructing the required rise in productivity. Let us consider some of these factors and also whether these were beyond the control of the establishment.

Firstly, was investment directed to a greater extent to open-cast mines in view of the favourable growth trend in it in quantitative as well as percentage terms compared to underground mines? Is the impact of this category of investment on relevant output and OMS better than in the pre-nationalisation period? Consideration of these issues will necessitate a measurement of investment in open-cast and underground mines as these are not available in published documents of the Government of India Department of Coal or Coal India Limited. So, a digression on investment in public sector coal undertakings may be made to record the results of an attempt to measure the investment categories under quest.

Investment in public sector undertakings is considered as equivalent to the sum of equities and long-term borrowings. The first complete financial year of the coal industry after full nationalisation is 1973-74. NCDC became a wholly owned subsidiary of CMAL from September 1973 and its equities and long-term borrowings got absorbed in the corresponding categories of CMAL, being respectively equal to Rs 1.3 crore and Rs 173.62 crore, totalling to Rs 174.92 crore. This excluded the Central government's holding of the Singareni Collieries' paid-up capital of Rs 2.72 crore which became a long-term investment of CMAL from June 1974, i e, in 1974-75. Adding to the Rs 174.92 crore the BCCL equities and long-term borrowings of Rs 2 crore and Rs 23.8 crore respectively total investment in 1973-74 of what later came to be called CIL (Holding Co) was Rs 200.72 crore. Singareni finance, however, continued to remain excluded. So, for the purposes of the matter in hand, 1974-75 should be taken as the first complete year as it includes all constituents of what became the holing company in 1975-76. Investment in 1974-75 in CMAL was equal to Rs 218.7 crore (equity) plus Rs 89.05 crore (loans) i e, a total of Rs 307.75 crore. Adding the investment of Rs 65.56 crore (equity Rs 2 crore and loans Rs 63.56 crore) of BCCL which came under the control of Coal Department in 1974-75 (and became a wholly owned subsidiary of the holding company in 1975-76) the total investment of what became the holding company was equal to Rs 373.31 crore. In 1981-82 the CIL investment was equal to Rs 1286.9 crore as equities plus Rs 1,453.5 crore as borrowings i e, Rs 2,740.4 crore. The rate of growth of investment per cent per annum for the period 1974-75 to 1981-82 was 90.5 and for 1975-76 to 1981-82, 66.9, the total investment of the holding company in 1975-76 being Rs 338.15 crore as equities plus 208.02 crore loans i e, 546.17 crore.

The increase in losses from 1974-75 to 1981-82 and 1975-76 to 1981-82 was 161.5 and 114.3 per cent per annum respectively. So, a comparison of investment and losses revealing a ridiculously higher percentage per annum in losses compared to investment may support the charge of investment going down the drain. What is the situation with regard to investment and losses of underground mines and open-cast mines separately? Now, the more than doubling of the output of open-cast mines in the post-nationalisation period upto 1981-82 indicates the huge investment. Stagnant and to some extent a deterioration in the output of underground mines during the same period does not however imply absence of investment. For, underground mines require investment for mere maintenance of production as mines, unlike factories, have a continuously receding floor. The National Coal Board in UK for instance spends about Rs 18 per tonne for maintaining production. So, if production, productivity and input costs remain the same, the cost of production rises every year due to this peculiar character of an extractive industry.

It is learnt on reliable authority that in the CIL this investment has risen from Rs 11 per tonne to about Rs 20/Rs 25 per tonne (average Rs 22.50) over the post-nationalisation period. Assuming that the underground mines did not have any new investment (resulting in additional fixed, assets) during this period, the picture of investment is as below:

*1974-75*

(a) Underground output = 58.2 m tonnes
(b) Investment cost per tonne for maintaining production = Rs 11
(c) Underground investment = (a) × (b) = Rs 64.02 crore
(d) Total investment = Rs 373.31 crore
(e) Open-cast investment = (d) − (c) = Rs 309.29 crore

*1981-82*

(f) Underground output = 63.4 m tonnes
(g) Investment cost per tonne for maintaining production = Rs 22.5
(h) Underground investment = (f) × (g) = Rs 142.7 crore
(i) Total investment = Rs 2,740.4 crore
(j) Open-cast investment = (i) − (h) = Rs 2,597.7 crore

The rate of growth of investment per cent per annum between 1974-75 and 1981-82 in underground, open-cast and aggregate workings comes out respectively to 17.5, 105.7 and 90.5 as given in the Table.

Thus the separation of total investment into different categories provides a very weak mitigating factor to the popular charge. Though investment data before nationalisation is not available, it is universally acknowledged that private sector investment was very unsatisfactory. Yet this highly unsatisfactory rate of investment was accompanied by positive profits. In the post-nationalisation period the 90.5 per cent annual rise in investment was accompanied by a 161.5 per cent annual rise in cumulative losses. Consideration of separate annual per cent growth rate of investment in underground and open-cast workings does not alter the position as is evident from the data of OMS and output.

TABLE

| Coal Mines | Before Nationalisation | | | After Nationalisation CIL | | |
|---|---|---|---|---|---|---|
| | 1951 | 1971 | Annual Average Percentage Change +/− | 1974-75 | 1981-82 | Annual Average Percentage Change +/− |
| (1) | (2) | (3) | (4) | (5) | (6) | (7) |
| Underground workings | | | | | | |
| (i) Output (M tonnes) | 30.20 | 58.50 | +4.70 | 58.20 | 63.40 | +1.3 |
| (ii) OMS (tonnes) | 0.58 | 0.86 | +2.40 | 0.54 | 0.54 | +0 |

d Indicates 1974.
e Indicates 1981.
f Indicates 1974.
g Indicates 1981.
Post-nationalisation items (iii) and (vi) have been estimated by us.
Sources have been indicated at the end.

The highly unsatisfactory investment in the pre-nationalisation period was accompanied by a higher rate of growth of *output* relative to the post-nationalisation period in both the total and underground workings. In OMS the same picture holds true for underground workings. The relatively better performance in rates of growth of output and OMS in open-cast workings do not have any impact on the profit/loss position.

Consideration of the rates of growth of *paid-up capital* in the two periods does not alter the situation though the relative performance in this item in the two periods is not as bad as in investment.

The profit/loss phenomenon results from the balancing of price and cost. In the pre-nationalisation period a near equal percentage rise in price and cost was accompanied by positive profits as percentage rise in wage costs was fifty per cent of that of price and total cost. In the post-nationalisation period the higher percentage rise in price compared to cost was accompanied by a very high percentage rise in losses although the wage cost per tonne rose less (as in the pre-nationalisation period) than price and cost. This indicates that prices throughout the post-nationalisation period were unremunerative as insufficient attention was given to improve productivity and reduce cost, as was pointed out by the Baweja Committee.

One mitigating factor to the popular charge is provided by the welfare measures adopted since nationalisation. The miserable record of the industry in this respect before nationalisation may be contrasted with sincere attempts made to improve matters in respect of welfare in the post-nationalisation period, particularly in the last few years. They have, however, been obstructed and frustrated a good deal by inter-union rivalries, mafia activities in the coal belt, the inadequate legal framework, environmental atmosphere of the industry and decline in discipline since nationalisation. Yet, the earnestness of the attempts in this direction deserves appreciation, as indicated by an expenditure of Rs 649 per head on social overheads including medical facilities, education, social and cultural activities, transport subsidy, etc, in 1980-81 compared to Rs 589 in 1979-80. The urgency however of taking active steps to improve productivity is not reduced.

Another mitigating factor that is often presented is that the post-nationalisation period is too short to manifest the impact of investment as machines in coal industry have a long gestation period. The strength of this statement depends upon a detailed analysis of the gestation period of the different types of machines used for which published data are not available. Since, however, a good deal of investment has been made in open-cast mines, where the period of gestation is not long, the strength of this mitigating factor is not likely to be weighty. Besides, there is also the factor of underutilisation of machines and of mines. The extent of underutilisation of machines in open-cast and underground mines in 1980-81 was on an average 37 per cent in open-cast mines and 64 per cent in underground mines ("Public Enterprises Survey 1980-81", Vol 2, p 64).

The percentage utilisation of coal mines in the nationalised industry improved from an average of 100 in 1974-75 to 102 in 1980-81 ("Public Enterprises Survey 1974-75", and 1980-81). It must be admitted that in respect of capacity utilisation the coal industry was in a much better position than the average of all public undertakings.

The mystery of hundred per cent utilisation of mines accompanied by a low state of utilisation of machines can be easily explained. It means that two machines were being used to produce a given quantity of coal with the machinery being used to the extent of 50 per cent on an average. Thus lower utilisation of machines implies purchases of a larger number of machines and this is what causes more and more investment without improvement in productivity.

Under-utilisation of capital equipment has been brought out vividly by K V Subramanyam:

> When coal mines were nationalised, the public sector inherited an unenviable legacy to add to the grossly mismanaged chaos of the National Coal Development Corporation which provided the nucleus round which to plan a viable coal industry . . . The NCDC's collieries were mostly open-cast mines. The experience of its executives was very limited so far as mechanised underground mining was concerned. The emphasis after nationalisation was, therefore, on extending open-cast mining. The first two mines planned for underground mining were entrusted to Polish experts. These are the now notorious, Sudamdih and Monidih deep shaft mines. As was to be expected, both became problem mines. The first has been abandoned for all practical purposes and the second is being rehabilitated with massive aid from the National Coal Board of UK. No Indian personnel were available when the Poles were inducted, for sinking and equipping shafts for the new underground mines. The public sector has neither created an organisation for such specialised jobs as shaft-sinking and tunnelling nor has it encouraged experienced contracting firms in the private sector to enter this field . . . The Central Mine-Planning and Design Institute was created as a subsidiary of Coal India. But even its planning and design functions seem to have been subordinated to the will of foreign collaborators. First, it was design of open-cast mines by Russians. Now it has extended to underground mines also by them in the Bengal coal-field. One important fact to be noted is that the aid-givers make it an avenue for the supply of equipment manufactured by them irrespective of its suitability to Indian conditions. Both the Mining and Allied Machinery Corporation (MAMC) and the private sector have been more interested in securing collaborations for indigenous manufacture of these machinery than develop new designs of machinery to suit Indian conditions. Coal India has, therefore, to modify its mine plans to accommodate the imported machinery even if that has serious adverse effects on safety and productivity.
>
> The net result of this aid-given machinery has been to reduce, Indian coal mines into museums of international mining machinery, open-cast as well as underground. Inability to standardise such a varied collection of machinery, has led to the piling up of spare parts' inventories, irregular maintenance schedules, increase in idle hours and consequent underutilisation of costly equipment leading to purchase of more equipment . . . That matters should have been allowed to deteriorate to such an abominable extent is a sad commentary on the organisational set-up of Coal India and the progress-monitoring agencies in the Ministry and the Planning Commission (*Economic and Political Weekly*, December 3, 1983).

Of the three mitigating factors to the charge of investment going down the drain, the separation of investment into categories and period of gestation are very weak while the welfare expenditure has some degree of strength. This leads to the consideration of the last mitigating factor, *viz*, a proper price policy. The plea is that the revision of prices from time to time to take account of rise in costs was not based on the special characteristics of an extractive industry engaged in producing exhaustible natural resources. Important factors making for unremunerative pricing were inadequate provision in price for depreciation of plant and machinery, for loss on subsidised sale of solid fuel prepared from coal, for working of uneconomic mines, for starting unviable mines in selected areas with a view to establishing links with consuming projects, for maintaining high stocks to take care of sudden increases in demand or sudden disturbance in transport and to take care of welfare work.

It is further claimed by the industry that besides the above factors, prices fixed with reference to current costs inadequately, become highly inadequate in an inflationary situation and when, fixed for short periods, they remained operative for long periods also. It is quite correctly maintained further that when losses resulting from unremunerative prices were financed by interest-bearing loans, they functioned as a built-in cost escalator. When, recently the loans were made interest-free, the repayment liability continued to operate as an in-built cost escalator. This could have been avoided by allowing 'Grants' to meet these loan burdens as in the case of a number of developed countries like UK, France, W Germany and Belgium. The rapid growth of public sector undertakings, most of them having similar financial problems, stood in the way of the adoption of such a policy for the coal industry. Thus the financial problems of the coal industry become entangled with those of the entire public sector and also of the economy, whose unhealthy nature is symptomised by the growing volume of deficit financing. This is not the place to discuss the problems of the entire economy. It is however, essential to remember that in such an environment no single industry can solve its problem through raising of administered prices. Indeed, such price-rise attends to the softer option rather than to the harder and a more difficult but a surer one, *viz*, improvement of productivity. Even in respect of administered pricing not sufficient notice has been taken of product variation, cost variation and quality differentiation. Average pricing is a very inadequate instrument for a complex situation. It is differential pricing which needs to be introduced after a thorough assessment of the situation. It is learnt that the Bureau of Industrial Costs and Prices has done this exercise but the report has not yet been published.

The resort to raising administered prices brings back the picture of the pre-nationalised industry asking continuously for higher prices and the authority steadily preaching the need for improving productivity. In the post-nationalised era the industry is repeating its pre-nationalised clamour and is receiving a favourable response though with a time-lag, which keeps it permanently in the red. The nation is crying for improvement of productivity and the government too is aiming at the same. Yet the situation is almost at a standstill.

This is not to reduce the importance of administered pricing but to emphasise the need for a rational and dynamic price policy which will, take care of a proper balancing of output from depillaring and development areas, have clear short-term and long-term objectives in fixing prices, allow differentiation in prices between subsidiary companies to take adequate care of variation in grades and costs of production so that units yielding financial surplus become utilised to take care of units with financial deficits in the interest of the industry as a whole. A dynamic price policy has also to take care of conservation of scarce grades in the interest of development of the iron and steel industry using metallurgical coal.

Even a perfect pricing policy will fail if there is indifferent management. For, improvement of productivity can result from a proper pricing policy if the management is conscious of avoiding waste wherever it occurs. This needs an honest and sincere examination on the lines done by the Baweja Committee in 1978. The Report placed before Parliament on August 2, 1978 dealt with various aspects of the industry, e g, stores, equipment, technology, finance, manpower, marketing, organisation, etc, to explore possibilities of cost reduction and made a large number of suggestions to improve efficiency. Quite a number of the recommendations were accepted by the government on principle and further investigations were set on foot. Implementation of the recommendations was expected to result in cost reduction to the extent of Rs 10 per tonne over a period of 3/4 years.

The rise in costs from Rs 79.77 per tonne in 1977-78 to Rs 134.40 per tonne in 1981-82, that is, by about 67 per cent, with the general price level rising by about 60 per cent, indicates that little has been done with regard to the Committee's recommedations. This is not surprising because the report was never published after circulation among members of Parliament. Some impact is, however, noticeable from the improvement in OMS from 0.68 in 1977-78 to 0.78 in 1981-82.

There seems to be no lack of knowledge regarding measures for cost reductions and/or improvement in productivity. Committees and commissions, foreign experts and domestic experts have practically flooded the country with their suggestions since independence particularly since nationalisation.

For this flood of attention after nationalisation the industry owes a debt of gratitude to the Arab world and the oil crisis of the early seventies. The international glamour of oil and the immense potential of nuclear energy had converted coal to almost a Cinderella among the energy sisters in India. This was highlighted by the fact that whereas users of coal such as railways, steel and other industries and also labour, had Ministers of Cabinet rank to look after them, coal was, until recently, looked after by a Deputy Minister or a Minister of State.

Most countries of the world are gradually changing over from oil to coal. In this situation India has an advantage in that most of its industries are coal-based. The challenge of meeting growing international and domestic demand is not a question of securing more finance only but also of crucial non-financial factors. Despite the expenditure of funds of the entire Sixth Plan in the first three years itself the industry has seen no significant improvement in the OMS. And, if the twenty-first century has to start with 400 m tonnes annual output of coal the weight of these crucial non-financial factors acquire great importance.

The importance of these factors has been prominently brought to the fore by the popular statement of investment in the industry going down the drain. This partly exaggerated form of the statement has urged greater importance to the factors of labour and management. Government ownership with its traditional association of job security and general indifference of officers has generated irresponsibility in workers. Inducing the coal miner to give his best is no less important than to take the maximum from machines. Monitoring and reviewing work progress is essential to take quick action against hindrances to production. The existing monitoring system needs to be revamped.

For its present plight the industry's practice is to blame labour. But a large section of the people places a much larger share of the responsibility on management for widespread corruption, indifferent and haphazard working of schemes, and political interference and patronage of the anti-social mafia in the coalfields. It is the domination of powerful vested interests on Coal India Limited, involving the official cadre also, that has led to the warning for the bureaucracy to streamline the administration, to attend less to "extra-curricular activities", to curb official tour programmes and to revamp the marketing system. On this latest (1983-84) action of the authorities, a special correspondent of the *Economic and Political Weekly*, however, observes,

> After having granted coal miners a wage increase of about Rs 150 per month, the Central government (in the person of the CIL management) launched a campaign to increase production in the coal mines. The priorities in this campaign to increase production were soon revealed. The first step of the new Chairman, I S Gujral was to gift Rs 50 crore to CIL bureaucrats. Instead of going into the reasons for shortfalls in pithead stocks and punishing those responsible for stealing, these stocks were just written off. The second step was to make it clear that no 'indiscipline' on the part of the workers would be tolerated. No matter what the reason, any gherao or similar incident resulted in suspension and subsequent dismissal; while any work stoppage was penalised with a fine of eight days 'wages' (July 14, 1984).

In view of the losses, political patronage of the mafia activities, involvement of a sector of bureaucracy and of trade unions, it may be doubted whether clearing up of the coal mess can be done in today's India. Efforts however have to be continued.

Politicians and bureaucrats cannot overemphasise that restoring health to the industry will elude us unless society treats well the men in the field. However, despite the best possible efforts of men in the field and of bureaucrats and politicians, success will continue to be elusive if the inflationary situation is not brought under the strictest control for which the will and the ability seems to be weak in the extant social structure.

# Infant Mortality in India

## Level, Trends and Determinants

Leela Visaria

*This paper aims at a critical review of the available data on the level of and trends in infant mortality and of the associated differentials during the last quarter of a century. An attempt is made to identify the gaps in our existing studies where future research efforts may be oriented.*

*The paper begins by setting out an approach to the analysis of data on infant mortality. Following that the national and the state level estimates of neonatal, postneonatal and overall infant mortality by sex and rural-urban residence are reviewed. Attention is then focused on the available evidence on the contribution of various prenatal, natal and postnatal factors to infant mortality during different time period. This approach is adopted to help identify and assess the possible role of different intervention programmes.*

[This is the third and final part of the paper. The first two parts appeared in the last two issues.]

### POSTNEONATAL MORTALITY

THE postneonatal mortality has been the target of the Expanded Programme of Immunisation (EPI) which began in January 1978. It seeks to control the infectious diseases which cause morbidity and mortality due to DPT, polio, childhood tuberculosis and typhoid. Subsequently, a measles immunisation feasibility study was launched by 36 medical colleges in the country to assess the need for and the administrative feasibility of introducing measles vaccine in the routine immunisation services. While the results of this study are awaited, some states such as Gujarat have reportedly decided to include measles vaccination in the EPI during the Seventh Five-Year Plan.

The official statistics show a steady rise in the targets as well as in the reported absolute number of immunisations against DPT, and in the number of mothers and children given "prophylaxis against nutritional anaemia". Table 21 summarises these statistics. Besides, the Maternal and Child Health (MCH) programme under the National Health Policy emphasises:

(a) protecting the children against Vitamin A deficiency, which can cause night blindness and/or blindness;
(b) promoting Oral Rehydration as a simple tool of preventing deaths caused by dehydration following diarrhoea; and
(c) supplementary feeding, through Balwadis and Anganwadis, of children whose physical growth reflected in weight gain falls below the norm.

Of these three only the oral rehydration scheme is likely to have some influence on the postneonatal mortality, because the other two programmes really cover children aged one year and above. The level of postneonatal mortality in the country and in the major states has already been discussed earlier. We need to examine the available data on the causes of postneonatal mortality, which are more environment-based than biological in nature.

Both the Khanna and the Narangwal studies have highlighted the importance of diarrhoea and gastroenteric disorders as a cause of postneonatal mortality. The association of competent medical professionals with these studies has contributed to a much better than usual identification of the causes of death. The data are summarised in Table 22.

The Khanna study, in the late 1950s reported a postneonatal death rate of 82, of which 32 per cent deaths were due to diarrhoea. The control villages of the Narangwal study (located at a distance of about 35 km from the Khanna study villages) had a PNMR of 53, some 14 years later. Diarrhoea, dehydration and related problems accounted for 40 per cent of postneonatal deaths. The medical literature also points to diarrhoea as a leading cause of postneonatal mortality.

The Khanna study reported a sharp increase in the death rate at the age of six months, particularly among children who did not receive solid food. The death rate per 1,000 persons years lived during the third trimester of the first year of age was 185 among children who did not receive any solid food and zero among those who did. The addition of solid foods to a diet of breast-milk led to weaning diarrhoea but lowered the risk of death, apparently through better nutritional status.

Diarrhoea and dehydration have been reported to be much more important causes of death among children at low levels of nutrition than among the better-nourished children (Narangwal Study, Vol 1, p 203). Malnutrition is precipitated and aggravated by diarrhoea through inadequate absorption

of the nutrients from food. Therefore, even the morbidity due to diarrhoea merits closer investigation, with adequate recognition of the fact that the identification and reporting of diarrhoea in a retrospective survey is a problem not only because of recall lapse but also because a few loose motions are often ignored as a common routine event, unworthy of any fuss.

While it is necessary to obtain some data on diarrhoea as a cause of death in order to assess the possible impact of oral rehydration therapy, it is equally important to know the beliefs and practices with regard to food and fluids usually given to children during diarrhoea. A study in rural and urban areas of Haryana observed that 98 per cent of mothers restricted both food (any preparation of wheat and pulses) and fluid (mostly milk and to some extent tea and water) intake of the children during an acute attack of diarrhoea. Mothers believed that more fluid and food administered to the child would result in larger and more watery stools (Kumar, *et al*, 1981). Effective communication and education will yield rich dividends to improve the awareness and information base of the mothers about the proper treatment of diarrhoea.

Infections of respiratory tract (bronchitis, pneumonia, etc) are another leading cause of death among infants. The factors underlying these respiratory infections include malnutrition, crowded living conditions, inability to purchase the prescribed medicines, tenacity of the infection, the difficulty faced by the poor parents in finding the time to look after the children.

The diagnosis of these infections and their treatment are said to be more complicated than can be entrusted to the village health workers. However, recently the Foundation for Research in Community Health, Bombay, and the Community Health Department of the Post-graduate Institute of Medicine and Research, Chandigarh, have experimented with involving lower-level health functionaries in fighting respiratory infections as well. Apparently, their experience is to be documented and evaluated by the scientific community.

### MORBIDITY DURING THE WEANING PERIOD

According to the Narangwal Study, even in the relatively "healthy environment" of the Punjab, with comparatively few intestinal parasitic infections and good levels of child and adult nutrition, children were ill 11 per cent of the time with respiratory tract infections, 6 per cent of the time with diarrhoea and eye infections each and 4 per cent of the time with fever. Further, the prevalence of infectious diseases was the highest between 7 and 15 months of age, when the breast-feeding alone is not sufficient and therefore the child becomes nutritionally most vulnerable. According to Kielman, even a mild illness, induced by immunisation with live agents, caused a significant decrease in weight.

Episodes of diarrhoea, and infections of respiratory tract as well as malaria, etc, result partly from contaminated water supply, inadequate feces disposal and unhygienic home conditions. Transmission of bacilii causing diarrhoea and related illnesses is primarily by food and water. The solid foods given during the weaning period become a major cause of diarrhoea among the young children.

Proper handwashing after a bowl movement has been shown to reduce the spread of the infection in Bangladesh (Khan, 1982, cited by Black, 1983). Personal hygiene was found to be even more important than the amount of water available in a study in Madurai district in Tamil Nadu (Rajasekaran, et al, 1977).

### ACCESS TO HEALTH CARE

A major determinant of the survival of infants seems to be their access to health care. Despite the substantial improvement since Independence in the coverage of rural India through Primary Health Centres and Sub-centres, the facilities are far from adequate. To take a difficult case of labour or a sick child to a PHC or a Sub-centre requires an effort and expenditure that is beyond the capacity of many rural households. Under the circumstances, the parents exercise difficult choices and by tradition and custom they tend to discriminate against daughters. This is reflected in the higher IMR for female children in several years as shown in Table 1. Similar data at the state level show persistent and markedly higher IMRs for females than the males in the northern states of Haryana, Himachal Pradesh, Orissa, Punjab, Rajasthan and Uttar Pradesh. In Assam, Karnataka, Kerala, Maharashtra, the northeast region and Tamil Nadu, the excess of female IMR over the male is small and/or not consistent.

An estimate of the magnitude of discrimination against females in the Punjab is pro-

vided by the Khanna study which indicated a female life expectancy at birth during 1956-59 in the 11 villages of the order of 45.6 years, 8.5 years below the male (54.1 years) (Visaria, 1971, p 71). The sex difference in the death rates (adverse to females) was higher during the second year of life than in the IMR (ibid, pp 45-47).

Khan has gathered evidence indicating discrimination against daughters in the duration of breast-feeding, other feeding and medical care (Khan, et al, 1983). The Narangwal data on the extent of "early care" in terminal illnesses, summarised in Table 23, also show discrimination against daughters.

Such discrimination is often subtle. The mothers internalise the cultural norms in their infancy and early age. It leads them to give priority to their sons and husbands over daughters and their own self in every respect. Such self-efficement partly contributes to the higher IMR of females.

## LINKS BETWEEN IMR, AND EDUCATION AND WORK STATUS OF WOMEN

Various dimensions of prenatal, natal and postnatal care get reflected in the socio-economic differentials in neonatal and post-neonatal mortality, which are discussed at length in the demographic literature on infant mortality. One of the most widely discussed and closely associated variables is maternal literacy and education. A negative relationship between the level of education of mothers and infant (and child) mortality has been observed in many developing countries including India. Tables 24 and 25 show quite vividly a markedly lower IMR among children if the rural mother is literate (90) relative to that among children of illiterate mothers (145). However, one knows little about ways in which literacy and education lowers mortality. Caldwell has postulated in the context of African countries that education has an effect on:

(a) the power balance between the spouses and between generations such that an educated mother has a say in devoting greater resources to children as opposed to parents and grandparents,

(b) the degree of fatalism with respect to children's ill health, and

(c) a confidence in the human capacity to manipulate the world, through knowledge of the location of facilities as well as access to an utilisation of them (Caldwell, 1979).

These hypotheses deserve to be explored in the Indian context as well. An interesting facet of the relationship between women's economic independence or status and IMR is also highlighted in Table 24 through the data on IMRs among children of working and non-working women. Of course, working women are not necessarily economically self-sufficient or independent. In fact, female participation in labour force seems to vary inversely with economic status (as reflected by the per capita expenditure) of the household. And given the general absence of creches it is not surprising that the children of working women suffer from a clear disadvantage in the form of a higher IMR. However, it is difficult to isolate the effect of the overall living standard of the household. Within the ranks of workers, the agricultural activities predominate in rural areas but the sample frequencies are large enough for the blue-collar production process activities (crafts, etc). Children born to rural women working in agriculture experienced lower infant mortality than those women working in other blue-collar production activities, presumably because agriculture tends to be seasonal and permits flexibility in work.

## CONCLUSION

The literature reviewed above justifies a basic questioning of the widely held belief that the level of infant mortality reflects the contemporary socio-economic milleu. Like the unprecedented declines in the crude death rates that occurred in many developing countries after the end of the Second World War, the IMRs have also declined rapidly to unusually low levels in many countries.

The data indicate that even when the IMR has declined in the last 20 years, the share of neonatal mortality has remained more or less constant and thus the applicability of Bourgeois-Pichat model is questioned in the context of India. The review in fact does indicate that the environmental or exogenous factors are important even in the neonatal phase of the child and account for high neonatal mortality. There is considerable scope for lowering neonatal mortality through simple antenatal care and through improving the

sanitary conditions at the time of birth.

Our review supports the belief that simple and inexpensive technology of prenatal, natal and postnatal care is indeed available to bring about a substantial decline in the IMRs in India. However, few studies have documented the socio-economic and organisational problems involved in the diffusion of the known technology.

*A priori*, it should not be difficult to persuade parents to change their attitudes and practices when the very survival of their loved ones is at stake. However, centuries of deprivation has generated an apathy and fatalistic acceptance of a high IMR that are unlikely to be shed without a convincing demonstration of the available alternative. The speedy adoption of the new technology for agricultural production inspires hope that the proverbial conservatism of the Indian villagers can be overcome quite rapidly. Also, it should be easier to lower infant mortality than to raise the level of contraceptive practice, although success with respect to the former objective will generate pressures for accelerated progress towards the latter goal.

**(Concluded)**

[This review paper was prepared for the Seminar on the Determinants of Infant Mortality in India, co-sponsored by the Gujarat Institute of Area Planning and The Population Council and held at Ahmedabad, October 1-4, 1984. I have benefited from extensive discussions with Pravin Visaria and the comments of Moni Nag and some other participants at the Seminar. Assistance provided by Meena Upadhyay and Harish Joshi is gratefully acknowledged. The list of references excludes studies cited as sources of data presented in various Tables. It includes, however, some studies that have been consulted but have not been cited explicitly.]

# Black Money and Effectiveness of Monetary Policy

**V Pandit**
**K Sundaram**

IN their latest communication on the question of black money and the effectiveness of monetary policy (*EPW*, September 8, 1984), Acharya and Madhur (hereafter AM) have sought to defend their modelling of the question and, despite their own doubts about the robustness of their empirical results, have stated that they "continue to subscribe" to their earlier conclusions. Their faith in the one regression equation estimated by them must indeed be overwhelming. For their reply to our critique not only does not squarely face the questions raised in our critique but also fails to recognise the implications of their 'caveats' for the issues at hand.

Before we proceed further, let us get the question of data out of the way. We had built up the data set (which was presented in our paper) using the same data sources as stated to have been used by AM in their original paper and following exactly the same procedures that they had stated as having followed. However, we do not wish to get into an interminable debate on 'our' data *versus* 'their' data and let us accept in toto the data now provided by AM. As we shall show presently, the problem of robustness, or rather the lack of it, of their empiricial results persists our use of their data.

Without getting entangled with polemics let us restate, explicitly this time, the basic empirical and analytical issues which are at the heart of the present problem. These are,

(a) the notion of monetary-credit policy as it is usually understood in India;
(b) distinction between informal credit markets and financial transactions involving black liquidity;
(c) the distinction between rural and urban informal credit markets and relevance of the bazar bill rate to the former;
(d) market imperfection and market segmentation within the informal credit market; and,
(e) importance of changes in the price level and in the rate of inflation in financial transactions.

The position taken by AM in their earlier paper and reiterated in their rejoinder has implications which they do not seem to have fully realised. Let us, therefore, take up these issues sequentially.

Our critique of AM had drawn attention to a few sentences in our 1976 paper. But AM do not seem to have taken any note of these. Since in their earlier paper they had quoted from our paper somewhat out of context, it is useful to reproduce the relevant sentences. We had said " ... This [black] liquidity is immune to any monetary-fiscal policy ... it can move around in the economy creating excess demand in *several vulnerable sectors of the economy* ..." It should be obvious from this statement as to what notions of monetary-credit policy one is talking about. Of particular relevance in this context is a policy dominated by sector-wise credit-rationing in order to maintain intersectoral balances. The cost of credit, howsoever accurately measured, is only one part of such a policy.

In our critique we had stated that " ... there is a qualitative difference between the operations in black money and financial operations in what may be called the 'legal' informal credit markets ..." But, in their rejoinder, AM have nothing to say on this difference. As everyone knows the bazar bill rate relates to one part of the informal but 'legal' credit market. It is thus incapable of enlightening us on the significance of black money in the content of monetary policy even if it were an accurate measure of the cost of credit in the informal credit market as such.

In their rejoinder AM state tongue-in-cheek that they are looking at the entire informal credit market and not merely at its urban component. That such an important point should have been made in a one-sentence-note (or footnote!) shows how confident the authors must feel about it. It should be well known that data on the bazar bill rate are based on quotations from dealers in Bombay, Calcutta and Madras. About its ability to capture trends in the rural credit market, the less said the better.

An explicit assertion underlying the AM analysis is that the entire informal credit market—whether rural or urban, 'black' or 'white'—is (i) fully integrated, and (ii) perfectly competitive. These strong assumptions are necessary in order to justify that what matters to every lender and every borrower is the cost of credit and nothing else. It is further the case made by AM that the cost of credit for this market-clearing, perfectly competitive market can be represented by the bazar bill rate. AM do of course claim their awareness of the bazar bill rate being less than an ideal measure of the cost of credit in the informal market. We too are aware that all of us, in our empirical research, find it necessary to use proxy variables. But there is a substantive difference between a situation in which such a proxy measure represents only an incidental phenomenon and is introduced only to minimise specification bias and another in which the variable itself is being explained or, even more seriously, bears the entire burden of evidence. The latter case is like a trial in which the bona fides of the principal witness itself are doubtful.

The fact that all interest rates move 'together' makes a poor argument for using 'any' one of these as a representative rate. Moving together is a well known feature of most economic time-series including those on rates of interest. This clearly does not justify, for example, using national product where the relevant variable happens to be capital formation. When we say, or Timberg and Aiyar claim, that different interest rates move 'in sympathy' the implication is certainly not that the different rates are substitutes for each other. Hicksian composite-good theorem could not be applied less appropriately than has been done. What this theorem requries is 'constancy' of the ratio rather than mere movement in 'sympathy'.

Finally, about the relevance of price changes. It is simple textbook stuff that when we talk of money there is a transactions demand and an asset demand. Our remark about the transportation of the elephant might have sounded harsh but it was nonetheless called for. How can demand for money/credit be modelled with no reference whatsoever to changes in the price level? AM have chosen to say nothing in defence of their model which makes no reference to real magnitudes. They have instead dwelt upon a minor point, namely, whether the rate of inflation should or should not have a lag. We shall take this up later. Let us reiterate that a legitimate model of financial transactions must recognise not only the real volume of transactions but also the adjustment of money rates of interest to the real cost of funds. The simplest way to do this is to provide some adjustment to the expected rate of inflation.

From the foregoing discussion and our critique of AM it should be clear that we regard modelling of the bazar bill rate as a vacuous exercise. Despite this we had taken some pains to point out certain mistakes in the AM analysis of this problem only in the hope that they will come up with a more acceptable theoretical and empirical model—whatever be its relevance to the original issue. Instead of doing so AM seems to consider this to be a cross that we must carry. Let us therefore address ourselves to some of the important issues without being too elaborate.

Our basic contention about the determination of the bazar bill rate is three-fold. First, the demand for liquidity must be specified in terms of real incomes and real stock of credit. This prompts us first of all to re-estimate the AM model by using deflated values of KO, YO and YU, using entirely their data. The re-estimated equations in linear as well as semi-logarithmic forms for the sample period 1960-61 through 1976-77 are obtained as follows:

$$(1)\ \mathrm{RI} = \underset{(1.63)}{-\ 4.814} - \underset{(0.86)}{1.481}\ \mathrm{D70} + \underset{(2.89)}{0.497}\ \mathrm{RO} + \underset{(0.77)}{0.00058}\ \frac{\mathrm{KO}}{\mathrm{P}} - \underset{(0.02)}{0.00001}\ \frac{\mathrm{YO}}{\mathrm{P}} + \underset{(4.04)}{0.00068}\ \frac{\mathrm{YU}}{\mathrm{P}}$$

$$\bar{\mathrm{R}}^2 = 0.941,\ \mathrm{d} = 1.54$$

$$(2)\ \mathrm{RI} = \underset{(3.81)}{-126.181} - \underset{(1.40)}{3.599}\ \mathrm{D70} + \underset{(2.88)}{0.481}\ \mathrm{RO} + \underset{(1.45)}{8.176}\log\frac{\mathrm{KO}}{\mathrm{P}} - \underset{(0.84)}{6.222}\log\frac{\mathrm{YO}}{\mathrm{P}} + \underset{(3.58)}{12.835}\log\frac{\mathrm{YU}}{\mathrm{P}}$$

$$\bar{\mathrm{R}}^2 = 0.944,\ \mathrm{d} = 1.52$$

These estimated equations speak for the 'robustness' of the AM model and need no elaboration. All we have done is to take account of the elephants' weight.

The second contention is that the relevant income variable is that relating to the unorganised and non-agricultural sector. This is the obvious implication of the fact that the bazar bill market is entirely an urban phenomenon and is informal in character. This is borne out by a comparison of the following three equations. One each of these corresponds to YO, YU and YUNA. All of them are in a semi-logarithmic form because this gives us relatively better Durbin-Watson statistics. We have for the sample period 1960-61 through 1976-77 the following results:

$$(3)\ \mathrm{RI} = \underset{(13.72)}{-\ 37.153} + \underset{(20.13)}{6.041}\log \mathrm{YO}$$

$$\bar{\mathrm{R}}^2 = 0.962,\ \mathrm{d} = 1.34$$

$$(4)\ \mathrm{RI} = \underset{(13.92)}{-\ 48.772} + \underset{(18.87)}{6.634}\log \mathrm{YU}$$

$$\bar{\mathrm{R}}^2 = 0.957,\ \mathrm{d} = 1.52$$

$$(5)\ \mathrm{RI} = \underset{(14.34)}{-\ 38.358} + \underset{(20.83)}{6.226}\log \mathrm{YUNA}$$

$$\bar{\mathrm{R}}^2 = 0.964,\ \mathrm{d} = 1.47$$

In terms of the real income variables the corresponding equations are:

$$(6)\ \mathrm{RI} = \underset{(8.74)}{-\ 146.50} + \underset{(9.77)}{18.046}\log\frac{\mathrm{YO}}{\mathrm{P}}$$

$$\bar{\mathrm{R}}^2 = 0.855,\ \mathrm{d} = 1.03$$

$$(7)\ \mathrm{RI} = \underset{(8.46)}{-\ 240.209} + \underset{(9.06)}{25.691}\log\frac{\mathrm{YU}}{\mathrm{P}}$$

$$\bar{\mathrm{R}}^2 = 0.835,\ \mathrm{d} = 1.03$$

$$(8)\ \mathrm{RI} = \underset{(15.76)}{-\ 179.719} + \underset{(17.28)}{21.885}\log\frac{\mathrm{YUNA}}{\mathrm{P}}$$

$$\bar{\mathrm{R}}^2 = 0.949\ \mathrm{d} = 1.49$$

These equations show the inadequacy of YO as the determinant of RI. However, the equations with other variants of the income measure do also seem to be in need for improvement.

The third contention is that the nominal rate of interest must be influenced by the expected rate of inflation. But, before we pursue this final point any further, let us turn to some of the questions raised by AM regarding our model. These points relate to (i) the use of YUNA as a determinant of the demand for credit in the bazar bill market, (ii) assumption that all agents are endowed with perfect foresight as regards the rate of inflation, and (iii) specifying RO as a determinant of the supply price of liquidity. Let us consider each of these one by one.

Regarding the use of YUNA the comment by AM is baffling. As they should know there exist no estimates of income appropriate to the urban informal sector. In any case the measure used by us is less erroneous than YU as used by AM, whatever be the percentage of credit transacted in the bazar bill market. If they had any better alternatives in mind they have not spelt them but.

About the expected rate of inflation AM have, at least, a debating point. We had some results based on the lagged rate of inflation but we did not highlight these properly. We shall subsequently abandon the assumption of perfect foresight and assume instead that the expected rate of inflation is some multiple of the lagged rate of price change, which is known.

Inclusion of RO in the supply function for supply of credit is very close to a text-book discussion of supply behaviour. If the hypothesis is that credits in the two markets, formal and informal, are substitutes, a rise in RO will cause a leftward shift in the supply curve (cost on the vertical axis and credit on the horizontal). This is quite in line with the position taken by AM and was included only to test *their* linkage hypothesis. However, it may be recalled that in the equations reported in our critique of AM this variable did not turn out to be important. To avoid any further misunderstanding we are quite happy to altogether drop this variable from our model.

The foregoing discussion gives us the revised model in which RI is determined by $\frac{\mathrm{YUNA}}{\mathrm{P}}$ and $\hat{\mathrm{P}}_{-1}$. In case the credit markets are linked we have two more determinants namely, $\frac{\mathrm{YO}}{\mathrm{P}}$ and $\frac{\mathrm{KO}}{\mathrm{P}}$. The following equations are estimated for the period 1960-61 through 1976-77 on the basis of data given by AM (and in their units of measurement). We have

$$(9)\ \mathrm{RI} = \underset{(3.04)}{-4.109} + \underset{(15.18)}{0.00255}\ \frac{\mathrm{YUNA}}{\mathrm{P}} + \underset{(1.75)}{0.05317}\ \hat{\mathrm{P}}_{-1}$$

$$\bar{\mathrm{R}}^2 = 0.943,\ \mathrm{d} = 1.60$$

$$(10)\ \mathrm{RI} = \underset{(15.74)}{-174.702} + \underset{(17.18)}{21.287}\log\frac{\mathrm{YUNA}}{\mathrm{P}} + \underset{(1.73)}{0.04701}\ \hat{\mathrm{P}}_{-1}$$

$$\bar{\mathrm{R}}^2 = 0.955,\ \mathrm{d} = 1.89$$

$$(11)\ \mathrm{RI}\ \ \underset{(1.69)}{-5.232} + \underset{(4.93)}{0.00277}\ \frac{\mathrm{YUNA}}{\mathrm{P}} + \underset{(1.57)}{0.05041}\ \hat{\mathrm{P}}_{-1} - \underset{(0.04)}{0.00014}\ \frac{\mathrm{KO}}{\mathrm{P}}$$

$$\bar{\mathrm{R}}^2 = 0.939,\ \mathrm{d} = 1.74$$

$$(12)\ \mathrm{RI} = \underset{(6.05)}{-174.391} + \underset{(5.06)}{21.234}\log\frac{\mathrm{YUNA}}{\mathrm{P}} + \underset{(1.65)}{0.04706}\ \hat{\mathrm{P}}_{-1} + \underset{(0.01)}{0.01952}\log\frac{\mathrm{KO}}{\mathrm{P}}$$

$$\bar{\mathrm{R}}^2 = 0.952,\ \mathrm{d} = 1.89$$

$$(13)\ \mathrm{RI} = \underset{(1.75)}{-\ 5.519} + \underset{(3.31)}{0.00349}\ \frac{\mathrm{YUNA}}{\mathrm{P}} + \underset{(0.79)}{0.03171}\ \hat{\mathrm{P}}_{-1} - \underset{(0.20)}{0.00007}\ \frac{\mathrm{KO}}{\mathrm{P}} - \underset{(0.81)}{0.00065}\ \frac{\mathrm{YO}}{\mathrm{P}}$$

$$\bar{\mathrm{R}}^2 = 0.938,\ \mathrm{d} = 1.86$$

$$(14)\ \mathrm{RI} = \underset{(6.81)}{-\ 178.322} + \underset{(3.90)}{27.856}\log\frac{\mathrm{YUNA}}{\mathrm{P}} + \underset{(0.89)}{0.02889}\hat{\mathrm{P}}_{-1} + \underset{(0.22)}{0.32817}\log\frac{\mathrm{KO}}{\mathrm{P}} - \underset{(1.14)}{6.40306}\log\frac{\mathrm{YO}}{\mathrm{P}}$$

$$\bar{\mathrm{R}}^2 = 0.953,\ \mathrm{d} = 2.10$$

In case D 70 ia also included as a regressor we have the two equations:

$$(15)\ \mathrm{RI} = \underset{(1.70)}{-5.823} + \underset{(3.15)}{0.00347}\ \frac{\mathrm{YUNA}}{\mathrm{P}} + \underset{(0.73)}{0.03036}\ \hat{\mathrm{P}}_{-1} - \underset{(0.37)}{0.00027}\ \frac{\mathrm{KO}}{\mathrm{P}} - \underset{(0.55)}{0.00052}\ \frac{\mathrm{YO}}{\mathrm{P}} + \underset{(0.32)}{0.51823}\ \mathrm{D70}$$

$$\bar{\mathrm{R}}^2 = 0.933,\ \mathrm{d} = 1.90$$

$$
\begin{aligned}
(16)\ \mathrm{RI} = {} & \underset{(4.95)}{-162.893} + \underset{(3.42)}{26.047} \log \frac{\mathrm{YUNA}}{\mathrm{P}} \\
& + \underset{(1.01)}{0.03395}\, \hat{\mathrm{P}}_{-1} + \underset{(0.82)}{4.57105} \log \frac{\mathrm{KO}}{\mathrm{P}} \\
& - \underset{(1.37)}{10.1275} \log \frac{\mathrm{YO}}{\mathrm{P}} - \underset{(0.80)}{1.985}\ \mathrm{D70}
\end{aligned}
$$

$$\bar{\mathrm{R}}^2 = 0.951,\ \mathrm{d} = 2.04$$

However, this point needs a closer examination. The justification provided by AM for using the dummy variable D70 as a regressor is that the post-1970 series on organised sector credit is more inclusive than the one for the earlier period. This is thus a case of the 'mis-speicification' problem in econometries. With some assumptions on the type of mis-specification the problem can be dealt with by means of dummy variables. To be more specific, if the pre-1970 series understated the volume of credit by a constant amount an intercept dummy is adequate. On the other hand, if the understatement was by a fixed proportion of the observed amount we need a slope dummy. Since it is difficult to be certain either way, we have re-estimated the equation on which AM base their argument. We have also re-estimated equations (15) and (16) including slope dummy variables. The results are as follows. The sample period remains as before 1960-61 through 1976-77. We should note that any other mis-specification is harder to deal with and OLS estimates could be quite inappropriate.

$$
\begin{aligned}
(17)\ \mathrm{RI} = {} & \underset{(2.03)}{4.9186} + \underset{(3.94)}{9.9709}\ \mathrm{D70} + \underset{(1.49)}{0.8881}\ \mathrm{RO} \\
& + \underset{(1.96)}{0.00610}\ \mathrm{KO} - \underset{(2.74)}{0.00379}\ \mathrm{D70.KO} \\

We believe that the equations and empirical results which do not support *a priori* views are as instructive, if not more, as those that do support such views and should therefore be faithfully reported. That motivates our having gone through all these results, rather than presenting a couple of final equations as AM have done.

These results speak for themselves. Most equations are bad because they carry unnecessary excess baggage. The only two variables that consistently hold out are the real non-agricultural unorganised income and the rate of inflation. Thus, there is no reason why equation (10) should be rejected unceremoniously in favour of the one produced by AM in support of their hypothesis. This remains an unanswered issue now as it was when we wrote last. In their reply AM have said nothing to justify their model in the light of our criticism. Instead they have raised some minor points about our model all of which have now been replied to.

The concern that AM show for 'raising' the 'standard of analysis' is indeed commendable. However, estimating a couple of mis-specific regression equations is neither the beginning nor the end of rigorous research. Statement of qualifications and caveats does little to raise the level of research from that of 'casual empiricism' when such caveats and qualifications are basic to the very issues at stake.

[The authors are grateful to Manmohan Agarwal, K L Krishna and Suresh Tendulkar for comments on an earlier draft. The usual disclaimers apply.]

---

## Usha Martin Industries

USHA MARTIN INDUSTRIES (UMI) is setting up a 100 per cent export-oriented unit at its existing site at Ranchi in Bihar for manufacture of 3,000 tonnes per annum of steel wire ropes, strands and slings at an estimated cost of Rs 190 lakh. ICICI has sanctioned a foreign currency loan equivalent to Rs 95 lakh to meet a part of the funds required for the project and the balance is proposed to be financed from internal resources of the company. The unit is expected to be commissioned during the fourth quarter of the current year. To meet the challenge of the coming decade, the company is currently implementing a major scheme of modernisation at an estimated cost of Rs 12 crore. To raise a part of the finance required for the scheme, the company is coming to the capital market on September 2 with a linked issue of 15 lakh equity shares of Rs 10 each at a premium of Rs 2.50 per share and 7.50 lakh 13.5 per cent secured non-convertible debentures of Rs 100 each at par. Existing equity shares are quoted on the market at Rs 46.50 each. The issue is being made partly by way of 'rights' and partly to the public. Applications from the public must be for both equity shares and debentures in the proportion of 25 debentures for every 50 equity shares applied for and in multiples thereof.

The company has a well diversified operation and its performance shows that the overall operations have remained satisfactory despite the recession encountered by the engineering industry in 1982 and 1983. The debentures offer a choice of two schemes for interest—a cumulative interest scheme and a non-cumulative interest scheme. The debentures will be redeemed at par on the expiry of 10 years from the date of allotment. UMI was established in 1960 in technical and financial collaboration with Martin Black and Co (Wire Ropes), UK. It has grown into a large diversified engineering conglomerate with current turnover exceeding Rs 58 crore. In addition to wire ropes, it manufactures a wide range of wires, wire rods, wire drawing and allied machines. The company's products are well established in over 30 countries. The company has also promoted joint ventures in Yugoslavia and Thailand. According to B K Jhawar, Chairman and Managing Director, during 1984 the company recorded a turnover of Rs 58.38 crore and earned a gross profit of Rs 3.04 crore. Its reserves and surplus stood at Rs 26.61 crore (including revaluation reserves of Rs 20.20 crore) as against equity capital of Rs 3.45 crore. Of this equity capital, Rs 165 lakh has been by way of bonus issues. The company has an uninterrupted dividend record since 1970. The last dividend was 16 per cent. The company expects to improve its profitability significantly as a result of the proposed programme of modernisation and setting up of the 100 per cent export-oriented unit. The issue is being managed jointly by the Merchant Banking Division of ICICI and J M Financial and Investment Consultancy Services.

You & Us

YOU. Purchasers. On the lookout for quality products. At reasonable prices. Supplied on schedule.

# Growth and Structures of Industries in Maharashtra

**Dr S B Sakhalkar**

**Executive Director, Maharashtra Economic Development Council, Bombay**

MAHARASHTRA carved for itself a distinguished and prominent place on the economic and industrial map of India. Even though Maharashtra accounts for only 9.5 per cent of the national population it contributes 13.1 per cent to the national income. The per capita state income in Maharashtra was Rs 2,525 last year, i e, 1982-83, whereas the per capita national income was Rs 1,891. Maharashtra leads all other states in financial and commercial activities and Bombay, the capital of Maharashtra, is truly regarded as the financial capital of India. Even though the state has only 9.7 per cent of the scheduled commercial bank offices in the country, it accounts for 17.8 per cent of deposits and 21.1 per cent of advances.

The state leads in urbanisation and is a reservoir of educated and skilled manpower. It has all along been in the vanguard in the industrial march of the country. This is because of the excellent infrastructure and encouragement provided by the state to the investors and entrepreneurs. The government provides ample industrial land at suitable locations together with adequate water and power facilities. The state accounts for 16.9 per cent of the electricity generated in the country and 16.8 per cent of the total industrial consumption of power. Although the state has only 10.5 per cent of the total number of factories in the country, it accounts for 17.6 per cent of the total number of factory workers in the country. The number of factory workers per lakh of population is 1,044 in India as against 2,012 in the state. The productivity of workers in the state is also very high. The per capita value added in industry was Rs 457 in the state against Rs 167 in the country. According to the Official Economic Survey, the state accounts for nearly one-sixth of productive capital and employment and one-fourth of gross value of output and value added by the organised industrial sector in the country. Output per employee in Maharashtra is 38 per cent higher than that of India and value added per employee is 50 per cent higher.

### INDUSTRIAL GROWTH

The rates of growth and the emerging pattern of industry in Maharashtra during the last two decades reflect inspiring entrepreneurial efforts and the development policy and the promotional measures adopted by the state government within the overall framework of industrial policy of the Union government.

The total number of factories in the state more than doubled from 8,233 in 1961 to 16,594 in 1981. The productive capital in them recorded over eleven-fold rise from Rs 619 crore to Rs 7,096 crore. The rise in output was even higher. Output increased over thirteen-fold from Rs 1,078 crore to Rs 14,351 crore. Value added by manufacture recorded over nine-fold rise from Rs 317 crore to Rs 2,981 crore. The growth in employment was, however, smaller at 51.5 per cent from 7.87 lakh to 11.92 lakh. The data thus show a shift in favour of capital-intensive industries which, however, is a common national feature of this period. This has, however, contributed to higher productivity in Maharashtra than that in the country. Output per rupee of productive capital, as per latest available figures, is Rs 2.02 in the state against Rs 1.38 in India. Similarly, employment per crore of productive capital is 220 against 203 in the country. The expansion of factories employing more than 50 persons was smaller at 50 per cent during the last two decades while that of factories employing less than 50 persons was 120 per cent. Despite the increased availability of power, the growth-rate of power-operated factories was lower than that of non-power operated factories. In fact there was a decline in the number of factories employing more than 50 persons in the non-power operated group of factories.

The industrial growth in Maharashtra accelerated further in seventies. The number of factories increased by 62.0 per cent during 1971-81 against 24.3 per cent in 1961-71. Output increased by 275.3 per cent in seventies against 254.7 per cent in sixties. Similarly value added increased by 209.2 per cent in seventies against 204.0 per cent in sixties. Productive capital, however, recorded a lower growth of 204.0 per cent in seventies against 277.0 per cent in sixties. Consequently, the capital-output ratio declined and output per rupee of productive capital rose from Rs 1.59 in 1961 to Rs 1.64 in 1971 and Rs 2.02 in 1981. Growth in employment was also lower at 19.4 per cent in seventies against 26.8 per cent in sixties. Consequently, both value added per employee and output per employed recorded a higher rise in seventies than in sixties. The changing structure of industries also resulted in decline in the ratio of value added to output from 29.4 per cent in 1961 to 25.2 per cent in 1971 and 20.7 per cent in 1981.

### PATTERN OF INDUSTRIES

The composition of industries in Maharashtra has undergone considerable change in the last two decades in favour of chemicals and capital goods and intermediate goods industries.

Eight major industires, *viz*, (i) chemicals, (ii) electrical machinery, (iii) transport equipments, (iv) machinery, machine tools other than electrical, (v) basic metals and alloys, (vi) rubber, plastics, petroleum and coal products, (vii) cotton textile, and (viii) food products account for three-fourth of the value of output and value added by the manufacturing sector. Nearly one-fourth of value added is contributed by chemicals industry. The share of this industry in the number of employees is much smaller at 9 per cent and total emoluments at 16 per cent. Cotton textile industry maintains the leading position in employment accounting for 24 per cent of the total number of employees in the manufacturing sector. However, because of relatively lower level of emoluments, the percentage share in the total emoluments is 20 per cent.

The annual average of emoluments per worker, as per latest available figures, is the highest for chemical industry at Rs 14,367 and lowest for the food products at Rs 4,354. For the entire industrial group the average is Rs 8,463. The higher emoluments paid by the chemicals industry has been adequately rewarded in terms of value added. Emoluments in the chemicals industry form 28.6 per cent of value added as compared with the average of 44.7 per cent for the entire manufacturing sector. Even though, the average level of emolument in cotton textile industry at Rs 7,120 is one-half of the chemical industry, its net value added per employee at Rs 11,385 is less than one-fourth of the chemical industry. Emoluments form 62 per cent of value added for cotton textiles, 59 per cent for transport equipment, between 40 to 50 per cent for electrical machinery, appliances, etc, other machinery, machine tools and parts, basic metals and alloys and food products, 34 per cent for rubber, plastics, petroleum and coal products and 29 per cent for chemicals.

Productive capital per worker, as per latest available figures is Rs 53,000 for all the industries. The highest level is for chemical industry at Rs 1,29,000 and the lowest is for cotton textiles at Rs 12,000.

It is interesting to study the labour absorption capacity of various industries and the productivity per worker. Output per worker, as per latest available figures, is Rs 1,10,000, which gives an output capital ratio of 2.06. Output per worker is very high at Rs 3,08,000 in the chemical industry while for the cotton textile industry it is Rs 46,000. The output capital ratio ranges from 1.46 for transport equipments and parts to 4.76 for rubber, plastics, petroleum and coal products.

The input content, i e, percentage of input to total output is the highest for food products at 89 per cent and lowest for the cotton textile at 70 per cent, while the percentage for all industries is 75. The ratio is 72 per cent for chemicals and electrical machinery and appliances, 80 per cent of basic metals and alloys and 84 per cent for rubber, plastics, petroleum and coal products.

### DISTRIBUTIVE CHARACTERISTICS

Distribution of factories by size of capital shows that the large-sized factories (i e, those employing capital of Rs 10 lakh and above), constitute only 16 per cent of the number of factories but account for 72 per cent of employment, 91 per cent of productive capital, 82 per cent of output and 87 per cent of value added. Small-scale units employing less than Rs 10 lakh of capital account for 85 per cent of factories, 28 per cent of employees and 18 per cent of output and 13 per cent of value added.

The output per rupee of productive capital in the small scale sector at Rs 4.16 is 2.23 times that in the large scale sector, while for value added the ratio is 1.56 times. Productive capital per employee at Rs 12,583 for the small scale section is only 25 per cent of that for the large scale sector. It would thus appear that the efficiency as measured by the value of output and value added per rupee of capital is higher for the small scale sector than the large scale sector. About 47 per cent of factories employ less than 20 persons and 27 per cent between 20 and 49. Factories employing more than 500 persons form 3 per cent of total number of factories but they account for 46 per cent of productive capital, 49 per cent of employment, 52 per cent of output and 57 per cent of value added. As against this, factories employing less than 50 persons form 74 per cent of total number of factories but account for only 14 per cent of employment, 6 per cent of productive capital, 11 per cent of output and 8 per cent of value added. In terms of gross value of output per worker, the performance of factories employing between 100 to 199 is the best. This group has an average value of output of Rs 1.23 lakh as compared to Rs 1.11 lakh for factories employing more than 500 persons. Value added per worker is the highest at Rs 26,000 for factories employing between 200 to 499 persons.

About two-third of the factories in Maharashtra belong to the non-corporate sector. But they account for only 6.9 per cent of capital employed, 20.1 per cent of employees, 14.7 per cent of value of output and 9.9 per cent of value added. Partnership firms predominate in this group. Of the total number of factories, partnership firms account for one-half, contributing to 17.1 per cent of employment, 13.5 per cent of output and 8.9 per cent of value added and only 6.2 per cent of productive capital. Under the corporate sector, the number of factories controlled by private limited companies at 1980 is higher than the public limited companies with 1,224 factories. However the share of public limited companies is much higher in productive capital, number of employees, value of output and value added. Co-operative sector account for 3.0 per cent of number of factories, 6.2 per cent of number of employees, 4.3 per cent of output and 2.7 per cent of value added.

The efficiency measured by per employee indicators, such as productive capital, output and output per rupee of productive capital show that the performance is better in the non-corporate sector than in the corporate, co-operative and other sectors. For example, the ratio of productive capital per employee in this sector to that in the corporate sector is about 36.6 per cent but the corresponding ratio of output per employee is about 62.0 per cent. The corresponding ratio of value added is 39.6 per cent. The output per rupee of productive capital is also the highest in this sector. Output per rupee of productive capital is 4.38 for the non-corporate sector as compared with 2.58 for the corporate sector and 1.89 for the co-operative sector. Under non-corporate sector, the ratio is 4.45 for partnership and 3.72 for individual proprietorship. Under the corporate sector, the raito is 3.86 for private limited companies, 2.44 for public limited companies and 1.59 for public corporations.

### SPATIAL DISTRIBUTION

Though Maharashtra has been in the vanguard in the industrial development of the country, industrial activity has remained concentrated in three districts of Greater Bombay, Thane and Pune only. Though these districts together account for 25 per cent of total population of the state, they account for about 70 per cent of the factories. These districts account for 72 per cent of employment, 69 per cent of productive capital, 81 per cent of output and 84 per cent of value added by the factory sector. Per capita value added by factories located in these three districts has been estimated at Rs 1,651 as compared with Rs 82 for the rest of the state and Rs 475 for the state as a whole.

Between 1961 and 1975-77 the percentage of registered factories situated outside these three districts declined from 38.4 per cent to 31.3 per cent, but their share in productive capital increased from 19.0 per cent to 30.7 per cent. There was only a marginal improvement in the proportion of employment, gross output and value added of factories situated outside the three industrially developed districts. It may be, however, noted that while the share of registered factories located in Bombay district showed marginal rise, there was a sharp decline in the percentage shares of productive capital, employment, gross output and value added. Thane district showed substantial improvement in the percentage shares of number of factories, productive capital employment, gross output and value added. The improvement in the shares of Pune was smaller than that of Thane district.

In order to achieve dispersal of industries outside the Bombay-Thane-Pune belt and to attract them to the underdeveloped and the developing areas of the state, the Government of Maharashtra has been implementing since 1964 a package of incentives to units set up in the developing regions of the state. The package scheme of incentives was modified on April 1, 1983, rationalising the scope, various scales and mode of release of incentives to ensure that the intending units got these incentives promptly. Under the scheme, the state of Maharashtra is divided into four Groups A, B, C and D. Bombay Metropolitan Area and Pune Metropolitan Area, are considered as developed areas and covered under Group A, where no incentives are provided. Specific areas in the rest of the state are divided into three Groups B, C and D depending upon the extent of these three areas on a graded scale. Thus in Thane district, Thane, Bhiwandi, Kalyan, Ulhasnagar and Vasai (within BMR) are grouped under Group B; Palghar, Dahanu Wada, Shahpur, Murbad and Vasai (outside BMR) under Group C; and Talasari, Jawhar and Mokhade under Group D. As a part of the strategy to develop backward areas, 17 growth centres has been selected for concentration of efforts and with necessary institutional network to subserve the needs of industrialisation. In these growth centres industries can agglomerate. These centres, provide attractive infrastucture facilities, housing facilities, telecommunication facilities, etc.

With a view to providing all types of assistance to entrepreneurs interested in setting up small, village and cottage industries under one roof, 27 district industries centres have been established to serve as a focal point in the districts. They provide necessary guidance in the district, explain various assistance, incentive schemes of Central and the state governments to entrepreneurs and provide or recommend scarce and controlled raw materials and also the marketing assistance. The expenditure on these centres is borne by the Central and state governments on 50-50 basis. DICs helped the establishments of 37.5 thousand units in 1981-82, comprising of 30.5 thousand artisan units (26.5 thousand in rural areas) 7.0 thousand units in small scale sector (2.1 thousand units in rural areas). An outlay of Rs 550 lakh has been provided in the Sixth Five-Year Plan.

### LICENSING AND REGISTRATION

Out of 4,052 industrial licences issued by the Government of India for setting up industries in Maharashtra during 1960 to 1982, 1,772 or 43.7 per cent were for Greater Bombay, 1,277 or 31.5 per cent for other parts of Bombay region and 304 or 7.5 per cent for other parts of the state. However, the percentage share of Bombay declined from 52.1 per cent during 1960-70 to 41.1 per cent between 1971-75 and 24.2 per cent during 1976-82. The share of Bombay region other than Greater Bombay increased from 27.5 per cent during 1960-70 to 33.7 per cent during 1971-75 and further to 39.6 per cent during 1976-82. Pune region accounted for 22.5 per cent of industrial licences during 1976-82 as compared with 15.4 per cent during 1971-75 and 16.1 per cent during 1960-70. The share of other regions in industrial licences increased from 4.4 per cent during 1960-70 to 9.7 per cent during 1971-75 and further to 13.8 per cent during 1976-82.

Industrial units in the medium and large sector which do not need a licence are registered with the Directorate General of Technical Development, Government of India while the small scale units are registered with the State Directorate of Industries. The DGTD registrations also show considerable improvement in the industrial activity in the state. From an annual average of 21 DGTD registrations during 1964 to 1970, it increased to 106 during 1971-75 and further to 172 during 1976-82. The percentage of registrations granted to Greater Bombay declined sharply from 70.2 during 1964-70 to 53.9 during 1971-75. The share of Greater Bombay during 1976-82 was hardly 8 per cent. There was, however, a sharp increase in the share of the rest of the Bombay region from 9.3 per cent during 1964-70 to 27.5 per cent during 1971-75 and 56.6 per cent during 1976-82. The percentage share of Pune region after declining during 1971-75, reverted back to the 1964-70 position, during 1976-82. The share of Aurangabad and Nagpur regions taken together improved from 2.0 per cent during 1964-70 to 7.9 per cent during 1971-75 and further to 16.3 per cent during 1976-82.

The licences data would show that, the dispersal of industries has resulted in the shifting of concentration from Greater Bombay to other regions of the Bombay region. In recent years especially during 1976-82, the Aurangabad and Nagpur regions have also attracted more industrial units but still their share was only one-third of other Bombay region in respect of industrial licences. For DGTD registration, it was still lower. The share of Bombay, Thane and Pune districts in total number of registered factories has increased from 61.6 per cent in 1961 to 68.9 per cent in 1975-77, while the share in employment showed a marginal decline from 73.9 per cent to 71.5 per cent between 1976 and 1977. There was, however, a sharp decline in the share of these three industrially developed districts in productive capital from 81.0 per cent to 69.3 per cent.

Although the number of small scale units recorded a larger increase of 42,929 during 1970-81 than the increase of 24,929 during 1960-70, the percentage increase showed a sharp fall from 51.3 per cent during 1960-70 to 144 per cent in 1970-81. The share of Bombay region in total number of small scale units in the state declined from 79.4 per cent in 1961 to 67.2 per cent in 1970 and further to 43.9 per cent in 1981. The share of all other three divisions increased during 1961-70 as well as 1970-81.

## CONCLUSION

The rates of growth and the emerging pattern of industry in Maharashtra during the last two decades reflect inspiring entrepreneurial efforts in Maharashtra and the promotional measures adopted by the state government within the overall framework of industrial policy of the Union government. There has been appreciable increase in the total number of factories and their productive capital, output, productivity and value added by manufacture. The industrial growth in Maharashtra was further accelerated in seventies and there has been a significant shift in favour of capital-intensive industries. The composition of industries in Maharashtra has also undergone considerable change during the last two decades in favour of chemicals and capital goods and intermediate goods industries. Eight major industries, *viz.* (i) chemicals, (ii) electrical machinery, (iii) transport equipments, (iv) machinery and machine tools (other than electrical), (v) basic metals and alloys, (vi) rubber, plastics, petroleum and coal products, (vii) cotton textiles, and (viii) food products account for three-fourth of output and value added by the manufacturing sector. Average output capital ratio for all the industries is 2.06 and it ranges from 1.46 for transport equipment parts to 4.76 for rubber, plastics, petroleum and coal products. Large-sized factories (i e, those employing capital of Rs 10 lakh and above) constitute only 16 per cent of the number of factories but account for 72 per cent of employment, 91 per cent of productive capital, 82 per cent of output and 87 per cent of value added. About two-third of the factories in Maharashtra belong to the non-corporate sector in which partnership firms predominate. The government policy has no doubt helped in establishing industries in underdeveloped areas, but Bombay, Pune and Thane districts continue to account for the bulk of the industrial activity in the state

# MSFC as a Development Catalyst

**S P Upasani, IAS**
**Managing Director, MSFC**

THE Maharashtra State Financial Corporation (MSFC) was formed after the re-organisation of states in 1962 and extended its operations to Union Territory of Goa, Daman and Diu in 1964. MSFC works for the cause of industrial development in the state by catering to the term loan requirements of small and medium scale industries for acquiring fixed assets like land, building, plant and machinery, etc. The Corporation extends financial assistance to industrial units by granting loans upto Rs 30 lakh to limited companies or registered co-operative societies and Rs 15 lakh to proprietary and partnership concerns. The bill raising this ceiling of financial assistance to Rs 60 lakh alongwith provision for several significant changes for SFCs working was recently passed by the Lok Sabha. These modifications are soon to widen the scope of the working of the Corporation.

Maharashtra holds a premier position in the field of industries in the country. The state today accounts for nearly a sixth of the productive capital as well as of employment and nearly a fourth of gross value of output and value added by manufacture by the organised industrial sector in the country. At the time of formation of the state, the industrial activity was not, however, spread evenly throughout the state, but was concentrated in the industrial belt of greater Bombay, Thane and Pune. The two constituent regions of the state like Vidarbha and Marathwada were not matchingly developed in regard to industrial progress. In order to reduce the regional disparities in industrialisation, the state government has been trying through its policy of industrial dispersal, to introduce locational flexibility among industries so as to promote growth of industries in backward areas. Promoting small scale industries is the sole responsibility of the state government. The state government channelises its efforts towards industrial dispersal and the promotion of small scale industries through the co-ordinated services rendered by the different state development agencies like MSFC, SICOM, MIDC, MSSIDC, Regional Development Corporations and DICs. From a humble beginning of sanctioning about Rs 2 crore to 160 cases and disbursing Rs 1.65 crore in 1962-63, MSFC has reached a stage where every year loans around Rs 60 crore are sanctioned and disbursements of Rs 40 crore are made. From a very small organisational set up to begin with, MSFC has considerably grown into a network of 9 regional offices and 20 branch offices spread all over the state and in Goa, Daman and Diu.

The two focal points of MSFC activities have been (i) encouraging small scale sector and (ii) promoting industrialisation in the 'developing' ('developing' areas include all districts in Maharashtra excluding areas covered by the three developed districts of Greater Bombay and some parts of Thane and Pune) and the 'backward' (there are 17 districts in the state notified as industrially 'backward') areas of the state. In the recent years over 80 per cent and during last year over 83 per cent (number-wise) of MSFC assistance has been directed to the industrial units from the 'developing' and 'backward' areas of the state.

MSFC has been working as the disbursing agency for the Central government capital investment subsidy scheme. With effect from April 1, 1983, the modified Central government capital investment subsidy scheme has made all 17 backward districts in the state eligible for subsidy. The industrial activities in the state have spread in the recent years to 'growth' centres like Nashik, Kolhapur, Nagpur, Aurangabad, Ahmednagar and to some new growth centres like Roha, Tarapur, and Chandrapur. MSFC alongwith other development agencies has rendered its best towards this industrial dispersal particularly in the small scale sector.

Since its inception the Corporation has sanctioned 27,887 loans for a total amount of Rs 504.12 crore and disbursed around Rs 331.41 crore by March, 1985. The significant aspects of the MSFC assistance are that, it has catalysed the total investment of over Rs 929 crore, which is estimated to have provided employment to 5.48 lakh persons.

## TYPES OF ASSISTANCE GRANTED BY MSFC

a) *Term loans*: The term loans are granted to industrial units for the creation/acquisition of fixed assets like land, building, plant and machinery. The assistance is normally given on a margin of 25 per cent to 40 per cent under various schemes and the repayment period for the loans is upto 8 to 10 years with a suitable moratorium of one or two years depending on the period required to implement the project.

b) *Composite loans*: The Composite loan upto Rs 25,000 is granted to meet both term loan and/or working capital requirements to certain categories of entrepreneurs like rural craftsmen and artisans. This enables the artisan to get his total requirement of finance from one agency only.

c) *Seed capital*: The Seed capital assistance is provided to the new entrepreneurs, if they are not in a position to raise adequate promoters' contribution. The maximum limit on seed capital assistance is Rs 2 lakh and the service charge is only one per cent. If seed capital required by the entrepreneur is more than Rs 2 lakh, his case could be considered under IDBI scheme of seed capital.

## SPECIAL SCHEMES

MSFC has diversified its operations in terms of several schemes to cater to the growing and changing needs of different regions, different industry groups and different types of entrepreneurs. To serve the specific needs of the entrepreneurs from the backward districts, Development and Assistance Services Cells have been set up by the Corporation to assist the prospective entrepreneurs from stage of product identification to the processing of their application.

*For the Technicians*: Two schemes have been devised for the technicians to encourage them to start their own manufacturing units by granting them financial assistance on 15 per cent margin.

Technicians' Assistance Scheme: Under the scheme, the Degree or Diploma holders from the recognised institutes with minimum 3 years industrial experience are provided assistance to set up their own industrial units. The proposals under this scheme are scrutinised by a High Level Technical Committee consisting to technical experts from various fields. With the recent liberalisation of the scheme, assistance can be granted beyond the previous ceiling of Rs 5 lakh.

Young Technicians' Assistance Scheme: Under this scheme loans upto Rs two lakh are given to young technicians, particularly those who are ITI trained and have 3 years experience.

*Modernisation Scheme*: The primary objective of the scheme is to encourage the industrial units in the small scale sector to adopt improved and up-dated technology. The scheme is meant for replacement or renewal of plant and machinery or acquisition of balancing equipments for effective utilisation of installed capacities. Cost of acquisition of technical know-how is also eligible for finance. Assistance will be need-based and as such, there will be no minimum or maximum limit of loan, but within the overall limits of sanction of the Corporation. There is no fixed norm for security and margin. The loan is granted at the rate of interest of 11.5 per cent per annum.

*Development Finance Scheme*: Assistance under the modified scheme is given to the entrepreneurs to meet the research and development cost incurred in the development of products/processes for commercial exploitation. The development finance is treated as a long term loan and granted on liberal terms in regard to the margin and the rate of interest. The proposed/existing proprietary/partnership/private limited companies, where development work is yet to be

carried out are eligible for a loan upto Rs one lakh at a reduced rate of interest of 10 per cent only. However, in case where development work is already carried out, a loan upto Rs two lakh is eligible at same rate as referred to above.

*Assistance to Doctors/Medical Practitioners:* This scheme has been introduced to extend financial assistance to doctors/ medical practitioners for setting up X-ray units in rural and semi-urban areas.

*Other Schemes:* There are other schemes devised to meet the requirements of specific categories of entrepreneurs:

a) Assistance upto Rs 50,000 against low margin and at 10 per cent rate of interest is provided to young educated persons to become self-employed.

b) Assistance upto Rs one lakh is granted to Scheduled Castes and Scheduled Tribes entrepreneurs on soft terms.

c) Assistance upto Rs three lakh against the margin of 15 per cent is provided to the Retired Army Personnel enabling them to start new industry.

### SCHEMES TO HELP IMPLEMENTATION OF PROJECTS

The entrepreneurs are exposed to a number of difficulties in the implementation of projects as per schedule. MSFC has made an attempt to introduce some schemes to help the entrepreneurs in over coming these difficulties.

(i) *Loans against state and Central incentives*: Non-availability of incentives during the implementation of project resulted in time and cost overrun. The Corporation has started giving loan against Central Subsidy from 1977-78. With effect from April, 1984, the Corporation has also introduced similar scheme for granting short term loans against state incentives to help the assisted units to overcome the difficulties in the implementation of their projects on account of the delay in the disbursement of capital incentives.

(ii) *Bridge Loan*: Sometimes the implementation of projects is held up for want of completion of legal documentation and hence unable to get disbursement. In order to help the entrepreneurs to overcome delays of this nature, MSFC has introduced a scheme to sanction Bridge Loan against MSFC's loan to the assisted unit. Such a bridge loan is normally granted for the period of six months which could be extended upto one year during which the unit is expected to complete legal documentation formalities.

### REHABILITATION SCHEME

Besides the above schemes of helping the assisted units during their implementation the Corporation has accorded a high priority to the task of rehabilitation of units. Under this scheme, additional finance is made available for completion of the project, modernisation, technology upgradation and for procuring balancing equipment. This assistance is given at 10 per cent rate of interest and is need-based. MSFC also shares along with the other financial institutions upto 50 per cent of the cost of preparation of rehabilitation report from experts in cases where MSFC is convinced about the viability of the project and the entrepreneur is not in a position to finance study.

### EDP PROGRAMME

In order to tap the potential entrepreneurs in the backward areas, MSFC has implemented Area Development Approach in some selected districts. To facilitate identification, training and development of new entrepreneurs, the Corporation conducted Entrepreneurial Development Programmes (EDPs), one each in the selected districts.

### PROCEDURAL CHANGES AND IMPROVEMENTS

(i) *Quicker disposal of loan applications*: The Corporation has delegated powers for sanctioning loans to Branch Managers and Regional Managers. The Branch Managers of 20 Branch Offices spread all over the state have been given powers to sanction and disburse loans upto Rs 50,000. The Regional Managers can sanction loans upto Rs three lakh and disburse loans upto Rs ten lakh. A time bound programme is also being vigorously implemented so as to reduce the pendency of applications. Powers have been delegated to technical staff at Regional Offices to clear technical reports for loan applications upto Rs ten lakh.

(ii) *Bipartite agreement with MIDC*: MSFC and MIDC have recently entered into a bipartite agreement in respect of all loans given by the Corporation to the borrowers located in MIDC areas. In place of the earlier practice of executing a separate tripartite agreement between MIDC, MSFC and the borrower in each individual case, MIDC and MSFC have entered into an agreement specifying the conditions which automatically become binding on the plot holders in MIDC areas. The execution of tripartite agreement for every loan to the plot holders was cumbersome, required the plot holders incur expenses and involved inordinate delay. The bipartite agreement between MIDC and MSFC would help the entrepreneurs as the delay is avoided and extra expenses are dispensed with.

(iii) *Expediting disbursement*: (a) MSFC is organising workshop every month at Regional Offices for the entrepreneurs who have been sanctioned recently loans and entrepreneurs who have not yet taken substantial disbursement to understand and solve the procedural difficulties. (b) Powers have been delegated to legal staff at Regional offices to finalise legal documents upto Rs ten lakh in respect of units in MIDC area.

(iv) *Visits of technical/legal staff to branch offices*: In order to solve the difficulties of entrepreneurs, the technical and legal staff from the Regional Offices make regular visits to Branch Offices on a fixed day so as to be available to the entrepreneur to complete processing of applications and expediting disbursement.

### CO-OPERATION WITH OTHER AGENCIES

MSFC closely associates in the meeting of Udyog Mitra which has been set up in every district. Open-house sessions are held by all the development agencies in the state with the existing and the potential entrepreneurs at different places so as to solve their problems. The follow up action on these difficulties is taken in Zilla Udyog Mitra meeting chaired by Collector of the district.

Industrial scene in Maharashtra is undergoing rapid changes. The composition of the industrial activity has shifted towards modern industrial groups and the new growth centres like Nagpur, Aurangabad, Ahmednagar, Nashik have come up and other centres like Chandrapur, Satara, Patalganga have also made rapid progress. A big petrochemical complex coming up at Nagothane near Alibag is expected to develop a network of down stream projects in its vicinity. The electronic industry in the state is poised for a speedy development in the three industrial estates coming up exclusively for 'Electronics' one each near Nagpur, Pune and Aurangabad. As a part of the integrated programme for industrial development, MSFC has made specific efforts for ancillary development by assisting ancillaries around RCF and the commercial vehicles plant by Ashok Leyland in Bhandara district. MSFC intends continuing as a development catalyst in the ensuing programme for industrial development in the state.

## IEL

IEL is the new name of Indian Explosives with which the three companies of the ICI group, namely, Alkali and Chemical Corporation of India (ACCI), Chemicals and Fibres of India (CAFI) and Cresent Dyes and Chemicals (CDC) have been amalgamated. IEL now has a broad and well diversified business portfolio. Besides explosives and fertilisers, its product range now includes crop protection chemicals, polyester staple fibre, paints and rubber chemicals, pharmaceuticals and several others.

# Co-operative Movement in Maharashtra
## Retrospect and Prospect

G S Kamat

MAHARASHTRA carved out for itself a niche in the Indian co-operative movement over the years. Historically, the birth of co-operatives, particularly in the agricultural sector, was on account of the Deccan Riots of 1875 which brought to the surface the farmer's grievances against the exploitative moneylending groups. The Deccan Riots Commission recommended solutions in two directions: (i) putting a check on the activities of the moneylender, and (ii) instituting an agency that would compete with him in the supply of credit. The Deccan Agriculturist's Relief Act was passed in 1879 by the Government of India. But the setting up of co-operative credit societies was delayed till 1904 when the first Co-operative Societies Act was passed for the country.

Table 1 gives the overall position of co-operative societies in the state since its formation in 1960. It will be seen from Table 1 that there has been a steady growth of the co-operative movement in diversified directions. The predominance of credit co-operatives is clearly seen. All the villages have been covered by a network of 18,521 primary credit societies. Their number will show a gradual decrease due to increase in the size of primary societies under the scheme of amalgamation approved at the national level.

In totality, the co-operative sector in Maharashtra consists of 71,130 societies with a gross membership of 180 lakh and a paid up share capital of Rs 850 crore. Their owned funds are about Rs 1,625 crore and they have mobilised deposits of the order of Rs 3,300 crore. They had advanced loans amounting to Rs 1,850 crore (1984).

### CREDIT MOVEMENT

A comparison of credit societies of Maharashtra *vis-a-vis* the all-India position would reveal that there were 19 per cent co-operative societies with 13 per cent membership, having 16 per cent working capital in Maharashtra. They advanced 24 per cent of short-term loans and 14 per cent of medium-term and long-term loans.

The co-operative credit structure in the state consists of the State Co-operative Bank, operating through 28 District Central Co-operative Banks and their 2,000 branches. The latter serve the member primary co-operative societies. About 35 to 40 per cent of the credit requirements in agriculture are met through the co-operative sector. On the other side, the overdue loans at the primary level have been causing great concern because of its sizeable percentage at 48. Out of about 18,353 primary agricultural credit societies nearly 51 per cent were in losses. These deficiencies need to be corrected as they threaten to choke up normal credit channels for the ultimate weak borrower.

There is a separate co-operative credit structure for supplying long-term credit to agriculturists. Originally it was a federal, two-tier structure but was later converted into a unitary pattern with the Apex Land Development Bank working through its branches at the district level. Even this pattern is under review now for a variety of reasons. While the position of the overdue loans in this activity has been relatively more serious at 54 per cent, there appears a noteworthy diversification in the purposes for which the long-term loans have been advanced. About 69 per cent of loans have gone for minor irrigation followed by loans for tractor and other machinery, lift irrigation, horticulture, etc.

Under the multi-agency approach, commercial banks have also been providing finance to the agricultural sector. In 1983, 367 primary agricultural credit societies were adopted by commercial banks (transferred societies). About 48 per cent of these societies were in losses. However, according to the latest report of the committee of experts appointed by the Reserve Bank of India, this scheme has by and large failed. Nonetheless the co-operative banks have to face unequal competition from the commercial banks operating in the so-called priority sectors. This is a challenge which the co-operative banking sector must face on the basis of efficient and effective management of resources and customer services. At the same time, it cannot overlook its commitments to the weaker sections for whom it primarily exists. Further, the loans portfolio must also be developed in a balanced manner so as to meet credit requirements of marketing, consumers, industries and processing. This will take away the lop-sided nature of their business operations.

### URBAN BANKS

The performance of urban co-operative banks in Maharashtra has been commendable. Their number in 1984 was 358 and they had a membership of 17.81 lakhs. Their share capital was Rs 58 crore and they commanded deposits of Rs 1,172 crore. They advanced loans of Rs 1,500 crore and the overdue position was about 8 to 10 per cent. Only ten banks were reported to be in loss. While this is a very encouraging picture of the urban banking sector, these banks need to diversify their loaning operations which today are mostly restricted to meeting the consumption requirements of their members (60 per cent). Most of the urban banks seem to suffer from over-liquidity. There is need and scope for advancing loans to small industries and young educated unemplyed entrepreneurs. They can also enter into consortium arrangements with their counterparts in the co-operative sector so as to deploy their surplus resources in favour of small scale industries which are in need of working capital.

There is urgent need to develop and strengthen agricultural marketing and processing on co-operative lines to ensure a larger share in consumer price to the farmer members. This will also help to reduce the level of overdues in co-operative credit. There were in 1984, 500 central and primary marketing societies in the state. Their membership was 5,95,000 and they had Rs 11.40 crore as share capital. They handled agricultural produce worth Rs 230 crore of which marketing of foodgrains was Rs 30 crore. They supplied agricultural inputs worth Rs 305 crore of which 83 per cent was accounted for by fertilisers. They distributed essentials in the rural areas of Rs 120 crore. Nearly 130 societies were in loss. Table 2 shows the performance of marketing societies in the state between 1961 and 1984.

A noteworthy feature of the co-operative marketing structure in the state has been its contribution to procurement of foodgrains

TABLE 1: SECTOR-WISE NUMBER OF CO-OPERATIVE SOCIETIES IN MAHARASHTRA

| Sector | 1961 | 1984 |
|---|---|---|
| 1 Agricultural and non-agricultural credit societies (apex and central) | 39 | 33 |
| 2 Agricultural credit societies | 21,400 | 18,521 |
| 3 Non-agricultural credit societies | 1,630 | 6,359 |
| 4 Marketing societies | 344 | 501 |
| 5 Productive enterprises (e g, sugar factories, rice mills, etc) | 4,306 | 17,767 |
| 6 Social service co-operatives (e g, consumer socities, housing societies, etc) | 3,846 | 27,949 |
| All societies | 31,565 | 71,130 |

and cotton on government account. Especially, the monopoly cotton procurement scheme has been able to secure a fair price to the cotton growers in the state since its inception a decade back. Unfortunately it has had a faltering continuity because of lack of consistant support from the Government of India and Reserve Bank of India. The special feature of this scheme is the built-in arrangement provided for linking credit to marketing under the statute. A separate State Co-operative Cotton Marketing Federation has been set up for implementing the scheme on a more permanent footing.

### AGRICULTURAL PROCESSING

The progress recorded by the processing co-operative in the state has also been encouraging. Table 3 gives an idea of the processing co-operatives for important crops in the state.

Among the processing co-operatives, sugar co-operatives of Maharashtra have recorded remarkable achievements. Out of 351 sugar factories in India by 1982, 179 were co-operative units and of these 81 were located in Maharashtra. The 67 sugar co-operatives in production in this state produced 88 per cent of sugar of total production in the state and 36 per cent of that in the country. The average recovery percentage has been above 10.7. These co-operatives have collected deposits amounting to Rs 220 crore specially from rural areas. These have become growth centres leading to integrated rural development in their area of operation. Co-operative dairies, poultries, department stores, co-operative banks, women's co-operatives, public schools and colleges, polytechnics and hospitals have come up in these areas, and have halted the migration of the rural population to urban centres through generation of employment opportunities at the local level. By-product industries like distillery plants and paper factories have contributed to minimising the overall cost of production. This development has also thrown up a new leadership in the rural areas.

TABLE 2: CENTRAL AND PRIMARY MARKETING SOCIETIES IN MAHARASHTRA

| Item | 1961 | 1984* |
|---|---|---|
| 1 Societies | 343 | 500 |
| 2 Membership | 1,401 | 5,950 |
| 3 Share capital turnover (value) | 131 | 1,140 |
| 4 (a) Aricultural produce | 1,742 | 23,000 |
| *Of which:* Foodgrains | 280 | 3,050 |
| (b) Agricultural requisites | 986 | 30,500 |
| *Of which:* Fertilisers | 756 | 25,500 |
| Seeds | 44 | 1,850 |
| (c) Consumer Goods | 952 | 12,000 |
| 5 Societies making profit | 211 | 310 |

*Notes:* 1 All amounts in Rs lakh.
2 Members in hundreds.
* Figures are provisional.

TABLE 3: PROCESSING CO-OPERATIVES OF IMPORTANT CROPS IN MAHARASHTRA

| Commodity | 1961 | 1984 |
|---|---|---|
| 1 Cotton ginning and pressing societies | 30 | 129 |
| 2 Rice mills | NA | 97 |
| 3 Oil mills | NA | 15 |
| 4 Sugar co-operative | 29 | 97 |
| 5 Spinning mills | 2 | 84 |
| 6 Other processing societies | 78 | 85 |
| Total | 130 | 507 |

There were 84 co-operative spinning mills registered in the state by 1984, of which 21 were in production. The weavers co-operative spinning mills have performed better than the growers' co-operative spinning mills. Amongst other noteworthy co-operatives, reference may be made to dairy co-operatives and their unions whose number went up from 450 in 1961 to 10,024 in 1984, handloom co-operatives which numbered 741, powerloom co-operatives 247, forest labourers' societies 391, fisheries co-operatives 989, labour contract co-operatives 4,668 and consumer co-operatives with their 2,025 primary consumers stores, 80 wholesale stores and one apex federation. Many of these societies have yet to make an impact on their membership and on the business of which they are a part.

A reference also must be made to the contribution made by the primary housing societies in solving to some extent the housing problem of the middle and lower classes of the community. In 1961 there were 1,495 housing societies and their number went up to 19,678 in 1984.

The co-operative law of the state has been amended and revised from time to time to meet the requirements of the changing co-operative movement. However, it must be said that in the effort to simplify and elaborate its provisions, the law has become bulky and complicated for a simple co-operator to follow. Progressively, the powers of the Registrar have also been increased, reducing to that extent the scope for democratic processes in the working of the co-operatives. Another fresh law has been on the anvil. It is hoped it will solve the problems and facilitate fast growth of the sector.

The cost of management of the co-operatives working at different levels have been constantly increasing while their respective area of operation continues to remain small. There is need to increase the size through amalgamation for increased business with larger membership on a diversified basis at reduced costs. This need is felt in the agricultural credit sector, co-operative sugar factories, spinning mills, consumer co-operatives, etc. The co-operative sector in Maharashtra has still the potential and the capacity to provide leadership not only for the weaker sections in this state but also for the co-operative movement and its beneficiaries in the whole country.

---

## Bannari Amman Sugars

BANNARI AMMAN SUGARS is putting up a Rs 9.5 crore modern sugar plant to crush 1,250 tonnes of cane per day at village Alathukombai in Periyar district of Tamil Nadu, where sugarcane is planted throughout the year and the plant can operate for 275 days in a year as against 150 days in the case of most other sugar mills. Production at the plant is expected to commence in November 1985 to synchronise with the start of harvesting season of the sugarcane crop. The company is coming out with a public issue on September 11, 1985 with an issue of 18.50 lakh equity shares of Rs 10 each at par, out of which 10 lakh shares have been reserved for allotment to NRIs. Subscription list for them will open on September 2.

The project has been promoted by two experienced sugar technocrats, S V Balasubramanian, executive Vice-Chairman of Sakthi Sugars, and K S Thirumalaiswamy. They have been encouraged by the monetary incentives announced by the Central government whereby the new sugar units are allowed to sell 93 per cent of their production as free-sale sugar in the open market for a period of four years and 60 per cent during the fifth year, as against the normal quota of 35 per cent of free-sale sugar. These incentives are estimated to amount to Rs 13.80 crore in the first five years, but may yield more if the current buoyancy in the sugar market persists.

According to Balasubramanian, on estimated crushing of two lakh tonnes in the first year and 2.75 lakh tonnes in the fourth year, the company expects to earn handsome profits from the very first year of its operations. The break-even point for the company's plant is only about 40 per cent in the first five years. The estimated sales value and profit before depreciation during the first accounting year commencing from October 1985 are placed at Rs 977 lakh and Rs 229 lakh, respectively, which are expected to rise to over Rs 1,418 lakh and Rs 505 lakh respectively by the fourth year. Net profit after providing for depreciation in the first year is estimated at Rs 157 lakh rising to Rs 429 lakh by the fourth year against an equity base of Rs 375 lakh.

The issue is managed by Merchant Banking Divisions of Canara Bank and Punjab National Bank. R K Garg and Associates is Consultant to the company.

# If you think you know how long it took Kinetic to become a leader in the two-wheeler business, wrong once more.

**Only three years.**

That's all it took to make Luna the number one brand in the 50cc moped market.
And Kinetic the fastest-growing company in the two-wheeler business.
Over the years, we have put over 6,15,000 two-wheelers on the road.
Increased our turnover by over 85% per annum; share value by over 2500% on the stock exchange.
Our product too has undergone constant improvement.
The Luna developed into the Luna TFR Plus and the Luna Double Plus. And we launched the Spark, the first of a new range of city vehicles from Kinetic.
Vehicles built to perform superbly on Indian roads.
So now that you have a choice of two-wheelers, remember the big name in the business.
Kinetic Engineering Limited.

Rediffusion/KE/3012o

# Monopoly Cotton Procurement Scheme in Maharashtra

MAHARASHTRA is a major cotton growing state in the country with more than 10 lakh cotton growers. The area under cotton in Maharashtra is about 26 to 27 lakh hectares while the production of cotton is about 16 to 18 lakh bales. This forms 30 per cent of the area under cotton and 20 per cent of the production of cotton in the country. 95 per cent of the area under this crop is rainfed and as such its yield in the state is lower than that in other states. Further, rainfed cotton is subject to the vagaries of monsoon, hence production of cotton in the state fluctuates from year to year.

In order to give a fair and remunerative price to growers by eliminating middlemen, the Government of Maharashtra, in consultation with the Government of India, enacted the Maharashtra Raw Cotton (Procurement, Processing and Marketing) Act in 1971 and implemented the Monopoly Cotton Procurement Scheme with effect from the 1972-73 season. Maharashtra is the only state in the country to introduce monopoly purchase of cotton from cultivators and its processing and marketing through co-operative agencies. The scheme is implemented by the Maharashtra State Co-operative Marketing Federation as the Chief Agent of the government assisted by Taluka Sale and Purchase Societies as sub-agents.

## BASIC OBJECTIVES

The main objectives of the Monopoly Cotton Procurement Scheme are as under:

(i) To ensure fair and remunerative price of cotton to the growers in the state.

(ii) To effect additional transfer of incomes to the cotton growers by eliminating middlemen and securing in full the advantage of terminal prices.

(iii) To bring about stability in the income of the growers and thereby stability and growth in the overall production of cotton in the state.

(iv) To supply scientifically graded quality cotton to the consumer mills.

(v) To strengthen the institutional framework of co-operatives by involving the co-operative institutions fully in the process of procurement, processing and marketing of cotton and to establish an effective linkage between marketing and recovery of co-operative dues.

(vi) To revitalise the rural economy by establishing a close connection between the various processes connected with cotton namely, ginning and pressing, oilseed crushing, spinning and weaving so that all workers and growers of cotton share the advantage of larger incomes.

The Monopoly Cotton Procurement Scheme is operated in the state by the Maharashtra State Co-operative Marketing Federation as the chief agent of the state government. For the purpose of implementing the scheme, the Marketing Federation has created three departments, *viz*, (1) Procurement and Processing; (2) Sales, and (3) Finance and Accounting. For operating the scheme in the field, the entire cotton growing area has been divided into 12 zones. Each zone is further sub-divided into sub-zones. There are in all 88 sub-zones. Each sub-zone has a number of procurement stations depending upon the arrivals of kapas. Each procurement station is a town or village having one or more number of collection centres. The collection centres are of two types, *viz*, (i) Facility centre, and (ii) Non-facility centre. The facility centre is a collection centre where ginning facility exists while the non-facility centre is a place where no ginning facility exists but is opened up to facilitate the cultivators to tender kapas not beyond 30 kms. Out of the total number of 614 collection centres in the 1982-83 season, 488 were facility centres and 126 were non-facility centres.

The Marketing Federation is assisted by the Taluka Sale and Purchase Societies who act as sub-agents to the Marketing Federation. There are in all 166 sub-agent societies in the cotton growing areas of the state. The functions of the sub-agents in connection with the Monopoly Cotton Procurement Scheme consist of the following:

(1) To maintain cultivator-wise ledgers and other records of tendering of kapas and its value at the guaranteed price.

(2) To effect various deductions from payment to cultivators on account of co-operative dues and Agricultural Produce Marketing Committee dues.

(3) To make payments to the cultivators through co-operative banks and prepare necessary hundies from time to time for the value of kapas tendered at guaranteed and final price as fixed by government.

(4) To submit various reports as prescribed by the Marketing Federation to assess the progress of the scheme.

(5) To maintain various registers as required for accounting purpose.

Under the Maharashtra Agricultural Produce Marketing Committee (Regulation) Act 1963, 230 Agricultural Produce Marketing Committees (APMC) have been established in the state, of which 159 APMCs are in cotton growing areas. These committees levy cess on the agricultural produce for carrying out their functions and are expected to provide basic amenities to the cultivators such as drinking water, shed, water for cattle, etc. To facilitate the procurement operation under the scheme all the cotton collection centres are declared as sub-marked yards of the respective APMCs. The APMCs thus get an assured income from the cess on cotton. The market cess on cotton charged by the APMCs is between 50 paise to 100 paise per Rs 100 worth of cotton.

## GREEN CARD

Under the Monopoly Cotton Procurement Scheme, the cotton growers in the state have to tender kapas produced by them at the collection centres. As an administrative measure, a green card was introduced which serves as the authorised identity card for the cotton grower to tender his kapas. This green card contains information regarding area under cotton, variety of cotton grown, the details regarding quantity of cotton tendered, its value and the recoveries effected from the value of cotton. This green card (now recovery card is used as green card) has been provided statutory basis subsequent to the amendment to Maharashtra Raw Cotton (Procurement, Processing and Marketing) Act 1971, in 1981.

The cotton grower brings his kapas to the cotton collection centre where the grader examines the variety and grade of kapas. The kapas is then weighed by authorised weighmen appointed by APMC. The weighment of cotton is done in the state with the help of 220 weigh bridges installed at the cotton collection centres or with the help of weighing pans.

If the cotton tendered is not consistent with the variety or grade given by the grader of the Marketing Federation or weighment made he can lodge a complaint with the 'Arbitration Committee' as per Section 10 of the APMC Act, 1963 which settles disputes according to the procedure laid down under Rules 97, 98 and 99 of the Act.

The kapas tendered at the collection centres is placed in the form of heaps separately for each grade and for each variety. This kapas is then ginned in the ginning factories, and lint and cotton seed are obtained. The lint obtained is then pressed into bales in pressing factories. The total installed capacity of the 488 ginning factories was 6,914 single rollers and 2,351 double rollers. Out of the total of 488 ginning factories, 185 were in the co-operative sector and the remaining 303 were in the private sector. There were in all 141 pressing factories of which 45 were in the co-operative sector and remaining 96 in the private sector during the season 1982-83. The kapas under the Monopoly Cotton Procurement Scheme is given for processing to co-operative as well as private ginning and pressing factories.

# If you think you know what inspired Kinetic to design India's most popular two-wheeler, you're wrong again.

**It was the length of your arm.
And your wife's sari.**

The arm length of an average Indian differs from others. A fact we considered when designing a vehicle with the right distance from seat to handlebar. And because most Indian women wear saris, they need a lower chassis frame, to get on easily. Ample proof that we do not merely copy a foreign product, but create, design and develop vehicles to suit Indian conditions. And constantly improve our products to give you maximum reliability, lowest maintenance cost and highest resale value.

It's this kind of innovative spirit that has helped Kinetic become the fastest-growing company in the two-wheeler business.

Soon, Kinetic will be launching a new range of two-wheelers. Suited to our conditions and built especially for us Indians.

So now that you have a choice of two-wheelers, remember the big name in the business.
Kinetic Engineering Limited.

### GUARANTEED PRICE AND MODE OF PAYMENT

The guaranteed prices for various varieties and grades of kapas are declared by state government before the commencement of every season. The Government of India considers the recommendations of the Agriculture Price Commission and fixes the support price of various varieties of kapas. The support prices so fixed for Maharashtra cotton varieties are considered at the time of fixing the guaranteed price under the Monopoly Cotton Procurement Scheme. The guaranteed price fixed for a particular variety and grade of kapas is the same throughout the entire season irrespective of time of tendering and fluctuation of cotton prices in the market. The Cotton Co-ordination Committee set up in 1981 recommends the guaranteed prices of kapas with effect from the 1981-82 season to the state government and the state government then fixes the guaranteed prices of kapas under the Monopoly Cotton Procurement Scheme. Prior to the appointment of the Cotton Co-ordination Committee, the state government used to fix the guaranteed price after taking into account relevant factors such as trend of cotton price, demand and supply of cotton and prices realised under the scheme in last season.

As per section 25 of the Maharashtra Raw Cotton Act 1971, the guaranteed price can be paid in two instalments. However, the government has paid the guaranteed price to the cotton tenderers at 100 per cent of the value of their kapas at the same time of tendering since 1977-78 season.

The present annual cotton crop in the state is about 16 to 18 lakh bales (about 80 lakh to 90 lakh quintals of kapas) involving a turnover of about Rs 450 crore. After processing of kapas, the cotton bales and the seed are sold in the market and the receipts are utilised for operation of the scheme as and when necessary. But there is some time gap between cotton purchases and sales. Hence the operation of the scheme requires massive institutional finance. The state government has contributed Rs 4.85 crore to the share capital of the Marketing Federation. But for getting institutional credit the Marketing Federation has to approach the Reserve Bank of India (NABARD) through the Maharashtra State Co-operative Bank to operate the scheme after providing the margin money of 25 per cent of total requirement.

The main financial resources for the margin money are the price fluctuation fund, capital formation fund, government loan, other resources of the scheme, etc. Due to heavy losses to the scheme in 1974-75, 1981-82 and 1982-83, the price fluctuation fund has been almost wiped out. But recently the capital formation fund has been established with the help of contributions from the cotton growers, the state government and the agent operating the scheme. The contribution from the growers was collected at the rate of one per cent of the value of the guaranteed price during the season 1974-75, 1980-81 and 1981-82 and at the rate of three per cent during 1982-83. Thus, the total contribution collected from cotton growers towards the capital formation fund was Rs 22.7 crore by end of 1982-1983 season. The state government is also committed to contribute Rs 25 crore towards the capital formation fund by March 30, 1985. The government had contributed Rs 20 crore upto March 31, 1983.

The scheme envisaged the recovery of co-operative dues through the value of cotton at the time of tendering according to the principle of linking of agricultural credit with marketing as advised by the Reserve Bank of India. The recovery of the dues is limited to 50 per cent of the value of cotton at the guaranteed price. Two-thirds of the total recovery is against short- and medium-term loans while the remaining one-third is against long-term loan. The total recovery of co-operative dues done through the cotton scheme since inception upto 1982-83 is Rs 342 crore.

### MARKETING OF COTTON

After processing of kapas, cotton seed is obtained as by-product which forms two-thirds of kapas by weight and the main product, lint, is pressed into bales. The cotton seed and bales are marketed by the Marketing Federation according to the following procedure:

(a) *Sale of Cotton Seed*: Under the cotton scheme about 50 to 55 lakh quintal cotton seed is available annually after processing the kapas. Out of the total quantity of cotton seed available, about two lakh quintals of quality seed are reserved for sowing purpose, while the remaining quantity is sold in open auctions. The seed for sowing purposes is processed and sold to the cotton growers through sub-agent societies at subsidised rates. Some quantity of cotton seed is also sold to the Maharashtra Oilseeds Commercial and Industrial Corporation according to their requirement and availability.

(b) *Sale of Cotton Bales*: The sale of cotton bales takes place in open competition in the free market in and outside the state. The cotton bales are sold either by negotiations with the buyers or by calling tenders or by giving quotations of expected prices. During 1975-76, the Government of India appointed the Bose Malik Committee for streamlining the sales of cotton by the Marketing Federation with a view to effecting stabilisation of cotton prices. This committee recommended direct sale of cotton bales to the textile mills. Accordingly, about 30 to 35 per cent of total sale of cotton by the Marketing Federation is made directly to the National Textile Corporation, State Textile Corporation, Co-operative Spinning Mills, etc. At the time of revival of the scheme in 1978, the Government of India desired that there should be co-ordination in the sale of cotton between the Cotton Corporation of India and the Marketing Federation. Accordingly, the Sales Policy Co-ordination Committee with the Managing Director of the Cotton Corporation of India as one of the members was set up under the Chairmanship of Minister (Co-operation). The state government then formed the Sales Promotion Committee to implement the guidelines of the Sales Policy Co-ordination Committee. However, as per the amendments to the Maharashtra Raw Cotton Act, 1971, the Cotton Co-ordination Committee, consisting of four officers of the Central government and four officers of the state government was appointed on September 24, 1981 and recommends the sales policy of cotton under the scheme. The guidelines given by this committee are followed by the Sales Promotion Committee.

(c) *Export of Cotton*: The pattern of cotton production in the country has changed in the last decade, with increase in the proportion of long staple and extra long staple cotton. As a result, the country, once a regular importer of long staple and extra long staple cotton, has become a net exporter of such cotton. In Maharashtra, the production of long and extra long staple cotton has increased considerably, i e, from 13 per cent in 1972-73 to about 60 per cent in recent seasons. However, the textile mills in the country are not in a position to consume the entire production of long and extra long staple cotton. Hence the long and extra long staple cotton is being exported. Maharashtra was the first state to export nearly two lakh bales of cotton procured during 1974-75 season. From 1975-76 to 1982-83, 14.31 lakh bales have been exported earning foreign exchange of about Rs 318 crore (including rupee payment under bilateral trade agreement) to various countries such as Hong Kong, Czechoslovakia, Rumania, Thailand, China, USSR, South Korea, Sri Lanka, Taiwan, etc.

### FINAL PRICES

The majority of the cotton bales obtained after processing kapas are normally sold during the same season. However, the almost entire quantity of cotton seed is sold in the same season. For working out final prices, the scheme accounts are closed when about 75 to 80 per cent of the total number of cotton bales are sold. For this purpose the variety-wise and grade-wise sale receipts of cotton and cotton seed are taken together

# If you think you know where Kinetic will go in the competitive two-wheeler market, congratulations, you're right!

**Up!**

That's the way we look at it.
And we'll do it not just by selling more two-wheelers and making profits, but by working the way we have been doing for the past twelve years.
Innovating.
Kinetic have always believed Indian customers deserve the best.
And that's just what we're geared to deliver.
In succession to the Luna range and the unique Spark, Kinetic is manufacturing a whole range of two-wheelers especially suited to Indian conditions and the Indian rider.
A range worth looking forward to.
So now that you have a choice of two-wheelers, remember the big name in the business.
Kinetic Engineering Limited.

ShreePadma

and the value of the stock of cotton and cotton seed, done as per the provision of the Maharashtra Raw Cotton Act, 1971, is added to it. From this total, the expenditure incurred on processing, marketing and miscellaneous items is deducted. If the total receipts are more than the total expenditure, 75 per cent of the excess amount is distributed (variety-wise and grade-wise) to the cotton growers and the remaining 25 per cent is credited to the Price Fluctuation Fund.

The average final price of kapas which was Rs 266 per quintal in 1972-73 went up to Rs 468 per quintal in the 1982-83 season. During the period of the last ten years, the average final price of kapas was more than the corresponding average guaranteed price in all the seasons except 1974-75, 1981-82 and 1982-83.

As stated earlier, 25 per cent of the excess of final price over the guaranteed price is transferred to the Price Fluctuation Fund. The Price Fluctuation Fund has been so as to adjust the losses under the scheme whenever the final price is less than the guaranteed price. It is also used for providing margin money to the scheme as per Section 33(3) of the Maharashtra Raw Cotton Act, 1971. The state government has initially contributed Rs 10 lakh to the Price Fluctuation Fund. The state government also contributes to the Price Fluctuation Fund as and when necessary. Accordingly, it contributed Rs 11.58 crore to adjust the loss incurred during the 1974-75 season. The amount accumulated in the Price Fluctuation Fund was Rs 46.51 crore at the beginning of the 1981-82 season. But by the end of 1982-83, it had come down to Rs (–) 2.75 crore.

### PROGRESS OF PROCUREMENT

The Monopoly Cotton Procurement scheme has been in operation for more than a decade with suspension on two occasions. The scheme was suspended first partially during the 1973-74 season with effect from January 15, 1974; again it was suspended during the entire 1977-78 season and during part of the 1978-79 season, upto December 15, 1978. The procurement of cotton has increased from 57.77 lakh quintals valued at Rs 133.67 crore in 1972-73 to 89.92 lakh quintals valued at Rs 438 06 crore in the 1982-83 season. The procurement was the lowest at 40.92 lakh quintals in 1976-77 while the maximum was in 1974-75 season at 91 lakh quintals. The zone-wise procurement in 1982-83 season indicates that the maximum procurement was 17.56 lakh quintals in the Yavatmal Zone followed by 11.69 lakh quintals and 11.64 lakh quintals in Parbhani and Nagpur Zones, respectively. The minimum procurement was 0.22 lakh quintals in Ahmednagar Zone while in Dhule Zone it was 1.25 lakh quintals. The variety-wise procurement suggests that nearly 47 per cent of the toal procurement was of H-4 variety, followed by 14 and 10 per cent of 1007 and Varalaxmi varieties, respectively. This indicates that these three varieties account for 70 per cent of the total procurement. The proportion of long staple varieties in the procurement was about 58 per cent and that of medium and short staple varieties was 25 and 17 per cent, respectively. The corresponding percentages of long, medium and short staple varieties in 1972-73 were 13, 50 and 37, respectively. This clearly shows that the production of long staple varieties in Maharashtra has increased by 40 per cent in the last 10 years. The average guaranteed price was Rs 231 per quintal in 1972-73. This increased to Rs 487 per quintal in 1982-83. The recovery of co-operative dues through the scheme was Rs 16.59 crore in the 1972-73 season and it increased to Rs 73.05 crore in 1982-83.

The disposal of cotton under the scheme depends upon the domestic demand of cotton. The number of cotton bales sold by the end of the season in 1972-73 was 8.28 lakh out of 11.48 lakh bales pressed (i e, 72 per cent). During the 1982-83 season also out of 10.21 lakh bales pressed 72 per cent were sold by the end of the season. In some seasons, *viz*, 1975-76 and 1976-77, this percentage was 94 and 97, respectively. But in 1974-75, season, it was just 24 per cent as there was a considerable fall in demand while overall supply of cotton was very comfortable. The average realisation per bale was Rs 1,151 in 1972-73 which increased to Rs 2,095 in 1982-83. Buyer-wise sales during 1982-83 season indicate that 40 per cent were sold to public sector mills, 33 per cent to private mills, about 3 per cent to state undertakings in other states and about 24 per cent were exported. The quantity of cotton seed sold was 37.31 lakh quintals valued at Rs 41.31 crore in 1972-73 season while it was 57.34 lakh quintals valued at Rs 123.23 crore in 1982-83 season. Thus the average selling price of cotton seed per quintal was Rs 111 and Rs 215 in 1972-73 and 1982-83 seasons, respectively.

### BONUS TO COTTON GROWERS

Since the inception of the scheme, the scheme has made net profits in all the seasons except 1974-75 and 1981-82. During 1975-76, 1976-77 and 1980-81 the profit worked out to Rs 39.58 crore, Rs 100 crore and Rs 19.63 crore, respectively. But during 1974-75 and 1981-82 the scheme incurred heavy losses mainly due to the slackness in demand for cotton. In fact, the state government had to contribute Rs 11.58 crore towards Price Flucttutation Fund to meet the losses in 1974-75. Similarly, in 1982-82 the net loss was Rs 46.34 crore. Most of the long staple varieties such as Varalaxmi, RHR-253, MCH-1, CBS-156, Suvin, H-4, Nimkar-391 were sold at a loss in 1979-80, 1980-81 and 1981-82. The production of Varalaxmi variety has been on the increase in recent years and this variety has contributed much to the loss under the scheme.

While closing the accounts, profits and loses are worked out separately for each variety. Some varieties show profit while others show loss. 75 per cent of the profit shown by the concerned varieties is distributed to the concerned tenderers as additional price (i e, bonus) and the remaining 25 per cent is credited to the Price Fluctuation Fund. Such additional price paid to the cotton tenderers in 1972-73 was Rs 15.23 crore while in 1981-82 it was Rs 1.67 crore.

The life of the Maharashtra Raw Cotton (Procurement Processing and Marketing) Act 1971 was upto June 30, 1980 and its duration was further extended twice on yearly basis upto June 30, 1982 with the concurrence from the Government of India. The state government approached the Government of India to accord sanction for the extension of the Act by another 10 years, i e, upto June 30, 1992. However, the Government of India after reviewing the operation of the scheme sanctioned further extension upto June 30, 1984. While reviewing the progress of the scheme, the Government of India and the Reserve Bank of India made various suggestions for smooth implementatin of the scheme. After due consideration of these suggestions, the state government carried out necessary amendments to the Raw Cotton Act, 1971, and requested the Government of India to sanction further extension to the duration of the Act upto June 30, 1994.

---

## Swan Mills

**SWAN MILLS has shown a higher trading** loss of Rs 3.68 crore for 1984 as against Rs 3.17 crore in the previous year despite an increase in turnover from Rs 38.20 crore to Rs 46.59 crore. After providing for depreciation, there is a net loss of Rs 5.08 crore (Rs 4.30 crore). After some write-backs and adjustments in respect of earlier years, the accumulated deficit carried to the balance sheet has amounted to Rs 4.79 crore. The directors attribute this outcome to a combination of several adverse factors such as recession in the domestic market, increase in the cost of cotton and other inputs and disturbed political conditions in Northern India for a major part of the year. Moreover, the closure of the Basanti unit throughout the year, except for a very short period in February 1984, contributed to the unsatisfactory working of the company. After prolonged negotiations with the Labour Unions and, with the blessings of the Government of West Bengal, a settlement has been recently arrived at and operations of the Basanti unit commenced from May 5 last.

abhinandan!

HDFC
congratulates
Maharashtra
on the
occasion of
its silver jubilee.

Maharashtra's growth in the last twenty-five years has been notable. And as the leading housing finance institution in the country, we are associated with the state's development right from the beginning of our operations. HDFC is now a major source of housing finance in the state, bringing a home within the reach of more and more lower and middle income families. Even the backward areas such as Roha, Jalna and Patalganga have received finance for housing development.

Over the years, HDFC has spread its activities throughout the country with 12 branch offices in Maharashtra, Gujarat, Karnataka, Andhra Pradesh, Kerala, Tamil Nadu, Madhya Pradesh, U.P., Rajasthan, Delhi and West Bengal. So far, the total loan approvals are more than Rs. 379 crores for over 100,000 families. With over Rs. 144 crores in deposits, HDFC is also emerging as a major savings institution mobilising deposits for the housing sector.

A growing commitment to development.

'How to give your product a strong backbone'

Petrez
Aromatic Hydrocarbon Resin

Golden coloured Petrez. The innovative resin. The backbone of products like rubber, paints, adhesives and printing inks. Specially created in a range of softening points varying from 70 ± 5°C to 130 ± 5°C (DIN 53180), to suit your specific need.

Now from IPCL in technical collaboration with CdF Chimie of France.

Petrez is the uncontested choice when you are looking for a resin that is economical, chemically neutral, and is compatible with other resins.

Petrez is an economical substitute for wood-rosin and the more expensive coumarone indene, terpenic and alkyd resins. This means your profitability goes up, while your quality remains as good as ever.

Petrez is just right.

Now available from IPCL and its regional offices.

# Trade Policies

24 SEI

THE government has this week released the Report of the Committee on Trade Policies submitted on the very last day of the last year (the chairman of the committee concludes his preface with the remark that "if December had thirtysix days, the report would have been better"). Trade policies have been a major focus of the present government's efforts to give a new orientation to its economic policies and this particular committee's recommendations are believed to have influenced the import-export policy announced in April this year which, as an innovation, is to be in force for the next three years. So there is bound to be considerable interest in the committee's report. The committee, which consisted entirely of government officials, has sought to set out the economic rationale of the trade policies which it has recommended and it is this overall rationale rather than the specific policy changes which it suggests which it is most worthwhile to examine.

It is to the committee's credit that it emphasises right at the outset that the foreign trade sector cannot and should not be separated from the national economy. It is also stated categorically enough that in an economy where exports constitute 5-7 per cent of GNP, export-led growth is simply not on the cards. Growth-led exports are seen instead as the more likely scenario for India. Indeed, at one point it is even acknowledged that "it is unrealistic to expect that exports would grow significantly faster than real national income". The unfavourable international setting for the growth of India's exports, like those of other third world countries, is also not glossed over. The persistent recession has led to protectionism in the industrialised countries and stagnation in international trade flows. There are few signs of any sustainable economic recovery and even such short-lived recovery as there has been in some countries has not had a commensurate impact on the growth of world trade in general and of the third world countries' exports in particular.

But after sounding all these cautionary notes, when it comes to discussing policies for export promotion, the committee suddenly decides that "a quantum jump in exports is the most important means to attain the objective of self-reliance". Forgotten apparently is the aphorism about growth-led exports and the assessment that the country's exports could not be expected to grow very much faster than the rate of growth of real national income itself. Even the unfavourable international environment only means that "our export effort would have to be intensified much further". The committee's suggestions for such intensification are on the whole along very conventional lines: the duty drawback system should be 'rationalised' (an euphemism, of course, for raising the rates of drawback) so as to provide complete reimbursement of taxes paid on inputs entering into export production; the regime of cash compensatory support must be maintained and, further, the CCS payment should be exempted from income-tax (which means, at current levels of CCS, a tax-free income of approximately Rs 450 crore per year for exporters); the import replenishment scheme needs to be made more liberal; further, there should be an exchange entitlement scheme for exporters which would enable them to use a certain fraction of their foreign exchange earnings for the purpose of market development; 50 per cent of the profits from exports should be exempted from income-tax instead of the present 10 per cent; and, finally, export production should be exempted from capacity licensing provisions and restrictions on import of capital goods or technology. Emphasising the need for efficient import substitution in place of import substitution *per se*, the committee points out how necessary it is to weigh the domestic resource cost of a unit of foreign exchange saved through import substitution; it evidently ignores the need to keep the same wary eye on the domestic resource cost of a unit of foreign exchange earned through export promotion on the lines suggested by it.

It is, however, the part of the report dealing with imports which reflects the essence of the committee's thinking. Having rightly ruled out export-led growth, larger exports are for the committee a means of financing the larger imports which are expected to follow from the import liberalisation and phased reduction of protection recommended by it. The lowering of protection the committee regards as essential for infusing competition in the domestic economy and creating an economic environment conducive to lowering of costs and erosion of monopoly profits. At the present stage of our development, the committee opines, it is especially necessary "to provide for more liberal access to import of technology in most sectors of the economy". The government should not try to 'over-regulate' even multiple and repetitive technology imports since that would limit competition among firms in the economy. Along with liberalisation of imports, including of technology, the committee wants the removal of barriers to entry by new firms into industries and the relaxation of capacity licensing provisions. These measures are expected to ensure absorption of imported technology and to create conditions conducive to innovation, for then domestic firms would move from the stage of importation through absorption to innovation, spurred by expection of higher profits, fear of competition or threat to survival in the market.

There are, of course, a number of reasons why the committee's faith in liberal imports together with relaxation of industrial controls will not bring about either greater competition and lower costs or absorption of imported technology. In very many industries the limited size of the Indian market will constitute a natural barrier to the flowering of competition simultaneously with adoption of technologically optimum scales of production. Nor is the institutional framework of international supply and purchase of technology and capital goods, with large multinational corporations on the one side and a third world bourgeoisie on the other, propitious for the sort of passage from import through absorption to innovation which the committee anticipates (a subject to which the committee does not refer even tangentially despite all the mass of studies produced under the auspices of the UNCTAD and other very respectable agencies). The Indian capitalists' pursuit of profit may lead them in the opposite direction precisely, of virtual deindustrialisation to settle for assembly of or even straightforward trading in imported wares. It is true, as the committee notes, that the continuous technological upgradation necessary for rapid and efficient industrialisation has not taken place so far either through import of technology or through indigenous technological development. But without a careful probing of the roots of this malaise, which the committee was unfortunately not moved to undertake, it will be unwise to seek the corrective in liberal import of technology. The cure is likely to prove worse than the disease.

## *Seventh Plan*

### Saving Rate Puzzle

THE 'Approach to the Seventh Five-Year Plan' had calculated that "the Plan can be based on the assumption of a 26 per cent saving rate". It did not think this was ambitious since, according to it, such a rate of saving had "already been achieved". The Planning Commission's more recent reported decision to lower the assumed rate of saving in the Seventh Plan to 24 per cent therefore comes as a surprise, especially as no reasons have been offered for the revision.

Gross domestic saving as a proportion of gross domestic product rose from 16.8 per cent in 1970-71 to 22.4 per cent in 1976-77 and 24.7 per cent in 1978-79. In the next two years the ratio hovered around 23 per cent and in 1981-82 it fell to 22.1 per cent. In the following two years the ratio was 22.8 per cent and 22.6 per cent, respectively. It would appear thus that the highest saving rate achieved in any year so far is 24.7 per cent, contrary to what was suggested in the Approach document.

Total saving in the economy is made up of contributions from the household sector, the domestic private corporate sector and the public sector. The share of the household sector in total saving rose from 72 per cent to 75 per cent between 1970-71 and 1980-81. By contrast, the share of the public sector declined from 18.4 per cent to 16 per cent as did that of the private corporate sector from 10 per cent to 9 per cent. The public sector improved its share somewhat in 1981-82 and 1982-83, though this was from the rock-bottom touched in 1980-81 (see Table).

In the early seventies physical assets formed about 60 per cent of household gross saving, the balance being held in the form of financial assets. Now the household sector holds its saving in these two forms in roughly equal proportions. Bank deposits constitute the principal medium of financial saving by the household sector with a share of 40 per cent, followed by provident funds (17 per cent), currency (15 per cent), claims on government (8 per cent) and loans to companies (7 per cent). An increasing proportion of household saving has been channelled to finance public sector activities, whereas the private corporate sector's direct draft on household saving—in the form of borrowings, shares and debentures, units of UTI and trade credit—has been small, round 13 per cent.

There is no official estimate of the breakdown of saving between the rural and urban sectors. Non-official studies have, however, suggested that the rural household sector's contribution to total household saving tended to decline in the seventies. This may appear intriguing in the context of the sizeable rise in incomes in the farm sector since the beginning of the seventies. A field survey conducted by the Tata Economic Consultancy Services of a sample of rich farmers in the relatively affluent areas of Gujarat, Maharashtra and Andhra Pradesh found that these farmers deployed their saving in fixed and working capital for agriculture as also in postal saving deposits and bank deposits. The absence of other forms of saving has been attributed to insufficient infrastructure, absence of promotional effort and marketing agencies, etc. The survey suggests that there is considerable scope for improving the mobilisation of saving from rural areas.

The performance of the public sector in generation of saving has been plainly uninspiring. The bulk of this sector's saving is made up of the profits of the Reserve Bank of India, the LIC, and the other financial institutions. The contribution of public sector productive enterprises has been negligible. And the Union government administration was a dis-saver to the tune of Rs 1,600 crore in 1984-85 and Rs 582 crore in 1983-84.

To finance the proposed public sector outlay in the Seventh Plan of Rs 180,000 crore (at 1984-85 prices), the Approach paper had called for generation of larger internal resources by public sector undertakings through improvements in efficiency and productivity, more rational pricing policies, toning up of tax administration to increase tax collection and curtailment of the government's consumption expenditure. It had also underscored the need for more effective mobilisation of rural saving. Has the Planning Commission then lost faith in the efficacy of these measures or their feasibility? Why otherwise has it decided to lower the projected rate of saving in the Seventh Plan to a level which had been touched in the mid-seventies? And what about the implications of the lower saving rate? Will it mean a widening of the gap in the resources available to finance the public sector Plan outlay or is it assumed by the Planning Commission that the public sector will be able to preempt for itself a larger proportion of the reduced saving? If indeed the latter is the Commission's presumption, some explanation is called for to show how it can be squared with the drift of the government's economic policies.

TABLE: SECTOR-WISE CONTRIBUTION TO GROSS DOMESTIC SAVING

*(Per cent)*

| | 1970-71 | 1975-76 | 1977-78 | 1978-79 | 1979-80 | 1980-81 | 1981-82 | 1982-83 | 1983-84 |
|---|---|---|---|---|---|---|---|---|---|
| Household sector | 71.8 | 70.4 | 72.2 | 73.4 | 70.9 | 75.4 | 69.2 | 69.5 | 74.3 |
| Public sector | 18.4 | 22.4 | 21.1 | 19.8 | 20.0 | 15.9 | 22.3 | 22.0 | 18.0 |
| Private corporate sector | 9.6 | 7.1 | 6.7 | 6.6 | 9.0 | 8.7 | 8.5 | 8.5 | 7.7 |

## *Calcutta*

### A Different History

*A Correspondent writes:*

ON August 24, Calcutta celebrated the 295th anniversary of the city's foundation with seminars, meetings, exhibitions and so on, held at a number of venues stretching from St John's church, in the yard of which lie buried the mortal remains of Job Charnock, to an old palace in central Calcutta belonging to a Bengali family favoured by the early British marauders with the Raja title. The participants also included a wide spectrum—historians, novelists, poets, and politicians like the old Congress stalwart Atulya Ghosh, Left Front minister Prasanta Sur and mayor Kamal Basu, the last two belonging to the CPI(M).

The organisers of these celebrations obviously trace the history of Calcutta from the Kiplingian myth of the 'chance-directed, chance-erected' settlement arising out of Job Charnock's 'midday halt' in 1690. True history, however, is somewhat different. This would-be location of the British settlement in Bengal was well known to Charnock and he made his selection after mature consideration of its strategic advantages.

Indeed, in 1686, that is, four years before the commonly reckoned date of the foundation of this British settlement, Job Charnock, then Agent of the East India Company in the *suba* of Bengal, had retreated to Sutanati, one of the three villages later to form the nucleus of the city of Calcutta, after having ransacked the Hooghly township during a conflict with the Mughal power. Secondly, far from being 'chance-directed', this location was chosen by the shrewd servant of the John Company with an eye to its immense strategic value. "In selecting Sutanati", writes Firminger, "as the place for the chief settlement in Bengal, Job Charnock made his choice deliberately and well . . . On three sides the place was secured by the river, the salt lakes and the ancient channel of Adiganga . . ."

The point, however, is not really so much concerning history, as one of looking at history. Whether its beginning is traced from 1686 or 1690, for a long period, Calcutta as the seat of the predatory British power was the nerve-centre of heinous crimes against the people of Bengal and India. The Bengalis and other Indians who served and collaborated with the British marauders in this early phase were solely motivated by narrow self-interest and objectively betrayed the interests of their own countrymen, without any mitigating circumstance in their own favour.

While its importance as a subject of historical research cannot be denied, no Indian can, however, in any way identify himself with this early phase of Calcutta's history or feel nostalgic about it. Indeed a lot of research and discussions are still needed to pinpoint the precise period from which Calcutta can be said to have begun its career as a focus of India's regeneration. Once this question is settled, celebrations should be organised to commemorate this turning point of history. Any fanfare about Job Charnock's 'midday halt' is a display of servility.

The recent Calcutta celebrations, however, are not something out of character with or incongruous considering our post-independence national practice. The Indian army, for instance, still celebrates the raising of various regiments and battalions tracing their origin to 1746, 1839 and so on and gloats over their exploits in various battles against the Indian rulers. The overall attitude of our elite and ruling apparatus is really coloured by the denouement of our freedom struggle which ended in a compromise with the British colonial rulers, as a result of which Indian independence is seen as evolution with its continuity with the Raj, which it partly is.

## *Superpower Summit*

### How Serious Is the US?

THE hopes resting on the November meeting between Ronald Reagan and Mikhail Gorbachev seem to be dimming with virtually every passing day. Ordinarily one would have expected that with a superpower summit round the corner, both parties would go out of their way to create an atmosphere which is conducive to some positive outcome in the negotiations at the summit. But exactly the opposite seems to be happening.

This is particularly so judging by the stance the US is taking on various matters of US-Soviet concern, even though the major initiative for convening the summit came from the US. The Soviets have, on the other hand, tried to be accommodative, on the surface at least, by declaring a five-month moratorium on nuclear tests and inviting the US to join in a mutual moratorium for a more extended period. The Soviets have furthermore not only forsworn any further missile deployments in Europe but also publicly offered to negotiate a mutually agreed reduction in nuclear warheads by as much as 30 per cent. The US has either spurned these Soviet gestures or raised procedural objections. For instance, on the mutual reduction of warheads the US objection is that if the Soviets are serious why do they not place it on the table at the ongoing Geneva negotiations on strategic arms limitation.

What is quite intriguing is that having sought a summit meeting, the US now seems to be on a path that could lead either to the summit's cancellation or to the summit, even if held, resulting in little tangible progress in the easing of superpower tensions or perhaps in actually accentuating them.

One day the US national security adviser accuses the Soviets of hypocrisy on arms control and declares that, unless they change their attitude, "even incremental improvements will be extremely hard to reach". Next day the US Administration announces that the US would conduct its first test of an anti-satellite missile-borne weapon against a target in space, claiming of course that the test was meant to develop US capability to deter threats to its own and allied space systems. The third day, the US despatches a strong note of protest to the Soviet Union against the use, over the past ten years or so, of 'spydust', a chemical capable of causing cancer, to track the movements of US diplomats posted in the Soviet Union. The explanation for raising the issue at this juncture is that only recently has the Administration learned of the said chemical's possible health hazards, although from reports of the briefing of US residents in Moscow on the subject it would appear that US diplomats themselves felt that the chemical powder was being used in such small quantities that there was possibly no cause for alarm. Evidently, the immediate purpose of the protest was to score one more point or to reinforce further the line that the US seems to have decided to take in the remaining few months before the November summit.

**SUBSCRIPTION RATES**

**Inland**

| | | |

Remittance by money order/bank draft/postal order requested. In view of revision of collection charges by banks, please add Rs 14 to outstation cheques.

All remittances to **Economic and Political Weekly.**

Does all this mean that the US Administration is having second thoughts on the advisability of a summit or even of engaging in any serious negotiations on issues of major concern? Or is it that all this is an exercise in preparing the US public for a possible failure of the negotiations, however seriously they are conducted? Suspicion now is gaining ground that the present US Administration is not, in fact never was, interested in serious arms limitation negotiations. And why should it be? It has more or less won the budget battle on defence, with practically all the weapon systems budgeted for left intact. So it can go full steam ahead with weapon-building. As for the threat to world peace, who cares? Certainly not the present US leadership.

## BUSINESS

# Blind Man's Buff

SEEN in the context of the latest cotton crop estimate of 101.5 lakh bales approved by the Cotton Advisory Board at a special meeting held on August 20, the 95 lakh bales target set for the Seventh Plan as also the various supporting programmes to achieve this target provide a telling example of the utterly futile exercises conducted in the Planning Commission, involving wasteful use of talented manpower. It was only about the middle of July that the Union agriculture minister Buta Singh convened a special meeting of state agriculture secretaries, agricultural production commissioners, vice-chancellors of agricultural universities, managing directors of national and state seeds corporations and agricultural scientists for evolving a national strategy to raise the overall production of cotton to 95 lakh bales (170 kg) by the end of the Seventh Plan. How could the agriculture ministry and experts who make up the working groups be so grossly misinformed about what is going on in the fields? What is true of cotton is perhaps equally true of other agricultural commodities. Not many outside the government have any illusions about the quality of our agricultural statistics.

The cotton season which ended with August is a stern reminder of the imperative need to improve the crop information system. Crop statistics put up at successive meetings of the Cotton Advisory Board, which is fully representative of all the interests concerned—the meetings are presided over by the Textile Commissioner—make an interesting study. CAB's first meeting of the season held on October 1 placed the 1984-85 crop at 79.80 lakh bales. This figure was revised to 84.75 lakhs at the subsequent meeting on February 2. CAB's third meeting held on May 10 placed the crop estimate still higher at 92 lakh bales. This figure was further revised to 101.5 lakh bales at the special—fourth and final—meeting of the Board held on August 20. The final estimate thus shows an increase of as much as 27.2 per cent over the first estimate put up at CAB's meeting on October 1. This brings into sharp focus the gross inadequacies in collecting crop information by the various interests participating in CAB meetings. Significantly enough, of all the estimates mooted at the CAB meetings it is the official estimates which are always very wide of the mark. The East India Cotton Association's estimates have been the closest to the mark.

Staple-wise and count-wise break-up of the final crop estimate submitted at the special CAB meeting in August is worth noting as it has a bearing on policy formulations. Staple-wise figures are: short 2.55 lakh bales, medium 41.95 lakh bales, superior medium 19.85 lakh bales, long 24.70 lakh bales and extra long 11.88 lakh bales. Countwise, 36.30 lakh bales comprised of cotton upto 24 counts, 17.50 lakh bales of 25s to 40s and 47. 13 lakh bales of 40s and above, making a total of 100.93 lakh bales.

Considering the progressive revision of crop estimates—these have had nothing to do with the weather conditions which could be described as ideal throughout, right from the time sowings to the harvesting of the crop—it is hardly surprising that cotton prices should have registered substantial declines from the highest levels recorded early in the season. The downward trend in prices continued upto the end of February and early March. Thereafter prices staged a sizeable rally which lasted until about the middle of April. Prices have been inclined lower since then. While short-medium varieties have slipped to the season's lowest levels, long and extra long staple varieties are currently quoted Rs 100 to Rs 300 a candy above the season's lows. By far the most significant aspect of the behaviour of cotton prices is the pronounced contra-seasonal weakness and that too despite record mill consumption of over 86 lakh bales during the 1984-85 season. In the absence of any dependable crop estimates, ad hocism marked the government's approach in dealing with the emerging cotton situation. Export quotas were released very reluctantly and were far short of the demands made by growers' representatives. The powerful industry lobby was successful in persuading the government to release an import quota for one lakh bales very late in the season, notwithstanding abundant indigenous supply of medium staple cotton. Belatedly realising that imports have had the effect of unduly depressing cotton prices, the government is reported to have decided to use imported cotton as buffer and even re-export it in the event of domestic prices declining below the support levels. Industry's purpose in importing cotton has apparently been well served as cotton prices have continued to display marked weakness even at the fag-end of the season.

The demand-supply balance-sheet of cotton for the 1984-85 season approved at CAB's special meeting on August 20 shows a surplus of 24.40 lakh bales at the end of August. Supply is placed at 118.50 lakh bales, consisting of carryover of 16 lakh bales from the preceding season, domestic crop of 101.50 lakh bales and import of one lakh bales. On the demand side, mill consumption is placed at 86.50 lakh bales— an all-time record—ex-factory consumption at 4.65 lakh bales and exports at 2.95 lakh bales, making a total of 94.10 lakh bales. The estimated carryover stock of 24.40 lakh bales is large enough to see the industry through till new crop supply becomes available. On current reckoning and expectations of normal weather, the 1985-86 crop has been estimated by CAB at 95/96 lakh bales. With many crucial weeks ahead, no forecast at this juncture can be taken seriously.

Perhaps the worst victim of the declining trend in cotton prices witnessed during 1984-85 is the Maharashtra State Co-operative Marketing Federation. Because of the relatively high guaranteed prices, the Federation is still left with an unsold stock of over eight lakh bales out of its total purchases of 17.50 lakh bales under the monopoly scheme. Reports are that the Federation is likely to incur very heavy losses this season, imposing a serious burden on the state exchequer. It is difficult to implement the monopoly scheme when the guarantee prices are fixed at well above the ruling market prices.

Under the new textile policy cotton has been assigned a pre-eminent role, or so the government claims. Utilisation of indigenous cotton is to be ensured by domestic consumption and by exports of cotton, yarn and other manufactures. Cotton growers shall always be assured off-take of their produce at remunerative prices. Cotton needed by the textile industry would be made available in adequate quantity and at reasonable prices. The role and functions of the Cotton Corporation of India would be reformulated to include price stabilisation operations and the Corporation would be allowed free access to international markets. The varietal imbalances of cotton is sought to be corrected by a mix of policies aimed at encouraging increased use of long and extra long staple cotton on the one hand and higher production of short and medium staple varieties on the other.

It is difficult to improve upon the objectives spelt out in the textile policy. But the basic question is how can one formulate appropriate policies for dealing with the various aspects of the cotton situation without reliable crop information? The need for strengthening the infrastructure for collecting reliable crop statistics can scarcely be over-emphasised.

## *Stock Market*

### Financial Institutions Take a Hand

THE stock market scene has undergone a profound change. Bulls who had been ruling the market for long, bidding up equity prices to levels which could not be justified in terms of any accepted norm—corporate profits/dividends, yield, price earning ratio or growth prospects—are now on the defensive. The magic of fluctuations which had of late become a major force behind the runaway boom has completely worn off. The unwinding of unhealthy bull speculation has uncovered many weak bull positions, converting paper profits into losses. The market which had never looked back after it undertook the historic bull campaign over seven months ago has been on the retreat since about the middle of August.

All this has come about because of massive institutional selling on August 12 and 16—this selling is still not over perhaps—causing the first major break in equity prices since the beginning of the upward trend in November. By the end of August, equity price indices had registered declines ranging between 11 per cent and 15 per cent from their all-time highs recorded in the second week of August; the all-time high in the case of Bombay was registered on July 22.

Considering the manner and the magnitude of the rise in equity prices over the past seven months or so, few could have had any serious doubts that speculative activity had assumed disquieting proportions. However, with speculative mania having firmly seized the market, bulls never bothered to take notice of unfavourable developments, including rigorous margins, exorbitant carry-forward charges and intermittent institutional sales in select scrips which, of course, were seldom large.

With its technical position rendered extremely vulnerable by the over-extended long account, the stock market was unable to withstand the pressure of institutional sales on August 12 and 16. It beat a quick retreat when it found all the major financial institutions—LIC, GIC and its subsidiaries, UTI and ICICI—emerging as keen sellers. These institutions placed orders with a large number of stockbrokers to sell a wide range of shares in the specified and non-specified list at market prices. Reports are that shares worth Rs 25 crore were off-loaded in two days. By the end of the month, institutions had effected total sales worth about Rs 35 crore.

It could not be just a case of all the institutions suddenly discovering the excellent opportunity the market offered to cash huge windfall profits—windfall profits, because nobody had dreamt of the rise that took place. Reports that behind these massive sales lay the government's unseen hand cannot be dismissed as wild gossip. The Union finance ministry had never made a secret of its concern over the runaway boom in equity prices. It was mainly at its insistence that the market authorities had taken a series of measures to enforce discipline on the market and contain speculation within manageable limits. These measures had not yielded the desired results. That the financial institutions had not acted entirely on their own is amply borne out by the manner in which the sales were effected—all the institutions emerging as sellers at the same time without specifying any price limits to the stockbrokers. This is not how institutions normally operate in the market. Nor is it desirable to do so. If price limits are not clearly indicated, the institutions would be easily outmanoeuvred by the stockbroking community.

Since all the major financial institutions are known to possess considerable investment expertise of their own, the propriety of the Union finance ministry dictating its decisions in such matters is open to question. Quite a few stockbrokers have been heard saying that not all the institutions have effected deliveries against their sales and that the sales have been carried forward. With the 'badla' rate of about 18 per cent (on an annualised basis) in their favour, institutions have everything to gain by carrying forward their sales. But if the financial institutions do not effect all the deliveries against their sales on schedule they would be exposing themselves to the charge of actively participating in stock market operations which ill becomes institutional investors. Indeed, the institutions would be setting a highly questionable precedent if they were ever to cover even a part of the sales effected by them. For their transactions would then acquire the status of speculative deals. This would add a new disturbing dimension to stock exchange dealings.

The overall behaviour of the market since about the middle of August indicates that the sharp break in equity prices that has taken place under pressure of institutional sales marks the beginning of a secondary correction that had been long overdue. Secondary reactions are as necessary to the stock market as safety valves to steam boilers. It is the most effective check on excessive speculation. It is difficult to say how long the corrective phase will last and how it will progress week by week. Odds are that the process of technical adjustment, which is now underway, could well turn out to be a long drawn-out affair. Seen in the context of the preceding staggering rise in equity prices, the current decline is still quite modest.

## LETTER TO EDITOR

# Struggle of Rural Women for Right to Education

SAKTI is a registered voluntary organisation working for the socio-economic improvement of women living below the poverty line in slums, rural and tribal areas. It has been running a women's development programme in about ten villages in Gingee taluk of South Arcot district in Tamil Nadu. The programme has enabled women to receive loans (from SBI) for purchasing milch animals and goats.

On March 8 the women attending the night schools celebrated International Womens Day. Since then 43 women attending the Nadupet women's night school and their supporters (both women and men) have been harassed by some anti-social elements from the Nadupet and the neighbouring villages to stop them from attending the night school. Physical intimidation and harassment from these goondas has increased during the last two months and they are insisting that the women's night school be closed down. During the last two weeks, the goondas have started beating up women attending the night school and their supporters. One of the night school teachers was also beaten up on July 17.

These anti-social elements have filed criminal cases against the women and their supporters. Police visited the area and have told the women to keep the night school closed. "Not even a lamp should be lit there", they were warned. Though complaints were lodged in the local police station, the physical harassment of the women and staff continues.

On July 16 the state legal aid board at Madras was contacted and petitions made to them. Some of the women MLAs and MPs of Tamil Nadu were also contacted and memorandums submitted to them. The main issues are:

(1) A move towards awareness and economic independence among the poor women and the scheduled castes is seen as a threat to the traditional powers in the village.

(2) Despite the physical harassment and intimidation the women are not demoralised.

(3) The developments require to be seen in the broader context of the struggles of the women and the poor.

JACINTHA S KUMARASWAMY

SAKTI, Bangalore.

# The Awesome Costs of Correction

### Romesh Thapar

THE price of hasty, 'instant' management is sometimes awesome, almost destructive of the original intent. Sant Longowal's killing at the hands of some hopelessly misguided youth parading as 'avengers' shocks because it should not have been possible to do this to him. He was targetted for destruction by the hard core extremists the moment he signed the Accord. What do we make of our security systems, and all the other paraphernalia operating against such killers?

One question leads to another. Why was it necessary to hold elections in September when the more experienced in political life were urging a longer time-span to cool emotions in Punjab, to permit Longowal to consolidate his hold, to isolate the extremists from their bases, and to cut across the gulfs dividing Sikh and Hindu? Surely, it could not be a reluctance to amend the Constitution. Was it then Governor Arjun Singh's desire to move speedily to higher responsibilities at the centre of power? Terrible errors are rooted in calculations of this kind.

Maybe, this hasty election was just the normal apolitical manager's obsession with maintaining the deadlines mentioned in the Accord, to clear the decks and declare one problem out of the way. This simplistic explanation probably contains the truth. It would be churlish to maintain that power was sought for the Congress.

Longowal could not have been persuaded to agree to a September election without some new perspective on the sharing of power and responsibility. Rajiv Gandhi's letter to the Punjab Congress, if read carefully, prepares the way for this healing touch. The direction is clear. Only candidates wedded to Sikh-Hindu unity, appreciative of the need to rise above the collisions of the past, and a warning to the factionalists of the Zail-Darbara era.

The structuring of the corrective, admittedly healthy in many respects, was by its nature very fragile. It was not sufficiently sensitive to the layers of alienation in Punjab's Jat communities. The 'instant' solution and the 'instant' response is a dangerous simplification in the realm of politics. It might work in societies less traditional and more modernised than ours. Here, the passage of time is critical, and timing has to be researched and made very precise.

Without Longowal, the Accord which was acclaimed continentally, has lost its anchor. The Sikh community is leaderless, at the mercy of unthinking terrorism, opportunist politicians looking for the 'big chance', and sleezy, criminalised operators living on the earnings of smuggling, on unaccounted gurudwara donations, and other suspect funding. That the hard-working Jats have lost Longowal, a man of the people, without worldly possessions, devoted to the interests of Punjab and Punjabis, and to a viable Indian federal polity, is a disaster.

The argumentation on whether the September election should be held or postponed captures the dimensions of the disaster. Whatever the decision, the killers will keep striking. This is their way of establishing Khalistan. There is no Longowal to expose them, and there is no one around to pursue his perspectives. A postponement of the election will give the killers a sense of achievement. On the other hand, if the time-table is maintained, it will make the hard core of killers more desperate. The dilemma is real, and we don't know what the people want. We never have at the best of times.

But the vulnerability of our political life is fearful. Can the farmer Badal rally the thoughtful? Is that supposed guardian of the gurudwara funds, Tohra, moving to hegemony? Or will the dubious Talwandi come into the play behind his aged Baba? The Sikhs by and large now see their future in the Akali Dal, and not a Punjabi Dal. But what has the Akali Dal reduced itself to in these few years? Can it find new, more relevant moorings? Who will risk his neck in this endeavour? Are not the killers a political presence?

These issues have to be raised at this moment of deep gloom, bordering on despair. Today, it is Punjab. Tomorrow, it could be Assam. This second accord is apparently, like the Punjab settlement, motivated by a promise that there will be a sharing of power despite ethnic collisions in the state. The non-violent student movement is not an anti-Congress force. That is fairly clear from the vibrations being received in the capital. If Chief Minister Jyoti Basu and the CPI(M) are startled by the 'surrender' to the Assamese, it is because Bengali votes have to be gathered, maybe, even a new state based on Cachar and some adjoining areas will be projected for this purpose.

In the politics we have popularised, issueless and based so squarely on caste, community and ethnicity, such material is highly inflammable. Accords are necessary, but there has to be an adequate follow-up and understanding of the fresh tensions that surface with every agreement. We cannot be apolitical managers in the complexity that is India. The cost is awesome.

Shortly, very shortly if Longowal's assassination does not paralyse the process of normalisation, we will be witnessing a rapprochement in Kashmir which will restore the old relationship between the National Conference and the Congress Party in this region. A failure here is unlikely because all the signs suggest that a continuance of the Shah regime will only create a Punjab-style situation shot through with fresh Pak-inspired insurgent activities. We destroy ourselves with delays, but unprepared haste is destructive too.

The fear which from the beginning naturally gripped many seasoned observers, that the unavoidable fragility of the accords could return us to the old confrontations should there be a breakdown in verbal and unwritten agreements, is now escalating. The inexperience of the coterie that now rules, a plus point in getting over the rigidities of the past and the tendency to allow complexities to paralyse decisions, could make a mess of the handling of the details which are so vital in political management based on trust or there could be sabotage (wilful or otherwise) from within a ruling party which is really dependent on equally inexperienced persons, largely living on the notion that political power is an essential lever for self-aggrandisement.

Several factors are at play, but, fortunately, two are dominant. First, Rajiv Gandhi's new-found, simple, straightforward resolve not to live enmeshed in a murky, amoral past, even if it means taking risks. And, second, his success in returning the political dialogue between him and others outside the ruling party to a framework of trust, the verbal agreement, the quiet understanding. Only those who have participated in the normalisation process are conscious of the change.

However, much more is required to deal with the twists and turns, the duplicities, and the growing violence of Indian politics. Rajiv Gandhi, make no mistake, is learning. But there will be no breakthrough to democratic normalisation unless he works towards wider and more sustained federal consultation. Let us hope that Sant Longowal's martyrdom will be for our troubled times what Mahatma Gandhi's was for a maddened continent in 1947. But martyrdoms alone are not enough. The people must change.

*August 23.*

---

## Larsen and Toubro

LARSEN AND TOUBRO proposes to set up a joint venture for the manufacture of electronic testing equipment in India in technical-cum-financial collaboration with Gould of USA, who is well known in this field in India and abroad. A new company will be registered for this purpose. The new company will have issued and paid-up capital of about Rs 6 crore, of which L and T will subscribe to Rs 4 crore and the balance will be held by the US firm. Under the licence agreement to be entered into by the new company, Gould will supply technical know-how for the manufacture of electronic testing equipment, train engineers of the company at its plant and depute its technicians in India to assist the company in the manufacture of these products.

SELF-RELIANCE
IN STEEL PLANT ENGINEERING AND TECHNOLOGY

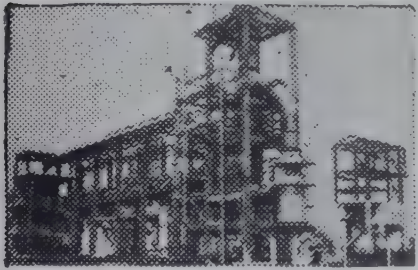
**Pioneer in steel plant consultancy in India,** DASTURCO has been closely involved in the planning, design and engineering of steel and allied projects for both the public and private sectors. It is consultant to several foreign governments, UNCTAD, UNIDO, World Bank and other international agencies.

**Integrated Steel Plants**
For Visakhapatnam Steel Project—India's first coast-based steel plant—DASTURCO as the Principal Consultant is providing comprehensive design and engineering services. DASTURCO is also engineering consultant for ☐ Modernisation of TISCO, Jamshedpur ☐ Silicon Steel Project, Rourkela Steel Plant.

**Alloy and Special Steels**
DASTURCO is the consultant to ☐ Alloy Steels Plant, Durgapur (initial plant as well as expansion) ☐ the Special Steels Plant, Salem ☐ Firth Sterling Steel, Nagpur etc.

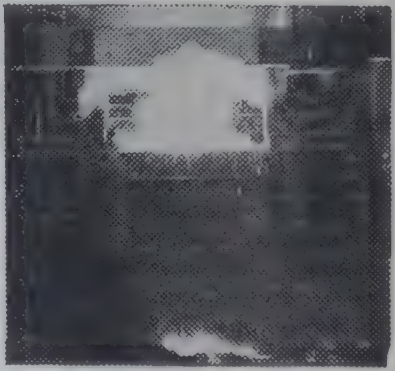
*TISCO modernisation : Charging molten metal into the 130-ton LD convertor*

*Superalloys Plant (Midhani), Hyderabad: Plant, general view*



*Sponge Iron Plant, Kothagudem : Direct reduction unit with waste gas cleaning facility*

*VSP—Rolling mill area : Roll shop column and equipment foundations*



*Alloy Steels Plant, Durgapur : Tapping of liquid steel from the 50-ton arc furnace (Stage-1 Expansion)*

**Mini Steel Plants**
India's first modern mini steel plant with advanced S-type curved mould continuous casting for Mukand Steel at Thane, Bombay was designed by DASTURCO as far back as 1959. Since then, DASTURCO has engineered a large number of mini steel plants in India and other countries ☐ Steel Complex, Feroke, Kerala ☐ Krishna Steel, Bombay ☐ Oswal Steel, Faridabad ☐ PT Badja Indonesia Utama, Jakarta etc.

**Sponge Iron Plants**
For SIIL's sponge iron plant, Kothagudem —India's first DR plant based on non-coking coals—DASTURCO has provided comprehensive design and engineering services.

Now, it is consultant to the Governments of Gujarat and Maharashtra for their two gas-based sponge iron plants.

**Superalloys**
Midhani's Superalloys Plant, Hyderabad—one of the most sophisticated and complex metallurgical plants in the world—was designed and engineered by DASTURCO.

**Export of Know-how**
As in India, DASTURCO is actively assisting steel development in the Arab world, South-East Asia, Africa and Latin America. Among the numerous assignments handled, the largest and most prestigious is the Misurata Iron and Steel Complex, Libya, now under construction, for which DASTURCO is the Principal Consultant. Currently, DASTURCO is also the Project Consultant for the Trengganu Direct Reduction/Electric Arc Furnace steel plant of HICOM, Malaysia. In Venezuela, DASTURCO provided design/engineering services for SIDOR plant expansion.

DASTURCO is the consultant to the Government of Oman for their first integrated steel plant (DR/EAF) and rolling mill. In Egypt, DASTURCO recently prepared a Master Plan for the development of the steel sector up to 2000 AD. And now, for the Government of Mongolia, DASTURCO is drawing up detailed plans for the establishment of the steel industry in the Republic.

# The Sway of Censorship

**A G Noorani**

IT is remarkable how confidently the state in India proceeds to stop the flow of information to the citizen. It is too brazen for words. The inconvenience, let alone the injustice, is not even attempted to be minimised. The recent case of the film 'Maficha Sakshidar', virtually a documentary of the Pune killings, provides a telling illustration. Its shooting began on April 17, 1980 and the film was completed in August 1983. The Examining and Revising Committees of the Board of Film Censors gave it an 'A' certificate without any cuts. The Revising and Re-Revising Committees saw it five times and refused a certificate in December 1983. A revised version was submitted in April 1984. But, once again, a certificate was refused. That was in December 1984. The producer, Hiralal Shah, thereupon moved the Film Certificate Appellate Tribunal set up by the 1981 amendments to the Cinematograph Act, 1952. The amendments came into force in 1983 and the Tribunal was set up on June 1, 1983.

This Tribunal passed Shah's film after 11 cuts. But on July 11, 1985 the Central government overruled the Tribunal's decision and refused certificate on the ground that it showed "brutal murders" being committed "without any feeling of remorse or regret . . . The modus operandi of the criminals is also shown".

Hiralal Shah will, of course, have no difficulty in citing examples of other films which have passed the Board despite the fact that by the Board's own yardstick in the present case the murders are more brutal and the "perverse pleasure" of the murderers is more evident. The long and short of it all is that for two long years the film has been through the varied procedures of censorship with a totally negative result in the end.

Consider the Kerala government's refusal to the British TV film maker J Edward Milner to shoot a film on developments inside the Catholic Church. Milner had come to India with his production assistant to shoot the film entitled 'Faith under Stress' for British television. They and their crew had almost finished their shooting schedule in Goa and other places in the country and were about to leave for Kerala when the state government refused permission for the shooting. The Central government had given the clearance for their work in the country (*Indian Express*, August 19). Kerala alone refused. According to the *Indian Express* correspondent what 'Faith under Stress' focuses on are the developments in the Catholic Church the world over in the wake of the emergence of the radical clergy advocating 'the theology of liberation'. They are rightly fighting for a church of the poor and do not share the conservative and pro-rich bias of other clergymen.

True, there is an immediate situation but it is no worse than say in Punjab where the ban on visits of foreigners and foreign pressmen has been lifted. The *Express* correspondent has reported on the current agitation and so have others. Why should anyone be forbidden to film it? We see these evenings on the TV even scenes of agitation by the blacks in South Africa not to forget the killings in Lebanon. Why is the Karunakaran government so hyper-sensitive? As the correspondent describes it,

> The ongoing traditional fishermen's agitation in Kerala for limiting the number of mechanised trawlers and measures for conservation of marine resources was to serve as a backdrop for Milner's filming in the state. The agitation by the Kerala Swatantra Malsya Tozhilali Union, an affiliate of the National Fishermen's Forum, is led by the state's radical Catholic priests and nuns.
>
> Sister Rose, a 43-year old Catholic nun of the Order of the Immaculate Heart of Mary is on an indefinite Gandhian fast in the coastal town of Alleppey in support of the fishermen, defying a ban on indefinite hunger strikes by clergymen imposed by the Catholic bishops.
>
> Both the official church in the state and the state government have opposed the traditional fishermen's agitation led by the radical clergy. The church backs a smaller rival fishermen's organisation led by a loyalist priest, Fr Parasuvila.
>
> Chief Minister Karunakaran had alleged that the agitation led by the radical clergy was foreign-funded.

It is a puerile accusation, the standard refuge of Congress(I) politicians. But what has Karunakaran to say of the correspondent's charge that "the police had, a few months back, allegedly prevented another free lance Keralite film-maker, Sasi, working for the Delhi-based 'Sentits' television film company from filming a march by the agitating fishermen to the state government secretariat in Trivandrum"?

If true, this is a shocking action on the part of the police. But the sad truth is that it is fairly common to find policemen snatching cameras and even roughing up photographers. In law no citizen is required to seek any permission or licence from anyone in order to take a photograph or shoot a film in a public place. Nor does he need to submit the film for censorship unless he wants to 'exhibit' it to the public or a defined class of the public. Section 4 of the Cinematograph Act, 1952 makes the Censor's certificate mandatory only for public exhibition. No permission is legally required for shooting a film in public places—roads, playgrounds, etc—open to all.

Those who shoot films or take photographs have the same rights as those who see and write, the press reporters. They are all entitled to the fundamental right to freedom of speech and expression which includes within its ambit the right to know, the right to receive information.

There is another aspect, besides. The film-maker or/and the photographer is as much a surrogate of the public as the press correspondent. Any citizen or public body can ask for a writ against the state ordering it to forbear from interfering with the rights of photographers and film-makers.

## Union Carbide India

UNION CARBIDE INDIA and RELIANCE INDUSTRIES have announced that the agreement of sale signed by them on March 27, 1984 for sale of the former's chemicals and plastics unit at Chembur in Bombay to the latter has ceased to be in force. It may be recalled that on December 30, 1983, Union Carbide had signed a letter of intent with Reliance Industries for sale of the unit as a 'going concern'. The sale was subject to approval of Union Carbide shareholders, debenture-holders, Central/state governments, financial institutions and various other statutory authorities and was to have been completed by September 25, 1984. On account of the delays in obtaining the various approvals, the completion date was extended from time to time and the last such extension expired on July 31, 1985. The expiry of the agreement was on account of the inordinate delay and the continuing uncertainty relating to the remaining approval. The management of the chemicals and plastics business has continued to be fully with Union Carbide India during this period, which has witnessed a firming up of the market for LDPE and chemicals.

# Fertiliser Project in the Bag

**Hansavivek**

*TATA CHEMICALS*, at long last, has received the letter of intent and MRTP clearance for the gas-based nitrogenous fertiliser project to be located at Babrala in Badaun district of UP. The fertiliser complex will be capable of producing 1,350 tonnes of ammonia per day which will be used for the manufacture of 2,250 tonnes per day of urea. The project will be implemented by Tata Fertilisers, which is at present a 100 per cent subsidiary of the company but which will be spun off as a widely held public company in due course. The company, either by itself or, if found necessary, together with its shareholders, associates and friends, will subscribe, on the basis of current estimates and subject to the final approvals of the government agencies concerned, Rs 75 crore to the equity share capital of Tata Fertiliser.

The company has turned in good working results for the year ended March 1985. The production of soda ash increased marginally by 2.5 per cent to a new high of 4,71,352 tonnes, representing a capacity utilisation of 94 per cent despite numerous handicaps. Production of densified soda ash increased by 22 per cent to 1,38,360 tonnes and placed the company in a better position to cater to the requirements of the glass industry and other users of densified soda ash. The production of refined sodium bicarbonate increased by 18 per cent to a new high of 21,669 tonnes. The production of salt during the year crossed, for the first time, the one-million tonne mark and at 10,23,288 tonnes, registered an increase of 36 per cent over the previous year. Correspondingly, production of bromine also increased by 52 per cent to 549 tonnes. Production of vacuum salt increased by 28 per cent to a new high of 90,118 tonnes, of which 15,100 tonnes were iodised. Production of caustic soda marginally declined by about 3 per cent and of pure salt by about 37 per cent due to sluggish demand. The benzene hexachloride plant was shut down for a month for complete overhaul and check-up to ensure maximum environmental safety. Production of BHC also declined by about 2 per cent.

The company has reported a gross profit of Rs 33.09 crore against Rs 31.97 crore in the previous year following increase in sales from Rs 105.16 crore to Rs 111.51 crore. These figures show a small decline in margins. With reduced provision for depreciation and a substantial saving in taxation, net profit has more than doubled from Rs 9.21 crore to Rs 20.97 crore. Unchanged dividend of 25 per cent on enlarged capital is covered 6.01 times by earnings as against 3.14 times previously.

The company could not meet the demand for soda ash and, sensing a shortage, unsuccessfully pleaded for import of this basic chemical. In the event, the company was once again reluctantly compelled to 'control' the distribution of soda ash. Subject to its contractual and moral obligations to those consumers who had stood by the company during the period of indiscriminate dumping of soda ash in the country, the company allocated the supplies on the basis of actual offtake during 1983-84 only among industrial consumers and had to cut off, once again, bulk supplies to the trade. The directors say that with the arrival of substantial quantities of imported soda ash now, the shortage situation is expected to disappear.

* 18 months.

*EAST INDIA HOTELS*' Chairman, M S Oberoi, estimates that 2.5 million tourists will visit India by 1990 and the country can earn Rs 15,000 crore in foreign exchange from tourism during the Seventh Plan. Oberoi says a meagre sum of Rs 187 crore was allotted for the development of tourism during the Sixth Plan, but foreign exchange earnings from tourism exceeded Rs 5,000 crore. Tourism thus accounted for 10 per cent of the country's foreign exchange earnings with a Plan outlay of less than 0.2 per cent. The grand old man of the country's hotel industry, however, notes with satisfaction that the Central government and the Department of Tourism have now directed all state governments to recognise tourism as a industry. The Planning Commission has also recognised the importance of tourism.

Meanwhile, the company's Bhubaneshwar hotel and the flight kitchen in Bombay are expected to open later this year. The extension to 'Oberoi Towers' in Bombay is expected to be fully operational in 1986. The renovation of 'Oberoi Intercontinental', 'Oberoi Grand' and 'Oberoi Mount Everest' is well underway. Further renovation programmes for the first two named hotels are also contemplated, including complete renovation of public areas. The management is also planning to renovate 'Oberoi Towers' and plans are under preparation. A part of the finances required for such renovation has already been raised by the company and additional financial arrangements will be made at the appropriate time.

The company has turned in satisfactory working results for the year ended March 1985. Gross profit has amounted to Rs 11.72 crore against Rs 11.17 crore in the previous year following turnover of Rs 42.33 crore against Rs 40.57 crore. With provision for depreciation requiring more, net profit is only a shade better at Rs 9.04 crore (Rs 9.03 crore). Dividend is maintained at 20 per cent on the capital enlarged by conversion of debentures and bonus issue. Equity distribution was covered 2.67 times by earnings against 3.60 times previously.

The issue of 15 per cent non-convertible secured 'rights' debentures of Rs 7.50 crore was oversubscribed and the company obtained a further sanction for an issue of Rs 7.50 crore. These debentures were allotted on July 17, 1984. In order to meet a part of expenditure required for refurnishing and renovation of its hotels, the board proposes to issue a series of 15 per cent non-convertible debentures aggregating Rs 6 crore on a private placement basis. An application to this effect has been made to the Controller of Capital Issues. The company earned foreign exchange amounting to Rs 28.56 crore and its wholly owned subsidiary, Mercury Travels (India), Rs 6.91 crore. The subsidiary showed a profit of about Rs 2 lakh against Rs 9 lakh last year.

*TATA-ROBINS-FRASER (TRF)* is diversifying its activities. It has obtained a letter of intent for manufacture of 50 each crawler-mounted side dump loaders and wheel mounted load haul dumpers as also approvals for technical collaboration with Thyssen Rheinstahl Technik-Deilmann-Haniel of West Germany for the manufacture of the former and with MAN Maschinenfabrik Augsburg-Nurnberg Aktiengesellschaft of West Germany for the latter. The management is initiating action to get the letter of intent converted into industrial licence. The company's diversification into manufacture of these underground mining machines at a time when coal mining activities are being substantially expanded is expected to pay rich dividends in the future. The company is also seeking an industrial licence for manufacture of stamping-charging-pushing machine and charging gas cleaning car and also for approval of collaboration agreement with Saarberg Interplan of West Germany. The management foresees substantial application of the stamp charging technology developed by its collaborator. The adoption of this technology by the steel industry in India will enable it to utilise inferior coking coal and yet obtain higher yields of coke of superior quality and consequently increase production of hot metal.

The company has turned in good working results for the year ended March 1985 with sales amounting to Rs 21.79 crore against Rs 10.25 crore in the previous year and gross profit rising from Rs 1.46 crore to Rs 2.03 crore. Margins, however, have shrunk noticeably. With both depreciation and taxation claiming more, the gap is narrowed and net profit is Rs 69 lakh (Rs 54 lakh). Dividend has been maintained at 16 per cent and is covered 3.28 times by earnings as against 2.57 times previously.

Efforts are being made to continuously update and modernise the plant facilities for achieving better quality of the products and higher productivity of operations. The company has been approached by some reputed companies abroad to take up marketing and after-sales service of their products in India. The feasibility of some of these offers is being considered. The company has initiated a foreign equipment sales cell with a view to emphasising this business.

*METAL BOX INDIA* extended its last financial year by six months to incorporate the sale of its bearings division as the Central government's approval under the MRTP Act was received only by the end of December last. Under the memorandum of understanding and arrangement signed with Tata Iron and Steel Company, this sale became effective from October 1, 1983. Consequently, accounts have been drawn up for 18 months ended March 1985. The company has shown a trading loss of Rs 2.55 crore against Rs 6.27 crore of the preceding 12 months ended September 1983 on sales of Rs 176.60 crore against Rs 112.59 crore. After depreciation, the loss has increased to Rs 5.63 crore (Rs 9.77 crore). With the fresh loss, the accumulated deficit has gone up to Rs 15 crore.

This outcome has been, in the main, due to the acute shortage and unprecedented increase in the cost of tinplate in the second half of 1984 and the inordinate delay in the finalisation of the sale of the bearings unit which caused enormous pressures on cash resources. The company's operations for the first five months, moreover, were subject to serious disruption as a prolonged strike at the Calcutta units ended only in February 1984. A change in government policy in March 1984 resulted in the imposition of heavy customs duty on the import of tin mill blackplate coils, which are required by the producers in India to manufacture tinplate. The problem was aggravated by the lack of timely decisions on the import of these coils, which led to periods of acute shortage of tinplate. The import duty on blackplate and tin free steel used directly by container fabricators was also increased by a steep 45 per cent. The cost of indigenous tinplate has increased by over 30 per cent since March 1984. To meet urgent customer requirements, the company had to import substantial quantities of tinplate by obtaining REP licences at a high cost. Another area of concern, according to Chairman Bhaskar Mitter, has been the import of processed food cans from Taiwan allowed to exporters of canned fruit products. These cans have been "virtually dumped" in the country, sometimes at prices below industry costs.

The 'Super Crown', a crown cork with a moulded liner, introduced last year, has helped the company to improve its market share in this product line. Further equipment for side seam welding of cans was installed at the units in the West and the North and this is expected to strengthen the company's position in the market. As was anticipated, sale of paper packages registered a healthy growth and a judicious marketing mix helped improve sales to major market segments like detergents, blades and confectionery. Furthermore, product modifications made to the Hermetet cartons helped in re-establishing this product firmly in the market. The company's machinery business is going through a difficult time. A breakthrough, however, has been achieved on exports to the USSR and this market is expected to expand in time to come. Export of third party items has more than made up the decline in packaging exports. The company has emerged as one of the largest exporters of fruit pulp.

The Chairman says that in the past several months the company has initiated various cost reduction measures, including management related costs, and the gradual impact of this is expected to commence from the current financial year. He feels that it is very necessary to contain employment costs of unionised employees as these are substantially out of line with wage costs in the packaging industry. Commenting on the prospects, he has said that the first quarter of the current year has shown a small estimated profit and, unless any major adverse factors intervene, it should be possible to consolidate this trend.

*INDIAN BANK* has shown impressive progress during 1984. It opened 77 new branches taking the total number to 1,041, of which 425 branches were rural, 237 semi-urban, 208 urban and 171 metropolitan at the end of the year. Further, the bank had 19 currency chests, 60 extension counters, 15 satellite offices and two mobile offices. Global deposits of the bank reached a level of Rs 2,371.7 crore registering a rise of 32.7 per cent over the year. Domestic deposits rose by 28 per cent to Rs 1,983.3 crore, which was higher than the rate of growth registered by all scheduled commercial banks. Global credit extended by the bank expanded by 37.7 per cent to Rs 1,592.1 crore and domestic credit by 30.6 per cent to Rs 1,171 crore. Advances to priority sectors recorded a commendable growth. The proportion of priority sector credit to total 'net bank credit' reached 40.3 per cent. Priority sector credit rose by 44.5 per cent to Rs 456 crore under 6,01,133 accounts as against 4,45,574 accounts at the end of 1983. Of this, agriculture accounted for Rs 165.2 crore, small scale industry Rs 192 crore and 'other' priority sectors Rs 98.8 crore.

Assistance rendered under the 20-point programme rose by Rs 37 crore to Rs 116.5 crore covering 2,13,736 accounts, of which Rs 27.2 crore covering 1,38,000 accounts were extended under IRDP, of which again Rs 6.9 crore were extended to 39,330 persons belonging to scheduled castes/tribes. The bank supported upto the end of 1984 some 5,389 self-employed persons with sanctioned limits aggregating Rs 9.3 crore. The bank earned a profit of Rs 1.41 crore against Rs Rs 1.40 crore previously. Out of this, Rs 110 lakh was transferred to contingency account for payment of bonus to employees and staff welfare, Rs 30 lakh to reserve fund and Rs 0.64 lakh to the government.

*UNITED LEASING*, New Delhi, is making a public issue on September 16 of 70,000 secured redeemable non-convertible debentures of Rs 100 each carrying interest at 15 per cent per annum and 3.50 lakh equity shares of Rs 10 each, both at par, to augment long term resources for meeting the requirements of its expanding activities. The company was one of the first to enter into specialised vendor leasing and has earned good success in this field. During 1984, it earned a gross profit of about Rs 33 lakh on a gross income of Rs 38 lakh. Its after-tax profit was about Rs 19 lakh on an equity capital of Rs 48 lakh and it paid a dividend of 15 per cent. Its gross assets as at end of 1984 stood at Rs 137 lakh. The company has signed an agreement for leasing of imported Skoda generators in India, which has further brightened its future prospects. According to R K Khanna, Chairman, the current year's working is even better with an estimated after-tax profit of Rs 8 lakh for the first quarter. The company expects to pay a minimum dividend of 16 per cent. Investors have to make applications for both debentures and shares in the proportion of 50 equity shares for every 10 debentures and in multiples thereof. The issue is managed by the Merchant Banking Divisions of Punjab National Bank, V B Desai, Bombay and Sikanderlal and Company, New Delhi. New Bank of India's Merchant Banking Division is advisor to the issue.

*NG EXPORT INDUSTRIES*, an existing solvent extraction company, is coming to the market on September 11 with a public issue of 7.40 lakh equity shares of Rs 10 each at par to raise a part of the finance required for increasing the capacity of its solvent extraction plant from 100 tonnes to 200 tonnes per day and of oil refinery from 30 tonnes to 50 tonnes per day. The project, estimated to cost Rs 106 lakh, is being implemented at the present plant site at Manavadar, a centrally declared backward area in Junagadh district of Gujarat. It is expected to be completed by the end of November 1985. The company is marketing its refined vegetable oils under the brand name of 'Rajhans'. It exports de-oiled soya cakes to Poland, West Germany, USSR, Denmark and Holland, among other countries. Owing to plough-back of profits, the accumulated reserves and surplus as at April 20 last were Rs 25 lakh against equity capital of Rs 24 lakh. A dividend of 12 per cent was paid for the Samvat year 2040. During the current year, the company is performing well. As compared to gross sales of Rs 373 lakh and profit after tax of about Rs 5 lakh during the Samvat year 2040, gross sales for about 6-month period ended April 20 last were Rs 384 lakh yielding a profit after tax of over Rs 7 lakh. The expansion of capacities will result in reduced overheads and other economies of scale, thereby further enhancing the profitability. The board thinks that the company will be able to pay dividend at the rate of 15 per cent on the enlarged capital for the accounting year commencing from November 13, 1985. The issue is managed by the Merchant Banking Divisions of Bank of Baroda and V B Desai.

*TRI-STAR SOYA PRODUCTS* is doubling its soya processing capacity to 400 tonnes per day with corresponding increase in the refining capacity to meet the anticipated increase in demand for soya refined oil and meal. The management expects the expanded capacity to be commissioned by the end of December 1985. To raise a part of the additional finance required for financing the expansion programme and augmenting the long-term resources, the company proposes to make a Rs 3.64-crore issue of 15 per cent secured redeemable convertible debentures of Rs 140 each, subject to the consent of the Controller of Capital Issues. A sum of Rs 40 out of the face value of each debenture will be instantly converted into four equity shares of Rs 10 each at par on allotment. The directors have decided to offer for subscription 1.20 lakh debentures as 'rights' to the existing shareholders on the basis of one debenture for every 10 shares held, 70,000 debentures to non-resident Indians and balance 70,000 to the public through prospectus. Meanwhile, the company has fared well during the year ended July 1985, the first year of full operations. It achieved capacity utilisation of 77.7 per cent and a turnover of Rs 15.28 crore, including exports of Rs 4.60 crore, according to unaudited preliminary figures. Gross profit is estimated at around Rs 1.30 crore. On expansion, turnover is expected to rise to Rs 25 crore in 1985-86 and to Rs 40 crore in 1986-87.

*HINDUSTAN ELECTRO-GRAPHITES (HEG)* is issuing 6 lakh 15 per cent secured non-convertible debentures of Rs 100 each on 'rights' basis to the existing shareholders of the company. The issue is being made partly to finance the cost of a spinning project set up in Jammu and Kashmir and partly for meeting working capital requirements of the company. The issue opened on August 28 and will close on October 10, 1985. As part of diversification programme, HEG has set up a spinning unit in J and K for the manufacture of cotton and synthetic yarn from man-made fibre filament and blends. The plant has an annual licensed capacity of 25,000 spindles, out of which about 8,000 spindles have already been installed and production started. The company is modernising its plant by updating the latest technology and also installing facilities to manufacture Ultra High Power (UHP) grade electrodes as well as longer length electrodes, which will be produced for the first time in the country and are in demand in the developed countries. The programme is expected to be completed by March 1986. HEG is also planning to set up a project for manufacture of newsprint and glazed/calendered newsprint from imported waste-newspaper and pulp with de-inking technology which will be introduced in India for the first time, having an annual capacity of 60,000 tonnes. This project is estimated to cost over Rs 100 crore and is planned to be set up in next two/three years. The company is working on a technical collaboration tie-up with a renowned foreign firm. During the past seven years ended April 1985, the company's turnover has increased from Rs 3.24 crore to Rs 42.69 crore. Turnover this year is expected to exceed Rs 60 crore. At full capacity, the newsprint project is estimated to generate a turnover of Rs 85 crore per annum.

# The Shavara Tribals of West Bengal

## I—Shavaras of Midnapur

**Mahasveta Devi**

THE Lodha and Kheria tribals are both mentioned in the census as Lodha-Kherias. The Lodhas are mostly concentrated in Midnapur. The Lodha concentration extends beyond Nayagram on Midnapur's border to Mayurbhanj district of Orissa. In 1983-84 I went to Mayurbhanj to attend a Munda conference where a benign looking tribal MLA told me smilingly that everything was being done for the Lodhas who were nothing but ungrateful wretches and thieves. Anyway, I can only talk of my state. The Kheria tribals of West Bengal are mostly concentrated in the district of Purulia. Some are to be found in the forest areas of Ranibandh (Bakura) and Banaspahari area under Binpur in Midnapur too. Even in the present days of dwindling forest belts, the Lodhas and Kherias live near forests.

The Lodhas far outnumber Kherias. Both were once known as criminal tribes. At least the Lodhas were denotified in the fifties. But the stigma of 'criminal tribe' haunts them. In 1983, while attending the bonded labour choupal in Palamau, I came to know that the Parhayia tribals too were looked upon by the neighbouring society as criminal tribes and were treated thus. It is to be noted that only the minority jungle-centred tribes were thus branded and the stigma persists. How deep the stigma is was nakedly exposed when Chuni Kotal, a Lodha girl, became graduate this year. While Chuni was praised skyhigh, almost all the journals reported that she came of a criminal tribe named Lodha. Chuni herself protested and her letters were published in some newspapers. How to remove this stigma from social conscience which lies dormant? In a children's journal one reads that a certain place in Jhargram is unsafe since criminal Lodhas haunt it. How to save the Lodhas from the onslaught by the mainstream if they do not become alert? A few months back the secretary of the Lodha-Shavara Samaj Kalyan Samiti wrote to me asking for my advice as one Sengupta had approached him with the bait of making a film on the Lodhas provided the Lodhas came forward with monetary help. A cheap but widely circulated journal has just printed a story about Lodhas raping other tribal women and the majority tribe being justified in killing the Lodhas.

The Lodhas remained a callously neglected minority tribe till 1982 when they revived their hitherto defunct Lodha-Shavara Samaj Kalyan Samiti and *Bortika* published a special Lodha supplement in which Lodhas and a Santhal contributed articles. *Bortika*'s aim is to remove the intermediary role of the intelligentsia between the man of the soil and the printed page. So *Bortika* prefers to publish what the grassroot level people have to say for themselves rather than an erudite article by someone learned. *Bortika*'s main aim is to document.

### UNHEEDED DEMANDS

In that supplement the Lodhas came out with their many grievances. First they held a meeting and sent an open letter to the chief minister of West Bengal with mass signatures and thumb-prints. We printed it. From 1979 to 1982 thirty-five Lodhas were killed in Patina, Khejurkuti, Shakpara, Ganua, Nunnunigerya, Saro, Baghjhanpa and Chakua. The first demand was for a judicial inquiry into the killings and suitable punishment for the culprits (nothing was done). The second demand was for legal punishment for the receivers of stolen goods and others who kept a small section of the Lodhas engaged in criminal activities (no result). The third demand was for employment for the educated Lodha boys and girls (a complete list with employment exchange numbers of the candidates were repeatedly sent to the appropriate authorities by this correspondent). The fourth demand was for compensation to the families of the slaughtered Lodhas, either employment or cultivable land (D Bandopadhyay, the then Land Reforms Commisssioner of West Bengal initiated an irrigation project for Patina Lodhas). The fifth demand was for residential schools for Lodha children (no result). The sixth demand was allotment of such land to landless Lodhas as was free of dispute and jotedar's hostility since some killings took place over land distributed to the Lodhas. The seventh demand was for making the Lodha community self-supporting through cottage industries, fishery, goat-keeping, piggery, poultry, etc, all on strictly co-operative basis. The eighth demand was for making the educated Lodhas belonging to the Samiti responsible for handling the money meant for Lodha development. The ninth demand was for letting the Lodhas live like human beings and freeing them from the dungeon to which they had been confined after thirty-five years of independence. The date was August 3, 1982, two months after the gruesome Saro-Baghjhanpa-Chakua killings.

The Lodhas had revived the Samiti in sheer desperation for physical survival. The awakening of the Lodhas surprised the state government. The sluggish serpent eternally in winter hibernation covering the Lodha name seemed to stir a little. Six Lodhas were appointed as Lodha cell social workers, including Chuni Kotal. And three boys were appointed as village welfare supervisors in Chakua, Chandabila and Pranabpalli, on contingency basis, at ten rupees a day. All were employed in September 1983.

This encouraged the Lodhas. Chuni went for college studies. Boys who had left school in the higher classes were persuaded to complete school. The need was for at least a hundred social workers in different thanas. It was physically impossible for six workers to cover more than three hundred villages. Since the village welfare supervisors were working in a smaller area, their usefulness was soon established. Through their devotion and dedication Lodha and some non-Lodha children came to the community centre for studying. These workers could persuade the Lodhas to give up drinking, to save from their wages, to live hygienically. They felt that the state government was coming forward with schemes for development and the Lodhas should be prepared to reap the full benefit of such schemes.

A tribe, hitherto disunited, mercilessly exposed to the onslaughts of the mainstream, was emerging for the first time ever as human beings. The tribals needed, and still need, these supervisors. They are easily cowered, easily thwarted, guiless people, they play into the hands of the wily tribal neighbours. Eager to please one and all, they will do anything to earn a friendly smile. How different is the picture in Chakashapur village under Debra (Midnapur) where I had the privilege of witnessing a ceremony in honour to a dead Lodha social worker. There the Santhals and Lodhas and Mundas and other castes were joint sponsors. I saw how freely the Lodha women joined in the community dances. How could they do it? Because there the Lodhas are now free from fear with help from their neighbours. Fear of others is deeply ingrained into Lodha existence.

In 1985 the picture is different. This year the three contingent posts have been abolished and the three boys, Krishnaprasad Bhukta, Tarun Bhukta and Jadunath Mallik, are without a job and the villagers are dumb spectators. What an incentive for the Lodhas to go for education and social work. An advising committee on Lodha development does not have a single Lodha among the members. If one employee from the Lodha cell gets included, it cannot help the Lodhas as such a member will not have any voice. Thus the Lodha sees that things get done in his name but he has no voice to say what he needs. He cannot even say how haphazardly Lodha development projects are being implemented. It is time that an outside agency is entrusted with the task of seeing and evaluating whether such projects are helping the beneficiaries to the intended extent.

### PERSECUTION OF TRIBALS

And how are the Lodhas being treated? Saro under Jhargram thana witnessed a brutal Lodha killing in 1982. On June 30, 1985, there was an incident of thievery at nearby

Andharisol village. The village worthies came and threatened two Lodhas of Saro to come out with the names of the culprits, else their houses would be burnt and possessions looted. The two hid in the forest, which they always do. Do they pray to the guardian gods and goddesses of the forest to hide them? I don't know. I hear that they were arrested, their homesteads along with other Lodha homesteads were looted. Now the wives of the two Lodhas trudge wearily from Jhargram thana to the Lodha cell office and go back home. Saro I visited in 1982. Quite a distance from Saro to Jhargram and to the Lodhas of Jhargram, sub-division Jhargram town administration is as inaccessible as New Delhi. About a month ago or so the Lodhas of Jaralata village were returning home after purchasing rice. The thana police accosted them and seized their cycles.

The persecution story of Radhanath Shavara, a retired armyman, will bring the picture into more clear relief. Radhanath, a man of keen social conscience, a resident of village Chandabila came back home after his retirement about eleven months ago. The Lodhas started to come to him whenever disputes arose or quarrels broke out and they accepted his judgment. If a man from their own community could solve matters, why run to others? On September 16, 1984, Radhanath was asked by the Lodhas of village Kundalia to settle some quarrel or dispute. Radhanath settled the matter. The controllers of Lodha life did not like it. They must have felt threatened. Were the Lodhas becoming too independent? Usually a Lodha in a scrape always has to run to others either with bribe or with a vow of allegiance. This is not the time for teaching the Lodhas a lesson by unleashing a lynch mob upon them. Methods more sophisticated, more wily are needed; best to punish a Lodha through another Lodha, thus keeping the names of other castes clean.

At Jaralata village a tank was being dug. Radhanath was the supervisor. On July 23, 1985 he was going to the block office with the muster roll, for only the work-supervisor was responsible for payment to the workers. It was under the Lodha development project. Near Patharnalla village Radhanath was approached by some Lodhas who requested him to accompany them to the thana to clarify points a of land dispute. No sooner than Radhanath entered the thana, he was arrested. The charges against him are many. All criminal ones. After much pleading the persuasion by some he was released on bail on July 28/29, 1985. But the case remains baffling. Only an impartial investigation can solve the mystery, but who bothers for a Lodha, even if he be a former jawan of the Indian army? What an encouragement to the Lodhas to advance their ways!

But the story of the two villages, Pataghar and Laljaal, is a fit subject for film-makers and playwrights who speak for social justice by portraying social injustice to the weak. The background story. The Kheria Shavaras of Pataghar wrote to me pleading for a well. The panchayats in West Bengal are doing such glorious work for the villages that till November 1983 many Kheria villages of Purulia like Pataghar did not have a single well for drinking water. Scums of the earth, the semi-dry streams were all they had. A well was sanctioned for Pataghar, a Kheria village. And it was allegedly snatched by an influential resident of Laljaal, a comparatively well-off village dominated by land-owning other caste people. Well, the Kherias ran here and there and another well was sanctioned for them. This was unforgivable, this effrontery of the hitherto submissive Kheria people who are threatened by starvation, landlessness and marauding elephants of Banapahari forest.

Madhu Shavara, according to the almost illegible letter from his son, Manik, was poor, a drink addict, and the unending battle of trying to eke out a living slowly affected his brain, already weakened by starvation. Father of a son and daughter, both teenagers, one day he beat his wife and drove her out to her parent's house. Then he became a suicidal maniac. Many times he tried to steal away to the forest and hang himself from a tree. Each time his son or a relative or a villager rescued him. Hekim Shavara, his uncle, was a comparatively well-off person, possessing some land and some heads of cattle. Hekim tried to help his nephew as much as he could. It was well known in many villages that Madhu was mentally deranged, and he was suicidal.

On June 16, 1985, Madhu took a 'lota' of water from his daughter, went to the forest and hanged himself with a rope made from strips torn from the lungi he was wearing. In the villages, fields and forests are people's latrine. Manik grew panicky when his father failed to return for quite a time, went to the forest, found his father, called the villagers and they brought the dead Madhu home. Perhaps the panchayat member or pradhan was informed. He and others advised Manik to cremate Madhu. The correct procedure would have been to inform the Binpur thana but that would have meant too much harassment for Manik. So Madhu was cremated.

On June 17, 1985 police from Binpur thana came and took Hekim Shavara and his sons to the police station on the charges of first murdering Madhu and then trying to conceal the fact by hanging him and assist in the cremation. Manik's letter is very pathetic. He tells me that neither his grandfather nor his uncles could have had a hand in Madhu's death. It baffles Manik why the police do not believe the residents of Pataghar who are in the know of the facts and why they believe the influential thirty-one other caste people of Laljaal who have allegedly filed the case and who do not know anything. He pleads that the case is a fabricated one and if Binpur police do not stop harassing his relatives, the result will be disastrous for all concerned. For his grandfather has already tried mediation by other people and failing in that, is pawning his possessions and cattle to appease you know who. Another Shavara writes with desperation that the Laljaal people are boasting that they want to teach a lesson to the Kherias who have become swollen-headed with all the attention they are receiving from the government.

### CLASS MOTIVATED

Why this vindictive attitude towards the Lodhas and the Kherias? Does the state government want it? No. But the neighbouring society, the controllers of village life, mostly belonging to the affluent class, cannot simply tolerate that the hitherto submissive people want to live like human beings. The treatment these unfortunates are receiving is basically class-motivated. In Midnapur the political picture is very muddled and the minority communities have always tried to survive by being loyal to the ruling party. But the major constituent of the Left Front in this district may show lip-sympathy for them but does not come to their succour when they suffer. It is also a fact that in the village hierarchy the controllers and operators have changed flags just to hold on to land. These days the controllers operate with wilier machination. The government's policy for Lodha development has roused the people who treated Lodhas as expendable. Midnapur, Purulia, Bankura, tribal inhabited districts should have administrative heads in Midnapur and Jhargram who understand the tribal question. But officers trying to do their duty and trusted by the people are always transferred. No one stops to ponder and think whether the government's declared policy is actually benefiting the Lodhas-Kherias or not. That a policy has been declared is enough to launch repressive actions.

Nor can the district administration be absolved of responsibility for the Lodha-Kheria question. When there is a special budget for them, why retrench the three boys? Why cannot a portion of that money be used to create more posts of social workers and village welfare supervisors? Narayangarh police station has the largest concentration of Lodhas. Is it all hearsay that schemes were made for tribal development, money allotted per scheme and nothing has been done in the last fiscal year? What is the role of the much lauded panchayats? If finance is released at the last moment how can schemes be implemented?

It is a matter of great shame that on the one hand the state government declares its policy for Shavara development and in actuality the people concerned are threatened, thwarted, harassed and pushed back to those days of the prison. This prison lies within the Lodhas and Kherias. Fear psychosis keeps them imprisoned within.

Who will help them? Surely not the political parties. Till date not one party has issued an official statement against the Lodha killings. Bigger issues interest them, not the oppressed tribes.

Saro people. Radhanath, Manik, Hekim, the names are endless. Midnapur district, at the core, politically and class-wise, is divided between Pataghars and Laljaals. An outside agency survey of the various rural and tribal projects will further reveal the role of the village panchayats in alleviating rural poverty. Who benefits from such projects? People on the paper, but in reality who?

And, to conclude the Midnapur Shavara story, has the Lodha-Shavara Samaj Kalyan Samiti (for that matter any grassroot level Samiti) been recognised as a responsible agency? The answer is 'no'.

The Purulia Shavara story is similar with shades of difference.

[To be concluded]

## LABOUR

# Textile Workers' Strike in Tamil Nadu

**Gnana Surabhi Mani**

**R Shenbagavalli**

ON July 15 the dispute between textile workers and mill owners in Tamil Nadu was referred to the Industrial Tribunal by the government of Tamil Nadu under section 10-B of the Industrial Disputes Act of 1947. When bilateral negotiation fails, section 10-B of the Industrial Disputes Act is invoked. The Joint Action Council comprising the CITU, AITUC, INTUC, HMS, DMK, AIADMK and Janata unions had already given strike notice and, if the bilateral negotiations then going on were to fail, the workers were to go on strike from July 16. When the workers heard that the government of Tamil Nadu was going to invoke section 10-B and refer the dispute to the tribunal, they got indignant and absented themselves from work right from July 14. The reference to the tribunal was viewed by the workers as a pre-emptive move on the part of the government to undermine the collective bargaining power of the workers through their unions.

More than two lakh textile workers were involved in the strike. The official estimates put the number of mills at 529, but the unions claim that there are over 600 mills in Tamil Nadu. Perhaps mills where unionisation has not taken place were left out from the official statistics.

Immediately after the official announcement referring the dispute to the tribunal, the INTUC and AIADMK unions officially backed out of the strike. However, the indignation of the workers over the reference to the tribunal was so much that a vast majority of even INTUC and AIADMK workers stayed away. Even with no party, person or unions exerting any pressure on them, workers belonging to these unions took an active part in the strike. The strike lasted only a few days. However, the workers still feel indignant over the reference to the tribunal, foreclosing other options.

The earlier settlement having expired on July 16, 1984, the Joint Action Council of all the textile trade unions presented a 28-point charter of demands to the mill owners. The mill owners responded with a 14-point charter of demands as a countermove. The mill owners seem to have insisted on the acceptance of their demands as a precondition for any negotiations. While the demands of the workers were for revision of basic pay and for safe working conditions, the counter-demands put by the mill owners amounted to a drive towards reversal of earlier established policies and conventions.

The 28-point charter of demands of the Joint Action Council of unions included, among other things, revision of basic wages, increase in dearness allowance, annual increment, night shift allowance, casual leave benefits, employment opportunities for women, abolition of substitute system and contract system, safeguard against retrenchment, and safety measures to be adopted in the mills.

Now let us have a look at the 14-point charter of demands insisted upon by the South Indian Millowners' Association (SIMA). The first demand is that work-load has to be fixed scientifically in order that productivity may be raised. When work conditions and types of machines vary from mill to mill, it is indeed absurd to prescribe a uniform work-load for all the mills. Then SIMA insists that the management should have the right to shift workers from section to section in the mill. The implication is that the unions should not interfere even where a transfer is found to be a case of vendetta against the worker. The third demand is the age-old one that wages should be linked with productivity. The Supreme Court has given its ruling against this years back. Productivity gets affected when mill owners do not re-invest in the mills the profits they make. The mill owners divert the profits into investment in various other sectors and this affects productivity in the textile industry for which the workers are in no way to blame.

The fourth demand is that the price of food items in the mill canteens should be fixed according to the fluctuations in the consumer price index (CPI). The fifth demand is that fixation of dearness allowance should be made on a half-yearly basis rather than on a monthly basis as is being done now. The sixth demand is that a DA of only 26 paise should be paid per point exceeding 3,000 points. The present position is that within 1,000 points 30 paise is being paid per point and 32 paise is being paid per point beyond 1,000. There is a contradiction in the fourth, fifth and sixth demands of SIMA in as much as it wants fixation of DA to be done on a half-yearly basis while prices of canteen items are to be fixed according to the fluctuations in cost of living index. The sixth demand wants to limit DA within a certain level for a period instead of it varying according to fluctuations in the CPI. These are all a push towards reversal of policies now followed.

The next demand seeks to lower the age of retirement. SIMA wants to retire workers at 55 whereas they are now retired at 58. The eighth demand is that skill and regular (240 days minimum) attendance should form the criteria for awarding a wage increment. And that too, upto the 40th year of age only. The demand implicitly acknowledges that a worker in a textile mill loses his health rapidly due to the health hazards he is exposed to while at work. Instead of trying to improve the working conditions and make the work atmosphere healthier and safer, SIMA proposes to freeze all increment in wages to workers after 40 years.

That promotion should be based on merit and skill and not on the service experience of the worker is the ninth demand. This implies that any worker can be penalised and not be promoted on a vague charge that he lacks merit and skill for which an objective assessment is not at all possible.

The next demand that SIMA has put forward is that bonus should be paid on the basis of 1965 Act. The 1965 Act prescribes a minimum bonus of 8.33 per cent and a maximum bonus of 20 per cent. In 1979, SIMA itself entered into an agreement with unions to pay a minimum bonus of 20 per cent. The bonus paid in various mills in Tamil Nadu from 1978-79 to 1981-82 exceeded the maximum and reached 32 per cent. When huge profits are being made by the mills, is it not right on the part of the workers to bargain for a higher rate of bonus? SIMA wants to reverse this trend and put an end to collective bargaining in respect of bonus.

SIMA wants to subject the workers to medical fitness tests frequently. That is its eleventh demand. That lay-off compensation should be paid only for the first 45 days of lay-off is the twelfth demand. (The demand of the workers is that full wages should be paid for lay-off exceeding 45 days.)

The thirteenth demand states that recruitment of workers should be done on the basis of merit and skill only. The implication is that the workers' heirs should not as a right claim to be recruited in the place of their fathers. Also it is sought to be ensured that the unions should have no say in the matter.

That 10 per cent of the total permanent workers will be substitutes is the last demand. This demand makes clear that the mill owners are bent upon exploiting cheap labour. While the unions want only two categories of workers, namely, permanent workers and learners, and demand the abolition of all other types of labour, SIMA wants to keep a high percentage of workers on a temporary basis all the time.

Most of SIMA's demands strive to put the clock back. A reversal of all that has been secured by the workers so far is attempted. In these circumstances, the workers have come to view the reference to the tribunal with suspicion and anger. They strongly feel that they cannot get justice from the tribunal. This is because earlier references to the tribunal had produced unfavourable results for the workers. Coimbatore mill workers who had been getting 12.33 per cent bonus previously got a reduction in bonus after the bonus dispute was referred to the tribunal. The bonus awarded by the tribunal was only 8.33 per cent. In the case of Pandian Sugar Mills where the workers were fighting against retrenchment reference to the tribunal resulted in retrenchment of workers. Industrial tribunals sometimes take more than two to three years to give their award. This sort of delay harms the interest of the workers.

After the talks the unions had with the minister concerned, the government agreed to constitute a Special Industrial Tribunal for settling the dispute. Only 12 demands of the workers were referred to the tribunal. The unions saw to it that the demands of learners, casual workers and contract labourers were also included. Demands pertaining to labourers working in mills having less than 2,000 spindles have also been referred to the tribunal. Though the unions have thus succeeded in making some changes in the terms of reference by insisting on the inclusion of more demands, the fact remains that the collective bargaining power of the workers through the unions has been bypassed by the reference to the tribunal.

# Sant Longowal: Some Recollections

**Harji Malik**

SHOCK and grief at Sant Longowal's assassination indicate how desparately the country needs men of integrity and goodwill. When such a leader appears, who shows no signs of personal ambition, whose incorruptibility is beyond question, we reach for him like drowning men cling to the last spar. That is the only explanation for the widespread sorrow at the death of a man who, until just about five months ago, was considered to be merely one of several prominent Akali leaders, totally regional, judged to be more limited in vision and experience than those who had served in the Janata state and Central governments, a religious leader, not a political heavyweight. In those five months he attained the stature of a national leader, a man of peace, in many ways the torchbearer of hope for those who are deeply concerned, not about mere political advantage, but about the very survival of the nation.

When he met the Nagrik Ekta Manch volunteers on his first visit to Delhi after his release from jail, he refused to sit down because he said that to do so in front of those who had rendered such heroic service to his people in the November terror would not be befitting. The young volunteers, cynical about politicians, had not been enthusiastic about the meeting arranged so that the Sant could thank them for their help and succour, but his simplicity and sincerity won them over. For he was a man who behaved according to his truths, free from any need to make gestures for the sake of appearances.

Perhaps that is why the ceremonial trappings following his assassination, the formal, often fulsome tributes, some from those who all along had maligned and undermined him, were such an ironic contradiction. The real tribute and love came from the hundreds of thousands who covered all the fields around the village at his cremation. For he was of the village people, a man of essential humility in the finest sense, a man without pretensions, a man who was always himself.

Until recently many had called him weak and ambiguous, others a coward who had been unwilling to stand up to the extremists for fear of his life. Today he is being talked of as akin to Gandhi in the ultimate sacrifice of his life in the cause of communal harmony. His death, like those of Gandhi, of Martin Luther King Jr, was no surprise assassination. All three men deliberately took up the gauntlet of peace in the face of violence and hatred, all knew what was at stake, all stood steadfast to death.

The qualitative difference is that in Longowal's case it is only in death that we have recognised the worth of the man, his deep sense of humanism and compassion, his courage and integrity, his abhorrence of violence, all qualities which, had he received national support earlier, both popular and political, while alive, could have served the country so well, and saved it much tragedy. The man of peace was to be appreciated only after the assassin's bullet, the man of goodwill, too late. For with earlier recognition the August Accord could have been signed before June 1984. That is the failure of our present polity.

On April 25, 1983 I met him for the first time in the Akali Dal office in the Golden Temple complex. I had expected a typical politician, 'diktator' of the Akali Morcha, tough, facile in his answers, aggressive, populist in manner. Instead there was the Sant with his serene expression, the gentle smile so quick to come, the mixture of quiet dignity and innate authority. The austerity of the room, furnished only with the barest essentials, reflected his style. We were punctual, so was he, dressed in his usual spotless, fresh white kurta and churidar, wearing the bright blue Akali turban, his face thoughtful above what was then a beard with many more black streaks than after his jail experience. Soft spoken—another surprise—he answered our questions briefly, to the point, with patient courtesy. He categorically denied that the Akalis had ever demanded Khalistan, warned that unlike the Assam situation, the Punjab crisis would be uncontrollable if it went out of the hands of the Akali Dal, and explained that religion must be part of politics in the interest of human welfare. He did not raise his voice, but at any mention of Bhindranwale a grim expression came over his face and when I asked if Sant Jarnail Singh was a member of the Akali Dal, Longowal replied tersely "You must ask *him* that". He uttered no word of ill-will against the Hindu community and we left with the conviction that this was a good man, certainly no fanatic, a leader in a category apart from the dominant majority of politicians.

Sixteen months later, after the trauma of the assault on the Golden Temple, I heard about him from a lawyer who had met Sant Longowal in Udaipur, where he had been 'detained' since June 8, 1984. The lawyer described the conditions of his detention in the Legislators' Guest House. The building was surrounded by about 200 men of the armed forces camped in tents pitched in the compound. Bunkers had been dug all around the building, and sandbags positioned, with armed men stationed everywhere, guns ostentatiously at the ready, according to the advocate. The curtains of the guest house had been replaced by heavy tarpaulins to prevent anyone from seeing inside and *vice versa*. Nor presumably could fresh air or light penetrate. The public road before the building had been blocked off, and the front doors of houses situated on the road sealed. The army was in control outside, the police inside.

Longowal told his lawyers that they were the first persons he had been allowed to meet since his solitary confinement started on June 8. It was now August. He was permitted no radio and the only newspaper he had seen till that day was on July 3, a Punjabi paper dated fifteen days earlier. No member of his family had been allowed to visit him. (After his release in April this year Longowal told the *Illustrated Weekly of India* that two members of his family visited him some weeks earlier. He also said that "six or seven armed men" kept encroaching on his privacy all the time.)

While the two lawyers who were representing him in the appeal against his detention in the Supreme Court were talking with him, the Jail Superintendent and a plain-clothed CID officer insisted on being present throughout. The lawyers protested that according to written rules a conversation between lawyer and client is 'privileged', the two men paid no attention and refused to leave, refused even to stay out of earshot, stating that their orders were to 'listen in'. The lawyer-client interview became a written question-answer interchange, in Gurmukhi and Urdu scripts. But after half an hour the government men objected and conversation was resumed, in Punjabi.

Yet this man, treated like the most dangerous national enemy, incarcerated in solitary confinement for ten months with no charge against him, cut off from the rest of the world in every way in a deliberate effort to break his spirit—he was allowed to walk in an enclosed courtyard outside his room once a day—showed no sign of bitterness when he was finally released, no sign of anger, of personal resentment. Not even the pain and shock of the news he received about what had happened in Punjab during his confinement and the reports of the post-assassination savagery in Delhi and other cities, provoked anti-Hindu sentiments from him. Angry and anguished, he only repeated what he had consistently asserted, that the Akali fight was against the government and the ruling party, both of whom he held fully responsible for what had happened.

In the unique circumstances in which he found himself on his release, politically on the defensive with his own people, thanks to the deliberate campaign to defame his name by describing his arrest as a 'surrender' and to the equally deliberate tactic to weaken him politically by removing him from the scene by a long, unjustifiable incarceration, Longowal's initial reactions to Indira Gandhi's assassination and the death of Bhindranwale led to misgivings in many circles but later events put all this in a proper perspective. In the interests of the community's welfare and the unity of the nation he generously overcame his deep-rooted mistrust of the government and the ruling party, and extended the hand of conciliation to meet the Prime Minister's initiative for an accord.

In late April when he visited Delhi I was curious to see if the past dramatic, tragic months had changed the Sant. He came to Tilak Vihar to talk to the many hundred widows of the November killings. The meeting place was overflowing with men, women and children, curious to see him, hungry for solace. The ground before the dais was crowded with the seated widows, old and young. Longowal looked different from the man I had met in April 1983. The serenity was there, but the face reflected a sadness that had not been present, there was sorrow in the eyes and the gentle smile was missing. He spoke very briefly, quietly, expressing his grief. He assured his listeners that the 'quam', and the Akali Dal were behind them, that they were not alone. "*We* will become strong" his voice carried conviction "But the ruling party will never be able to remove this stain from its forehead."

One of the widows rose to tell her story. She started quietly, but soon tears streamed down her face through the words. Longowal listened to the harrowing tale, related without dramatics, tears in his eyes. Another widow described how her husband and sons had been brutally done to death in front of her and the other seated women wept quietly at their own memories. Compassion is a rare quality in politicians, but one could sense strongly Longowal's deep sense of compassion, could instinctively feel that he shared one's own sense of terrible helplessness in the face of such pain and suffering. His sharing of grief came through in his few simple words, in the very diffidence of his bearing, in his eyes, throughout that pilgrimage of grief in Sultanpuri and Mongolpuri. He walked through the lanes of burned homes, some with heaps of ashes just over the threshold, visited homes where survivors had returned just to share their grief with him, sat in Gurudwaras which bore the marks of insensate hatred. He made no dramatic gestures, spoke no passionate words. But those who had suffered felt he shared their anguish and their anger, that he was with them.

At Sapru House a couple of days later, his first public exposure in the capital, he impressed everyone with that same simplicity, that great gift of conviction and sincerity without oratory, the sense of quiet strength and determination, touched always with the diffidence of humility. Unlike most public leaders he had no convenient images to suit different situations. He was always himself.

That was only the starting point of the emergence of Sant Longowal as the one Sikh leader who could restore to the community its sense of pride and honour, through the assertion of his own courage, his commitment to Hindu-Sikh amity and to the nation's integrity along with his commitment to non-violence. In a few short weeks he transformed the picture of the future, built up credibility, emerged as a national figure with a national role to play, and in spite of those who opposed his call for communal amity and condemnation of violence, there was hope that, given time, he would overcome.

Had the elections been postponed as he advised, he would have consolidated his strength, mobilised the vast majority of Sikhs in Punjab and in the rest of the country who welcomed this sea change in Sikh politics. It would not have been an easy struggle but there was every chance for success. He could have interjected a desperately needed credibility into the Indian body-politic. Tragically, political expediency once again dictated otherwise, elections were announced, 'Longowal, Man of Peace, Is Killed' read the headline in *The Statesman*, and India's future once again teeters on the razor's edge.

## Standard Equity Fund

STANDARD EQUITY FUND, engaged in leasing, hire-purchase and other allied financial activities like providing venture capital to non-resident Indians, is now diversifying into manufacturing. It will bring to India, for the first time, hi-technology diagnostic kits for detection of heart attacks, as well as sophisticated medical instruments. The project is being set up by Stangen, a division of the company, in collaboration with Immuno Diagnostic Corporation, USA, which will provide complete know-how. The project cost is estimated at Rs 25 lakh. Based on the detection of an enzyme released during heart attacks, the diagnostic kits, named CPK-MB kits, provide accurate and highly reliable tests for early detection and evaluation of coronary damage and for infarct size determination. According to Dr K Anji, Chairman, presently these kits are being imported and are 'expensive'. The kits manufactured by the company will bring these tests within the reach of the common man. The projected sale of kits during the second year of operation is estimated at 20,000 which should generate a turnover of Rs 60 lakh. The turnover of medical instruments is likely to be around Rs 40 lakh. Stangen being a division of the company, SEF will be able to take advantage of depreciation and tax benefits. SEF is entering the capital market on September 19 with a public issue of 6 lakh equity shares of Rs 10 each at par to raise additional finance for its expanding activities. The company commenced operations in October 1984 and in just eight months earned a profit of over Rs 2 lakh. It paid a maiden dividend of 12 per cent. The shares of the company will be listed on the Bombay and Hyderabad Stock Exchanges. The company is confident of maintaining 12 per cent dividend on the enhanced capital in the current year also. The public issue is managed by Champaklal Investment and Financial Consultancy (CIFCO).

# "Only DUBBLE gives me that laundry-washed look. At home!"

I've tried many detergent cakes, but I'm convinced that Dubble with Lime is far, far superior. It gets my clothes laundry-clean, laundry-smart. And adds that fresh, fragrant touch to the entire family wash.

Dubble Lime Detergent Cake. I'd recommend it with confidence to my best friend. Try it, you'll stay with it.

DUBBLE
THE LIME DETERGENT CAKE

REVIEW OF MANAGEMENT

# Effectiveness and Efficiency in Public Administration

## A Theoretical Framework

**Satya Deva**

*Western theorising about effectiveness and efficiency has reached an impasse; also, it is hardly relevant to underdeveloped countries.*

*The legacy of colonialism consists of emphasis on the maintenance of law and order, neglect of people's languages, weak local administration, acceptance of Westernisation with all its faults, and higher status and salaries of the loyal generalists who control and discipline specialists and the populace.*

*Monopoly capitalism and the building of the nation state lead to centralisation ('unity and integrity'), unbalanced growth and preference to loyalty over merit. The conflict and balancing of land-owning and capital-owning sections of the bourgeoisie lead to autonomisation of the state and rule by the bureaucracy unchecked by a legislature (as in contemporary Punjab).*

*The acceptance of the domination of international monopoly capital by the ruling class in its own narrow interest leads to dependency, and hinders the growth of science and technology. All these factors together lead to increasing pauperisation, and ineffectiveness of the programmes of poverty removal.*

THE success of an organisation is often said to be measured in terms of its effectiveness and efficiency. Effectiveness refers mainly to goal-fulfilment, and efficiency to output per unit of input. Efforts to apply these concepts in Western society have, however, met with serious difficulties which can be explained by contradictions inherent in this society. Painstaking research has led to conclusions such as the following: "Single prescriptions for effectiveness are like mirages: desirable but distant, receding, unreal."[1] Considerations like those of moral acceptance and professional ethics, and the need for human involvement and creativity, which have generally been sought to be ignored in classical theory are ultimately seen to be important: "Selection of the appropriate decision-making structure is influenced by the legitimacy of the alternative structures, the proportion of professionals on the staff, whether or not an emergency exists, the degree of improvisation involved in the work, and so forth."[2] Researchers find that, "In any organisation the personal needs that workers most want fulfilled are the very needs whose fulfilment facilitate (*sic*) organisational effectiveness."[3] And yet, management values and perspectives often remain "at odds" with the psychological satisfaction of workers. Western theory-building efforts may, thus, be said to have reached an impasse: Nor does there seem to be a practical way out of this impasse. If this is the state of the science and art of administration with regard to developed countries, application of the same paradigm to underdeveloped countries with far more complicated problems can only be described as ridiculous. In the following we shall try to build a theoretical framework consisting of testable hypotheses deriving from various aspects of the socio-economic reality as it has been unfolding itself under the impact of historical forces in underdeveloped countries like India.

Large scale organisations have arisen in the world only in modern times. Merchant capitalism and the nation state arose in Europe around the sixteenth century. The nation state then needed large civil bureaucracies and standing armies. The industrial revolution led to mechanised production by large numbers of workers. Trade unions and political parties now emerged. These organisations needed functionaries with certain kinds of information and orientations to provide with colleges appeared in large numbers; the mass society needed mass-circulation newspapers.

Modernisation came later to countries of South Asia, Latin America and Africa. The nature of large scale organisations in these countries may be studied under the following headings, in rough chronological order: (1) colonialism; (2) monopoly capitalism, state and nation building; (3) autonomisation of the state; (4) dependency; and (5) pauperisation. We shall see how these processes have influenced the effectiveness and efficiency of large scale organisations. It is notable here that while conceptually the processes mentioned above may be distinct, in practice they have often worked together; also while they may be roughly chronological they have been telescoped into each other. Hence our hypotheses are the results of abstraction from a complex and changing reality.

## I

## Colonialism

In most of the underdeveloped countries, modernisation came through colonialism. The imperial power imposed and maintained its rule through large civil and military bureaucracies. Their effectiveness, therefore, came to be judged in terms of the maintenance of the *status quo* despite popular discontent. Insofar as popular discontent has remained, together with poverty and political ineffectiveness of the mass, the role of the bureaucracy has remained much the same, as evidenced by the frequent use of police and military forces for curbing protest and maintaining law and order. Dispersal of power would lead to search for positive methods of dealing with causes of discontent, and to the use of minimum force by the state. In the near absence of these concerns, the effectiveness of bureaucracy has been judged by the *maintenance of law and order*. In view of this emphasis, *cultural development has had a low value* as a contributor to government effectiveness. One of the important continuities between the colonial period and the present is the use of foreign languages for administration, education and research—the failure to develop and use people's languages is rarely seen as an indicator of the ineffectiveness of the organisations responsible for these functions.

One of the important aspects of colonial administration was the strengthening of central institutions and the neglect of local ones.[4] Thus central services were well-staffed and well-paid while local services languished. By contrast, in countries like the UK and the USA local governments are powerful and their services well-staffed. In India, however, the colonial pattern has, by and large, continued. Municipal and Panchayati Raj bodies remain weak and their services under-staffed and poorly paid. The *efficiency of local services, therefore, remains low*. Rural areas, by and large, remain without public utilities such as the supply of clean drinking water and social services for health, education, and welfare of the needy. *Local administration, except in a few metropolises, remains highly ineffective.*

Imperial rule required a civil service consisting mainly of Indians, who would, however, identify with the rulers. This was achieved by two interrelated means—higher education and higher status for the civil service. Higher education was made compulsory for entry into the higher echelons of the civil service. It is notable, by contrast, that in England entry into the Administrative Class for a non-graduate was always permitted through one of the two methods of recruitment. In India, however, education upto graduation at least was required. This education, given through the English medium and consisting of a study of the achievments of litterateurs and scientists in the West, had the effect mainly of developing among the students identification with the West. It rarely inspired or equipped them to find solutions to the problems of their own society; they were mainly expected to recapitulate what Western writers had said. Hence the needs of imperial rule created an elite whose education consisted mainly in orientation favourable to the West, and which tended to be dependent upon Western science and technology. The nature of the education and the character of the elite has remained much the same after Independence. Hence, development, as defined by this elite consists mainly of Westernisation: *effectiveness comes to mean aping the West with all its faults*—importing the latest technology for a few organisations, while the majority remains in the bullock-cart or the bicycle age; the building of costly showpieces like the city of Chandigarh; spending large sums on television; and what is most symbolic, showing commercials, which can be avoided in India because television is in the public sector, in contrast to the USA where it is in the private sector and finds its sustenance through commercials.

The imperial civil service had to be paid highly and given a high status to make it a dependable instrument. Hence salaries and perquisites in colonial administration came to be not merely 'compensation' for services performed, but the price of loyalty. Loyalty was the prime quality of the administrator who controlled the specialised operatives. Hence the salaries and status of administrators, who were mostly generalists, came to be higher than those of specialists. Insofar as the emphasis on loyalty has not lessened, the salaries and status of generalist administrators continue to be generally higher than those of specialists. Hence, interestingly enough, *in the higher echelons efficiency is said to be related to salaries, while in the lower ones this relationship is considered to be weak*. Thus an agricultural scientist may often be drawing a much lower salary than a younger administrator who may have studied only literature but who advises the minister on policy formulation and implementation, while involves controlling and disciplining scientists and farmers.

## II

## Monopoly Capitalism, State Building and Nation Building

Capitalism came to India with colonialism. The first 'factories' were set up by the British at sea ports. British firms had special privileges which none else had. When Indian firms were established, they could not compete with British firms on an equal footing. Hence British firms came to be large and sprawling monopolies. Thus colonies like India never knew classical capitalism with large numbers of competing entrepreneurs; here it was monopoly capitalism from the beginning. This monopoly capitalism, with foreign capital to begin with, was foisted upon an agricultural society by force. It was not an indigenous growth: only in isolated pockets like Bombay and Calcutta did some Indian entrepreneurs arise and set up textile and jute mills around the end of the last and the beginning of the present century.[5] Hence economic development in the pre-Independence period was oriented towards fulfilling the interests of the British monopolies. The growing of cash crops, the networks of transport and communication, the production of electricity, and fiscal policy were all aimed at supporting these monopolies. Growth was not balanced regionally: the vast sub-continental hinterland was to support the industries in coastal metropolises. Hence, *effectiveness of administration was judged by the support it provided to monopolistic business, and not to balanced regional growth*. Insofar as monopolies have flourished after Independence also, this has continued to be the criterion of effectiveness. Our so-called planning has made little change in this pattern because (i) resources have remained mostly in private hands, (ii) the inherited infrastructure such as the railway network continues partly to determine the pattern of business, and (iii) monopolistic interests have influenced political decision-making in their favour.

Monopoly capitalism has fostered centralised state power in the erstwhile colonies. Large scale industries often get their fuel from one place, raw materials from a second place, labour from a third place and sell their products in a fourth place. Centralised political control over a large area, ensuring security and a single system of legal and financial institutions, is, therefore, essential for the development of large scale industry. Hence the building up of centralised state power (often called 'unity and integrity') becomes the paramount political objective: *centralisation per se comes to be equated with effectiveness*.

Political centralisation necessarily produces strong central leaders. Owners of capital see to it that leaders favourable to them become powerful. Donations to political parties by companies, which have now been legalised in India, and image-building through mass media, leavened with subtle religious appeal, lead to the creation of leaders who then become symbolic of the nation. The emotional bonds of nationalism are used to strengthen the state. Hence, *national integration comes to be another goal in terms of which effectiveness is measured*. Backward sections of the society and backward areas tend to suffer in any case in the course of capitalistic development which channels resources to those who can give the highest returns. *The emphasis on national integration further helps to de-emphasise measures for the protection of the interests of poor minorities, low castes and backward regions.*

*Powerful central leaders make themselves effective through a network in which* power flows from the top downwards. This is ensured by the flow of election funds downwards and of loyalty upwards. Hence loyalty becomes an important value in itself. Appointment of politicians and administrators to high positions tends to be made primarily on grounds of loyalty. Insofar as effectiveness comes to be defined in terms of stability, and stability is ensured through loyal functionaries, *loyalty comes to be seen as a highly important factor in the achivement of effectiveness*.

Monopoly capitalism, a dominant party, and powerful leadership do not leave much scope for competition; hence, *efficiency suffers in both production and administration*. In a situation where industrialists are dependent for their survival more upon political support for obtaining licences, raw materials and import quotas, than upon the quality of their products, the need for good political contact-men is greater than that of good engineers. Similarly, if a minister finds that winning an election depends primarily upon the support of loyal politicians and administrators (who collect election funds, control the leaders of vote banks, and browbeat voters) and not so much upon the efficiency of the agencies under his charge, he prefers functionaries who are loyal, to those who are merely better as scientists or other professionals. The achivement of effectiveness (in terms of the survival of the leaders) thus conflicts with the achievement of efficiency: *loyalty of functionaries is preferred to their merit*.

Loyal civil servants, on deputation as managing directors of public sector undertakings, often become the instruments for the exercise of patronage. Since recruitment here is direct, and not through the Public Service Commission, constituents of politicians can easily be appointed. Similarly, contracts can be given to businessmen who give donations to the ruling party. *The effectiveness and efficiency of the public sector thus are seen by ruling politicians mainly in terms of strengthening themselves politically.*

## III

## Autonomisation of the State

Most underdeveloped countries nowadays tend to be under dictatorial rule. In India also Emergency rule (1975-77) was of this kind: the fundamental rights of citizens were suspended, strikes and other forms of protest were disallowed, judges were transferred and superseded, there was press censorship, restrictions were placed on the publication of proceedings of Parliament, elections were postponed and there were indiscriminate arrests of citizens. Dictatorships in contemporary underdeveloped countries are comparable to absolutism in Europe in the 17th and 18th centuries. Marx[6] and Engels[7] pointed out that such absolutism results from the balancing of two powerful classes: in this situation the civil and military bureaucracy comes to rule, with an adventurer at its head.

In sub-continents like India conditions vary from area to area. Wherever the capitalist class holds together, it rules through a democratic system. If, however, capitalism develops in agriculture, the land-owning and capital-owning sections of the bourgeoisie may become almost equally balanced. In this situation democracy gets abrogated.[8] Thus in contemporary Punjab the interests of big farmers and big industrialists are in conflict: the outputs of industry (such as tractors, fertilisers and pesticides) are the inputs of agriculture; and the outputs of agriculture (such as cotton, sugarcane and cereals which workers eat) are the inputs of industry. Hence if prices of industrial products rise faster than those of agricultural commodities, the farmer suffers. This conflict of interests between the two powerful classes (which is given religious colour to obtain the support of the poor) makes democratic rule difficult: the civil and military bureaucracy now comes to rule. When state power becomes autonomised in this manner, *the test of the effectiveness of the administration becomes the avoidance of overt conflict and violence.*

The bureaucracy becomes very powerful in such a situation. This explains the great power of the bureaucracy in almost all contemporary underdeveloped countries—it comes to play a dominant role in policy formulation and implementation. With the increase in power, the status and income of the bureaucracy also tend to rise. Thus in contemporary Punjab, civil servants are functioning as advisers to the Governor, in place of ministers. *In the absence of checks by the legislature, bureaucrats tend to corner greater benefits for themselves and claim that this is essential for efficiency.*

In areas which are 'disturbed', *better equipment of the police and the paramilitary forces* is said to lead to greater effectiveness in terms of the curbing of the violent activities of extremists representing one or the other section of the bourgeoisie.

## IV

## Dependency

Insofar as capitalism came to underdeveloped countries with colonialism, it was from its inception moribund. It lacked the competitive spirit; did not help to develop new technology; did not allow the fruits of prosperity to reach the workers for these fruits were transferred to the imperial power; and engendered attitudes of inferiority and dependence upon the West.

By the time the colonies got their political independence, international monopoly capital had been much strengthened. The entrepreneurial spirit had remained underdeveloped in the erstwhile colonies in any case; the entrepreneurs now find that it is less risky to join the transnational corporations as junior partners, than to try to compete with them, even in the protected home market. Hence the industrial bourgeoisie of the underdeveloped countries tends to be an appendage of transnational corporations.

Since the industrialists thus are dependent upon foreign technology, growth of indigenous technology suffers. Engineers and other technologists now find that there are 'better' openings in administration and sales than in research. In the public service also, engineers have been preferring jobs in administration rather than in their speciality. *Engineers who function as engineers tend to have a lower morale and lower efficiency than those in administrative positions.*

Dependence upon the West in science and technology makes researchers in underdeveloped countries overlook problems of their own societies and focus on those being faced in the West; for the test of their eminence is recognition in the West. Hence universities fail to attend sufficiently to problems of the society which finances them. *While public money is used to maintain universities, their faculties refuse to accept evaluation of their contribution: their effectiveness remains highly doubtful, if effectiveness be defined in terms of the growth of knowledge needed by their own society.*

## V

## Pauperisation

Increasing poverty is the result of all the processes discussed above. Thus colonialism leads to the transfer of wealth to the imperial country. Monopoly capitalism leads to an increasing gulf between the rich and the poor. Autonomisation of the state is often associated with social turbulence and lack of employment and production. Dependency implies an inferior status in international economic relations. Hence, *while governments of underdeveloped countries often claim to be fighting poverty, in fact poverty is generally spreading* there. With the rise of industrial capitalism large numbers of artisans are continually being thrown out of employment. With the rise of capitalism in agriculture, small and marginal farmers tend to sell their lands, and to join the ranks of landless labourers.[9] Resources channelled through programmes for poverty removal are often cornered by the rich and powerful sections. Expenditures on the personnel employed for these programmes are in any case large and disproportionate; what is worse, they are often able to coerce the beneficiaries to share the benefits with them: the ineffectiveness of anti-poverty programmes is writ large in vast rural areas and urban slums.

## CONCLUSION

Modern capitalist society functions characteristically through large scale organisations. Hence the success or failure of these organisations is deeply related to economic, political, social and cultural aspects of the society. The quest for universally applicable generalisations, as for example in the behavioural approach, is therefore a futile one; if any generalisations are found they are likely to be trivial in character.

Our discussion has shown that in the underdeveloped countries the nature and role of organisations is shaped by factors deriving from colonialism, monopoly capitalism, state and nation building, the tendency towards the autonomisation of the state, dependency and, flowing from these factors, widespread poverty.

It is notable that our exceptation from an organisation differs with our class position: for the employer it consists in saving on salaries and wages, while for workers it consists in being well-paid. In other words our conceptions of effectiveness are different because our goals are different.

Colonial institutions were effective from the point of view of the imperial power; similarly, the concentration of wealth and power in the hands of a few capitalists and politicians is considered to be effective by them and those who benefit from these structures. Strengthening of the bureaucracy in an autonomised state is said to lead to effectiveness and efficiency of this bureaucracy; however, those who suffer in this authoritarian system would not agree. Even dependency may be designated as 'liberalisation' by a ruling class which derives support from its connections with transnational corporations, while poverty becomes more widespread. It is all a matter of definition.

# Evaluating the Evaluators

## Performance of Bureau of Public Enterprises

**Prajapati Trivedi**

*This paper analyses the performance of the Bureau of Public Enterprises (BPE). It argues that the source of the ineffectiveness of BPE lies in its inability to measure the performance of public enterprises in a way that is both fair to the managers and to the nation. The institutional set up of BPE too significantly contributes to its ineffectiveness. Finding the present system of performance evaluation used by BPE severely lacking, the paper suggests three axioms of public enterprise performance evaluation against which all future efforts of BPE should be judged.*

THERE is no other governmental institution in India which has been subjected to such a consistent barrage of criticism as the Bureau of Public Enterprises (BPE). It has been referred to as a fifth wheel which is completely redundant. In its present form, most critics feel, it is neither useful nor ornamental.[1]

As far back as 1974 the Committee on Public Undertakings (COPU) of the Fifth Lok Sabha had this to say in its 40th report:

> The Committee gathered the impression during their visits to public undertakings as well as during the evidence tendered by the chief executives of the public undertakings that the Bureau has not been able to discharge its role and functions to the entire satisfaction of public undertakings. Not only have its guidelines or advice not found ready acceptance with the undertakings, it has also not been able to resolve the problems facing some undertakings in any tangible manner. In the circumstances, the Committee cannot but look askance at the heavy expenditure which is being incurred on this top heavy Bureau ...

A decade later not much has changed. Another committee evaluating the BPE could use these lines verbatim to describe the situation as it exists now. However, this paper will try to show that the critics have missed the main point. That is the reason why, in spite of this hostile environment, BPE has survived and even prospered over the years. But, first, a word about BPE's background.

### THE HISTORY OF BPE

To evaluate BPE's performance it is essential to know its goals and objectives. For this one has to go back in time and examine the original intentions. A proposal to set up an entity like BPE in the Ministry of Industry, the only ministry with many public enterprises at that time, was floating around as early as 1960. However, it never came to fruition. Instead, BPE was set up in 1965 in the Ministry of Finance. It was briefly transferred to the Cabinet Secretariat in Janaury, 1966 (see Exhibit) but by June 1966 it was re-transferred to the Department of Co-ordination, Ministry of Finance. By 1969 it had come to exist as a separate entity under the Ministry of Finance.

### THE OBJECTIVES OF BPE

During this turbulent formative period two committees deliberated on the nature and functions of BPE. First, the Estimates Committee of the Third Lok Sabha in its 52nd Report in 1963-64 recommended the setting up of BPE. Its recommendations were accepted and BPE was set up in 1965. Second, this issue was taken up by two study teams of the Administrative Reforms Commission, which presented its final report in 1968.

A survey of the proposals by these committees shows, quite convincingly, that one of the main objectives envisaged for the BPE was for it to be a monitoring agency for collecting information and evaluating the performance of public enterprises (Basu, 1984).

Following the Estimate Committee's report the Bureau of Public Enterprises was set up with the objectives of: (a) Reviewing periodically the working of public undertakings; (b) Presenting reports and reviews of the operations of public enterprises to the Parliament or government agencies; (c) Devising steps to improve productivity and profitability; (d) Providing a central point of reference and consultation on important aspects of management; and (e) Exploring avenues of the economy in capital costs.

The final report of the Administrative Reforms Commission also consisted of a similar but expanded list of objectives.

### REASONS BEHIND THE PERCEIVED FAILURE OF BPE TO ACHIEVE ITS OBJECTIVES

As mentioned earlier there is no dearth of criticism levelled against BPE. However, they suffer from two major weaknesses.

First, the critics have adopted a very partial approach with a restrictive perspective. They have, in general, looked at a specific function of BPE and found it lacking, without looking at the total picture. Second, in most cases the solutions offered are equally unconvincing. Therefore, BPE has continued to survive in its original form without being effective.

This paper, in contrast, argues that problems associated with various aspects of BPE's functioning are inter-related. It also delineates the conceptually sound method to search for an alternative. It argues that the source of all the trouble with BPE's functioning lies in its inability to evaluate public enterprise performance. If one cannot distinguish "good" performance from "bad" performance then the public enterprise game is all over. If a "good" manager and a "bad" manager are treated in the same way because of one's inability to distinguish between them, then the former will have no incentive to strive as hard and the public enterprise system will be eventually loaded with overwhelming mediocrity.

The other objectives of BPE, mentioned above, cannot be achieved either under these circumstances. It cannot act as a "central point of reference and consultation" if it does not know what exactly should be pursued by the public enterprises. Nor will it have criteria to hire competent people and fire incompetent people, or, suggest ways of improving performance. In short, the inability to evaluate public enterprise performance is the cause and all other alleged problems of BPE are mere symptoms.

In fact the problem has a dynamics of its own. Since BPE does not have a convincing criterion or framework for performance evaluation it is not effective. And, because it is ineffective it does not attract very talented and highly trained professionals, which in turn leads to the perpetuation of its ineffectiveness. The validity of this argument is best illustrated with an analogy to the alleged reasons for the comparative efficiency of private enterprises. It is argued that the main reason for this is that private enterprises have a single, well-defined criterion for performance evaluation—profitability. This imposes a certain discipline and provides a sense of direction to a private enterprise. It enables it to move in the direction in which its owners (stockholders) want it to move.

In contrast, public enterprises have multiple objectives, which are often conflicting. Therefore, unless a way is found to merge these objectives into a composite criterion, the public enterprise managers will continue to be confused by such mixed signals (Jones, 1982). To be sure, BPE has proposed one such composite criterion. The remainder of this paper will examine the validity of this criterion and explore alternatives.[2]

### THE VALIDITY OF BPE CRITERION

Pursuant to its charter, the Bureau of Public Enterprises presents an annual report on the working of all public centerprises under the Central government. It also periodically reports to the Finance Minister and the various committees of the Cabinet on the performance of these public enterprises. In addition, in recent years it has published another document entitled, "Performance Aims and Financial Targets of Central Government Enterprises".[3] This document represents BPE's effort to define the performance criterion for public enterprises. Therefore, we will concentrate on it to illustrate our argument.

The approach suggested by BPE consists of evaluating public enterprises on the basis of the following two criteria: (a) the rate of capacity utilisation; and (b) the rate of return on capital employed. This approach is bedevilled with so many conceptual problems that it is a complete non-starter. It violates every principle of public enterprise performance evaluation. The major problems with this criterion are as follows:

1) The criterion does not indicate the relative weights of these two criteria. Are they equally important or is there a trade off? It is quite possible that capacity utilisation may increase while profitability may go down. In this situation no judgment on the performance is possible. The absence of relative weights is likely to confuse the managers more than providing a useful guideline.

Elementary economics tells us that increases in output are not always correlated

FIGURE 1

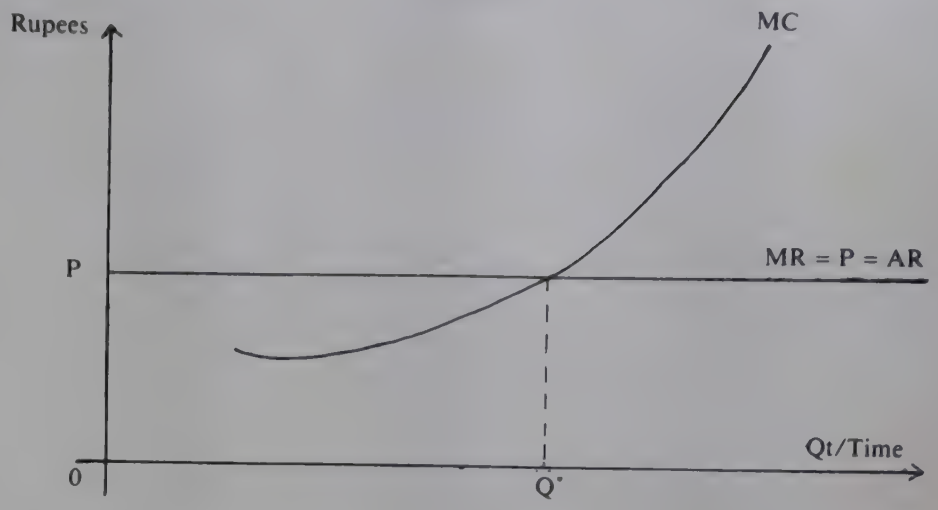

FIGURE 2

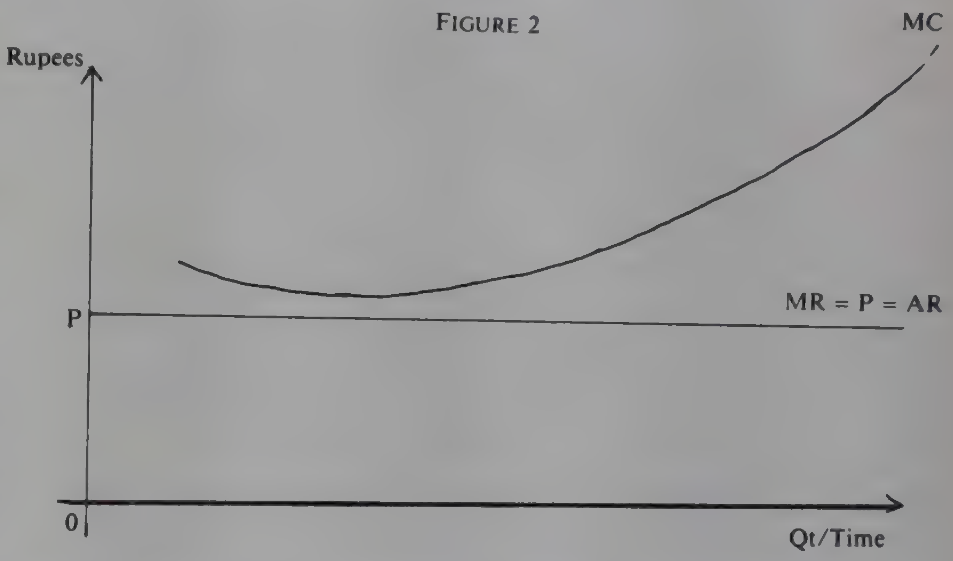

with increases in profits. Consider Figure 1 in which a typical set of marginal cost and marginal revenue curves are presented. The marginal revenue curve depicts a price taker's situation since that is exactly what most public enterprises are. The price of their outputs is usually regulated by the government.

Clearly, increases in capacity utilisation are likely to be positively correlated with profits if the public enterprise is operating to the left of $Q^*$. If it is operating to the right of $Q^*$ then the two criteria will be negatively correlated. The BPE seems to be assuming that all public enterprises are to the left. This is clearly a strong assumption.

More often than not the situation facing most public enterprises is likely to be as shown in Figure 2. Due to the government's objective of maintaining "reasonable prices" the price of output is often "too" low. Whereas, the input prices, usually beyond the government's control, are high. Under these circumstances any increase in capacity utilisation will be negatively correlated with financial returns.

2) The heart of the problem with BPE's criterion consists of a very typical conceptual mistake with all such multiple indicators.[4] The motivation for using multiple indicators comes from the realisation that partial indicators do not capture all aspects of performance. For instance, labour productivity and capital productivity tell us how these two inputs are being used by the public enterprise but they do not tell us anything about whether the operation of the public enterprise is increasing or decreasing the overall welfare of the society. In their attempt to overcome this problem evaluators often combine several partial indicators hoping that they will be able to capture the total picture.

In doing so they violate one of the fundamental principles of public enterprise performance evaluation. They include some benefits and costs more than once. That is, the various partial indicators that form part of the multiple indicator are "duplicative". To illustrate this point let us examine this problem in the context of BPE's criterion.

Consider the following example: A public enterprise increases its output by Rs 100 and increases its consumption of intermediate inputs by Rs 100. Clearly, the society is neither better nor worse off as a result of the public enterprise operation. *Ceteris paribus*, the financial performance will not be affected. However, the rate of capacity utilisation will go up. And if we were judging the performance of the public enterprises on the basis of BPE's criterion, we would be forced to conclude that the enterprise performance has improved, which is not true from the society's point of view.[5]

3) Another problem with this criterion is that it is a "single period" indicator. That is, it looks at costs and benefits in one given period. It ignores the future effects of present actions and also consequences in the present or past actions. Therefore, a public enterprise could raise the rate of capacity utilisation as well as financial returns on the capital employed by postponing the necessary maintenance. In other words, a public manager may be rewarded for doing those things that are not in the national interest. Ultimately, the society has to bear the consequence of deferred costs at some later date.

Similarly, this criterion is unfair to the present management who may be paying the penalty for mismanagement in the past Machines may be breaking down more ofter because proper maintenance schedules were not adhered to in the past.

4) A serious problem with BPE criterion relates to the measurement of cost and benefits in current prices as opposed to constant prices. In the context of public enterprises, where prices are often regulated, use of current prices is close to meaningless. It is quite likely that a public enterprise may appear to have improved its performance in terms of BPE criterion, if the only thing that happened, from one year to another, was an increase in its output price.

Besides being a misleading indicator of performance the use of current price indicators may induce a wide variety of perfunctory behaviour. For example, managers may be encouraged to try to get the price of their output increased rather than strive to increase real productivity. Those who have the right political alignments are likely to succeed in getting higher prices for the output and lower prices for inputs. Once again, perceived improvement in the performance of these public enterprises may have no systematic relationship with the social welfare.

We could continue to point out some more problems, but suffice it to say that BPE's approach, at best, is not very useful for measuring public enterprise performance. At worst it provides signals which could induce serious misallocation of the nation's scarce resources. The preference for "outcomes over procedures" in the public enterprises expressed by the Prime Minister is a step in the right direction. However, in the absence of the government's ability to measure "outcomes", India may end up in a situation which has neither the discipline of the "rules and procedures" nor the pressure to perform.

### GUIDELINES FOR AN ALTERNATIVE CRITERION

Public enterprise performance evaluation is a difficult task but not an impossible one. It is not enough to collect a mass of information on public enterprises and publish them. It has already been tried in India and elsewhere with no success. What is required is a conceptual framework which is easily understood and can be defended.

What must be avoided are the two extremes of either a very simple indicator for all public enterprises or a very complex system, custom designed for each enterprise. The key to successful performance evaluation is "judiciousness". While the diversity must be recognised there should be some unifying principles underlying the performance criterion for various public enterprises. The purpose of this section is to outline those principles.[6]

Any public enterprise performance criterion which meets the following principles is likely to capture the true performance of the public managers.[7] These principles are the *meta-criteria*, that is, the criteria to judge a criterion.

However, before stating this set of *meta-criteria* it may be useful to recapitulate the purpose of public enterprises. In a mixed economy public enterprises are an instrument of public policy. Therefore, as with any other public policy instrument, the operation of public enterprises ought to enhance the social welfare. If we accept the validity of this perspective then the following principles follow logically from it:

> *Principle 1:* Any public enterprise performance evaluation criterion must count each benefit and each cost at least once and at most once.

It is obvious that if some costs and benefits are ignored by the performance criterion, then it can never capture the "true" impact of public enterprise operations on the social welfare. These costs and benefits can be divided into two broad categories: *Pecuniary* and *Non-Pecuniary*. The former refers to those costs and benefits which can be measured in monetary units such as the cost of the raw materials, labour, and working capital. The latter refers to those costs and benefits that cannot be valued in monetary units. Examples usually include benefits from research and development (R and D), corporate planning, and plant maintenance.

Notice that all of these examples represent the benefit side. This is indeed the usual case. Public enterprises are blamed for comparatively poor performance in these areas *vis-a-vis* private enterprises. The reason is not difficult to see. These activities impose a cost in the current year but pay dividends in some future year. A public manager, who has a comparatively short tenure at a public enterprise, is likely to avoid such activities in order to appear as successful as possible in the current year. A private owner, on the other hand, cannot afford to do this because any postponed maintenance will eventually catch up with him.

To meet the requirements set forth in Principle 1, the evaluators will have to take the following steps:

a) First, they must make a complete list of all possible costs and benefits associated with the operation of a particular public enterprise. These costs and benefits in question are "true" or "economic" costs and benefits as opposed to the "accounting" ones. Accountants look at costs and benefits from a private stockholder's point of view whereas public enterprise evaluators ought to view them from the society's vantage point. For example, taxes are a legitimate cost for private enterprises, and owners ought to reward their managers for bringing down the tax liability through "tax planning", but they are a mere transfer payment from the government's point of view. It does not really matter who keeps the taxes, the enterprise or the government.

b) Second, evaluators must take the pecuniary costs and benefits and find out the surplus (i e, benefits minus costs.) This concept of surplus has the same structure as the "profit" used by accountants except that it measures the publicly relevant costs and benefits. Hence, we may call it "Public Profit".

c) Third, one has to take the remaining benefits and costs, that cannot be measured in monetary terms and add them up with "public profit" using a suitable normalising procedure.[8] We can call "public profit" the "primary indicator" because it captures the bulk of opertional benefits and costs. It is a measure of the "true surplus" generated by public enterprises in the current period. The other indicators, such as the effectiveness of a corporate plan and the quality of the maintenance programme[9] may be referred to as the "supplementary indicators". Together they give us our desired "composite indicator".

The key to meeting the requirements of Principle 1 is that the primary and the secondary indicators must be mutually exclusive or non-duplicative.

> *Principle 2:* A public enterprise performance evaluation criterion must be monotonically related to social welfare. That is, an increase or decrease in the value of the criterion should reflect an increase or decrease in the society's welfare. In other words, it must be "fair" to the nation.

The first principle implied that one must have the right categories of costs and benefits, those that reflect the society's perspective. This principle carries that process one step further. It implies that not only should one have the right categories of costs and benefits but they must be valued appropriately. That is, one must use shadow prices which reflect the true opportunity costs, rather than market prices.

It is at this point that most policy-makers throw up their hands in despair. Many consider shadow prices to be a subterfuge or a rhetorical ruse used by the economists to confound the non-economists. They argue that any performance evaluation system involving shadow prices is likely to be difficult to implement. For example, it would be very difficult to fire the chairman of a large public enterprise in any country because the shadow multiplier for labour is 0.3 and not 0.5. Often, the result is to adopt a nihilistic attitude and drop the whole scheme.

This paper contends that there is a practical way out of these two extreme positions. The trick again is to be judicious in one's approach to policy-making.

a) First, evaluators should only try to use shadow prices where the distortions are severe and a shadow price is easily obtainable. For instance, if a country imports oil and sells it at a controlled price, below the cif price, then one should use the latter price if indeed the difference between the two prices is significant.

A shadow price obtained, after manipulating complex matrices, with great precision to the fourth decimal place is likely to lead to a more precise failure.

b) Second, a public enterprise performance evaluation system is likely to be concerned more with the trend than the level of performance. That is, what is more important is that compared to the previous year the enterprise should continue to improve. Fortunately, it turns out that some studies (Jones, 1979) have found that the trend in market prices and shadow prices are usually similar. Therefore, even though shadow prices are the conceptually right prices to use, on practical grounds the trend in market prices can be used as a proxy in the initial stages of implementing an evaluation system.

> *Principle 3:* A public enterprise performance evaluation criterion must be monotonically related to management's performance.[10] That is, increases and decreases in the value of the criterion should be related *only* to factors within the control of the public enterprise manager. In other words, it must be "fair" to the public enterprise management.

The purpose of a performance evaluation system is to induce desirable behaviour among public managers. In a mixed economy, such as India, where there is a general regard for "fairness", a criterion that appears to be "unfair" is likely to lead to undesirable behaviour.

For example, if the price of oil shoots up due to a crisis in the Middle East and an oil consuming public enterprise shows a deficit in terms of our primary indicator then it is extremely unlikely that the manager will be fired. No one will consider it "fair" to fire him for a situation over which he had no control. Now if the evaluators did nothing else to adjust for this exogenous change, then it is conceivable that this public enterprise manager may indulge in other undesirable behaviour and get away by blaming the whole thing on an adverse change in prices.

Principle 2 requires action to prevent this from happening. For instance, this requirement could be met by measuring public enterprise performance at constant prices rather than current prices.[11]

This completes our review of the three fundamental principles of public enterprise performance evaluation. These are the universal axioms from which particular corollaries applicable to different contexts should follow. It is the job of evaluating agencies such as BPE to use these as guidelines and devise criteria for various public enterprises. Unfortunately, BPE's present efforts are not even close to being acceptable.[12]

However, to be fair, we have to temper our judgment regarding BPE's effectiveness by examining the position of BPE in the government's institutionl hierarchy and its effect on BPE's performance.

## BPE AND THE INSTITUTIONAL HIERARCHY

Even if BPE was able to come up with a set of criteria which meet the fundamental principles of performance evaluation outlined above there is no guarantee that it will cease to be ineffective. Without being facetious, the real question is, "Who cares about what the BPE does?" Unfortunately the answer may be, "No one".

The problem lies in the multiplicity of principals. It is one of the paradoxes of performance evaluation that the effectiveness of performance evaluation of an agent decreases with the increase in the number of principals. Different principals evaluate performance from different perspectives and hence overwhelm the agent (public enterprise in our case) with a huge list of requirements which are often inconsistent with one another. This can have two possible consequences. By reducing the feasibility set to a minimum it can stifle the initiative and lead to poor performance. Alternatively, it can provide the public enterprise manager the opportunity to pursue his preferred objectives by playing one principal against another.[13]

In India there are too many controlling agencies yet there is very little control. First, there is the Planning Commission, which decides on the overall priorities in the public and private sectors and monitors the performance of certain core industries. Second, the Parliament, as a trustee of the public interest, also monitors the performance of public enterprises. This is achieved by vesting the legal authority for supervision and control of public enterprise in the Cabinet Ministers, who are the nominees of the Parliament. The control over the Ministers is exercised *via* questions and debates in the Parliament and the Committee on Public Undertakings. Third, the Auditor General of India puts forth an audit report for each enterprise every year. Fourth, the Bureau of Public Enterprises publishes its Annual Reports on the performance of the public enterprises. Finally, each public enterprise is required to publish its financial statements annually under the Indian Companies Act, which is enforced by the Registrar of Company Affairs.

Each of the above monitoring agencies has a slightly different concern. Therefore, while the Planning Commission may be concerned with the overall social welfare, the Auditor General emphasises propriety and the Annual Report looks at conventional financial measures of performance. Given this chaotic state of control structure there is no hope for salvation no matter how sophisticated India gets in devising appropriate performance evaluation criteria.

There are several alternatives and each has its strengths and weaknesses.[14] The arrangement which appears to be best suited for India may be described as follows:

(i) The Bureau of Public Enterprises should be detached from the Finance Ministry and brought under the Prime Minister's Secretariat. The Director-General of BPE should be directly responsible to the Prime Minister.

(ii) BPE should then develop an appropriate set of criteria and criteria values for the various public enterprises and monitor their performance.

(iii) The Ministry and its Minister, under whom a public enterprise falls, should be equally responsible for the enterprise performance. In other words, the Minister of the concerned Ministry should have to do all the explaining to the Prime Minister.

This system would appear to have many advantages. First, contrary to the present, the concerned Ministers will no longer have merely an adversarial relationship with the public enterprises under them but will have to act as their partners. For instance, public enterprises producing cement fall under the Minister of Industries. If these enterprises are having difficulty procuring coal and are in the danger of performing poorly because of it then the Minister of Industries will have to take up this matter with his counterpart in the Ministry of Energy.

This will also help the Prime Minister keep a better tab on the performance of his Cabinet. At present, the Prime Minister has to rely on what the Cabinet members tell him about the performance of public enterprises under them. Obviously, it is in the interest of the Cabinet members to downplay poor performance (unless it has already generated too much outcry). With a professionally staffed BPE the Prime Minister can truly begin to emphasise "outcomes" over "procedures", his professed policy.

Finally, the importance of having a uniform accounting system for all public enterprises under BPE should not be minimised. At present, public enterprises present their financial accounts just like their counterparts in the private sector. The wide variety of formats make the comparison and monitoring of public enterprise performance difficult.[15]

## CONCLUDING COMMENTS

The objective of this paper was to analyse the performance of BPE. It argues that the ineffectiveness of BPE should be viewed as a problem of vicious cycle whose source lies at the inability of BPE to measure the performance of public enterprises in a way that is both fair to the managers and to the nation. Further, it finds that the institutional set up of BPE significantly contributes to its ineffectiveness.

This paper examines the present system of performance evaluation used by BPE and finds it severely lacking. It then goes on to suggest three axioms of public enterprise performance evaluation against which all future efforts of BPE are to be judged. Given the stakes one can only hope for a quick re-evaluation of the present system.

## Notes

[I am grateful to Leroy P Jones for helpful discussions. Thanks are also due to members of the Boston Area Public Enterprise Group (BAPEG) and the participants of the workshop on "Policy for Public Enterprise in Developed Countries" held at the Harvard Institute of International Development (HIID) in 1984, for their comments. However, all errors remain my sole responsibility. Part of the research on this paper was supported by a grant from the International Development Research Centre, Canada.]

1 For a wide range of comments on BPE's performance, see Murthy (1976).

2 To appreciate the full range of ideas involved see: Cabral (1981); Ahroni (1983); Chatterjee, N (1978); Chatterjee, P (1979); Chattopadhya (1978, 1981); Dholakia and Khurana (1976); Om Prakash (1981); Morarka (1981); Fernandes (1981); Finsinger and Vogelsang (1982); Gupta, M (1981); Jenkins (1979); Nove (1973); Sastry (1980). No attempt will be made to review these approaches as it has been done elsewhere (Trivedi, 1984, 1985a).

3 Bureau of Public Enterprises, "Performance Aims and Financial Targets of Central Government Public Enterprises: 1982-83 and 1983-84", Ministry of Finance, New Delhi, April 1982.

4 See Trivedi (1985a) for a detailed discussion of this point with respect to the performance criterion used by the Korean Development Bank.

5 Note that the only changes are in the output and the intermediate inputs. Labour is assumed to remain constant. If employment had increased we might have some justifica-

tion for saying that the performance has improved.

6 No attempt will be made to set out the details of a complete performance evaluation system. Interested readers can refer to Jones (1981), Jones and Trivedi (1983), Trivedi (1985a; 1985b) and Nawab (1984) for a precise and detailed application of this conceptual framework.

7 At this juncture it may be worth noting the important difference between "managemeht's" performance and the "enterprise" performance. Management's performance is obtained by adjusting "enterprise" performance for all factors beyond the control of public enterprise management.

8 See Jones and Trivedi (1983) for an example of one such procedure.

9 For details of an attempt in Korea to do this at a practical level, see Trivedi (1985b).

10 See the difference between management's performance and the enterprise performance noted earlier.

11 It should be noted that this may not always be the correct response. It is appropriate when a public manager is stuck with a given technology and there is little or no room for substitution. If, on the other hand, there were a large number of substitution opportunities then one would want to continue using current prices. This is essential to induce the manager to find cheaper substitutes and utilise them. This will improve allocative efficiency, which is precisely what one wants.

12 Pakistan is in the process of implementing a system based on these principles. For details of this attempt see Nawab (1985) and Mehdi (1984).

13 For a general discussion of issues involved see: Pelicon (1982) and Boneo (1981). For a discussion regarding these issues in a particular country see: Bell (1979) and Abtan (1979).

14 For a discussion of some of these alternatives, see, Ramanadham, V V, (1984).

15 See: Pretrovic (1978), Tang and Lin (1985) and Ministry of Economic Affairs, Republic of China (1971) for an analysis of the merits of uniform accounting in public enterprises. See: Riise (1982) for an example of this system in a more developed nation.

# Cost of Technology Imports
## The Indian Experience

**Nagesh Kumar**

*Though acquisition of technology from abroad may at times prove to be an expeditious way of getting the requisite technology, it has inevitable short and long run implications for the economic and technological development of the borrowing country. A significant amount of literature has directed itself to assessing the impact of technology imports by India. Most of the studies in this category are, however, partial in their scope in that they have studied the impact in specific cases or on some specific parameters. This paper summarises the current state of knowledge on this aspect.*

*The author deals first with the direct costs of import of technology and later with its indirect impact on the economy through its implications for balance of payments, the technological environment, industry structure, equity, etc. While doing so, significant studies made for other developing countries are kept in the background so as to provide comparison.*

INDIA, like many other developing countries, has relied considerably upon foreign sources for getting technologies for programmes of its industrialisation. Between 1950 and 1983, over 8,000 collaborations between foreign and local counterparts had been approved by the government involving transfer of technologies. It has been argued by some scholars (notably Lall and Mohammad, 1983) that the magnitude of technology imports by India for the scale of its economic activity is negligible in comparison with other developing countries which embarked on industrialisation like Brazil, Mexico, etc. However, it is also important to note that most of the modern/large industrial complexes in the country are based on imported technology.

It may be noted at the outset that broadly there can be two modes of technology imports (TECHIM), *viz*, formal or disembodied and informal or embodied. The former comprises of technology transfer contracts for which specific government approval is required. The latter may include the transfer of technology which is embodied in capital goods, skills of technicians, technical literature, etc. The disembodied technology transfer can also be of two types: one, through foreign direct investment (FDI) package—where whole package of resources like capital, entrepreneurship, management, technology, etc, is transferred; and second, through licensing of specific resources like proprietary process/product technology, etc, at arm's length.[1] In the case of India, in the period till the mid-sixties technology transfer through FDI was encouraged because of the foreign exchange crisis of the late fifties. The government felt that foreign exchange cost of the projects could be met by the capital inflow part of the package. In the late sixties, in the wake of yet another foreign exchange crisis, realising the deleterious balance of payment impact of the FDI, the government made the technology import policy restrictive and strict. Illustrative lists of areas were issued where no import of technology was to be allowed; where technology could be permitted only on licensing basis; and where it could be permitted through FDI. In addition, a general ceiling of 40 per cent level of foreign equity in any enterprise was also imposed under the Foreign Exchange Regulation Act, 1973. This strict policy governed the technology imports all through the seventies. In the eighties again the technology import policy has been liberalised to facilitate the modernisation of capital equipment in the Indian industry which has since become obsolete and hence is unable to compete in the international markets. Liberal technology imports through FDI (even upto 100 per cent ownership) are also being permitted in the cases of export oriented manufacture.[2] This recent trend of liberalisation is likely to continue during the Seventh Plan period as well because modernisation of industry and export orientation are planned to be pursued on priority basis.

Though acquisition of technology from abroad may prove to be an expeditious way of getting the requisite technology at times, it has some inevitable short and long run implications on the parameters of economic and technological development of the borrowing country. A significant amount of literature has directed itself towards assessing the impact of the technology imports in India. However, most of the studies in this category are partial in their scope and nature in that they studied the impact in specific cases (or sample) or are restricted to impact on some specific parameters.[3] This paper summarises the current state of knowledge on this aspect. Literature on the technology imports particularly through the FDI and multinational corporations (MNCs) is enormous and hence any effort to review it has to be selective. We shall also restrict ourselves to studies pertaining to the manufacturing sector because bulk of the technology imports have been and would continue to be in this sector. We shall first deal with the direct costs of TECHIM and later with its indirect impact on the economy through its implications on balance of payments, technological environment, industry structure, equity, etc. While doing so, significant studies made for other developing countries will be kept in the background (in notes) so as to provide comparison.

### Direct Costs

The direct cost of TECHIM includes its servicing burden remitted abroad in foreign exchange. In the case of TECHIM through licensing the usual costs are lumpsum payments, royalties and technical fees paid abroad by the licensees. In the case of TECHIM through FDI, usual servicing charges include remittances of profits and dividends. In such case it is not possible to ascertain the proportion of remittances attributable to TECHIM as such because those remittances are payments for the whole package of resources transferred through FDI. Some times, however, payment of dividends are accompanied by royalty or technical fees as well. In the case of embodied technology transfer, the cost of technology is implicit in the price of the equipment imported or in the remuneration of the personnel and hence are difficult to be separated.

Table 1 presents yearly remittances made by the private sector companies on account of profits, dividends, interests, royalty and technical fees for 1960-61 to 1979-80. It is evident that total remittances have steadily risen from Rs 23.48 crore in 1960-61 to Rs 132.68 crore in 1979-80. These figures are, however, only a partial reflection of the *direct* costs since these do not include the remittances of lumpsum fees and payments for TECHIM by the public sector companies nor do they include payments for embodied TECHIM. It can be seen that the relative significance of royalty and technical fees in total remittances has declined substantially over the years. This is in spite of the fact that licensing as a mode of TECHIM has gained importance during this period, particularly in the seventies. Though it is possible that licensors are relying more on lumpsum fees than yearly payments like royalty and technical fees, as Desai (1984) observes, the trend is an expected one. This is because the licensing agreements have a finite duration (in India generally 5-7 years) and payments are made for that period only while FDI continues life-long (unless the foreign investor divests his ownership). In fact the servicing burden in the case of FDI, in a typical growing and profitable enterprise, is expected to increase steadily. Thus while servicing burden of new agreements of TECHIM through FDI cumulates to that of the old ones, payments for new ones replace those of the expiring ones in case of licensing. Probably that is why some studies like Subrahmanian (1972), Kurian (1966), indicated that TECHIM through FDI may have been excessively expensive. A case study of direct costs of technology transfer in three petrochemical complexes, set up in the country, by Khanna (1984) shows that in the case of two complexes set up by multinational firms with one-third equity participation, 57 and 64 per cent of total profits were appropriated by the collaborators. In the third complex which was set up in the public sector with technology acquired under licensing, however, the cost was substantially lower at 2 to 4 per cent of total profits. These findings again point to the excessively expensive nature of TECHIM through FDI.[4]

Pillai (1984) had shown that significance of total remittances as a proportion of value added in manufacturing sector had a rising tendency till 1970-71, but it started declining thereafter. He explained the declining trend in terms of reduction in technological dependence of the country.

Several studies have found the direct costs of TECHIM to be excessive. For instance Chandra (1973) on the basis of data provided by the RBI survey (1968) concludes that the net foreign exchange cost of production through imported technology has been quite high. Studies by Kidron (1965) and Subrahmanian (1972) have also noted the high cost of imported technology in India's first phase of import substituting industrialisation. The explanations given include:

> popularity of foreign brand names among Indian elite consumers outweighted technological characteristics, competitive terms and prices of imported technology; the choice at old trading partners as a source of technology made Indian buyers to lose thier initiative in the negotiation and given a weak technological base the terms settled for the imports of technology then were excessive and onerous (Subrahmanian and Pillai, 1982, pp 12-13).[5]

Some studies (like ILPIC, 1969; Subrahmanian, 1972; Kidron, 1965) have pointed to the repetitive and hence wasteful imports of technologies for a number of products. In some cases more than one firm had been permitted to obtain technology from the same source and for the same product thus adding to the cost without contributing any thing significant to the country's technological stock (Subrahmanian, 1972; Neerso, 1975; Kumar, 1982).[6]

In contrast to the general impression created by the studies cited above of high cost of imported technology, a study by NCAER (1971) argues that from the point of view of an individual firm the cost of imported technology is much less than that of generating it through local R and D effort. Hence the study finds a justification for the imports that have taken place in the area of technology. However, it may be pointed out that NCAER's study refers to the private costs of TECHIM and compares them with private costs of generating technology locally which might in fact be greater in some cases (Balasubramanyam, 1971). The imported technology has significant indirect social costs while local research may have substantial external economies. A fair assessment of imported technologies in a country should thus be based on weighing of the social costs *vis-a-vis* social benefits. The findings of NCAER's study, therefore, are at best parochial.

TABLE 1: REMITTANCES ABROAD BY INDIAN PRIVATE SECTOR COMPANIES

*(In rupees crore at current prices)*

| Year | Profit | Dividend | Interest | Royalty | Technical Fees | Total Remittances |
|---|---|---|---|---|---|---|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| 1960-61 | | 11.38 | | 9.06 | 3.07 | 23.48 |
| 1961-62 | | 14.14 | | 8.83 | 2.13 | 25.11 |
| 1962-63 | | 18.35 | | 8.09 | 2.38 | 28.82 |
| 1963-64 | | 16.11 | | 9.50 | 3.18 | 28.79 |
| 1964-65 | | 20.30 | | 3.26 | 3.20 | 26.76 |
| 1965-66 | 13.50 | 19.40 | | 2.95 | 6.98 | 42.83 |
| 1966-67 | 14.47 | 28.77 | | 5.13 | 10.43 | 58.80 |
| 1967-68 | 15.95 | 32.70 | | 4.32 | 14.68 | 67.65 |
| 1968-69 | 12.96 | 30.25 | | 4.78 | 17.97 | 65.96 |
| 1969-70 | 12.72 | 31.41 | 9.28 | 5.80 | 13.05 | 72.26 |
| 1970-71 | 19.12 | 43.48 | 12.80 | 5.23 | 20.63 | 95.26 |
| 1971-72 | 9.94 | 38.87 | 12.13 | 5.86 | 13.90 | 80.70 |
| 1972-73 | 15.54 | 39.08 | 15.60 | 7.33 | 11.33 | 88.88 |
| 1973-74 | 21.91 | 37.51 | 16.27 | 6.21 | 14.08 | 95.98 |
| 1974-75 | 7.10 | 18.46 | 36.70 | 8.46 | 12.56 | 83.37 |
| 1975-76 | 20.36 | 24.84 | 24.65 | 10.49 | 25.66 | 106.00 |
| 1976-77 | 19.39 | 48.47 | 25.11 | 15.88 | 37.80 | 146.65 |
| 1977-78 | 10.13 | 68.01 | 22.70 | 19.50 | 28.19 | 148.71 |
| 1978-79 | 4.80 | 54.40 | | 11.30 | 24.63 | 111.06 |
| 1979-80 | 2.50 | 50.90 | | 12.00 | 27.64 | 132.68 |

## INDIRECT COSTS

Indirect costs of the TECHIM includes those undesirable implications on macroeconomic parameters like balance of payments, local technological environment, industrial structure and the like which do not appear explicitly in the accounts. Most of these undesirable effects emanate from the regulatory clauses inserted in the technology transfer agreements by the technology suppliers limiting the independence of the recipients in their decision making. Stewart (1979) identifies the ability to make independent technological choices as one of the stages in the development of technological capacity. Table 2 shows the incidence of regulatory clauses found in a RBI (1974) survey. In what follows we analyse the implications of these clauses and present further evidence found in different studies on the indirect impact of the TECHIM.

In addition to inflows of capital associated with the TECHIM (as in case of FDI) and the servicing outflows, the propensity to depend upon imported capital goods, raw materials and other goods, foreign technicians, etc, and orientation towards exports do affect the balance of payment of the technology importing country.

(i) *Import Dependence*: On *a priori* grounds one can expect that a foreign supplier of technology would insist on foreign sources of supply of capital goods and raw materials for two reasons; one, because of his familiarity with foreign sources, real or imagined inadequacies of local producers;[7] and two, to provide market to his or his associate's production. Sources of supply are controlled by the technology suppliers through regulatory clauses in the foreign collaboration agreements. Some times performance guarantees of technology are made conditional to use of raw materials, etc, obtained from the sources indicated by the technology supplier (Subrahmanian, 1972, p 174). Subrahmanian (1972, p 146 ff) finds that out of 130 collaboration agreements studied, 41 (i e, 31.5 per cent) had clauses restricting the purchase of materials. In most cases the clauses made it obligatory on the part of the local party to purchase raw materials, components, etc, from the technology supplier or its associates. The RBI (1968, 1974) surveys also show that a significant number of regulatory clauses present in the foreign collaborations restricted the sources of supply of raw materials and capital goods. These clauses were present mostly in the agreements for transfer of technology without any financial stake or those with minority ownership by the technology supplier. It can be expected that in the cases where the technology supplier retains ownership also, *viz*, FDI, preference of foreign sources of supply over local ones need not be insisted upon through formal regulatory clauses but may be effected informally. In the packaged technology transfer deals and in turnkey projects, capital equipment is usually purchased by the technology supplier and it is only logical to expect him to depend relatively more on foreign sources. Furthermore, Subrahmanian (1972) finds that a substantial proportion of agreements studied by him contained clauses barring any change in the designs and original specifications provided by the technology suppliers. This restriction obviously hinders substitution of imported materials by local ones.

A few studies have attempted to compare actual propensity to depend on imports of raw materials, etc, of firms using imported and local technologies. Subrahmanian and Pillai (1979) classify 85 firms selected from three industries, *viz*, engineering, pharmaceuticals, and dyestuffs and intermediates into four clusters according to varying levels of foreign association. The first two clusters include firms which obtained technology through FDI respectively with majority and minority foreign ownership. The third cluster includes firms which obtained technology on licensing basis (unaccompanied by foreign ownership) and the last, those which depended upon local sources of capital and technology. They find that the firms in the former two clusters (i e, those with FDI) had significantly higher level of import intensity of raw materials than the latter two clusters. Among the latter two clusters while firms with technology licensing (cluster III) have higher import intensity than those without any foreign association in the pharmaceutical industry, in the other two industry groups import intensity is marginally higher for cluster IV forms. This may be because of the fact that in these technology intensive industries, indigenous development of technology is relatively new phenomenon and hence firms without foreign association might be late entrants in the sectors with higher initial import dependence.

Kelkar (1977) compares the ratio of imports to value added for firms with FDI (subsidiaries and minority foreign owned companies) and those with pure technical collaboration for 1964-65 to 1969-70 using the data provided in the RBI (1974) survey. He finds that the import/value added ratio is substantially higher for FDI firms than for the pure technical collaboration companies for all the years.[8]

The available evidence, therefore, establishes that when technology is imported through FDI, the dependence on imported raw materials is likely to be substantially higher than in case of technology either obtained under licensing or generated locally. This might imply that process of substitution of imported raw materials by local ones is faster in case of technology obtained in unpackaged conditions (i e, licensing) than in package of FDI.

(ii) *Export Performance*: One can expect that a foreign technology supplier might not like the importing firm to become its competitor in its existing and/or potential markets. Thus Subrahmanian (1972) finds that 57 per cent of the total foreign collaboration agreements contained clauses placing restrictions on the exports of the technology importing firm. In other 10.8 per cent cases exports were sought to be discouraged through a higher rate of royalty on export turnover. Similarly, the RBI surveys (1968, 1974) indicate that the bulk (about 60 per cent) of the regulatory clauses present in the collaboration agreements concerned exports: either banning exports to some or all countries or requiring foreign collaborator's permission for exports.[9] However, it is not necessary that exports are restricted through formal clauses. It might be done informally particularly when the foreign collaborator shares ownership of the enterprise.

TABLE 2: RESTRICTIVE CLAUSES IN FOREIGN COLLABORATION AGREEMENTS, 1964-70

| Type of Restrictive Clauses | Majority Foreign Owned Subsidiaries | Minority Foreign Owned Affliates | Purely Technical Collaboration Companies | Total |
|---|---|---|---|---|
| 1 Restrictions on exports | 80 | 457 | 419 | 956 |
| 2 Conditional payment clauses | 5 | 48 | 41 | 94 |
| 3 Other restrictions | 19 | 113 | 103 | 235 |
| a) Sources of supply of raw materials, plant and machinery | 3 | 21 | 28 | 52 |
| b) Restriction on production capacity | — | 4 | 15 | 19 |
| c) Restriction manufacture of products similar to those produced under the collaboration agreement | 9 | 56 | 51 | 116 |
| d) Restriction that internal sales be routed through distributors specified by the collaboration | 2 | 10 | 6 | 18 |
| e) Others | 5 | 22 | 3 | 30 |
| 4 Total (1 to 3) | 104 | 618 | 563 | 1285 |
| A) Total number of agreements with regulatory clauses | 68 | 320 | 266 | 654 |
| B) Total number of agreements | 167 | 489 | 442 | 1098 |
| C) A as percentage of B | 40.7 | 65.4 | 60.2 | 59.6 |

*Source:* Adapted from Table Nos 9 and 12 of RBI, "Foreign Collaboration in Indian Industry", Bombay, 1974.

Subrahmanian and Pillai (1979) have also compared the export performance (in terms of a composite index) across the four clusters of firms with varying degrees of foreign association in engineering, pharmaceutical, and dyestuff industries.[10] Their findings suggest that export performance is inversely related to level of foreign association in that the firms in clusters I and II (with FDI) performed significantly worse than those in cluster III (technology licensees). The best export performance was demonstrated by the firms without any foreign association (with the exception of pharmaceuticals industry). A few other studies (Nayyar, 1978; Goyal, 1979; IIFT, 1981, among others) also indicate poor export performance of foreign affiliates in India though they do not undertake a comparison.

Therefore, the available evidence indicates that TECHIM hinders development of exports from the importing country. This is more so with cases where technology is imported in packaged form (through FDI). In view of the fact that promotion of exports is a social priority because of the necessity to earn valuable foreign exchange, the adverse impact of TECHIM on export performance is an important social cost.

(iii) *Transfer Pricing*: Transfer price is the price at which intra-firm (i e, between two affiliates of a multinational enterprise) trade takes place. Hence imports of raw materials, spare parts and capital goods, etc, from the technology supplier (and exports from the local affiliate to them) in the case of FDI take place at transfer prices determined by him.

Since the transfer prices are determined by the technology supplier who is dominant party, there is tremendous possibility that these are distorted. There is ample national and international evidence of indulgence of multinational enterprises into manipulation of transfer prices to the disadvantage of host (technology importing) nations and covertly transferring the resources (Lall, 1973, 1979; Chandrasekhar and Purakayastha, 1982; Subrahmanian and Pillai, 1976; Kumar and Chenoy, 1983; Chaudhuri, 1984; Kumar, 1984; Krishna, 1984).[11] The extent of manipulation in certain cases was over 100 per cent. It must be noted, however, that it is extremely difficult to estimate the social cost of transfer of resources by way of manipulation of transfer prices. And TECHIM through FDI alone is amenable to risk of transfer pricing and not licensing except the possibility of overcharging in the case of tied purchases of equipment and materials.

Therefore, it appears from the evidence presented above that in addition to the direct outflows of foreign exchange on account of servicing, TECHIM can have significant impact on country's balance of payments indirectly. This indirect impact is likely to be more adverse in the case of FDI than in case of licensing. Several studies like Kurian (1966), Subrahmanian (1972), Bose *et al* (1974), Lall and Streeten (1977), Goyal (1979), IIFT (1981) have found negative overall direct impact of operations of foreign controlled firms on India's balance of payments. Patel (1984) and Indu Emencee (1983) observe that the foreign exchange burden of foreign capital has a growing tendency.

## LOCAL TECHNOLOGICAL CAPABILITY

Blumenthal (1979) observes that technological level of a country is a function of imported technology, domestic R and D and relation between the two which is often complex.[12] Vital issues from the point of view of technological capability development of the recipient country relate to the diffusion, adaptation, assimilation and absorption of technology and further innovations subsequent to import. In what follows, we summarise the evidence available on impact of TECHIM on each of these parameters.

(i) *Diffusion*: Diffusion of imported technologies may be different than that of indigenous technology depending upon the restrictions placed by the technology suppliers on its horizontal transfer.[13] There is considerable evidence that technology suppliers do restrict technology diffusion. Subrahmanian (1972, pp 144-149) finds that out of 130 agreements studied as many as 84 (64.6 per cent) had clauses making it obligatory for the recipient firms to keep all the technical information secret and not to transfer, assign or sub-license the right to know-how to any party. These clauses are strictly enforced and in a number of cases the collaborators retain the technical control over the process, in some other cases they have the right to appoint technical director/plant manager, etc, to ensure the secrecy of the know-how (Subrahmanian, 1972, p 155; Dasgupta, 1977). RBI surveys (1968, 1974) also indicate inclusion of clauses restricting diffusion of the technologies imported under foreign collaboration agreements. The RBI survey (1974, p 74) reports that nearly 70 per cent of the collaborations signed by the private sector companies had a clause which implied that the technology imported was for exclusive use of the importers and not for sub-licensing, etc. The high incidence of such restrictive clauses is in spite of the government's insistence that the importer should be free to sub-license the technology. The evidence of multiple collaborations signed for same products as reported in ILPIC (1969), Subrahmanian (1972) is a reflection of the lack of diffusion of technology imported by one firm. The technology transfer under such conditions remains a closely guarded secret and hence can at best be termed as a private transfer and not a national transfer thus leading to multiple imports. It is evident that even public sector companies importing a technology find it difficult to sub-license it to another public sector concern. Manufacture of quartz watches is a case in point where the two public sector corporations have resorted to separate imports of very similar technologies from two Japanese multinationals.

Therefore, diffusion of imported technologies is made difficult, some times even impossible by the restrictions imposed by the technology suppliers.

(ii) *Assimilation and Adaptation*: The process of absorption and adaptation of the imported technologies may also be influenced by the technology suppliers through regulatory clauses. Subrahmanian (1972) reports that a substantial proportion of the collaborations studied incorporated a clause restricting the freedom of the borrowing company to change the original designs and specifications. The practice of limiting the freedom of Indian venture to introduce changes in the product/process designs, etc, observes Subrahmanian, "has far reaching implications from the national view point. It prevents local adaptation of the first and second levels and retards assimilation of imported know-how." Very often the process/product specifications supplied under foreign collaboration may not suit the local conditions in terms of local availability of materials, etc, and hence adaptation becomes necessary. Furthermore, during the process of adaptation a more effective assimilation of the technology may take place. Restrictions on changes in original specifications may make substitution of imported raw materials by local ones difficult, leading to continued dependence on imports. Hence the tendency on the part of technology suppliers to restrict the adaptation is an important social cost of technology imports.

Studies made by the Directorate General for Technical Development (DGTD) on the adaptation of technologies acquired under foreign collaboration [summarised in Pillai (1979)] reveal a very slow progress. In some cases the time taken for adaptation stretches upto 20 years. Another revealing observation made by the studies is that foreign controlled firms were particularly less concerned about adaptation and absorption. An UNCTAD (1983) study of Indian capital goods industry corroborates that foreign controlled firms were less interested in adaptation. The foreign controlled companies often represent entities permanently dependent upon their parents in home countries for technology. This finding is shared by Baldev Singh (1977) and Sidhu and Rao (1977). Evidence of the high incidence of renewals of foreign collaboration agreements as found by Subrahmanian (1972, 1984) and DGTD studies (see Pillai, 1979) particularly in case of foreign controlled firms, is in fact an indication of failure of the technology borrowing enterprises to adapt and assimilate the imported technology. Thus perpetual dependence on foreign collaborators through renewals continues. In any case, the imported technology, howsoever well adapted to the borrowing country's environment is inferior to the locally generated technology in terms of local technology capacity building because benefits latent in its creation are lost.

(iii) *Local R and D*: Another factor limiting the progress of adaptation/assimilation (and further innovation) of technology is the tendency to shy away from the research and development activity by the technology importing firms. In this regard again the evidence shows that the foreign controlled companies lag behind the rest of the companies. Subrahmanian (1971) in a case study of the Indian chemical industry found that the foreign controlled companies by and large were relatively less R and D conscious than their local counterparts and spent insignificant proportion of their turnover on R and D. The RBI Survey (1974) also found that companies which had foreign financial collaboration were less active in setting up R and D, than those which had purely technical collaboration, perhaps owing to availability of newer technology from their parent bodies (p 133).[14] Similarly Kumar (1985a) while comparing the R and D intensity of operations of foreign controlled and locally controlled firms in 43 Indian manufacturing industries finds that the former spent significantly less on R and D than the latter.[15] The foreign ownership was found to be having a negative though mildly significant influence on the R and D intensity while the technology import under licensing had a strong favourable effect even when other influences on R and D intensity were controlled for.[16] UNCTAD (1983a) study of Indian machine tools industry reaches similar findings. Chisti (1977) observes that R and D activity of the subsidiaries of multinationals in India confines only to minor product modifications, raw materials substitution, etc.

Quite apart from the fact that possibility of importing foreign technology in a sphere may damp the Indian initiative to create, duplicate, or imitate it (Devadhar, 1967, p 270; Morehouse, 1980; Stewart, 1979) there is evidence that affiliates of multinational companies may even be actively hampering the research activity carried out by the local firms. Desai (1980, p 86 ff) demonstrates how foreign firms attempted to use vague provisions of the Patents Act to thwart the successful innovations made by Haffkine Institute, Bombay, and Excel Industries (a private local firm) in the sixties. Similarly, Chaudhuri (1981) documents the way an Indian pioneering firm in the field of drugs, *viz*, Bengal Chemicals and Pharmaceutical Works (BCPW) which by the fifties succeeded in developing technology for production of many vital drugs like Thiacetazone, Nikethamide, Nicotinic Acid, Dapson, Chlorpropamide without any foreign help was harassed by a multinational. Sidhu and Rao (1977, p 222) note how the local R and D activity in progress is forestalled by foreign agencies by registering patents. Instances of technology dumping at a cheap price to dismantle local innovations in progress are also known.[17] In their efforts to hamper local technological capability building in the developing countries, the multinational corporations are often joined by the aid-giving agencies (knowingly or unknowingly). Mehta (1977, 1982), BM (1979) document how a creditable technological capability built up in the Indian fertiliser and steel industries was scrapped by the government (presumably under pressure from the foreign agencies). Menon (1980) and Dhar (1984) also provide illustrating account of Indian fertiliser industry including the role played by the World Bank and other aid givers in the technology choice undermining the local interests.[18] Alam (1982) shows that the electronic switching technology in communications which was imported in preference to indigenously developed one, may not be successful in the local environment. Case of National Silicon Facility (*India Today*, February 15, 1985) is yet another example of showing preference for imported technology over more efficient local alternatives. Ramamurti (1978) shows that the proposed broad based agreement between pioneering heavy electrical firm BHEL, etc.

The evidence presented above tends to indicate that contribution of technology imports to local technological capability building has been rather limited. The limiting factors have been the reluctance on the part of the foreign technology suppliers to impart capabilities required for efficient adaptation and absorption, by restricting the ability of the technology importers to make independent technology choices, blocking the way of horizontal diffusion and assimilation and absorption of the imported technologies, by neglecting the R and D activity, and sometimes even by actively hindering the innovative activity of local firms. Of the modes of technology imports, FDI seems to be less efficient way of import than pure technical collaboration in terms of local technological capability building because foreign ownership and control perpetuate the dependence of the local enterprise on foreign sources and discourages the autonomous technological capability building. Deolalikar (1980) concludes from his study of Indian pharmaceutical industry that use of foreign technology by local firms has more desirable societal consequences than its use by a foreign firm. Lall (1980) in his study of technology exports from different developing countries finds that countries that permitted a free flow of technology by means of foreign controlled affiliates have not exported technology of the diversity and complexity shown by those that have restricted such imports and protected local technology.

### EMPLOYMENT EFFECT

Technology imports can affect employment in the borrowing country through their employment generation potential *vis-a-vis* alternative technologies. It is widely believed that technologies imported from the developed market economies may not suit the factor endowments in the less developed countries like India (Stewart, 1977). It is argued that since the developed countries are usually capital abundant and labour scarce, the technologies developed there might be labour displacing (and capital intensive). An excessive induction of such technologies in the labour surplus economies may, therefore, create distortions like growing capital scarcity and unemployment.[19]

A few studies have addressed themselves to the examination of choice of technique of the foreign controlled firms *vis-a-vis* their local counterparts. Balasubramanyam (1974) finds that imported technology was more capital intensive than the indigenous technology in four industries he studied. Agarwal (1976) compares the factor proportions in foreign subsidiaries and local firms in 34 industries and finds that the former were more capital intensive than the latter in majority of the industries. Lall and Streeten (1977, Chapter 6) while comparing capital output and capital labour ratios for multinational and local firms in a limited sample conclude that foreign ownership (transnationality) does not have a discernible impact on capital intensity.[20] By comparing the production functions of affiliates of multinational firms in developed and developing countries, Leipziger (1976), and Courtney and Leipziger (1975) reach the conclusion that multinationals do respond to the factor price in the host countries. Implications of this finding are that the government policies of making capital artificially cheaper and labour costlier (through labour laws) which most of the developing countries have adopted is partly to be blamed for higher capital intensity of foreign firms in developing countries.

Therefore, the evidence that imported technologies are more capital intensive is far from conclusive as yet. One of the deficiencies of the studies is that the comparisons are made on the basis of ownership and not on the basis of source of technology. Second, the factor prices in the developing countries are also distorted.

Another dimension of effect on employment is changes in working conditions/wage rates due to technology imports. Particularly, in the cases where the technology supplier retains part of ownership and management, i e, FDI, working conditions and wage payment behaviour may be expected to be different (Singer, 1970). Systematic evidence on comparative performance of foreign controlled and local firms in this regard is, however, scarce because of data limitations. On the basis of a comparison of proportion of earnings of high income employees in total wage bill, a proxy of employee compensation propensity, between foreign controlled and local firms across 49 Indian industries, Kumar (1985b) finds the former to be having a tendency to pay higher than the latter in most of the industries.[21] However, much of the influence of foreign ownership on employee compensation propensity vanishes when other influences like skill intensity and market structure are controlled for. Sinclair (1982) makes a case study of an affiliate of a Scottish multinational in India and compares the working conditions in their plants in India with those in the home country, finding much poorer standards in the former.

### EFFECT ON MARKET STRUCTURE

Entry of multinational corporations in developing countries for transferring technology can affect the host coountry's market structures since they enjoy monopolistic advantages which may impede the entry of potential local entrants.[22] While evidence on adverse impact of foreign penetration on host country market structures for some newly industrialising countries in Latin America and ASEAN is growing[23] there is hardly any systematic study on this aspect in India. Studies by Kidron (1965), Subrahmanian (1972) and Subrahmanian and Pillai (1977) do indicate correlation between foreign investments and concentration but they may be owing to common determinants of these two (Caves, 1982). Similarly, Kumar (1982) noted that representation of foreign (FERA) companies among companies which registered under the Indian monopolies legislation on account of market dominance was disproportionately large.

### DISTRIBUTIVE IMPACT

The FDI mode of TECHIM may affect the inter-country distribution of income through distribution of profits between home and host countries. It can also affect the intra-country regional distribution through location of their projects. The intra-regional distribution can be affected through choice of technique: labour or capital intensive; as well as through wages and working conditions in the plants of foreign controlled enterprises *vis-a-vis* those in local firms.

FDI's effect on market structure (concentration) ultimately gets reflected on income distribution. And it can affect the intertemporal distribution by deciding how much of the surplus value added to be retained for further investment and how much to be paid to the shareholders.[24] The literature on technology imports or foreign investments has, in general, neglected these aspects. Lack of detailed statistics might have been responsible for this neglect. Evidence on influence of FDI on choice of technique, wages and working conditions, and on market structures, though scanty as it is, has already been discussed above. An important influence of penetration of foreign capital and technology in India, which has a lot to do with income distribution, is its deleterious impact on the traditional industries and skills. Rahman (1983, p 74 ff) has shown how several traditional industries like textiles, dyestuffs, etc, were destroyed by the intrusion of foreign capital during the colonial period in India. Similarly Ray (1977, p 227 ff) observes that technology imports displace local engineers and scientists and also have adverse impact on local entrepreneurship through unjust competition. Grossman (1984) has shown through his theoretical model that "an inflow of foreign owned industrial enterprises into the LDCs has an adverse effect on the supply of local entrepreneurships". On the basis of his empirical studies, Siddharthan (1979) concludes that MNC firms in India may stand in the way of growth of Indian firms. Goyal, Rao and Kumar (1984) illustrate the deleterious impact of MNCs operating in the consumer goods sector in India on small scale firms.

### DEPENDENCE AND POLITICAL ECONOMY

It has been argued that excessive dependence on foreign technology, particularly through FDI, reduces the controllability and hence sovereignty of the host country.[25] Various studies done in the context of Canada like Gorecki (1976), and UNIDO (1980) have shown that investment/diversification decisions of foreign controlled enterprises are taken outside the host country, usually in the home country to fit in their global strategies. Similarly, Howe and McFetridge (1976) have shown that R and D decisions of foreign controlled firms in Canada are taken outside Canada. Though the evidence of similar sort is not available for India as yet, there is no reason to believe that it would differ much. But it is fairly well known that multinationals control the composition of boards of directors of their Indian affiliates through articles of association (Chaudhuri, 1979).

Excess involvement of multinationals in the host country's economy may activate them to play politics and manipulate the host country policies to their advantage. The political dimensions of foreign capital in India have been studied in some detail by Kidron (1965), Markensten (1972), Tanzer (1970), Martinussen (1977), Saini (1981), IIPA (1983).[26] Kumar (1982), Kumar and Chenoy (1983), Corporate Studies Group (1983), IIPA (1983), Goyal, Rao and Kumar (1984) provide evidence that MNCs operating in India often violate the local regulations. Growing evidence is now available on multinational companies dumping hazardous drugs, pesticides which are banned or severely restricted in their home countries, and technologies to manufacture them in developing countries [see for instance Rahman (1983, p 80) for dumping of pesticides, and Kumar and Chenoy (1983) for cases of banned drugs].[27] They have been found to be using double standards for industrial safety and pollution abatement between developed and developing countries.[28] And they, often, export technologies to developing countries which are already obsolete in their home countries.[29] Rahman (1983, pp 86-7) provides such an example in electronics industry in India.

Another consequence of the excessive dependence on foreign technology which received little attention is that it leads to perpetuation of dependence, not just on foreign technology as outlined above, but also on foreign sources of finance. As we have noted above, foreign technology suppliers usually insist on imported equipment and capital goods thus leading to higher foreign exchange costs of plants erected with foreign technology. To finance the foreign exchange cost of the equipment/plant, the host developing countries which usually suffer from foreign exchange shortage, resort to foreign commercial borrowings, suppliers credits, and/or seek foreign aid. Even before the plant is commissioned, the interest burden (to be paid in foreign exchange) on the accumulated foreign debts starts mounting up. Further loans are raised to pay the interest and so on. Suddenly the country finds itself in a Debt Trap. Alarmingly high foreign debt levels of several developing countries which intended to industrialise with open doors for foreign technology and capital like Mexico, Brazil, etc, are testimony to this phenomenon.

In addition, excessive involvement of MNCs in a country can also have important socio-cultural effects. Through high pressure marketing and advertising techniques which they usually employ they can affect the consumption pattern and tastes of the local population. Literature on contours of soicocultural effects is, however, scarce. Yet Krishna Kumar (1980) and Utrecht (1982) provide a general account of cultural effects of MNCs in developing countries.

### OVERALL IMPACT

The foregoing discussion shows that the direct costs of technology imports might, in fact, be indicating only a minor part of the total social cost. However, it is almost impossible to precisely determine the magnitude of the indirect costs. UNIDO (1979) estimated that direct costs of technology transfers to developing countries were of the order of approximately one billion dollars in 1975. Rough estimates for indirect costs made by UNIDO are placed anywhere between $ 6 billion to $ 12 billion a year (equivalent to 2 to 4 per cent of the national income of the developing countries). Even this figure seemed to be an underestimate. If allowance is made for the transfer of inappropriate technologies and the long term influence of technologies that undermine development of endogenous capabilities, it could well be as high as $ 30 billion to $ 50 billion a year (UNIDO, 1979, pp 18-19). It implies that direct cost of technology imports may be only a trivial 2-3 per cent of the total cost. There can, however, be wide variations in total social cost of import of the same (or similar) technology depending upon the mode/source and on bargaining because of imperfections in the technology markets.[30]

The significant conclusions emerging from the foregoing analysis are that considerable technology imports that have taken place in the Indian economy both in disembodied form through FDI and pure technical collaborations; and embodied in capital goods, skills, etc, have significant direct and indirect costs. The data on remittances as a proportion of manufacturing value added showed a rising tendency till the seventies and declining afterwards. Significance of dividends and profits, i e, servicing of FDI in total remittances has gone up. The direct costs in the case of FDI mode of technology transfer may be higher than in case of licensing (pure technical collaboration). Among the indirect costs are the adverse effects of TECHIM on balance of payments through higher dependence on imported equipment, raw materials, etc, of the technology importing firms, coupled with their poorer export performance and possibility of manipulation of transfer prices. Here again firms which imported technology through FDI perform worse than those under purely technical collaboration. Building up of local technological capability is limited by the foreign technology supplier's attempts at restricting the diffusion of the technology and reluctance on their part to impart the capability to adapt and assimilate to the importing enterprise. These practices perpetuate continuous dependence of the borrowing countries on the foreign sources of technology. Foreign controlled companies spend relatively little on R and D in India and prefer to depend on their parent companies for their technological requirements. In this respect again FDI mode of TECHIM has higher indirect cost than alternative modes. The conjectural evidence which is available suggests that imported technology is more capital intensive than indigenous technology hence may not be fully appropriate to the local conditions but distorted factor prices may also be responsible for such a situation. Only conjectural evidence is available on adverse impact of foreign penetration on local market structures as well. Income distribution is worsened by the demise of traditional industries due to competition by foreign technology. Foreign penetration also discourages local entrepreneurship. In addition, excess dependence on foreign technology may have political repercussions and may drag the country to the foreign debt trap. Though it is difficult to ascertain the magnitude of indirect costs of TECHIM, crude estimates that have been made show that it could be 30 to 50 times the direct cost. Implications of these for the policy are that while appraising and selecting a particular technology for import or while taking a make or buy decision, indirect costs associated with it must be kept in mind in addition to the direct ones.

The Indian literature on the evaluation of impact of TECHIM, this survey would suggest, is extensive. However, there are numerous questions to which we have no answer as yet. For instance, while we have some indications that FDI may have been an expensive mode of TECHIM than pure technical collaborations, one does not know the relative costs (and efficiency) of technology transfer that takes place through capital goods, technicians, etc. How do various sources of technology like CMEA countries, the US, Europe, Japan; and within the Western world, private sector *versus* public sector firms compare in terms of direct and indirect costs?[31] Though Pillai (1978) shows that even a local public sector corporation is no better than the private companies in bargaining with potential technology suppliers more research is needed on the question, whether terms of same technology transfer are better than the government (i e, a public sector corporation) rather than a private firm is on the bargaining side. Whether large conglomerate multinational corporations are better sources of technology transfer than the small/medium sized firms in the home countries. What role does the technology acquired from abroad *vis-a-vis* that generated in the country play in the country's international trade? What policies could the government pursue in different sectors to minimise the social costs of TECHIM and at the same time ensuring the inflow of advanced technologies? It is imperative, therefore, that further research be concentrated on some of these aspects.

## Notes

1 See for details Graham (1983), UNCTC (1983).

2 For an account of policy towards foreign collaborations in India see among others IIPA (1983), Kapur (1983), UNCTC-ESCAP (1980), Agarwal (1982), India, Ministry of Industry (1982), Kumar (1982).

3 A few studies have made use of the methodologies of social cost benefit analysis to evaluate overall benefits of some chemical and pharmaceutical projects set up with foreign direct investments (Lal, 1975; Kumar 1980, 1984, respectively). These studies have yielded mixed results about the social desirability of the projects. Hence no generalisations are possible. No such attempt has been made to evaluate a TECHIM project. Bos, *et al* (1974) in a five-country study, including India, attempt to evaluate the effects of FDI on national income, balance of payments, public and private savings in the framework of a sophisticated macro-economic model. This model, however, leaves out a number of indirect effects of FDI and also does not cover licensing.

4 There could, however, be several factors responsible for the substantial difference in the costs of the first two petrochemical complexes and the third one. First is the rental for the capital investment in the case of the first two. Secondly, the third complex was set up at least a decade later than the first two, by when probably the local technological capabilities had developed to some extent leading to more effective bargaining and unpackaging of the technology. And finally, the third complex had the Government of India on the negotiating side (IPCL being a public sector company) rather than a private sector firm. Also see UNCTAD (1983b). UN (1974) argues that imperfections in the technology markets affect both the price as well as quality of the technology traded and hence the role of negotiations.

5 Alunkal (1978) shows that foreign exchange cost of TECHIM can vary, indeed very widely, depending upon the choice of technology, suppliers, negotiating skills from the borrowing country's side, etc.

6 Mason (1973a), Desai (1982) also note that cost of technology imports has been too high.

7 See McAleese and McDonald (1978).

8 Cohen (1975) for South Korea, Taiwan and Singapore also found that foreign firms tend to import more and buy less from local firms than do their local counterparts. McAleese and McDonald (1978) in the case of Ireland also find that foreign owned firms had propensity to buy a lesser proportion of inputs from the local markets. Newfarmer and Marsh (1981) find that firms in Brazilian electrical industry import markedly more than the local firms.

9 Vaitsos (1974) reports that 75-90 per cent of the total contracts signed by the Andean countries for acquisition of technology had export restrictions (complete or partial).

10 Cohen (1975) in the case of South Korea, Taiwan, and Singapore, however, found that foreign firms tend to export a marginally higher fraction of their output than local firms. He also finds that foreign firms tend to have a lower value added per dollar of sales than local firms. Chen (1983) could not find any evidence that foreign firms export a higher proportion of their sales than local firms in south-east Asian countries. Also see Helleiner (1973, 1976), Nayyar (1978) on manufactured exports by MNCs from developing countries.

11 Vaitsos (1974) provides evidence on transfer pricing in different industries in Andean countries. OSACI (1981) illustrates a case of transfer pricing in Brazil. Also see Lall (1981a).

12 Also see Stewart (1979).

13 For an international study of diffusion of semiconductor technology, see Nabseth and Ray (1974).

14 US Tariff Commission (1973), Creamer (1976), Mansfield, *et al* (1979) provide evidence that US MNCs tend to concentrate their R and D activity at their headquarters in US. Furthermore, Creamer finds that whatever R and D activity that is undertaken abroad is confined to industrialised countries of Europe and only a 'negligible share' finds its way to the developing countries.

15 Ragachand (1981) for Canada also reaches the same conclusion. Evans (1979), Gordon and Fowler (1982) for pharmaceuticals industries in Brazil and Canada also conclude the lesser R and D intensity of foreign firms compared to the local firms.

16 See Kumar (1985a). Caves, *et al* (1980), and Palda and Pazderka (1982) also find foreign ownership to be having an adverse effect on host country R and D activity.

17 See for instance case of radar technologists in Vohra (1981).

18 A few such instances again in the fertiliser industry have been quoted in Alunkal (1978).

19 See also UN (1974).

20 Studies done for other developing countries yield mixed findings. For instance, Cohen (1975), Mason (1973b), Reidel (1975), Chung and Lee (1980) fail to find any significant difference between capital intensity of foreign and local firms, but Solomon and Forsyth (1977) do find the foreign firms to be more capital intensive. See Lall (1981a, Chapter 2) for a survey.

21 Lim (1977) for Malaysia, and Dunning and Morgon (1980) for six European countries also reach similar conclusions. Also see ILO (1976, 1981), and Dar (1979).

22 See Lall (1981a, Chapter 2), UNCTC (1983), Caves (1982, Chapter 4) and Bergsten, *et al* (1978, Chapter 7) for reviews.

23 For instance Newfarmer and Mueller (1975), Evans (1977), Connor and Mueller (1977) for Brazil and Mexico; Lall (1981a, Chapter 3) for Malaysia show significant positive relationship between foreign presence and concentration. However, Rosenbluth (1970) fails to find a discernible relationship for Canada while Fishwick (1981) finds an inverse relationship for a number of European countries. See Lall (1981a, Chapter 2) and Dunning (1981, Chapter 7) for surveys.

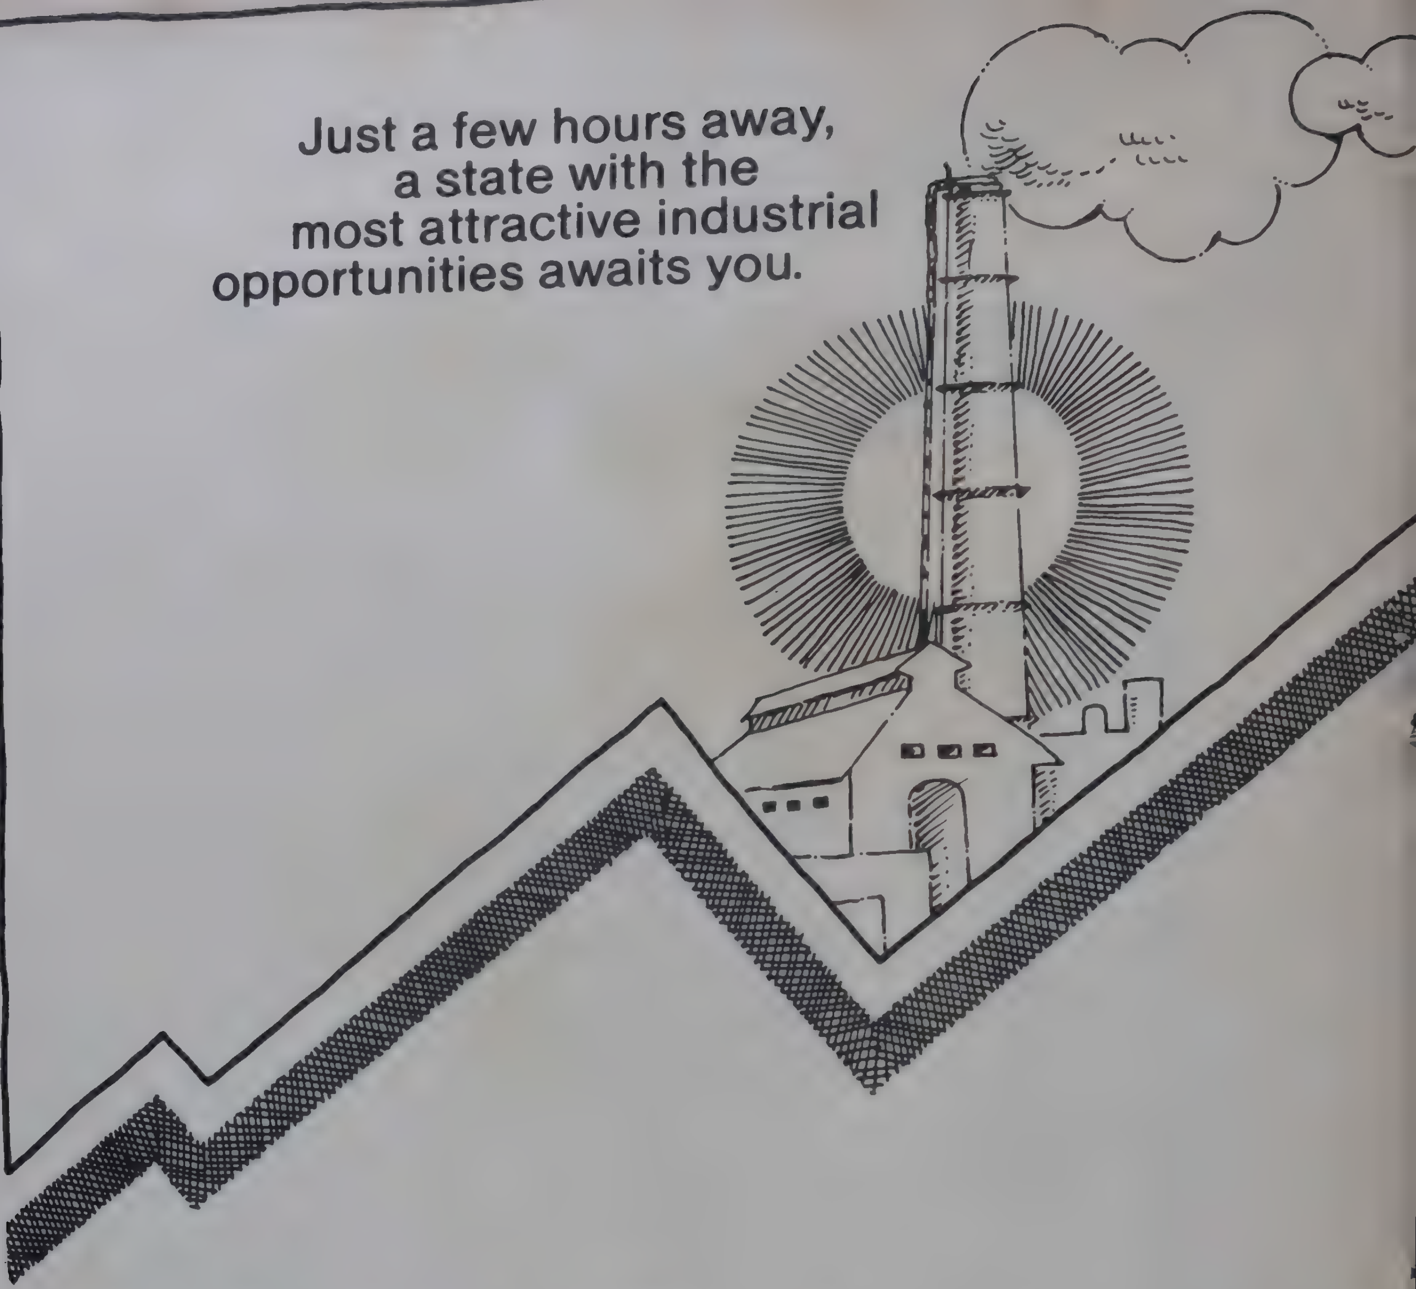
24 See Vaitsos (1974, 1979), Kumar (1980) for further details.

25 See Billerbeck and Yasugi (1979).

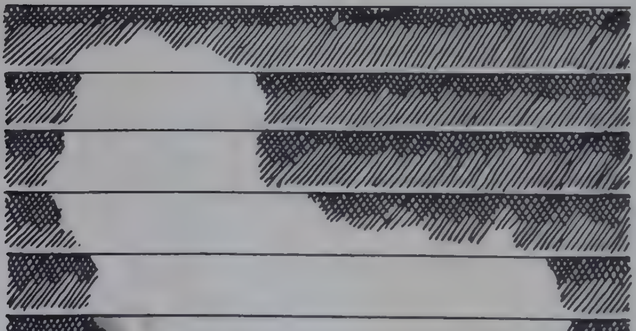
26 Barnet and Mueller (1975) remains one of the classic studies discussing the politics of MNCs internationally. However, a number of case studies are also available, see for instance, Evans (1979), Langdon (1978), Utrecht (1981, 1982, 1983), Sampson (1973), Stauffer (1983).

27 Silverman (1976), Richter (1982) for more instances of this kind. Also see Castleman,

Just a few hours away,
a state with the
most attractive industrial
opportunities awaits you.



**Uttar Pradesh. The place to grow bi**



**PICUP** UDYOG BANDH

Big things are happening in Uttar P

Just a few hours away from you, UP awaits with opportunities for the medium scale entrepreneur, which are probably the most attractive in the country. And an industrial climate ideal for growth. There are some very good reasons for this. Reasons which have led to some of the biggest projects being set up in UP in the recent years.

**Huge power potential**

UP has an excellent scenario for power availability. With giant State power generation projects at Anpara, Parichcha, Tanda, Maneri Bhali, Unchahar, etc. gradually reaching full generation. As well as UP's share in Central Sector power projects like Narora, Singrauli and Rihand. So that UP's power availability is steadily growing at more than 17% per annum, and the industrial sector will have a power surplus by mid-1985. Even today there are no scheduled industrial power cuts and new units are assured of no power demand cuts for 5 years.

**The largest labour force**

UP has the largest traditionally skilled and most peaceful labour force in the country — easily adaptable to precision work. Labour unrest is rapidly on the wane. A traditional cosmopolitan culture precludes communalism and parochial feelings.

**The most attractive "Backward Areas"**

There are as many as 43 districts eligible for Backward Area concessions in UP. But even the 15 Category A (most backward) districts include areas like Kanpur Rural, Dehra Dun, Nainital, Sultanpur (adjoining Lucknow), Jaunpur (adjoining Varanasi) and Fatehpur (adjoining Allahabad/Kanpur). Districts with developed infrastructure like trunk railways, nationl highways and convenient air connections. Industries in these Category A districts are eligible for Central Capital Subsidy of 25% of capital investment, subject to a ceiling of Rs.25 lakhs. Subsidy that can be clubbed with the promoter's equity for determining equity : debt ratio. To enable larger loans with promoter's contribution as low as 10% of project cost. Financial facilities include liberal term loans, seed capital, underwriting assistance, leasing of industrial equipment, foreign exchange loans and concessional loans for modernisation.

**The heaviest Sales Tax Concession**

UP is possibly the only state in India which offers new Industrial units total sales tax exemption/deferment with no ceiling on quantum of exemption that can be availed, for 5,6 or 7 years, depending on the project location.

**The most powerful coordination body**

To help entrepreneurs in gathering information, liaising with various government departments, and expediting licencing, sanctions etc, the Government of UP has a special high power cell called Udyog Bandhu, under the Chairmanship of the Chief Minister of UP. Apart from all the liaison services, the entrepreneur can go right to the top through Udyog Bandhu and so cut across all red tape.

**Those who are moving to UP**

● Modi Xerox ● Bharat Gears ● TELCO ● DCM-Toyota ● TEXMACO ● Lohia-Piaggio ● Escorts-Yamaha ● Wheels India ● Phillips Carbon Black ● Ceat Tyres ● Century Pulp & Paper ● Bajaj Auto ● Hindustan Motors ● Orient General Industries ● Hindustan Brown Boveri ● Gulf Consolidated Company for Services & Industries of Bahrain ● HMT ● BHEL ● Bharat Electronics ● Hindustan Aeronautics ● Indian Telephone Industries ..... to name only a few

The ancillary opportunities due to all these projects are in itself staggering.

For further details of industrial opportunities and facilities, do get in touch with us at:

## Gujarat Lyka Organics

GUJARAT LYKA ORGANICS promoted jointly by Gujarat Industrial Investment Corporation (GIIC) and Lyka Labs has come to the capital market with an issue of 10.30 lakh equity shares of Rs 10 each at par to raise a part of the finance required for the 7.45-crore project for the manufacture of 79 tonnes of semi-synthetic penicillins and intermediate thereof. Out of this issue, 2.5 lakh shares have been reserved for preferential allotment to non-resident Indians on repatriation basis. The private sector promoter Lyka Labs is one of the pioneers in the manufacture of semi-synthetic penicillin based formulations and ranks amongst the highest sellers of antibiotics in the country. The company has entered into technical collaboration with Ininter of Switzerland, which has successfully implemented projects for manufacturing semi-synthetic penicillins in many countries. The plant is being set up at Ankleshwar in Bharuch district of Gujarat and is expected to start trial production in September 1985 and commercial production soon thereafter. The company will produce 6 APA Ampicillin, Amoxycillin, Cloxacillin, etc, which are all mainstream antibiotics for treatment of various ailments, and, the formulations based on these are amongst the highest sellers in the country. A part of the present demand is being met through imports and the creation of manufacturing facilities in the country will help save foreign exchange. The company does not expect any marketing problems. About 50 per cent of the production will be consumed by the Lyka Group of companies and the balance will be marketed through selling agents. The break-even point of the project is estimated at 53 per cent of capacity and no overrun in cost is envisaged. According to C I Gandhi, Managing Director, the company expects to achieve 60 per cent of capacity utilisation in the first year of production and to gradually increase it to 100 per cent in the fourth year. The turnover should rise from around Rs 7.5 crore to Rs 14 crore in this period. Investors in the issue will be entitled to 80 CC and wealth tax benefits. The issue is managed by the Merchant Banking Divisions of State Bank of India and Champaklal Investment and Financial Consultancy (CIFCO).

# Prospects for Self-Reliance and Indigenisation in Automobile Industry

## Case of Maruti-Suzuki Project

**T Hamaguchi**

*This study of the prospects for self-reliance and indigenisation in the automobile industry concludes that the liberalisation policy in respect of the automobile sector should be oriented more towards the development of the automobile ancillary industry in the long-run. Care should be taken to ensure that the concessional import tariffs with respect to automobile ancillary items and spares do not pose a threat to the domestic automobile ancillary industries.*

*Secondly, the definition of project imports now applies only to establishment of a new unit or a substantial capacity expansion and is unlikely to be helpful to automobile ancillary units which have already attained a certain degree of skill and productive capacity. For them marginal expansion or technological upgradation may be sufficient, but they may be baulked by the high tariffs on imported raw materials and capital goods not falling within the scope of project imports.*

*Finally, the policy of reservation of certain automobile ancillary items for the small-scale sector needs to be modified and the criteria for reservation should be based on considerations of scale of production and technology.*

THE Maruti-Suzuki Project on manufacture of automobiles has been the centre of attention of the nation in many ways. The project has initiated the process of revitalisation of India's automobile industry which is nearly thirty years behind the most recent technological development in the world. The project involves the largest-ever direct investment by Japan into India. Another significance attached to it is the development and absorption of the foreign technology, embodying thirty years' of evolution, within a span of five years. In other words, under the banner of self-reliance, the project is also responsible for implementation of the indigenisation programme.

The idea of manufacturing "people's" cars, small and low-priced so as to reach the masses, was first developed in early 1960s when the Indian economy was experiencing accelerated growth. Yet the project was not given serious consideration till the 1970s, when there was a severe shortage of passenger cars. Car production, which was growing at 5.4 per cent per annum in the 1960s, had declined to one per cent a year in the 1970s. At the same time, the demand for cars increased steadily and was estimated at 80,000, against a capacity of over 35,000 in the industry, by 1974. Thus people had to wait for years to get a car, and even a car used for a few years was sold at a premium. So the government decided to set up a public sector unit for the manufacture of small cars with a capacity of 50,000 vehicles per year with foreign collaboration.

The late Sanjay Gandhi, who had an ambition to become a car manufacturer since his childhood, claimed then that he had developed an indigenous, fuel-efficient, small car which did not require any imports of know-how and capital goods. He was given a licence to produce 50,000 cars a year as Maruti and Co Ltd, while the government shelved its own project. However, Maruti could complete production of only a hundred cars or so before the factory was seized by the Janata government in 1977. By the time the present regime came into power and decided to resume production, the significance of the project underwent a considerable change due to the new environment faced by the economy.

It had long been a belief of Indian planners that a step-up in investment in the infrastructural sectors, made possible by abstaining from current consumption, would vastly enhance consumption in the future. Thus the production capacity of many final consumption goods, including passenger cars, was governed through licensing, so that more resources would be canalised into the priority sectors. In the same vein, final consumption goods were given little importance in the matter of allocation of foreign exchange. As long as an item was produced domestically, its import was discouraged by licensing restrictions and tariff walls. But this policy allowed India's automobile industry, among many others, to ignore international developments in cost and technology. Even a large domestic demand could not bring about modernisation since the supply was controlled by industrial licensing

The supremacy of the norm of import substitution in India's economic policies was questioned for the first time since Independence, when the problem of a high saving rate co-existing with low industrial growth, in other words low efficiency, was pointed out. In the late 1970s, it was thought that cost and technology conditions needed to be improved by transfer of foreign technology. This measure would attain the objective of self-reliance in the longer run.

The Matuti-Suzuki Project became a symbol of the new thinking. It could make the first breakthrough partly because the two oil shocks had sent inflationary waves in the economy and conservation of fuel had become a national priority. Secondly, it was alleged that the then Prime Minister Indira Gandhi wanted to ensure that her late son's dream of the small car would come true one day. Maruti and Co Ltd was nationalised and the project to produce the small car was taken up in the public sector.

The new company, Maruti Udyog Ltd (MUL), initially planned to start with light commercial vehicles. However, the government insisted that it manufactures the small car and promised to back the venture with appropriate policy changes. MUL abandoned Sanjay Gandhi's idea of making a car without foreign collaboration. It concluded a financial and technical tie-up with Suzuki Motor Co Ltd, a motorcycle and car manufacturer of Japan. Suzuki now holds 26 per cent of MUL's shares and the balance is held by the government.

In the agreement between the two companies concluded in 1982, it was specified that MUL was to produce 30 per cent of the value of each finished car. In turn, its collaborator Suzuki was to transfer the technology corresponding to production of the same proportion. However, as far as the other 70 per cent of the value was concerned, the agreement was largely open-ended and a condition was laid down that 60 out of the 70 per cent would be supplied domestically. The supply source was not specified. The experience over the last three years shows that MUL has been facing difficulties in locating suitable vendors of auto ancillaries.

### INDIGENISATION POSSIBILITIES DOUBTFUL

A few months ago, a Director at MUL who is on deputation from its collaborator Suzuki, hinted to a group of journalists visiting the factory at Gurgaon that the indigenisation plan may not be implemented on schedule because the Indian auto ancillary industry was not in a position to supply the products in conformity with specifications. This was the impression he had after meeting the auto ancillary manufacturers here and investigating their products. The conversation reveals the fear prevailing among the Japanese, even at the time of signing the agreement that their technology would possibly relapse as Indian components increase in the car. Perhaps responding to this argument, the Industry Minister Virendra Patil cautioned, in his address to a conference on automobiles and allied industries, that car manufacturers should make every effort to keep up to the schedule of phased indigenisation as approved by the government.

Meanwhile it was agreed that the target of indigenisation for the sixteen months' period December 1983 to March 1985 be scaled down from 31.5 per cent to 23 per cent. It seems that the target for the year 1985-86 was lowered correspondingly. According to the earlier newspaper reports, MUL was to achieve indigenisation of upto 45 per cent of the value of a finished product. Later the Industry Minister stated that the target for the year was 35 per cent, while answering a question in the Lok Sabha in April 1985. The ultimate target of 90 per cent indigenisation by the fifth year of production has hence been pushed further away.

MUL's indigenisation programme from the official commencement of production in November 1983 to the present may be divided into three major periods. The company started 'production' with zero indigenisation with the import of about eighty complete cars totally assembled in Japan. Thus the cars reached the market on schedule. The first stage of indigenisation began when the assembly shop of a handling capacity of 20,000 vehicles a year was completed in December 1984. The production under the first stage of indigenisation of MUL was characterised by the assembly of semi-knocked down (SKD) packs supplied by Suzuki. The assembly at this stage basically involved fitting into the imported car low technology and value components and equipments like tyres, tubes, batteries, electric wiring, wheel rims, seats and glasses. These parts have been indigenised soon after the functioning of the assembly line.

The assembly operation itself is essentially a process of indigenisation of the labour inputs. In value terms, this may have some significance since the indicator of indigenisation is in terms of value of the product. According to MUL's Annual Report for 1983-84, during the first four and a half months since the commencement of production, the aggregate salaries, wages, allowance and other benefits paid to the employees amounted to about Rs 51 lakh , excluding the remuneration to the board of directors. This roughly corresponds to 12.1 per cent of the value of sales during the period. The value of indigenous input materials consumed in the same period stood at about Rs 10.9 lakh, which was 1.9 per cent of sales. Although production during the period was in the form of import of complete cars from Japan, the proportion of indigenised inputs, including labour, to the total sales was thus close to 12 per cent, as was reported by newspapers in 1984.

The second stage of indigenisation started when Phase I of the project ended with the construction of the weld and paint shops and the expansion of capacity from 20,000 to 40,000 vehicles a year, in June 1984. Meanwhile some more domestic parts and equipments like small rubber parts, bolts and nuts, spring and plain washers were brought into assembly. It was declared that the company was able to achieve the revised target of indigenisation for the year 1984-85, i e, 23 per cent. The completion of the weld and paint shops enabled MUL to go for a higher level of indigenisation. As the painting and welding operations started to be executed within the factory, the component packs supplied by Suzuki were replaced by those of a lower value, namely completely-knocked down (CKD) packs. The landed price paid by MUL for the import of a complete car is said to be Rs 30,000 while the price of the CKD packs supplied by Suzuki was Rs 27,722, as was also disclosed by the Industry Minister in Parliament in April 1985.

It is not possible to disaggregate the increment of 11 per cent in the indigenisation rate over the year, into labour and material segments, as the Annual Report for 1984-85 has not been published. However, the fact remains that indigenisation of the labour input has been the most important feature in the process of indigenisation in the project. As more of the process related to production was performed within the factory, the simpler assemblies as inputs were supplied by Suzuki so that more domestic labour could work on them. With the completion of the machine and press shops as a part of Phase II of the project, the proportion of the value of a car to which MUL itself can contribute will go up to 30 per cent. Then as far as indigenisation is concerned, Suzuki's mission in this project would be accomplished.

If MUL is to achieve indigenisation beyond 30 per cent, it has to pursue this by incorporating more of the domestic products in assembly. Indigenisation of components and equipments, however, could achieve only a limited success so far. The major progress in this respect has been observed only in the areas of relatively less technological sophistication and low value. Take for instance the engine, whose assembly has begun in MUL recently. MUL has already started using thirty indigenous parts for the assembly, such as gaskets, spark plugs, spring and plain washers, knock pins. But the more vital and value added parts like carburettors, radiators, pistons and fuel injection equipments, etc, are yet to be indigenised.

## BARRIERS IN INDIGENISATION

The fact that MUL could achieve relatively limited indigenisation in auto parts and components does reflect the weakness of the industrial base of the Indian auto ancillary sector. It seems that MUL does not have much command over the domestic ancillary industries to secure supplies of components and equipment of a reasonable quality corresponding to the planned indigenisation programme.

A Japanese production director of MUL once commented on the quality of the products of Indian auto ancillary industries as 'different'. The reporter of the newspaper interpreted this expression as revealing 'poor'. But there was a suspicion that 'different' might stand for 'a-Japanese'. Pran Talwar, President of the Automotive Component Manufacturers Association (ACMA), maintained that the Indian auto ancillary industry has attained considerable excellence and was capable of ensuring indigenisation of Japanese vehicles. He drew an example of the engine being manufactured under licence from the French auto maker Peugeot which is planned to be indigenised to the extent of 68 per cent within a short span of two years, dismissing the apprehension of the Japanese on the quality of Indian auto components. Some auto-parts manufacturers went to the extent of saying that the criteria for selecting vendors for the supply of parts were so manipulated that only Japanese companies would be able to supply to MUL. Alternatively, Indian manufacturers have to seek collaboration with Japanese counterparts in order to have their supplies accepted.

According to MUL's Annual Report 1983-84, the criteria for selecting auto parts vendors are technology and quality, cost and delivery performance, so as to cope up with MUL's objective to produce low-cost, high quality vehicles and keep the production at a steady level. The procedure in the selection of auto ancillary items is laid down as (i) inspection of production shops of the vendor and to locate those with the necessary equipment and technology; (ii) tests on the samples obtained by the vendor, including actual driving tests for distance upto 20,000 kms; and (iii) examination of supplies during the test supply period with respect to consistency and uniformity in quality.

The procedure is mainly regarding the quality of supplies and does not cover the other criteria needed in selection of auto-parts and equipments, namely, delivery performance and cost. If at all the strict criteria are to be met with respect to cost and delivery performance, no vendor would probably be qualified and the attainment of indigenisation would be unfeasible. Although MUL's production exceeded the set target by 10 per cent, the production line often ground to a halt because one of the vendors did not keep up to the delivery schedule and stocks of the components had run out. Another problem with indigenisation is that MUL has to offer prices that are 50-60 per cent above the international price while purchasing domestic products.

The failure to keep punctuality and a high cost are the result of the limited economies of scale. The incentives for economies of scale do not exist for the auto ancillary sector since the demand for high technology auto components by the automobile industry has not grown as they should. Secondly, the industrial licensing system with the protection of domestic markets by prohibitive tariffs, initially meant for self-reliant growth by management of scarce resources, has been dismantled completely. This has led the automobile industry to operate on a 'cost-plus' basis. High costs are passed on to the consumer after adding margins depending upon the market structure. Even quality-conscious producers have to follow the methods of others in the absence of supporting policies. These factors in the automobile industry have affected the performance of the auto ancillary sector.

If the problem of low demand for ancillaries has to be solved the following barriers have to be overcome. First, spurious and sub-standard parts are dominant in the market. Japanese companies assess that some of the Indian auto ancillaries, though not as good as those in Japan, are comparable to South Korea and better than those in Taiwan. Nevertheless, parts of sub-standard quality dominate the market. According to a study made by the ACMA, basically a body of the organised sector, the production of spurious and sub-standard components was of the order about Rs 700 crore in 1981-82, compared to the produce of Rs 648 crore by the organised units under ACMA.

It is believed that the reason for the prevalence of sub-standard components in the market is the exemption of small-scale auto ancillary undertakings from industrial licensing. Another problem which is associated with scale of production is the reservation of auto ancillary items for the small-scale sector. Under the changing requirements of auto parts by the automobile industry, some of the items reserved for the small-scale sector such as radiators, oil seals, leaf springs have become more suitable for larger-scale production.

Similarly, concessions of excise duties are also made available to small units. The units in the unorganised sector find ways and means to utilise the provision of exemption or concession of excise duties, which average about 31 per cent. They flood the market with low quality parts at lower prices but with a higher safety hazard. The provision of concessional treatment given to the ancillary sector with respect to excise duty has been encouraging the spurious units to flourish. If the exemption is withdrawn, these units will have to face fierce competition from the established units. The only way to survive the competition would be for them to improve the quality of their products. Otherwise they are to be displaced.

The points made so far, however, are not to antagonise the small-scale sector in the auto ancillary sector. The small-scale sector exists when it utilises its natural advantage of being small. The advantage here is in terms of production capacity and technology. It is often observed that some entrepreneurs choose to remain in the small-scale sector only because of the incentives given by the government. On the other hand, in certain areas of the auto ancillary sector, the optimal scale for economical production has changed according to the change in quantity and quality of demand, while the economically viable operation of higher technological sophistication requires larger scales. The policy on reservation of productive activities to particular sectors should not discourage new entrants whenever capacity or technology gaps have been identified.

Another major barrier is the customs tariff. Recent changes in this policy have resulted in a regressive tariff structure for auto components. The effective rate of import duty on components of fuel-efficient motor cars on SKD and CKD packs for the manufacture of fuel-efficient motor cars with engine capacity not exceeding 1,000 cc is 40 per cent. On the contrary, if they are to be produced indigenously, most of components are not available domestically. The import duties on non-traditional raw materials like silicon rubber (182 per cent), vegetable fibre papers (160.4 per cent), stainless steel strips (340 per cent), bonding adhesives (304 per cent) and fifty others with duties more than 100 per cent are hardly an incentive for the auto ancillary sector to start production of high technology components.

The recent changes in the customs tariffs have also slashed down the effective rate of import duty from 65 per cent to 45 per cent on machinery and associated equipments as well as on auxiliary equipments, components or raw materials for manufacture of the former items in setting up a new unit or in the substantial expansion of an existing unit in an industrial plant. However, the definition of project import is so narrow that it will benefit only those who go in either for a major capacity expansion or for setting up a new unit. ACMA estimates the import duty of capital goods necessary for modernisation and expansion in the sector at between 75 and 115 per cent.

The disincentives built in the structure of industrial and trade policies for auto parts makers, in addition to the prolonged stagnation over the years, are hardly helpful for the auto ancillary units to endeavour new ventures and create capacities to suit new specifications. The policies of upgradation and expansion of capacities in the automobile industry seem to be self-defeating in the long run because the auto ancillary industry would be given no chance to become self reliant even if the objective of producing fuel-efficient vehicles will be achieved in the short run by freer imports. At the same time, the situation is ripe for the Japanese to enjoy earnings from India through component supplies, which could have been tapped by Indian parties through indigenisation.

## SUZUKI'S CONSIDERATIONS IN MUL

India's industrial collaboration with Japan so far has not been commensurate with the opportunities made available by Japan's rapid economic growth to the rest of the world. At the end of the fiscal year 1982-83, the cumulative total Japanese direct investment into India was US $ 58 million (Rs 587 crore) accounting for only 0.1 per cent of its direct investment over the world. Nevertheless, the series of liberalisation measures in India in recent years looks very attractive to Japanese auto makers. The Japanese automobile industry has built a capacity which is one and half its domestic consumption. A challenge was posed in 1981 when they were asked to take on a voluntary restraint in exports to the US, which imported about 50 per cent of Japan's total exports of vehicles every year. Against a ceiling of 1.68 million cars a year (later enhanced to 1.85 million in 1984 and 2.3 million in 1985), the Ministry of International Trade and Industry (MITI) of Japan allots quotas to each car exporter based on the performance in the pre-restraint period. Those who have fared well in the voluntary restraint system are the largest auto makers like Toyota and Nissan who are given quotas of 30.8 per cent and 27.1 per cent respectively. These manufacturers not only secured bulk shares of the export to the US, but also increased their profit per unit by concentrating on exports of relatively expensive cars in the $ 10,000-plus range.

The small car manufacturers like Isuzu and Suzuki tried to cope with the new situation by concluding affiliation with General Motors to sell light commercial vehicles and small cars in the US. Despite lobbying by General Motors in support of them, the two companies could sell only 60,000 against 300,000 planned initially. Suzuki also faced difficulty in the sales of motor cycles, for which it is better known in the domestic market compared to automobiles. Due to intensification of competition at home induced by stagnant exports, the number of motor cycles sold between March 1982 and March 1983 fell by 23.7 per cent. As a result of both these factors, the total sales of Suzuki declined by 5.1 per cent in the first half of 1983-84 compared to the previous corresponding period, while ordinary profits were 26.7 per cent lower. For Suzuki, to set up joint ventures abroad must have been a vital corporate strategy for improvement of performance as it assures stable markets for its products in the host countries without being bothered by trade restrictions.

Suzuki's total overseas direct investment was US $ 39.7 million at end June 1983, comprising 3.7 per cent of its total assets. Out of this, the investment outstanding in equities in automobile ventures amounted to US $ 9.82 million, that is, 24.7 per cent of its aggregate investment abroad. Suzuki's overseas processing and assembly units in Thailand, the Philippines, Indonesia, Pakistan, Spain and Columbia, besides in India, turned out production worth US $ 28.5 million for the year 1982-83, which was equal to only 1.8 per cent of the value of aggregate sales by Suzuki (see Table 1).

The profitability of overseas operations by car manufacturers cannot be assessed only in terms of equity and other financial participation and production in its ventures abroad. By means of the collaboration involving technology transfer, the company also receives fees on technical know-how for patents, trade marks and other information in connection with design, development, manufacture assembly, sales, etc, and the related documentation. In the case of MUL, technical know-how fees paid during 1983-84 amounted to Rs 91.9 lakh (subject to withholding tax at 40 per cent), i e, more than half the initial paid up capital contributed by Suzuki.

Revenue by way of payment of dividends from equities, interest payment from debentures and technical know-how fees, royalties and other lumpsum fees is the explicitly stipulated benefits to the collaborators. The collaborator is also assured of the implicit benefits like contracted supplies of their products and parts. In 1983-84, MUL paid Rs 4.62 crore for components like SKD/CKD packs and Rs 6.17 crore for capital goods. Assured and secured markets for the products are vital for the survival of Japanese car markers. Suzuki exported 33 per cent of its total sales in 1983-84, but that still happened to be 10 per cent lower than in previous years mainly due to its voluntary export restraint to the US market. Thus a move towards an assured market like India is only logical in this situation.

### FOREIGN INVESTMENT BY JAPANESE AUTO MAKERS

It is not only auto manufacturers that have welcomed India's liberalisation policies in Japan. The fact is that the Japanese have started to view India as a large potential market, since considerable decline was observed in project exports due to the depression prevailing in oil exporting countries and the debt-servicing crises in some of the developing countries. Though Japan's surplus in trade amounted to a record US $ 33,680 million in 1984, project exports from Japan nearly halved from US $ 17,500 million to US $ 8,300 million (on approval basis) between 1981-82 and 1983-84. The number of orders and the amount involved in them from the oil exporting countries reduced on a large scale as they had to adjust to smaller revenue from oil exports. On the other, the countries with a payment problem have been advised not to undertake large capacity expansion, while many creditor countries discontinued export insurance and suppliers' credit schemes for exports to them.

To Japanese project exporters, the most attractive feature in the recent policy liberalisation in India is the concessional customs tariffs provided for all types of imports such as machinery, instruments apparatus and appliances, control gear and transmission equipment, auxiliary equipment as well as components or raw materials for the manufacture of the former items required for projects concerning the initial setting up of a unit or the substantial expansion of a existing unit of an industrial plant. The effective rates of customs duty for imports under this category range around 45 per cent but similar items imported independently are charged with a tariff of more than 65 per cent. Take for example transmission conveyor or elevator belts. If this item constitutes a part of a project, 45 per cent would be the rate of duty charged, as against 65 per cent for independent imports.

TABLE 1: SUZUKI'S OVERSEAS VENTURES
(At June 1983 Present)

| Location | Paid Up Capital US $ Million | Capital Paid Up by Suzuki (US $ Million) (Share of Total) | Kind of Operations |
|---|---|---|---|
| Thailand | 0.78 | 0.38 (48.94) | Production of motor cycles |
| Philippines | 0.91 | 0.36 (40) | Production of motor cycles |
| Indonesia | 4.20 | 2.90 (70) (with Honda Motors and 4 others) | Production of passenger cars |
| India | 6.57 | 1.71 (26) | Production of passenger cars |
| Pakistan | 9.02 | 1.13 (12.5) | Production of passenger cars |
| Spain | 11.34 | 0.57 (5) | Production of jeeps |
| Canada | 0.53 | (100) | Import and sale of motor cycles and passenger cars |
| United States | 0.90 | 0.90 (100) | Import and sale of motor cycles |
| Columbia | 3.26 | 2.77 (85) | Production of motor cycles |
| Australia | 9.82 | 9.82 (100) | Import and sale of motor cycles and others |

Another encouraging feature to the Japanese is that the recent collaboration agreements approved by India, even if they are of a technical kind, refer to relatively long periods. There is a Japanese company which was allowed to enter an agreement with an Indian partner extending over ten years for transfer of technology in glass lining process. These agreements assure them the markets for their products and parts until the Indian partners are ready for indigenous production. The benefits of collaboration with Indian enterprises are not limited only for the agreement period. Japanese entrepreneurs are hopeful that they can build a foothold through their collaborations in the Indian market which has been relatively unexplored by them so far. The prospects for market expansion too are extremely bright particularly in the automobile sector, where for instance, the demand for scooters and motor cycles has been increasing by 20 per cent a year recently. A list of such collaborations concluded with Japan is given in Table 2.

As market entry by way of exports and joint ventures is limited in Europe and America because of tough competitions with their local counterparts, expanding markets to developing countries has been one of the critical overseas corporate strategies for Japanese auto makers. There has been two distinct features in the overseas corporate strategy of the Japanese automobile industry. One is the technical tie-ups among major auto makers in industrial countries such as those between General Motors of the US and Toyota of Japan, Volkswagen of West Germany and Renault of France. Wherever competition is too fierce and disastrous, the companies choose to work in collusion. In the case of the collaboration in which knocked down packs are supplied by Toyota and assembled in General Motors, the latter has taken this opportunity for starting the production of small cars, while the former is provided with a riskless entry into the American market.

The other way is to tie-up with an indigenous manufacturer by technology transfer as well as financial participation. The objective of collaborations of this kind is to invest where exports are not possible due to protection and to substitute joint production for export.

The two factors in the overseas investment strategy of car manufacture corroborate with each other since the common feature is predominance of assembly operations rather than production activities proper. About half of Nissan's assets in overseas ventures in production is attributed to the light truck plant in the United States where only processes like pressing, frame welding, body assembling and painting are conducted. In the case of Toyota, only two units in Australia and Indonesia, among its overseas factories, undertake the vital process like engine assembly.

Japanese auto makers have a good reason for not going in for the more sophisticated process as like engine manufacture in their overseas units. Toyota initially intended a venture with India's Delhi Cloth and Mills Co Ltd for the manufacture of light commercial vehicles, which was basically assembly of knocked down packs. But on insistance of the Indian government, it had to agree to include engine assembly and press lining in the venture by which the proportion of indigenous value of a finished product would go up from 49 per cent to 90 per cent. The investment to create the capacity had to be correspondingly stepped up by 30-60 per cent. E Toyoda, President of Toyota Motors, argues that it is difficult to maintain a break-even in engine manufacture abroad.

Suzuki has no other way but to develop overseas production and sales capacity since options open to them by way of exports are much more limited than automobile giants like Toyota and Nissan. Suzuki also agreed to the full-fledged venture with India including vital processes like press lining and engine assembly, besides general assembly and final processing. Yet its hesitation for deeper involvement in the project is implicit from its decision on equity participation, i e, to the extent of 26 per cent only. It was said that the government offered the firm 40 per cent equity participation initially. When a Japanese investment mission visiting India in 1983 was asked why Suzuki took 26 per cent instead of a 40 per cent equity, it was reported that the Japanese were reluctant to answer the question.

A more implicit but very plausible reason for the Japanese not wanting to undertake the transfer of more sophisticated operations rests on the nature of its transfer of technology, especially to developing countries. The traditional objective of Japanese direct investment accompanied by technology transfer has been to relocate its domestic industries abroad and to create division of labour with trading countries so that it can specialise in areas where it has comparative advantages. Since overseas ventures are generally relocation of its own industries, Japanese direct investment has concentrated on areas which are integrated to its industrial structure. The technology transferred by the Japanese to developing countries is found to be more general in nature, such as techniques concerning assembly, quality and cost control, inventory management, so that their domestic industries can specialise in the more sophisticated operations.

TABLE 2: INDIA-JAPAN COLLABORATION IN AUTOMOTIVE INDUSTRY

| Name of Company | Name of Collaborator | Item of Manufacture | Year of Approval | Nature of Collaboration |
|---|---|---|---|---|
| 1 Commercial Vehicles | | | | |
| 1) Maruti Udyog Ltd | Suzuki Motors | Light commercial vehicles | 1982 | Technical and financial |
| 2) DCM Co Ltd | Toyota Motors | Light commercial vehicles | 1983 | Technical and financial |
| 3) Hindustan Motors Ltd | Isuzu Motors | Medium and heavy commercial vehicles | 1983 | Technical |
| 4) Eicher Goodearth Ltd | Mitsubishi Motors | Light commercial vehicles | 1983 | Technical and financial |
| 5) Swaraj Vehicles Co Ltd (with Punjab Tractors) | Mazda Motors | Light commercial vehicles | 1984 | Technical and financial |
| 2 Passenger Cars | | | | |
| 1) Maruti Udyog Ltd | Suzuki Motors | 800 c c passenger cars | 1982 | Technical and financial |
| 3 Scooters and Motor Cycles | | | | |
| 1) Kinetic Engg Ltd | Honda Motors | Scooters | 1983 | Technical and financial |
| 2) Ind-Suzuki Co Ltd | Suzuki Motors | Motor cycles and Mopeds | 1983 | Technical and financial |
| 3) Escorts Ltd | Yamaha Motors | Motor cycles and scooters | 1983 | Technical |
| 4) Majestic Auto Pvt Ltd | Honda Motors | Motor cycles | 1983 | Technical and financial |
| 5) Bajaj Auto Ltd | Kawasaki Heavy Industries | Motor cycles | 1984 | Technical |
| 4 Others | | | | |
| 1) Hindustan Motors Ltd | Isuzu Motors Ltd | Troopers | 1984 | Technical |
| 2) Punjab Tractors Ltd | Komatsu Fork Bft Co Ltd | Forklift trucks | 1984 | Technical |

However the changes in the world economic environment no longer allows the Japanese to create such harmonious division of labour. The trend is particularly conspicuous in the automobile industry where an increasing number of countries have taken measures to protect their domestic industries and do not accept foreign investment in this area unless it contributes to building a local industrial base and other socio-economic objectives. Some of them started to impose a strict law on local content on multinational auto makers. For example, Brazil which allowed operations of foreign companies like Volkswagen, Fiat, Ford and General Motors for years, suddenly introduced the law on local content a few years ago. The trend is not peculiar to developing countries who aspire to have their own automobile industry. An indigenisation law has twice been passed in the US Congress to regulate Japanese direct investment in the US automobile industry.

It may be very illuminating to take the example of Japanese direct investment in Taiwan where they failed to conclude an agreement because they were sticking to the traditional idea of division of labour. Taiwan has been imposing 65 per cent tariffs on automobiles imports mainly to discourage imports from Japan and strike a balance in its trade with it. This has worsened the inefficiency prevailing in the five major car assemblers. Recently, Taiwan decided to reduce the tariff to 30 per cent in six years so that the domestic auto makers would be forced to become competitive enough to export. In the meanwhile, a deal was under negotiation between Toyota and the Taiwan state-owned China Steel Corporation, but in vain. The reason was that the Taiwanese government insisted on the norm of 90 per cent local content in six years, besides fixed time-tables for reaching 50 per cent export targets with penalties in case of its failure. In Toyota's contention, the target of indigenisation could not be attained at competitive prices, as parts from Taiwan cost 20-60 per cent more than those from Japan.

### ASSEMBLER-ANCILLARY RELATIONS

Technology and efficiency in the auto ancillary sector more or less determine the quality and price of finished cars. It is widely known that the excellency in the auto ancillary industry is an indicator of industrial maturity. To achieve this higher specialisation larger economies of scale is necessary. The Indian auto ancillary industry, characterised by dominance of spurious units, does not show any of such signs.

A similar state prevails in Taiwan. To meet the legal requirement of indigenisation of upto 70 per cent of the value of a car, major local auto assemblers try to pick up useable products from the domestic market as much as possible. If the products thus obtained fall short of their demand, they acquire imports paying penal import duties of 35-40 per cent. Therefore, the proportion of indigenised parts varies from car to car, sometimes running as high as 75 per cent.

Japanese car makers, after Toyota's failure to conclude a deal with Taiwan, seem to realise the importance of investment in upmarket production of vital parts prior to that in assembly production. The strategy to set up a final assembly unit and to wait for the auto parts makers to follow-up by backward linkages has been found to be unreliable. The collaboration agreed to between Nissan of Japan and Premier of India to start with engine manufacutre is apparently based on reflection of this experience. They have also disclosed a plan of producing a Japanese car 'Sunny' in the future. Nissan would decide on implementation of the plan depending on the progress in the initial engine manufacture, or otherwise the plan would be withdrawn if they find the progress to be unsatisfactory.

For MUL, which started the project with final assembly, a mandate of indigenisation for auto parts will have to be pushed through by any means. To meet technological and financial requirements and to expand and update the auto ancillary sector, foreign collaboration on auto parts manufacture has been suggested as solution. Already last year, foreign collaboration agreements have been concluded on manufacture of vital auto parts like fuel injection equipment with Yugoslavia and the UK, shock absorber with Italy, West Germany and the US and auto electricals with France, besides with Japan.

However, there is a doubt whether the Japanese would choose the parts produced in collaboration with non-Japanese partners. The Japanese automobile industry has developed an intricate network of horizontal integration among assemblers and vertical integration between them and auto ancillary manufacturers. The integration has resulted in a tremendous reduction in cost and improvement in productivity. A recent study shows that there exists a cost difference of US $ 1500-2000 per unit between American-made and Japanese-made cars, or that a Japanese auto maker requires only 65 per cent of the labour required by an American auto maker to produce a product of the same quality. Japan has been successful in this area because it has attained interchangeability in auto parts. This basically means that in order to reduce the cost in changing the product and process designs, the high volume parts are made common to various lines of production.

Apart from this sort of horizontal integration, the Japanese automobile industry has created vertical integration where final assemblers contribute only 30 per cent of the value of a finished car, compared to the case of the US assemblers who depend on auto ancillary vendors for 50 per cent of the unit product value. This was possible due to the intimate assembler-ancillary relationship peculiar to the Japanese automobile industry. Final car assemblers in Japan have set up subsidiaries and affiliates in the auto ancillary sector by taking equity shares and participating in their management. For example, Toyota has affiliates such as Toyota Auto Body for the manufacture of car bodies with equity participation of 40.3 per cent, Kanto Auto Body for car bodies with 49 per cent participation, Toyoda Gosei for macro-molecular auto parts with 47.1 per cent participation. It has also associated with other important auto parts manufacturers like Toyo Radiator for radiator manufacture with 7.9 per cent equity participation, Kayaba Industries for hydraulic equipment and shock absorbers with 11.5 per cent, Akenobo Brake Industry for brakes and press products with 16.8 per cent, Ichikoh Industries for lighting equipments with 8.6 per cent, Shiroki Metals for metal parts with 61.2 per cent, Aishin Seiki for transmissions, brakes and related parts with 21.1 per cent, Koito Manufacturers for shield beam lamps with 20.6 per cent. The affiliates and associated units given here are among the first section companies listed in major stock exchanges in Japan and renowned for their good performance. Major auto makers in Japan thus have been directly involved in the development process of the auto ancillary industries in Japan by establishing integration with them through equity participation.

Given the strong ties existing between assemblers and auto parts makers, we can easily imagine that Japanese auto collaborators would prefer the parts manufactured under collaboration with Japan. This tendency would be more pronounced in the case of Premier or DCM than of MUL. The partners of the former two, namely Nissan and Toyota, are the largest two in Japan's automobile industry and have well-established affiliates and associates in the auto ancillary sector. In order to get supplies conforming to their specifications for their ventures in India, Toyota has already brought two of their ancillary associates, namely Aishin Seiki and Nippon Denso to India to collaborate with their Indian counterparts, which a small auto maker like Suzuki would not have possibly achieved. It seems that the Japanese have already a detailed blue print on how to occupy the Indian automobile and auto ancillary market. Nissan has taken an initiative to establish regular communication among Japanese auto makers intending to operate in India to discuss problems like 'how to avoid duplication in production' in particular items, so that they should be able to attain some measure of economies of scale (see, for example Table 3).

Collaboration with the Japanese has now become a practical solution for Indian auto parts makers to survive in the changing environment. Under the technical guidance of Japanese counterparts, there would be a greater possibility for Indian companies to get their supplies selected by auto makers who have collaborations with Japan. Moreover, by concluding a collaboration agreement, it is possible for them to import raw materials and capital goods at 45 per cent customs duties, much lower than the case of independent imports that are subject to penal rates of 75-115 per cent for capital goods and 60-250 per cent for raw materials. A typical example of an auto parts maker who tided over the problem with Japanese collaboration is Clutch Auto Ltd. It assembles CKD packs shipped from Japan to supply to MUL.

## CONCLUDING REMARKS

Whether or not to allow Japanese domination of India's automobile and auto ancillary industries should not be considered as a matter of ethical judgment. The liberalisation policy should be assessed only in terms of its costs and benefits in the long-run. Costs and benefits arising by adoption of a particular measure in the liberalisation policy would change from time to time in correspondence with the response of beneficiaries of the policy. They are also influenced by the other aspects of the same policy as well as by the industrial and commercial policy as a whole. As soon as a response is obtained from a particular policy, it has to be evaluated against the objectives of the policy. If it is found that the response is in a right direction and as expected, the policy will be justified. Otherwise, it should be subject to revisions or repeal immediately. Justifiability of a policy at a particular point of time, however, cannot be maintained always because the environment undergoes changes in response to the policy itself or on its own, or because of the shifts in policy emphasis. For meaningful implementation of liberalisation, the policy should be pointed and flexible, so as to be integrated into the dynamism of industrial competitiveness at any moment.

Take the instance of clutch assembly from CKD packs. The indigenisation has to be undertaken in this area itself so that the process in indigenisation of automobiles as a whole would make a move ahead. But soon after the clutch manufacturer achieves a certain level of indigenisation, the duty concessions given to the final assembler for clutch imports have to be reduced or withdrawn immediately so that the clutch maker would have some more time to achieve a higher degree of economies of scale by taking advantage of domestic demand. Otherwise, the liberalisation policy would prove to be detrimental to domestic industries and allow foreign dominance in the long-run.

In this particular context of indigenisation of the automobile industry, the following points should be taken care of:

(1) The liberalisation policy for the automobile industry should be more oriented towards the development of the auto ancillary industry in the long-run. The concessional import tariffs of 45 per cent provided for the manufacturer of fuel-efficient motor vehicles with engine capacity not more than 1000 cc are valid upto March 1990 with respect to the auto ancillary items like carburettors, auto electricals, steering gear and driven axle assemblies, clutch assemblies, brake assemblies, gear box, shock absorbers, dashboard assemblies and engine. A similar provision extends to the spares for the purpose of warranty coverage and after-sale service. This should not pose any undue competition to the domestic auto ancillary industries during the period of validity of the provisions. Otherwise, the skilled industries would be discouraged to expand their capacity because they cannot expect growth in demand for their products due to liberal imports. Or the auto entreprenuers who intend to enter foreign tie-ups would refrain from it facing tough competition from imports.

(2) The definition of project imports covering raw materials and capital goods is applied only to the case of establishment of a new unit or of a substantial capacity expansion. This may not be helpful for the auto ancillary units which already have attained a certain degree of skill and productive capacity. For them, marginal expansion or technological upgradation is sufficient, but they are not able to do so because of high tariffs on raw materials and capital goods imported beyond the scope of project imports.

(3) The policy on reservation of certain auto ancillary items to the small-scale sector has to be modified to accommodate the changes in demand of the automobile industry. The criteria for reservation should be designed on considerations of scale of production as well as of technology. It may be possible to develop a division of labour in the same auto ancillary item for the purpose of original equipment and for after-sale services according to the level of skills. In such a case, the reservation criteria only in terms of scale would be irrelevant.

## GNFC

GUJARAT NARMADA VALLEY FERTILISERS COMPANY (GNFC) has achieved record production of 4,74,302 tonnes of urea during the year ended June 1985, the third year of commercial operations. During 1982-83, production was 4,44,911 tonnes and during 1983-84 it was 4,73,382 tonnes. While the urea production scaled new heights during the year, the most significant achievement has been in the ammonia plant producing 3,00,895 tonnes as against 2,78,386 tonnes produced in 1983-84. In this, the highest on stream factor of 95.25 per cent was achieved during 1984-85 as against 76.42 per cent for 1983-84. GNFC has decided to install a captive power plant to meet internal power requirements in pursuance of the Government of India's decision to encourage continuous process industries to have their own captive power supply. The project is being implemented in two phases. The first phase will meet the power requirement of the ammonia-urea and methanol plants. The second phase will meet the power requirements of the formic acid plant, nitrophosphate plant and other projects under consideration by the company. The first phase, already under implementation, consists of installation of one oil/gas fired boiler of 180 tonnes per hour of steam generation capacity at 95 kg/cm pressure and 42°C temperature and steam turbo generator set of 25 MW/30 MVA capacity with necessary auxiliaries and utilities. The first phase is estimated to cost Rs 38.50 crore. The project is being financed partly by internal resources and partly by loans from financial institutions. The entire foreign exchange requirement of Rs 83.50 lakh will be covered by loans from financial institutions. In its expansion and diversification plans, the company is considering production of 475 tonnes per day each of nitrophosphate and calcium ammonium nitrate with which a project to produce concentrated nitric acid with capacity of 100 tonnes per day is also envisaged. Further, a large expansion of ammonia-urea capacity as well as of the recently commissioned methanol plant is under consideration. A project to produce butachlor and some other projects based on electronics in various fields are being explored.

# Financing of Working Capital in Indian Industry

V S Kaveri

*This review of working capital finance, based on the Reserve Bank of India's studies on Finances of Large Public Limited Companies, concludes that Indian industry has by and large failed to change its pattern of working capital financing in keeping with the norm suggested by the Chore Committee. While the position of working capital management showed some improvement between 1975-79 and 1979-83, industries have not succeeded in widening the base of long-term funds to the desired extent.*

## I

## Introduction

WORKING capital generally refers to the investment in current assets which are required to carry on the operations of the business. Sometimes it is also referred to as the difference between current assets and current liabilities. Management of working capital considers both terms, i e, the investment in current assets (gross working capital) and the difference between current assets and current liabilities (net working capital). Gross working capital is used for assessing the quality and quantum of current assets, whereas net working capital is used for the study of financing of current assets. A high investment in the different forms of current assets helps in maintaining continuous production and sales but at the same time it will prove to be a costly affair to the firm as funds are obtained at a cost. On the other hand, a low investment in different forms of current assets may cause shortages and thus bring obstacles in the smooth flow of production and sales. So a balance has to be struck between these two extreme levels and in this context the review of the position of working capital at different intervals becomes necessary. To carry out this review, the balance sheet as a source of information would be of great help.

The balance sheet is a statement of position of assets and liabilities at a point of time. The financial position of the firm is assessed through the study of assets and liabilities. Current assets and current liabilities are the two major components of the balance sheet. Study of the position of gross working capital, i e, current assets, suggests the liquidity position of the firms. These current assets should not only be in liquid form but also be in line with the level of operations. The Tandon Committee suggested norms for inventory and book debts for 15 major industries. It is necessary to examine whether inventory and book debt levels of the firm are as per the suggeted norms. Similarly, study of the position of net working capital, i e, current assets less current liabilities, indicates short term solvency of the firm. Current ratio of the firm is the best indicator of the working capital position. The ratio should be at least 1.0; this is the manimum requirement. Efforts should be made to maintain a higher ratio.

Items in the balance sheet are interdependent. Hence, if the working capital position is unsound, the total financial position of the firm gets adversely affected. To elaborate, if the firm holds current assets more than necessary, it experiences shortages of long term assets, provided funds are limited. Similarly, if the long term funds are short of long term assets, short term funds have to be partially used for the long term assets. In such circumstances, the current ratio is unsatisfactory. Thus in the context of balance sheet analysis, the study of working capital position occupies a significant place.

Each industrial firm aims at maximising return on investment for which it keeps on acquiring assets and using them for productive uses on a regular basis. When this is done, it can maintain a steady growth in production, sales and profits. If profits are considerably and regularly ploughed back, it is possible to strengthen the capital base. Consequently, dependence on financial institutions for working capital in particular and term finance in general gets reduced over a period of time. This view was upheld by the study group to frame guidelines for follow-up of bank credit (Tandon Committee) appointed by the Reserve Bank of India in 1974. This study suggested three methods for computing maximum permissible bank finance, keeping in mind the need to provide sufficient time to borrowers to adjust their base of long term funds. In the context of a 'time-bound programme', the report states, "We feel that the third method is an ideal to reach, as it will provide the largest multiplier of bank finance; the next best method from this aspect is the second one, followed by the first. However, to avoid hardship to borrowers, we recommend that we should make a beginning with the first method and then move to the second and the third methods. It is necessary though, to have a time-bound programme and we suggest that banks should initiate immediate action to place all borrowers, say, those having credit limits in excess of Rs 10 lakh from the banking system, on the first method, beginning with the borrowers having weak financial positions, as early as possible, say, within a period of about one year. At that stage, the Reserve Bank may review the system and chalk out a further programme for switching over to the second and third methods, in stages, in the light of circumstances then prevailing" (para 6.10).

As recommended by the Tandon Committee, the Reserve Bank initiated a review exercise in 1979 by appointing a working group under the chairmanship of K R Chore to review the system of cash credit (popularly known as the Chore Committee). This working group looked into the feasibility of switching over borrowers from the first method to the second and the third methods. *Inter alia*, the report states, "Although it was the intention of the Tandon Committee that the borrowers should gradually progress from the first method to second, by and large, it has not happened in practice. A shift to the second method will necessarily imply increasing either the capital funds or the term borrowings. Because of the tax advantages in bank borrowings, borrowers are normally reluctant to improve their gearing ratio. Similarly, on account of the convertibility clause, borrowers are also reluctant to make increasing use of term borrowings. Because of the above considerations, it is hardly likely that, left to themselves, the borrowers enhance their contributions to working capital and to improve their current ratio it is necessary to place them under the second method of lending which would give a minimum current ratio of 1.33" (para 5.9).

It is apparent from the above statement that the Chore Committee suggested the second method mostly based on industrialists views about bank borrowings and not on the basis of a review of working captal finance of industries which the Committee was expected to do in 1979. Similarly, after the implementation of the Chore Committee's recommendations in respect of the second method, a fresh review is now expected to find out how far industries have changed their style of working capital finance as desired by the Chore Committee. This paper is written to fulfil these two expectations. To state more specifically, the paper makes a review of working capital finance of industries at two points of time: (i) 1979 and (ii) 1983 (the year for which latest data were available).

## II

## Data Base

The study used data as given in the Reserve Bank of India studies of finances of large public limited companies for the period 1975-1983. Data related to selected large, non-financial, non-government public limited companies (each with a paid-up capital of Rs one crore or above). The size of the sample of the selected companies varied from year to year. The number of the companies included in the study for the year 1975, 1979 and 1983 stood at 385, 415 and 478 respectively. Data covered major items of balance sheet, ratios and funds-flow statement. Companies in the sample closed their accounts during the period April 1 to March 31 of each year. On an average, 35 per cent of the selected companies closed their annual accounts in December, 27 per cent in June, 9 per cent in September and the rest in the other months. We collected data for each of the 12 major industries besides aggregate figures of all industries.

Balance sheet data speak of the position of various assets and liabilities at different points of time. Study of assets and liabilities with the use of ratios indicated liquidity, solvency, profitability and capital structure of the companies. From the data as given in the funds-flow statement, it was possible to get an idea of management of funds in general and of working capital in particular. Since balance sheet data are used, the study is not free from balance sheet limitations. Besides, it is difficult to assess the trend in working capital management since data were collected at three different intervals.

## III

## Methodology

Working capital is required to hold current assets which include raw materials, stock-in-process, finished goods, book debts and other current assets such as cash and bank balance, investment in government and other approved securities, deposits kept with suppliers, loans and advances (to be recovered during one year), etc. To finance these current assets, sundry creditors and other current liabilities, long term funds and bank borrowings are considered as sources. Other current liabilities include creditors for purchases of materials, advances from customers, accrued expenses, statutory liabilities and other known liabilities such as dividend payable, tax payable, etc. Long term funds include term liabilities (institutional term loans, debentures, term deposits, etc) and equity. Equity consists of paid-up value of share capital, reserves and surplus. Bank borrowings are made available to the firms on the basis of the method adopted for computing Maximum Permissible Bank Finance (MPBF).

The Tandon Committee suggested three methods for computing MPBF which are as shown in Table 1. It is apparent from the Table that the contribution of long term funds towards working capital increases under the second method and the same is further increased under the third method which is not in use.

To take any company from the first method to the second method, increase in long term finance should be substantial not only to ensure the expected contribution of long term finance towards financing of current assets under the second method but also financing of fixed assets and non-current assets. Let us take an example. Balance sheet of ABC Company Ltd as on 31st December, 1982 and 1983 as is given in Table 2. Increase in long term finance during 1982-83 was Rs 39 lakh, and this amount was utilised for financing fixed assets of Rs 30 lakh, non-current and miscellaneous assets of Rs 5 lakh and current assets of Rs 4 lakh. This contribution of Rs 4 lakh towards current assets from long term finance was adequate to put the company under the second method, when the current ratio increased from 1.25 in 1982 to 1.33 in 1983.

TABLE 1: METHODS OF COMPUTING MPBF AS SUGGESTED BY TANDON COMMITTEE

| 1st Method | 2nd Method | 3rd Method |
|---|---|---|
| (1) Current assets | (1) Current assets | (1) Current assets |
| (2) Current liabilities other than bank borrowings | (2) Current liabilities other than bank borrowings | (2) Core current assets |
| (3) Working capital gap (1 – 2) | (3) Working capital gap (1 – 2) | (3) Real current assets (1 – 2) |
| (4) Minimum stipulated net working capital (25 per cent of item 3) | (4) Minimum stipulated net working capital (25 per cent of item 1) | (4) Current liabilities other than bank borrowings |
| (5) Actual/projected net working capital | (5) Actual/projected net working capital | (5) Minimum stipulated net working capital (25 per cent of item 3) |
| (6) MPBF (3 – 4) or (3 – 5) whichever is lower | (6) MPBF (3 – 4) or (3 – 5) whichever is lower | (6) Actual/projected net working capital |
| | | (7) MPBF [3 – (4+5)] or [3 – (4+6)] whichever is lower |

*Note:* Net working capital = Total current assets – Total current liabilities (including bank borrowings).

TABLE 2: ILLUSTRATIVE BALANCE SHEET OF ABC CO LTD
(Balance Sheet as on December 31)

*(Rs lakhs)*

| Liabilities | 1982 | 1983 | Change | Assets | 1982 | 1983 | Change |
|---|---|---|---|---|---|---|---|
| Other current liabilities | 6 | 10 | 4 | Current assets | 30 | 40 | 10 |
| Bank borrowings | 18 | 20 | 2 | Fixed Assets | 60 | 90 | 30 |
| Long term finance | 76 | 115 | 39 | Non-current and miscellaneous assets | 10 | 15 | 5 |
| | 100 | 145 | 45 | | 100 | 145 | 45 |

This study considers five ratios, *viz*, (i) current ratio; (ii) bank borrowings as percentage of working capital gap or current assets; (iii) sundry debtors as percentage of sales; (iv) inventory as percentage of sales; and (v) debt as percentage of equity. As stated earlier, current ratio indicates the position of liquidity and short term solvency. It is also possible to understand the position of net working capital. Bankers' stake in financing of working capital gap or current assets can be judged from the ratio of bank borrowings as percentage of working capital gap or current assets. Bank borrowings were related to working capital gap and current assets under the first method and the second method respectively. Sundry debtors and inventory are the two major items of current assets. Hence, changes in these two items bring significant change in the total of current assets. Therefore, attempt should be made to hold sundry debtors and inventory in proportion to operations of the business. For this purpose, sundry debtors as percentage of sales and inventory as percentage of sales are computed. Finally, debt as percentage of equity suggests the capital structure of the firm. It is desired to have a lower ratio of 1:1. Lower the ratio, greater would be the contribution of equity to the net working capital. Thus, in this paper, it is attempted to use these five ratios for understanding the position of working capital. Data were available for computing these ratios.

We have used data for analysis in two ways, *viz*, (i) time analysis and (ii) industry-wise analysis. Under the time analysis, we have reviewed the working capital finance of all industries for the period 1975-1983. We considered the year 1975, when the Tandon Committee recommendations were accepted as the base. The latest data were available for the year 1983. In 1979, the Chore Committee recommendations were accepted. Hence, we reviewed the position of working capital at two points of time, *viz*, 1979 and 1983. Time analysis aimed at understanding how the working capital position of all industries changed from time to time in response to the recommendations of the Tandon Committee and Chore Committee. But under the industry-wise analysis, it was attempted to ascertain the performance of each of the 12 major industries in the management of working capital. Data were available for these 12 major industries. We analysed data in the following order:

(1) Study of figures of current assets, sources for financing of current assets and long

term funds and long term assets for 1975, 1979 and 1983.

(2) Study of selected ratios for 1975, 1979 and 1983 to find out the reasons for changes in figures as stated above.

(3) Study of funds-flow statements for 1975-79 and 1979-83. From this statement, we understood changes in (i) components of long term finance; (ii) long term finance *vis-a-vis* fixed, non-current and miscellaneous assets; and (iii) net long term finance [gross long term finance—(fixed + non-current + miscellaneous assets)] *vis-a-vis* current assets, bank borrowings and other current liabilities.

For time analysis, we analysed the data as stated above. But for industry-wise analysis, we restricted ourselves to the study of absolute figures and ratios.

## IV

## Results and Analysis

Data were analysed to review the working capital of the firms. The review was done on time basis and industry-wise basis. As regards the time analysis, the review was for two periods, i e, 1975-79 and 1979-83.

In Table 1, data relating to financing of current assets are given. As seen from the data, in 1975 working capital gap, under the first method worked out to be Rs 2,418 (Rs 4,623-Rs 2,205) crore, and hence long term finance and maximum permissible bank finance were expected to be Rs 604 crore (25 per cent of Rs 2,418 crore) and Rs 1,814 crore (75 per cent of Rs 2,418 crore) respectively. But actual long term finance and bank borrowings were Rs 1,248 crore and Rs 1,170 crore respectively. Since actual long term finance was greater than expected long term finance, bank borrowings had to be lower than maximum permissible bank finance. Therefore, current ratio was as high as 1.37. But this happy situation did not last long. In 1979, current ratio declined to 1.23 because the ratio of increase in current assets was lower than the rate of increase in current liabilities. The rate of increase in current assets and current liabilities in 1979 over 1975 was 34 per cent and 49 per cent, respectively. When we study changes in the components of current assets and current liabilities in 1979 over 1975, we do not find any marked change. For instance, inventory as percentage of total current assets declined from 57 in 1975 to 55 in 1979. But sundry debtors as percentage of total current assets increased from 20 in 1975 to 24 in 1979. These observations in respect of inventory and sundry debtors can also be confirmed from the study of other three ratios, *viz*, sundry debtors as percentage of sales, inventories as percentge of sales and sundry debtors as percentage of sundry creditors.

Higher rate of increase in current liabilities in 1979 over 1975 resulted in lower contribution of long term finance towards financing of current assets. This is evident from the study of figures as given in Table 3. It will be seen from the Table that the contribution of bank borrowings to financing of current assets increased from 25 per cent in 1975 to 29 per cent in 1979. Similarly, current liabilities other than bank borrowings went up from 48 per cent in 1975 to 52 per cent in 1979. As a result of the steep rise in the contribution of these two items, long term finance experienced a drastic cut in its share of financing of current assets from 27 per cent in 1975 to 19 per cent in 1979.

Thus far we have examined the position of current assets, current liabilities and long term finance as on the accounting year ending date of 1975 and 1979. Let us now examine what changes took place between these two dates from the study of funds-flow statement. The study of sources and uses of funds of all industries during 1975 to 1979 suggests reasons for the lower contribution of long term finance. A summarised funds-flow statement (1975-79) is given in Table 4. Long term finance [borrowings (long term) + share capital + reserves and surplus] fell short by Rs 72 crore to finance fixed assets and non-current assets. Consequently, short term funds, i e, current liabilities met this deficit.

From the above discussion, we conclude that industries did not widen the base of long term finance and hence the contribution of long term finance to working capital funds declined. Consequently, current ratio declined from 1.36 in 1975 to 1.23 in 1979. Although the Chore Committee suggested the second method in 1979, industries in general were not in a position to adopt the same in view of the declining position of long term finance. In fact, industries increased their dependence on bank borrowings for working capital and to certain extent, the same were also utilised for financing of fixed and non-current assets.

In 1983 current ratio improved marginally to reach 1.26 from 1.23 in 1979. Reasons for this marginal improvement include higher rate of increase in current assets over current liabilities and higher contribution of long term finance towards financing of current assets. The rate of increase in current assets and current liabilities in 1983 over 1979 was 98.5 per cent and 94.9 per cent respectively. When we study changes in the components of current assets and current liabilities in 1983 over 1979, we find that although inventory as a percentage of total current assets declined, sundry debtors and loans and advances as percentage of total current assets increased. Sundry debtors and other current liabilities together as percentage of total current liabilities went up very sharply from 53 in 1979 to 62 in 1983. But bank borrowings as percentage of total current liabilities declined steeply from 36 in 1979 to 29 in 1983.

As seen from the data given in Table 3, contribution of long term finance for financing of current assets increased marginally from 19 per cent in 1979 to 20 per cent in 1983. As a result of higher contribution of

| Reserves and surplus | 502 | 2040 | | | |
| | 3191 | 10294 | | 3191 | 10294 |

current liabilities other than bank borrowings and of long term finance to financing of current assets, bank borrowings as percentage of total current assets declined sharply from 29 in 1979 to 23 in 1983.

The summarised funds-flow statement (1979-83) reveals that increase in current assets was Rs 6,115 crore during 1979-83 and nearly 22 per cent of total increase in current assets were financed by long term funds. As against this, during 1975-79, long term funds were short of financing of fixed assets and non-current and miscellaneous assets. Thus, during this period, i e, 1979-83, the base of long term funds widened. But the rise in long term funds was below what was expected under the second method. Hence, bank borrowings continued to be higher than maximum permissible bank finance (Table 5). Bank borrowings (actual) as percentage of maximum permissible bank finance declined slightly from 127 per cent in 1979 to 125 per cent in 1983. Thus, the recommendation of the second method, as suggested by the Chore Committee, was by and large not implemented by industries during the period of 1979-83.

### INDUSTRY-WISE PATTERN

Let us now examine performance of each of the major industries by using data as given in the Reserve Bank Study of Finance of Large Public Limited Companies for 1975, 1979 and 1983.

We computed bank borrowings as percentage of working capital gap for 12 industries for 1975, 1979 and 1983. The average percentage of bank borrowings to working capital gap of these industries for 1975, 1979 and 1983 was 96.2, 66.2 and 76.6 respectively. These data suggest that industries in general reduced their dependence on bank borrowings considerably in 1979. And in 1983, bank borrowings were found to be reasonable, considering the percentage of 76.6 in 1983 which was close to 75 per cent as suggested under the first method. Shipping, electricity and cement industries need a special mention here because of the fact that their current liabilities other than bank borrowings exceeded total current assets in 1983 and hence they were not expected to borrow from banks for working capital. But they did borrow and used the borrowed amount for long term assets. Cotton textile industry is another case which kept on increasing its dependence on banks. This is evident from the study of the percentage of bank borrowings to working capital gap, which went up from 60 in 1975 to 91 in 1983. Sugar industry also borrowed from banks for working capital more than the expected level of 75 per cent of working capital gap. Among these industries, silk and rayon industry needs to be rewarded because its dependence on bank borrowings was the lowest and percentage of bank borrowings to working capital gap was around 30 in 1975, 1979 and 1983. Similarly, engineering, chemicals and tobacco industries borrowed from banks on a moderate rate. In such cases, percentage of bank borrowings to working capital gap was less than 75 in 1975, 1979 and 1983. Thus there was wide divergence in respect of bank borrowings for working capital among industries.

*Source: Reserve Bank of India Bulletin*, March 1977, July 1980, and January 1984.

Although industries in general reduced their dependence on bank borrowings, their average current ratio did not improve. It declined from 1.22 in 1975 to 1.10 in 1979. This situation arose due to the fact that the rate of increase in current assets was lower than the rate of increase in current liabilities in 1979 over 1975 figures. In 1983, the average current ratio of these 12 industries moved upwards marginally to reach only 1.12 from 1.10 in 1979. Current ratio fluctuated widely among the industries. Three industries, *viz*, silk and rayon, engineering and chemicals maintained current ratio which was above the average figures in 1975, 1979 and 1983. Ironically, current ratio of electricity and shippng industries was lower than 1.0 in 1975, 1979 and 1983. In four industries, *viz*, tobacco, cotton textile, cement and rubber, current ratio declined continuously and the rate of decline was very steep in 1983 over 1975. Percentage of bank borrowings to working capital gap increased steeply in 1983 over 1975.

Three ratios, *viz*, sundry debtors as percentage of sales, inventory as percentage of inventory and bank borrowings as percentage of working capital gap, were studied to ascertain why current ratio fluctuated widely among these industries. Silk rayon, chemical and engineering industries maintained higher current ratio because their inventory holding, book debts level and bank borrowings were reasonable. Levels of three ratios were mostly below the average figures in 1975, 1979 and 1983. Among these three ratios, bank borrowings as percentage of working capital gap was much below the average level, while the levels of other two ratios were almost close to the average levels. Hence, current ratio was high. But shipping and electricity industries maintained a lower current ratio because their dependence on bank borrowings was significant and their inventory holding and book debt level were found to be insignificant. This is evident from the comparative study of these ratios with the average figures for 1975, 1979 and 1983. Tobacco, cotton textile, cement and rubber industries experienced a sharp decline in current ratio in 1983 comparing to 1975 figures as there was a marked rise in the ratio of bank borrowings to working capital gap in 1983 over 1975. The average percentage

*Source: Reserve Bank of India Bulletin,* March 1977, July 1980, and January 1984.

of bank borrowings to working capital gap of these four industries went up from 55 in 1975 to 75 in 1983. Among these industries, cotton textile and cement industries relied considerably on banks for working capital. In the case of cement, there was no need to borrow from banks for working capital in 1983 since current liabilities other than bank borrowings exceeded current assets.

Chemical industry maintained higher current ratio and its debt/equity ratio was also very low in 1975, 1979 and 1983. As against this, shipping industry's current ratio was less than one and hence, its debt/equity ratio was as high as 246 per cent and 206 per cent in 1979 and 1983 respectively. Tobacco, cotton textile, cement and rubber industries experienced continuous decline in current ratio and they had similar experience in debt/equity ratio which kept on increasing. On the whole, these 12 industries increased their dependence on long term debt in 1983 compared to 1975. This is evident from the average debt/equity ratio of 12 industries which went up from 73.4 in 1975 to 102.4 in 1983. Since contribution of long term funds towards working capital increased, the average percentage of bank borrowings to working capital gap declined from 96.2 in 1975 to 76.6 in 1983.

## V

## Conclusions and Policy Implications

This review of working capital finance refers to two points of time, *viz*, the accounting years ending in 1979 and 1983 and is based on data as given in the Reserve Bank of India studies on Finance and Large Public Limited Companies for the respective dates. The findings of the review may be summarised as follows:

(1) Recommendation of the second method was not implemented by industries in general as seen from the study of data relating to 1979 and 1983. Current ratio remained much less than 1.33 in both years.

(2) Industries were not able to shift to the second method as they could not widen the base of long term funds to the extent desired. Relatively speaking, the position of working capital management during 1979-1983 appears to be more satisfactory than the same during 1975-1979. Long term funds contributed towards current assets to the extent of 22 per cent during 1979-1983 when their contributions to the same was negative during 1975-1979. Current ratio fell steeply from 1.37 in 1975 to 1.23 in 1979 and then moved up marginally to reach only 1.26.

(3) Among the 12 industries, silk rayon, chemical and engineering industries managed working capital satisfactorily during 1975-83. Their current ratio was above 1.0 and contribution of bank borrowings to working capital gap was found reasonable. Holding of inventory and sundry debtors was also found to be reasonable. Shipping and electricity industries required insignificant current assets. But their dependence on short term bank borrowings was sizeable and hence their working capital management was found to be unhealthy. Engineering industry witnessed heavy dependence on bank borrowings. Cement industry was not needed to borrow from banks for working capital since current liabilities other than bank borrowings exceeded current assets. Tobacco, cement, cotton textile and rubber industries experienced declining current ratio. Thus, quality of working capital management varied widely from industry to industry. But the average current ratio of these 12 industries remained less than 1.33. Therefore, by and large, the recommendation of the second method was not put into practice.

We can conclude that despite giving sufficient time to industries to readjust their capital structure so as to shift from the first method to the second method, progress achieved towards this end fell short of what was desired under the second method of working capital finance. In this context, we offer three suggestions:

(1) Industries have to strengthen their efforts to raise the base of long term funds for which they have to tap further resources in the capital market besides increasing the present rate of ploughback of profits.

(2) Banks have a vital note to play to keep a check over the sanction and use of working capital finance to industries. The sanction of working capital finance needs to be totally need-based and for this purpose banks have to install an efficient information system through which they would be able to interpret borrowers' data in the light of changes in the concerned industry. Dialogues with borrowers have to be more rational so as to verify assumptions made in their projections realistically. Besides need-based lending, banks have to gear up their post lending activities to ensure the effective use of borrowed funds. They have to set-up an effective follow-up system which can signal mis-use of funds at the early stage and they have to take appropriate action immediately. In respect of both credit appraisal and follow-up, banks' efforts are presently found inadequate. As a result of this, it has not been possible to bring industries under the second method.

(3) Borrowers should appreciate benefits of shifting over the second method. They have to share all useful information with banks, so as to see the results of borrowed funds. If necessary, they have to redesign their information system so as to provide information needed by banks.

THE IMPACT OF PARTIES

*Politics and Policies in Democratic Capitalist States*

Do parties in fact make a difference? To what extent and under what circumstances does the political composition of governments affect policy formulation and outcome?

The essays in this collection examine the impact of political parties on key policies in democratic, capitalist states. The areas of policy covered are—public expenditure, macroeconomic policy, defence, wages, and income distribution. There is a strong common core of approach, focus, and purpose to the essays.

The whole range of interpretations and explanations of the varieties of policy are surveyed and tested to consolidate and synthesize supposedly rival approaches.

## UGANDA

# Second Coup d'Etat

**Henry Mapolu**

ON July 27 Milton Apollo Obote of Uganda made history by becoming the first African head of state to be overthrown by the army a second time. This second coup came only five years after he had been reinstated in power after being ousted by the first coup of January 1971. It was a dramatic turn of events, depicting in a rather bizarre manner some of the worst aspects of contemporary African politics.

Obote had resumed the presidency in 1980 with a very definite mission: to rehabilitate socio-economic life in the country following the massive ravages experienced under the decade-long military rule. Yet that second term of office of his was to be characterised by extreme ineptitude and blatant corruption. Indeed, for the mass of the Ugandan people life under the Obote regime was just as difficult as under the previous military administration. Obote's rule was so depraved that when in early July the commander of one brigade in the north of the country rebelled against the government, he was able to immediately amass support from many army units which then began to march southwards at such rapid pace that they were able to capture the capital city, Kampala, in less than two weeks. The city is situated in the extreme southern edge of the country. The rebellious troops encountered practically no resistance throughout the country. Strictly speaking, theirs was not an armed onslaught to demolish a regime, they rose merely to bury a body that was long dead.

### REPLAY OF 1971 COUP

The army that has overthrown Obote this time was constituted by Obote himself no so long ago. It grew out of the factionalised politics that Ugandan exiles carried out for years in Tanzania and elsewhere after the 1971 coup. It was only with the massive involvement of Tanzanian troops that this rabble of an army was able to oust the military dictatorship in 1979, thus paving the way for Obote's return to power. With the assistance of training initially from Tanzania and subsequently from Britain and North Korea, Obote was able to give that rabble the semblance of a national army. And it is that army that has finally turned against him, causing him to once again flee into exile in a most ignominious manner.

Thus in many respects the July coup was a replay of their 1971 one. For at that time also Obote had been overthrown by an armyman whom he had personally groomed for years: the now notorious Iddi Amin. Beginning in 1965 Obote had become more and more dictatorial in his administration, and by the end of the following year he had succeeded in establishing a veritable reign of terror: he had arbitrarily abrogated the constitution, banished the traditional rulers with whom he had had to share power, arrested more than a quarter of his own cabinet, and imposed a state of emergency. In all this, he inevitably had to rely more and more on the army, bringing it onto the fore of civil society. And he personally chose the barbaric Iddi Amin to help him accomplish his designs, promoting him to the rank of chief of defence forces. Having been thus tended so well by Obote, Amin by 1971 found Obote an anachronism and removed him without much ado.

And so this time also. A number of army officers had followed Obote into exile when he was first overthrown in 1971. On recapturing power, he appropriately remembered them, awarding the most senior one of them the post of chief of defence forces. It took Major General Tito Okello and his colleagues in the army less than five years to also find Obote redundant. His rule even in this his second term—euphemistically termed the 'liberation' era—was of such a militaristic nature that a civilian head of state indeed became anachronistic. Obote's preference for the post of chief of defence forces is characteristic: the more illiterate and savage, the better. Just as Iddi Amin had surprised the world by his uncouthness, so also Tito Okello surprised his listeners when he barely managed to read the one paragraph statement prepared for his swearing-in as head of state—in a country with one of the highest rates of literacy in Africa. We will have to wait to experience his reign, which he has promised will be brief.

The July coup was in fact the climax of a long process of political atrophy within Obote's administration. Ever since he had regained power in 1980, after elections which are widely acknowledged to have been rigged in his favour, Obote had once again installed in Uganda a reign of terror. In fact, in many respects he merely continued the repression for which Iddi Amin is so infamous. He thus antagonised large sections of the population and it is no wonder that over the years numerous armed opposition groups emerged throughout the country—groups that easily 'liberated' huge chunks of the country from his administration. Attempts by the army to root out these groups were always thwarted, for unlike Iddi Amin who had ignored the country as a whole but pooled all resources for the army, Obote treated the army in the same manner as he treated the other segments of the society: a means of personal enrichment. The army lacked the equipment, discipline, and above all popular support to be able to effectively fight the many guerilla units professing different ideologies in accordance with the social forces they materially represented. More and more, it assumed lumpen characteristics. Shirking the responsibility of fighting the guerillas, the army more and more turned on the civilian population: erecting numerous roadblocks everywhere ostensibly for carrying out security checks but in reality for harassing, robbing, and generally intimidating the population. No wonder, then, that in time the army found Obote's civilian government itself an obstacle to their looting.

### ARMY ON LOOTING SPREE

Contrary to other coups in Africa, the July coup in Uganda took place in broad daylight. The taking of Kampala occurred at mid-day as people went about their business. From about 11.00 a m lorries carrying soldiers began to enter the city; the streets were then full of people who simply gazed in bewilderment. Within a few minutes, however, the city was turned into an inferno. Apparently the soldiers had been detailed to secure various key installations in the city, and on reaching them, disembarked and began to fire indiscriminately without regard to the hundreds of civilians in their midst. The main post office, the central bank, and the headquarters of Obote's Uganda People's Congress are all situated in close vicinity to each other along Kampala's main thoroughfare: Kampala Road. It being a Saturday, the street was literally brimming with people; yet very heavy gunfire was used to secure those buildings as frightened civilians clambered in all directions, falling on each other in utter confusion.

Apparently no one was killed in all this tumult. Prior scouting had told the rebel troops that there would not be much resistance to beat off, and the soldiers had therefore entered the city in packed lorries and carrying only light arms as if going to a parade. All the shooting was in the air, and was intended to merely scare off people from the streets prior to announcing a curfew. We happened to be in the vicinity of the parliamentary buildings—grandiose and flamboyant, but hardly used for any serious purpose since the late 1960s. Along with hundreds of other passers-by, we were caught up in the middle of the intense action that was undertaken to secure those empty buildings. For all that, not a single shot was heard emanating from inside the buildings. Apart from wasting a great deal of ammunition and terribly ruffling up civilians—men, women, and children—there was absolutely no fight to secure the parliamentary buildings.

Within three hours the centre of the city had been completely deserted, save for hordes of soldiers. What ensued then, which was to be continued for the next two days, sharply depicted the nature of the contradictions in Uganda society. To begin with, the soldiers very soon abandoned their various assignments and instead went on a looting spree. In broad daylight they would break into shops and help themselves to whatever they chose. Soon they realised they could not carry much on their heads; every soldier now went for a vehicle—preferably a pick-up van—on which cookers, refrigerators, furniture, radio and TV sets, etc, would be stashed and driven to a hideout before returning for another helping. The looting was so thorough that by Monday afternoon it had completely stopped for the simple reason that there was nothing more to loot. All the casualties of the coup occurred during this period of looting, for anyone resisting to part with an item demanded by a soldier was quickly shot.

The second factor was the entry onto the scene of the lumpen proletariat. Although Kampala Radio had announced maximum curfew by Saturday afternoon, the city was full of people by 5.00 p m. It had emptied of the upper and middle classes just to be refilled by the lumpen proletariat—a class that in Uganda is so overgrown as a result of the rule of both Amin and Obote that it most typifies Kampala and other urban areas. As happens everywhere in the world, the lumpen proletariat holds its festivals during political upheavals; and so on this occasion Kampala's lumpen class came out in force.

We were very well situated to clearly observe the panorama that was unfolding, for the hotel in which we sought sanctuary and in which we remained trapped for several days happens to be in Bondo Road which, at the heart of the city adjoins Kampala Road, and at the other end is the main getaway to the north. Bondo Road closely by-passes the country's only university, Makerere, which is picturesquely located on a hill and on the plains inevitably surrounded by shanty suburbs. Indeed, it is the suburbs on the plains of Makerere Hill that constitute the main residence of Kampala's lumpen proletariat. And so, on Saturday evening and the whole of Sunday thousands of people trekked along Bondo Road to the centre of the city and returned with all sorts of goods. Absolutely oblivious of the gunshots that were heard continuously day and night, members of the lumpen proletariat—men, women, and even children—looted shops, offices, garages, and eventually private homes. Normally, the soldiers would shoot at the padlock, enter the premises, and help themselves to the most expensive items which would be packed on the looted cars. As soon as the soldiers had left, the civilians would come in next, with women and children coming in last to scavenge among the debris.

In time organisational structures began to form so as to scaffold the exercise. Groups of soldiers would form bands with lumpen civilians; the soldiers provided weapons and the surety that looted property was not requisitioned by other soldiers, in turn the civilians provided information on places both for looting and for hideouts as well as numerous skills—e g, opening a safe, repairing a faulty vehicle, driving a vehicle without a switch, etc. Some bands took to driving around town requisitioning anything carried by civilians who ventured into the streets unescorted by armed bands.

The alliance between the soldiers and the lumpen elements was easy to forge because, in essence, the Ugandan army is a lumpen army. It recruits its rank and file from the depraved fringes of both urban and rural communities, and concentrates mainly on the northern districts of the country where economic conditions are the worst. Furthermore, since Obote's return to power the army as an organisation encouraged very much the lumpenisation of the soldiery. Frequently troops were not paid salaries, and officers were known to appropriate moneys meant for their men who then would be left to fend for themselves through extortion at roadblocks and direct robbery. And that is the army that Obote relied upon to check the growth of the many 'bandit' units.

The character of the army could be clearly seen in the manner in which the soldiers treated civilians and public utilities. They treated these with utmost disdain; soldiers with a lorry full of looted property would occasionally stop to rob an elderly lady of the pair of aluminium pots she had managed to obtain, or a youngster—clad in tatters—of the pair of tennis shoes he had scavenged somewhere. They definitely behaved worse than an army of occupation. It was significant that they had no mercy even for those insitutions that one would think the army would need if it was going to rule the country effectively: having secured both the central bank and the post office, the soldiers entered the buildings and took whatever they thought was worthwhile and vandalised whatever they thought was worthless. By Tuesday afternoon, when it became possible to walk into the streets *albeit* in a tense atmosphere, we trampled upon heaps of treasury bills and other important documents thrown about in Kampala Road by the soldiers who were now guarding the two institutions.

### Lumpenised Society

Obote's administration was inclined to lumpenise not only the soldiery but practically all sectors of the working people. Civil servants frequently went without salaries for several months, and its was officially acknowledged that even senior civil servants could never survive on the salaries they earned—they had to engage in all sorts of activities, legal and illegal, to be able to survive. At the state owned Lake Victoria Hotel in Entebbe employees had not been paid for upto three months at the time of the coup, and had been scrounging on the guests—cheating them on this and that, begging for money, pinching from rooms, etc—although during that time the hotel was nearly always full.

As a result of the International Monetary Fund's economic prescriptions and the corrupt and compradorial nature of Obote's regime, socio-economic conditions in the country had over the years been deteriorating very fast for the vast masses of the people. Inflation was running at breakneck speed: at the beginning of the decade the US dollar was equal to some 60 Ugandan shillings, but by the time of the coup the ratio had reached some 650 shillings to the dollar. The legal minimum monthly wage at the time of the coup stood at 6,000 shillings—enough to buy only two litres of beer, or four bars of laundry soap, or three kilograms of meat.

Yet during that time Kampala literally wallowed in consumer luxuries. Soon after regaining power, Obote, who also doubled as his own Finance Minister, introduced a system whereby the country's foreign exchange reserves, earned through the export mainly of peasant produce and mineral goods, were periodically auctioned to buyers who used it to import goods into the country. Needless to say, they imported only those goods whose turnover would be fast and large, i e, luxuries to satiate the demands of the Ugandan bourgeoisie and that of neighbouring countries. Kampala became the most attractive shopping centre in Eastern Africa.

But in all the wealth of wares vended, one sought in vain for even a simple good with the mark 'made in Uganda'; for industrial production was practically at a standstill as a result of both sheer neglect and the government's import policy. At times industry was strangled in a most brutal and direct manner; we learnt, for instance, that a dignitary in Obote's government had the curious habit of constantly ordering restraint in production at the brewery whenever sales of imported beer—a business he controlled—were not upto his liking. If then the economic policies pursued by the Obote regime under the guidance of the IMF benefited anybody it is the multinational companies which used Uganda as a dumping ground and captive market, and secondarily the compradorial bourgeoisie that carried out import-export trade. The working people fared worst of all.

If there was one clique which was notorious for its brazen enrichment at the expense of the country, it was Obote's own cabinet. Although nearly all of Obote's ministers had been needy exiles during Amin's reign, nearly all of them became millionaires in two to three years, running numerous businesses within the country and outside as well. With Obote at the helm, politics became such a lucrative business that when he announced that civil servants and parastatal employees seeking election in the parliamentary elections scheduled for December 1985 would have to resign their posts by June 1985, Makerere University lost 13 of it its professors. The chief executive of a state-owned factory in Jinja town similarly resigned, but had the foresight and brazenness to take with him all the company's funds, in both local and foreign currency, so that by July the factory had stopped production for lack of inputs and working capital.

Such was the level of official looting perpetrated daily in high circles under Obote. Clearly, then, the three-day looting that was a sequel to the coup was merely a concentrated form of the long-term looting carried out by the authorities. If Obote had regained power with a promise to clean up the mess created by Iddi Amin, in actual fact he merely confounded that mess. And he still would have continued to reign for long if he had not committed fatal political blunders. For, strictly speaking, the factors that precipitated the coup that ousted him for a second time were of his own making. Previously Obote had been completely oblivious of the various cleavages that necessarily arose in his corrupt regime As long as each faction generally looked to Obote for political clout, he did not give a damn for all the infighting that characterised his government. As is well known, political struggles in Africa very soon acquire a tribal and/or religious shrouding, and in Uganda this factionalised politics was of late reaching such proportions that Obote's own actions began to be associated with it. Lacking the tact to steer clear of that politics, he thought he could clamp down on it by lending his weight on one side. It was a fatal mistake. Having an army which is predominantly of one tribe, Obote made it appear that he was siding with a tribal grouping that enjoys a minority position in the army. The officers from the majority tribe could not but be alarmed, and when they ordered their men to march on Kampala, Obote had no option but to flee.

Such, then, is the brankruptcy of politics in Africa. For it should not be thought that these features are purely Ugandan, in truth they characterise political developments in the continent as a whole. The political decay differs from one African country to another only in its degree.

### NO POLITICAL DIRECTION

It is true, though, that in the case of Uganda these common aberrations have tended to manifest themselves most sharply, and the political decay has thus appeared in a most exaggerated form throughout the history of independent Uganda. Indeed, the people of Uganda have suffered a lot; for two decades a beautiful country has been severely ravaged by savage rulers. The people's resourcefulness is vindicated by their ability to survive and indeed make progress in practically all fronts despite almost insurmountable odds. Economically, for instance, self-reliant acumen has been demonstrated; for if industry proper has been crippled, the outskirts of towns are full of small scale industrial enterprises that use local resources and skills. Similarly, peasant achievement in food production can only be described as highly commendable. With a different political system the Ugandan people could do wonders.

How they are going to fare under General Okello still has to be seen. But one cannot hope for much. To begin with, the new military leadership is completely devoid of political direction. It was perhaps significant that upon capturing the capital city, the troops for a while attempted to celebrate their victory in the streets but were absolutely unable to coin even a single slogan that would express their sentiments and also rally support from the civilian population. The attempt was immediately abandoned; theirs was a movement without a mission. The entire horizon of their social vision ended at the doorstep of the consumer shop, which they looted extravagantly in emulation of their political rulers.

Secondly, it should not be forgotten that basically it is only Obote and very few of his close colleagues who have left the political scene. The new rulers are so incapable that they have been looking for collaborators from the remnants of the old regime. Four weeks after the coup, they had not yet succeeded in forming a full cabinet—posts have been dished out to individuals and groups on a piece-meal basis. The task of securing agreement from all the warring groups seems a very tough one for them. At most, therefore, one can only hope that some form of general accommodation will be reached in the near future so as to give the Ugandan people peace—*albeit* necessarily a temporary one. For the possibility of a popular democracy is still as remote as ever.

---

# The New UNIDO

## Expectations *versus* Realities

### S Nanjundan

THE first part of the first session of the General Conference of the United Nations Industrial Development Organisation (UNIDO) in its new capacity as an autonomous specialised agency of the United Nations system was held in Vienna from August 12 to 17. 110 of the 120 member states, seven observer states, as well as observers from other United Nations and International Organisations participated in the Conference.

UNIDO takes it place as the 16th independent agency in the United Nations system. It has been in existence as an autonomous or semi-autonomous organ of the United Nations General Assembly since 1966. The conversion of UNIDO into an independent specialised agency was among the measures recommended by the second General Conference of UNIDO at Lima in 1975. The present Conference is the culmination of 10 years of preparatory work by United Nations member states to achieve this independent status.

The Conference appointed as its first Director General, Domingo L Siazon of the Philippines who had been in Vienna for years in the Philippine Mission and in recent years as the Ambassador of that country. Most of the time of the Conference was taken over the election of the Director General by its Industrial Development Board. After a series of five sets of balloting among three candidates (respectively from the Philippines, Mexico and Nigeria), spread over a period of three days, the Philippine candidate was finally elected by a simple majority of 24 out of 53 members of the Industrial Development Board.

The other tasks accomplished by the first session of the first Conference were the election of the Industrial Development Board and the Programme and Budget Committee, as well as provisionally approving Rules of Procedure and an Agreement with the United Nations. The new Director General and the Secretariat will have until the end of September to prepare a Programme Budget for the biennium 1986-87 and to make proposals on the re-organisation of the Secretariat. The budget as well as these proposals will be considered by the Programme and Budget Committee which will meet from the last day of September. The Industrial Development Board will meet in November, with the second and final part of the first General Conference in December, to approve the scale of assessment for members of the organisation, to approve the budget, to approve staff rules and regulations and agreements with UNDP and UNIDO, in order that the new organisation begins functioning *de jure* from January 1, 1986.

### NATURE AND FUNCTIONS OF THE NEW ORGANISATION

That a new autonomous agency of the United Nations system has been created in the 40th year of the anniversary of the United Nations is considered significant and an omen of the good intentions of the international community in regard to fulfilling the objectives of industrialisation and economic development of the Third World. In reality, however, it is the first time that an organ of the United Nations General Assembly, hitherto financed from the budget of the United Nations, is being converted into a specialised agency. The new agency will be independent of the United Nations General Assembly, it will have its own budget approved by its General Conference, resources being raised by assessment from its member countries, as is the case with other autonomous agencies such as FAO, ILO, UNESCO, WHO, etc. The developing countries which proposed an autonomous agency in 1975 considered autonomous functioning essential for fulfilling the Lima target and Lima objectives of industrialisation and international co-operation. At that time, 10 years ago, even though the first oil shock had happened; it was a period of optimism for North-South co-operation. The special session of the United Nations General Assembly held later in that year not only endorsed the Lima Declaration but also exuded optimism in relation to industrial redeployment and re-structuring as well as flow of resources from the North to the South.

In the changed circumstances of today when the world economy is at a standstill if not stagnating, when the burden of debt of the developing countries and the lack of growth of developed countries has led to drying up of multilateral assistance, when it will be difficult to raise additional resources, it is a moot question whether the conversion of UNIDO will be to the long-run advantage of industrialisation of the developing countries.

The objectives and functions of the new organisation, contained in articles 1 and 2 of the Constitution (see Appendix), are broad-based and are no different from those of the present organisation. The silver lining in the cloud is in fact the greater enthusiasm of the developed countries than the developing for the establishment of the new organisation which may lead to provision of more support and resources to the new organisation, provided acceptable policies and programmes are undertaken.

### Developing Countries and UNIDO

From its beginning in 1966 UNIDO, like UNCTAD, has been regarded as the organisation *of* the developing countries, instead of *for* the developing countries. It has always been headed by a person from a developing country. It has sought to become a forum for consultations on issues of re-deployment and re-structuring as well as of industrial financing. Such a rule has not been acceptable to the developed countries, who have sought to emphasise the technical assistance role of the organisation. In reality technical co-operation with developing countries in the establishment and improvement of industries, through the deployment of UNDP and other bilateral resources, has become the major function of UNIDO. Expenditures on technical co-operation projects in developing countries amount to $ 80-90 million per year.

It is the hope of the developed countries that UNIDO would shed its role of being a forum for debating North-South issues and strengthen its role as a professional body providing technical assistance and co-operation for the industrialisation of the developing countries. The Constitution of the new UNIDO, which requires the programme and budget to be approved by a two-thirds majority of 27 members of the Programme and Budget Committee (15 from developing countries, 9 from developed market economies, and 3 from developed socialist countries), will tend to ensure the realisation of such an expectation.

There is much to be said for UNIDO streamlining its activities and concentrating on becoming a leader in providing advice on industrialisation issues and in co-ordinating technical co-operation for industrial development, rather than engaging in discussions, debates and consultations for the purpose of negotiation of concessions from developed countries, for which other UN fora exist.

### India and UNIDO

While India has always played a leading role in UNIDO's governing bodies and in its Secretariat, the government does not seem to have a clear perception of its role or of what it wants to achieve from or through UNIDO as such. It lacks a strategy on its role in UNIDO. India has always lent strong support to the executive head of the organisation. It has made available voluntary contributions in a generous manner. However, it has not succeeded in bringing cohesiveness or working out meaningful co-operation within the Group of 77. There is lack of co-ordination in approaches towards the same issues coming up in different governing bodies such as those of UNIDO, UNDP and ECOSOC. For example, India's assistance to ECA on the Industrial Development Decade for Africa is not co-ordinated with its assistance to UNIDO for the same programme. The approaches to issues in the United Nations General Assembly or its committees might differ from those in the Conference or Industrial Development Board of UNIDO. The creation of the new UNIDO offers a unique opportunity for India to review its role, policy and strategy in relation to the new organisation, taking into account the short-term and long-term advantages to the country in its relations with both the developing and the developed countries.

### Appendix

Article 1: *Objectives*

The primary objective of the organisation shall be the promotion and acceleration of industrial development in the developing countries with a view to assisting in the establishment of a new international economic order. The organisation shall also promote industrial development and co-operation on global, regional and national, as well as on sectoral levels.

Article 2: *Functions*

In fulfilment of its foregoing objectives, the organisation shall generally take all necessary and appropriate action, and in particular shall:

(a) Encourage and extend, as appropriate, assistance to the developing countries in the promotion and acceleration of their industrialisation, in particular in the development, expansion and modernisation of their industries;

(b) In accordance with the Charter of the United Nations, initiate, co-ordinate and follow up the activities of the United Nations system with a view to enabling the organisation to play the central co-ordinating role in the field of industrial development;

(c) Create new and develop existing concepts and approaches in respect of industrial development on global, regional and national, as well as sectoral levels, and carry out studies and surveys with a view to formulating new lines of action directed towards harmonious and balanced industrial development, with due consideration for the methods employed by countries with different socio-economic systems for solving industrialisation problems;

(d) Promote and encourage the development and use of planning techniques, and assist in the formulation of development, scientific and technological programmes and plans for industrialisation in the public, co-operative and private sectors;

(e) Encourage and assist in the development of an integrated and interdisciplinary approach towards the accelerated industrialisation of the developing countries;

(f) Provide a forum and act as an instrument to serve the developing countries and the industrialised countries in their contacts, consultations and, at the request of the countries concerned, negotiations directed towards the industrialisation of the developing countries;

(g) Assist the developing countries in the establishment and operation of industries, including agro-related as well as basic industries, to achieve the full utilisation of locally available natural and human resources and the production of goods for domestic and export markets, as well as contribute to the self-reliance of these countries;

(h) Serve as a clearing-house for industrial information and accordingly collect and monitor on a selective basis, analyse and generate for the purpose of dissemination information on all aspects of industrial development on global, regional and national, as well as on sectoral levels including the exchange of experience and technolgical achievements of the industrially developed and the developing countries with different social and economic systems;

(i) Devote particular attention to the adoption of special measures aimed at assisting the least-developed, land-locked, and island developing countries, as well as those developing countries most seriously affected by economic crises and natural calamities, without losing sight of the interest of the other developing countries;

(j) Promote, encourage and assist in the development, selection, adaptation, transfer and use of industrial technology, with due regard for the socio-economic conditions and the specific requirements of the industry concerned, with special reference to the transfer of technology from the industrialised to the developing countries as well as among the developing countries themselves;

(k) Organise and support industrial training programmes aimed at assisting the developing countries in the training of technical and other appropriate categories of personnel needed at various phases for their accelerated industrial development;

(l) Advise on and assist, in close co-operation with the appropriate bodies of the United Nations, specialised agencies and the International Atomic Energy Agency, the developing countries in the exploitation, conservation and local transformation of their natural resources for the purpose of furthering the industrialisation of developing countries;

(m) Provide pilot and demonstration plants for accelerating industrialisation in particular sectors;

(n) Develop special measures designed to promote co-operation in the industrial field among developing countries and between the developed and developing countries;

(o) Assist, in co-operation with other appropriate bodies, the regional planning of industrial development of the developing countries within the framework of regional and subregional groupings among those countries;

(p) Encourage and promote the establishment and strengthening of industrial, business and professional associations, and similar organisations which would contribute to the full utilisation of the internal resources of the developing countries with a view to developing their national industries;

(q) Assist in the establishment and operation of institutional infrastructure for the provision of regulatory, advisory and developmental services to industry;

(r) Assist, at the request of governments of the developing countries, in obtaining external financing for specific industrial projects on fair, equitable and mutually acceptable terms.

## REVIEWS

# Technology as Manna from Heaven

### Monojit Chatterji

**Capital and Technological Progress in the Indian Economy, 1950-51—1980-81** by S Hajra; Radiant Publishers, New Delhi, 1985; pp xvi + 198, Rs 95.

THIS book deals with an important topic. The slow and uneven growth performance of the Indian economy has been the cause of much soul-searching and hand-wringing amongst economists, politicians and policy-makers. Part of the concern stems from the fact that, unlike many other underdeveloped countries, our rate of savings and investment has been fairly impressive. Thus one of the pre-conditions of high growth, *viz*, a high and relatively stable investment path has more or less been met in India. Despite that, our growth performance has been inadequate. This is one of the author's central concerns in this book. The other main concern is to shed some light on the optimality or otherwise of the sectoral allocation of investment. The author's main conclusions are that the unsatisfactory growth performance of the Indian economy is due to a low rate of technological progress and that "a step up in the rate of capital formation in the private corporate sector (as opposed to the public sector) will contribute to higher growth of industry" (p 186). The main policy conclusion that he draws from this is that "modernisation, technological absorption and technological upgradation are a must" (p 190). In this context the author endorses "the recent liberalisation of the policy of technology import . . ." (p 190). The reader may well ask on what analytical and empirical foundations these strong conclusions are based.

The author's methodology is simple if not simplistic. He estimates Cobb-Douglas production functions allowing for simple exogenous manna-from-heaven type technological progress. In this approach, technological progress is viewed quite simply as that contribution to production which cannot be explained by the standard factors of production. In other words, technological progress is another way of expressing our ignorance of the forces affecting the productive process. Since capital and labour are highly correlated, the author fits the production functions using capital alone. Land is omitted presumably on the grounds that it is not a scarce resource in India. In log-linear form the author's basic estimating equation is: $\log y(t) = a + b \log k(t) + ct$ where $y(t)$ is output at time t, $k(t)$ is capital stock at time t, and a, b, and c are the parameters to be estimated: b is the economies of scale parameter while c is the technological progress parameter.

Estimates of a, b, and c were obtained both for the whole economy and for various sub-sectors of the economy using CSO data obtained from the National Accounts Statistics. The capital stock series had to be constructed from the investment series available from these sources. Given the well known problems of measuring capital, this is a tricky business. The author appears to have simply cumulated the relevant investment series without any attempt to allow for depreciation or to use an appropriate benchmark for the value of the initial period capital stock. In the light of this, the author's well determined estimates of a, b, and c must be treated with some caution. However, the main problem is not so much the statistical shortcomings but the interpretation of the results. Even if one took the author's estimates at face value, serious difficulties remain.

The author's basic estimating equation (above) can be differentiated with respect to time to obtain the growth equation: $g(y) = c + b\ g(k)$ where $g(y)$, $g(k)$ are respectively the growth rates of output and capital. Along a steady state growth path the capital-output ratio is constant so that the growth rates of capital and output are the same. Denoting this common steady state growth path by g, the growth equation can be rearranged as: $c = (1 - b)g$. Given the values of b and g, the steady-state warranted value of c can be calculated. If the actual value of c turns out to be lower than this warranted value then the capital-output ratio is rising and steady growth cannot be maintained. The Indian economy has indeed been characterised by a steadily rising capital-output ratio. The author merely confirms this by obtaining an estimated value of c considerably lower than the warranted c. Hence the author's claim that our poor growth performance is due to too low a rate of technological progress as measured by the parameter c.

This is not a very helpful finding; indeed it is almost tautologous. Since technical progress is not modelled or explained in any way, what are we to infer from this? The author notes that other (high growth) countries have had a higher rate of technical progress (a higher c). Since c is treated like an exogenous god-given constant, are we to infer that our poor growth performance is because god likes us less than she/he does other countries? Certainly there is nothing in the author's estimates to suggest that liberalising the import of technology will increase the value of our c. If anything, the import of capital-intensive technology from the advanced countries will further increase our capital-output ratio. In the author's framework this will further increase our warranted c and thus we will need an even higher actual c to maintain steady growth.

The author's other main conclusion regarding the desirability of restructuring investment towards the private sector is even more curious. On page 90 the author reports the estimated values of b and c for private and public sector manufacturing industry. The private sector has a much higher value of c (god likes the private sector more than the public sector?) but a much lower value of the scale parameter b Indeed the public sector's scale parameter is not significantly different from unity. This implies that the elasticity of output with respect to capital accumulation is considerably higher in the public than in the private sector—nearly three times as much if the author's estimates are taken seriously. The growth of private sector output is, relatively speaking, due to technical progress. The implication seems to me to be quite clear—we should allow god to help out her/his friends in the private sector whilst we humble humans should direct our investments towards the public sector where they actually produce results. A similar argument follows if the estimates for another almost exclusively public sector industry, *viz*, gas, electricity and water (page 141) are examined.

The real difficulty for all of this stems from the overly simple methodology the author has adopted. There is no attempt to connect the various sectors in order to test for a leading sector type hypothesis. In an underdeveloped country where backward and forward linkages are likely to be important, such an approach might well yield insights, particularly on the question of intersectoral investment. An attempt to explain technical progress would also have been very useful. A proper treatment of the disease (of low technical progress) might then be more successful. Despite these shortcomings, the book raises some important issues. In that it serves a useful purpose.

# Not Official History, Not Independent Evaluation

### Bhabatosh Datta

**Reserve Bank of India: Fifty Years, 1935-85** by E P W da Costa; Reserve Bank of India, Bombay, 1985; pp 161, Rs 50.

ON the occasion of the completion of its fifty years of operation, the Reserve Bank commissioned E P W da Costa to write a book "which would highlight the landmarks in the development of the Bank as an institution, bringing out in full flavour its major contributions as a central banking institution". Da Costa, very naturally, has not gone beyond his brief and the occasion was not one in which the Reserve Bank would be wanting to publish itself a critical analysis in depth of its working over the fifty-year period. This task, it may be expected, will be taken up by others. The official history edited by S L N Simha covers the first sixteen years in great detail, but an official history suffers from certain limitations. It is time that the later history was analysed in detail and an evaluation made of the success and failures of the Bank.

Within the constraints of the assignment, which spoke only of 'landmarks' and 'contributions', da Costa has written an eminently readable book. The chapter on the political and economic environment of the thirties gives a clear picture of the backdrop on which the Reserve Bank was introduced. The only vital missing point relates to the gestation period from 1927 to 1934 on which an interesting paragraph or two could have been written. It should also have been mentioned, without any suggestion derogatory to the Bank, that the Reserve Bank of India Act was finally passed in 1934, not because of the recognition of the monetary needs of the economy, but because the European business interests were insistent that power over finance and banking must not be transferred to Indian ministers before an independent central bank had been established.

The treatment of the subject in da Costa's book is historical and the account given is short but fairly full. Certain things have to be glossed over, like the position taken by the Bank when the Travancore National and Quilon Bank failed in 1938. More important is the rather superficial description of the role of the Reserve Bank in expanding the rupee circulation during the War, when it was made to accept large amounts of sterling and when half-hearted attempts to stem the inflationary pressures were found to be inadequate. On the credit side, there could be some mention of the positive part played by the Bank in saving some commercial banks from the serious pressures of the immediate post-War years.

Chintaman Deshmukh gets full attention, but the other governors are referred to only casually. The full story of Osborne Smith's departure will perhaps never be told. Da Costa's statement that Benegal Rama Rau resigned in 1957 "apparently because of differences with the then Finance Minister T T Krishnamachari" is a polite understatement, when it is well known that Rama Rau was asked to resign within a very short time-limit. Perhaps the author did not want to go into the question of the relationship between the Finance Ministry and the Reserve Bank. There is thus no mention of the fact that important decisions were (and still are) taken without consulting the Bank. The most glaring example was that of the decision to nationalise 14 major commercial banks in 1969, which was taken without any discussion with the Bank. In fact, even the Finance Minister was not consulted. Of course, a golden jubilee celebration, with the Prime Minister presiding, is not the right occasion to raise the question of the autonomy of the Bank and its right to be heard when important financial decisions are taken.

The account given in the book of the recent years is rather superficial, though the chapter on rural credit is fuller than those on industrial development, export credit, etc. The chapter on 'Stabilisation, Destabilisation and Restabilisation of Prices' does very little to justify the high-sounding title. And the rather purple paragraphs at the end of the book on "the most surprising of all political developments since Independence" and the "smooth, miraculously smooth, process of desirable change" could have been left out in a work which though commissioned as a publicity handout, is written by one who begins the book by asking Memory to hold the door. There is no reason why da Costa's memory should be myopic.

The book of course serves its purpose as a publicity handout. While many unpleasant facts are brushed under the carpet, the more obvious facts are there including details about the later careers of some governors. Some omissions could however have been rectified. For example, there is a table on the money stock ($M_1$ and $M_3$) from 1969-70 to 1984-85 in the Appendix, but the explanation in the text is sketchy. The historical information could also have been checked carefully. For example, it is not quite correct to say that under the Currency Act of 1927, "the government had the option of giving gold or sterling against rupees". In fact the option was given to the buyer to demand gold provided that he tendered rupees equivalent to the value of 400 ounces of gold at Re 1 = 8.47512 grains (i e, 1,065 tolas at Rs 21. 3 as. 10 p per fine tola). Gold dealers could easily offer the required Rs 22,620 and that kept the market price of gold at a little below Rs 22 per tola.

A brief reference has been made to the Research and Statistics unit of the Bank. The book could have given a fuller account of the important work done by this unit and of the immensely valuable publications, besides the *Bulletin*. No serious student of economics can do without the *Reports on Currency and Finance*, the *Annual Reports* and the *Monthly Bulletin* and there is rich material in the various special reports and occasional papers. It will not perhaps be uncharitable to say that the general reader will get a better idea about the Bank from its staff publication on "Functions and Working" than from da Costa's book. But the book is apparently meant for a different clientele.

It is time that the Reserve Bank took up the preparation of the second volume of the official history, the first volume of which covered the first sixteen years from 1935 to 1951. An official history is not a substitute for an independent expert evaluation, but it provides the base for further work. A convenient cut-off date for the second volume will be 1969-70 covering the activities and performance of the Bank from the First Plan to the beginning of the Fourth Plan, i e, over three five-year plans and three years of 'plan holiday'. The seventies brought in a new position with the Reserve Bank at the head of a nationalised banking system and also brought the Bank face to face with the problems of severe inflation and of uncomfortable increases in foreign reserves. Probably the appropriate period of study for the third volume will be 1970-1985. If da Costa's evaluation of the Bank being "poised for a new adventure" in 1985 is correct, that year ought to turn out as a water-shed.

---

## Colour-Chem

COLOUR-CHEM's Chairman B M Ghia has reiterated his plea to the Central government of urgent revision of the anomalous import duty structure. At the company's annual general meeting in Bombay he said the extent of actual imports—totally unwarranted in areas where efficient import substitution has already been well achieved—should cause concern to all those interested in the nation's industrial base. Some sectors of the chemical industry in particular are being severely hit by the continuance of indiscriminate imports, though the national exchequer also pays dearly for them. Referring to the current working of the company, the Chairman says that in spite of turbulent conditions in some of the major consuming centres, turnover has been some eight per cent ahead of the same period last year. The company's project for setting up a plant for manufacture of meta phenoxy benzaldehyde (MPB) at Roha in Maharashtra is likely to commence regular production very soon.

# Exploitation and Labour Theory of Value

## A Critique of Roemer's General Theory of Exploitation and Class

**Khalid Nadvi**

*The uniqueness in J Roemer's work lies in his attempt to put forward a model to deal with exploitation in all modes of production. It is the author's contention, however, that Roemer's method and the model that it produces are highly flawed and reject certain aspects of a Marxian approach which are central.*

*Roemer posits a model of exploitation based upon unequal ownership of human (skills) and non-human property (land, means of production) and seeks to prove the superiority of this property rights model over the conventional surplus labour model of exploitation. In rejecting the labour theory of value, however, Roemer loses the core of the Marxist theory of exploitation, namely, the social relations of production between commodity producers and the exploitation of labour through the creation of surplus value at the point of production.*

*This paper begins by presenting a brief outline of the leading features of Roemer's model. This is followed by the author's major criticisms of the substance and methodology of Roemer's General Theory. Finally, the author puts forward his arguments for the need for a surplus labour theory to understand exploitation and restates his position on the centrality of the labour theory of value.*

### I

### Introduction

OUT of the celebrated debate on the transformation problem there has arisen what is rather fancifully termed as a neo-Marxian approach, whose most renowned exponent Steedman has utilised the Sraffian system to obtain a formulation for prices. (See Steedman 1977 and Steedman, Sweezy, *et al*, 1981.) Such neo-Ricardian analysis has concerned itself primarily with value and prices. However the recent works by Roemer (Roemer, 1982a, 1982b) which we argue have to be seen as an extension of this school, have taken such neo-Ricardian analysis onto an altogether different dimension; from specific price formation models to the level of a general theory of exploitation. His writings have without a doubt taken Marxist academia by storm, a reflection of their novelty as well as quality. A few excellent commentaries and critiques of Roemer have appeared (notably Abell 1983; Eatwell 1982; Przeworski 1982; Elster 1982; Wright 1982); however, surprisingly, none have seriously dealt with the implications, both in terms of theory and praxis, of Roemer's rejection of the labour theory of value. This rather simple oversight on the part of these commentators is the focus of our arguments against Roemer in specific and the neo-Ricardian school in general.

The uniqueness in Roemer's work lies in his attempt to put forward a model to deal with exploitation in all modes of production. The aim of such a general theory being to lay the foundations for an analysis of the laws of motion of socialism. Such an aim is an achievement in itself and deserves applause. There is without a doubt a need for Marxists to provide critical analysis of the socialist mode of production which goes beyond the individual, concrete, case specific approach put forward within the format of the Marxist theories of the State.

Nevertheless, it is our contention that Roemer's method and the model that it subsequently produces are highly flawed and reject certain aspects of a Marxian approach which we consider central. Roemer, who professes to be a concerned Marxist, somewhat cheerfully, acknowledges the 'heresy' in his writing and yet bravely carries on not so much in providing a critique of the contradictions in Marxist thought, but in putting forward *a priori* statements. He posits a model of exploitation based upon unequal ownership of human (skills) and non-human property (land, means of production). He goes to great lengths to prove the superiority of this property rights model over the conventional surplus labour model of exploitation. In rejecting the labour theory of value Roemer loses what we believe to be the core of the Marxist theory of exploitation, namely, the social relations of production between commodity producers and the exploitation of labour through the creation of surplus value at the point of production.

In the following section we present a brief outline of the leading features of Roemer's model. We state at the outset that we shall not attempt to deal with the more detailed mathematical proofs of Roemer's theorems. This is followed by our major criticisms of the substance of and methodology within Roemer's General Theory. We are not convinced by the arguments used by Roemer for the suitability of a games theoretic approach and the need for a synthesis between the neo-classical general equilibrium and Marxist schools through the structure of mathematical modelling. Such a noble task is in our opinion doomed to failure due to the quite distinct approaches and contradictory aims of the two disciplines. Finally, we put forward our arguments for the need for a surplus labour theory in understanding exploitation, we restate our position on the centrality of the labour theory of value.

### II

### Outline of Roemer's General Theory

As has been noted, Roemer attempts to put forward a theory of exploitation which encompasses feudal, capitalist and socialist modes of production. Exploitation in each mode comes about as a result of an unequal distribution of property rights. Consequently feudal exploitation is derived from differential access to freedem from bondage, where such freedom (to freely trade) is itself a property right. Interestingly, Roemer equates feudal exploitation with what he terms as "neo-classical" exploitation where factors of production are no longer paid their marginal product. Capitalist exploitation results from unequal ownership of the means of production, i e, alienable non-human assets. Socialist exploitation is a consequence of inequitable distribution of inalienable, human property. Differential endowments of human assets taking the form of skill and status exploitation (and, presumably, gender and race exploitation).

Under feudalism all three forms co-exist. The transition from feudal to capitalist mode of production brings about the eradication of feudal exploitation (the removal of the barriers of free trade). Similarly, the transition from capitalism to socialism entails the destruction of capitalist exploitation. In Roemer's words, "each revolutionary transition has the historical task of eliminating its characteristic associated form of exploitation" (Roemer, 1982a; p 21).

The test for exploitation put forward by Roemer ranks as one of the most novel features of his model. Exploitation is said to exist if a coalition of agents could withdraw from the given social and economic relations, with their per capita share of the inequitably distributed property rights (assets) and subsequently raise their social welfare levels (whatever that social welfare criterion may be).

This concept of 'contingently feasible alternatives' is not a purely abstract tool to ascertain exploitation by positing an alternative state where the coalition of agents can be better off by not facing such exploitation; it is in fact conceived as being hypothetically feasible. Consequently the test for exploitation under feudalism involves the elimination of feudal bonds, where a coalition of oppressed agents (serfs) could raise their standards of living, income, welfare by withdrawing from the master-serf relations with the land they operate and the tools they utilise for production. Similarly, capitalist exploitation exists if a coalition of workers can withdraw from the capitalist economy with their per capita share of the means of production and raise their welfare levels.

Roemer argues that this model of exploitation based upon property rights is superior to the orthodox Marxist definition based upon extraction of surplus labour in that exploitation can be shown to exist in the absence of employment relations.

The logical proof of this is provided in the model of a subsistence economy. Roemer shows that in such an economy, agents optimise their leisure (i e, minimise hours worked) while maintaining subsistence needs on the basis of their given endowments. If a labour market with uniform technology and identical subsistence patterns exist, then agents will trade in labour endowments in order to satisfy consumption needs, while minimising the actual labour performed. There will be agents who will acquire their subsistence needs through the purchase of the labour power of others, and there will be agents who will have to sell all their labour in order to meet their subsistence requirements. Those who work more than is socially necessary to satisfy subsistence needs are considered exploited while those who work less than is socially necessary are exploiters. Exploitation is judged on the basis of labour time.

From this Roemer derives what he calls the Class-Exploitation Correspondence Principle (CECP). Given the choice of hiring labour, working for oneself and selling labour (or a combination of these) Roemer constructs five distinct 'class' categories on the basis of given endowments. They can be described as follows: (i) pure capitalists who only hire labour; (ii) small capitalists who both hire others and work for themselves; (iii) petit bourgeois who only work for themselves; (iv) mixed proletarian who work for themselves as well as selling part of their labour power; and (v) proletarians who only sell their labour. Roemer's rank ordering puts the pure capitalists and small capitalists at the top of the wealth hierarchy as the richest and most exploitative members of society, while the mixed and pure proletarians are on the lowest rungs of the wealth ladder, being the poorest and most exploited strata.

Having constructed the link between exploitation and class, Roemer goes on to show that a labour market need not exist for such a link to hold. If the labour market is replaced by a capital market we find that the class structure embodied in the CECP still holds. Agents attempt to satisfy their subsistence needs on the basis of their given capital endowments. Consequently, as in the labour market economy, an agent faces the choice of lending capital to others at a given rate of interest, working one's own capital or borrowing capital, or some combination of these. Thus a producer with limited capital endowments will have to borrow capital at the given rate of interest in order to finance his/her production. As above, at an equilibrium solution with given equilibrium price vector, those agents who work less than the socially necessary labour time are the exploitative class, while those who work more than is socially necessary to satisfy consumption needs form the exploited class. Thus, as before, in the rank ordering of classes, the exploited are the borrowers of capital while the exploiters are the lenders of capital. The significance of this is outlined by Roemer:

> In class and exploitation properties the two solutions are isomorphic; the credit and labour markets are functionally equivalent. We can thus produce the highly articulated class structure usually associated with a labour market, with no institutions for labour exchange, and using just a credit market. The heresy is complete. Not only does exploitation emerge logically prior to accumulation and institutions for labour exchange but so does the articulation of exploitation into class (Roemer, 1982b; p 265).

Exploitation can now be explained without recourse to any understanding of wage relations or analysis of the labour process. The conclusion of Roemer's exercise is that the inequality of wealth endowments (property rights) is a sufficient condition for exploitation to occur.

Within an accumulating economy, the analysis is much the same. As agents differ in their endowments of assets, at an equilibrium solution there will exist the conditions for exploitation (in contradiction to the neoclassical gains from trade arguments). Exploitation occurs when a producer "cannot possibly command as much labour value, through the purchase of goods with his revenues, as the labour he contributed in production, and an exploiter is one who unambiguously commands more labour time through goods purchased no matter how he dispenses his revenues" (Roemer, 1982b; p 269). This definition narrows the exploited and exploiter classes within the CECP, hence widening the 'grey area' of producers who are neither exploited nor exploiting.

On exposing his model to production technology sets more general than the simple Leontief input-output matrix (where each good is produced by precisely one process) Roemer comes up with a surprise. As he outlines, in order to explain exploitation in general technology models one has to define the concept of labour embodied in a commodity. However, when using the traditional Morishima definition of labour embodied (where labour embodied in a commodity bundle x is the minimum amount of direct labour used amongst all the possible ways of producing $\underline{x}$) Roemer finds that the CECP breaks down. In the face of the possible destruction of his model, Roemer constructs an ingenious, if somewhat dishonest, escape path from the problem.

He puts forward an alternative definition of labour embodied. Instead of Morishima's method which is to scan all the production processes in order to find the one with the least direct labour used, Roemer argues that at the going equilibrium prices, one must scan those processes which are maximally profitable. Thus the labour value embodied is " . . . the minimum amount of direct labour used in producing $\underline{x}$ minimised over the set of maximally profitable processes. This generates a definition of exploitation for which the CECP is true in the general constant returns to scale model of production" (Roemer, 1982b; p 272). In the Morishima definition of labour embodied, labour value is a function of the technology used and is independent of prices. For Roemer's definition, however, labour values are purely dependent on price; price precedes value. In Roemer's words, "equilibrium prices must be known before labour value can be said to exist" (Roemer, 1982a, p 150). This new definition overthrows the traditional Marxist view that values precede prices. It is, as Roemer is the first to acknolwedge, somewhat heretical. There is a hint of determinism in Roemer's arguments. Before we can estimate value we must know the vector of all equilibrium, profit maximising, prices.

Having inverted this aspect of the labour theory of value, Roemer goes on to argue for a labour theory of exploitation. In his eyes there is nothing intrinsically unique in labour power that gives it the property of creating surplus value.

> Indeed, in an economy capable of producing a surplus, any commodity has this magical property [of creating surplus]. If we choose corn as the value numeraire and calculate embodied corn values of commodities and the embodied corn value of corn, we can prove that the economy is capable of producing a surplus if and only if corn is exploited, in the sense that the corn value of a unit of corn is less than one. There is absolutely nothing special about labour power in this regard (Roemer, 1982b; p 273).

Nevertheless, within the capitalist mode of production labour power is the only asset uniformly distributed; so Roemer argues if, as historical materialists, we are concerned with a theory that deals with class struggle, the conflict between the exploited and the exploiter, then that theory can only be the labour theory of exploitation. For Roemer

> The accumulation of capital can . . . be explained, as a technical fact, by choosing any commodity as value numeraire. But class struggle between proletarians and capitalists can only be explained by choosing labour as the value numeraire (Roemer, 1982b, p 275).

To summarise, Roemer's property rights model of exploitation and class presents us with a number of interesting and novel features. He begins by explaining exploitation in the subsistence economy as being based upon an unequal endowment of wealth. He goes on to argue that for such exploitation to exist there is no need to have a labour market, a credit market will suffice in its place (heresy No 1?). Differential initial wealth endowments and the consequent trading relations in endowments between exploiters and exploited leads to the presence of a class structure, the CECP.

The argument is much the same for an accumulating economy, with Leontief technology. While the subsistence requirements are rejected as being subjective preferences, a differentiation of society into exploiters and exploited along class lines akin to the CECP is found. On introducing more general technology sets, the CECP falters when faced with Morishima's definition of labour embodied. Roemer's new definition of labour embodied leads us to the consequence of equilibrium prices determining values (heresy No 2?). Another argument for the rejection of the labour theory of value.

We now have the conditions for a general theory of exploitation which incorporates exploitation under feudal, capitalist and socialist modes of production. Roemer's ingenious test for exploitation uses games theory to construct "contingently feasible alternative states" under which exploited agents could improve their welfare by 'withdrawing' with their share of society's alienable and inalienable assets.

Exploitation on the basis of inequitable distribution of property rights leads to feudal exploitation, capitalist exploitation and socialist exploitation. It is the last which is the unique feature of the general theory of exploitation. Exploitation under socialism results from an inequitable distribution of human endowments. It takes the form of exploitation based upon skill and status (and, presumably, gender and race). The historical task of the socialist transformation is to eliminate capitalist exploitation by bringing the means of production under social ownership. Any resultant exploitation such as skill/wage differentials or race and gender exploitation are a feature of socialist exploitation and hence beyond the realms of socialist transformation. Roemer concedes that at certain historical moments socialist exploitation may be considered socially necessary (this is so when the welfare of the withdrawing coalition is diminished by withdrawing from the economy, for reasons such as lack of pooling of skills or loss of incentives). A crucial element within the game theory, withdrawal analysis states that exploited agents cannot improve their welfare or their class status by remaining within the exploitative economy. An individual's class status and degree of exploitation is determined by his/her given alienable and inalienable wealth endowments. He/she cannot improve his/her class position except by withdrawing as a member of a coalition from that economy. Consequently exploited agents under socialism cannot improve their welfare within socialism (unless of course such exploitation is considered socially necessary for reasons as described above); and like the proletariat withdrawing from the capitalist mode of production and initiating the socialist transition, so exploited coalitions under socialism must withdraw from that state and hence initiate the transition to the next (presumably communist) mode of production.

Now that we have the essence of Roemer's model, *albeit* in a much simplified form, we can move to our own criticisms of Roemer's work.

## III

## Criticisms of Roemer's Model

It is probably not surprising that Roemer's model has been more favourably received by neo-classical economists than by Marxist theoreticians. A reflection not only of the fact that Roemer's highly technical method is immersed in the language of neo-classical economics, but furthermore, that Roemer's understanding of Marxism has strayed extensively from the traditional discipline of dialectical historical materialism.

Our major criticism of Roemer lies in his rejection of the labour theory of value and the surplus labour approach to exploitation. We shall leave the discussion of this issue to the last when we shall present our arguments for the centrality of the labour theory of value in Marxist thought.

Our initial criticism of Roemer's model lies in its inherent static nature; a feature determined by his use of Walrasian, dynamic statics, general equilibrium analysis. Despite a taxonomy of exploitation under socialist, capitalist and feudal modes of production, Roemer's method deals only with static equilibria in each case. He constructs ideal states of each mode of production for the purposes of comparisons of qualitatively different forms of exploitation. He shows limited awareness of historically progressive transition from mode to mode. At most he argues that the historic duty of any revolutionary transition is to eradicate the characteristic form of exploitation of the mode of production against which it is in struggle. There is little understanding of the dynamics of transition states and none whatsoever of the concept of the dialectic. Roemer's Marxism is bereft of the dialectic form.

There is no analysis in his arguments of the relative autonomy of political determinism in class formation and revolutionary transition. In order to explain revolutionary transition one has to explain class struggle in somewhat more detail than Roemer does, in simplistically reducing it to the struggle between exploiters and exploited. In order to understand class struggle one has to be aware that there are political factors that play a part in the determination of class struggle. As Wright has pointed out class cannot be defined in purely economic terms. "Class is an intrinsically political concept and for it to serve its explanatory purposes it must have its political dimensions systematically represented within the concept itself" (Wright, 1982). While we may disagree with Wright as to the degree of relative autonomy of politics from economic determinants within the class formation matrix; Wright's arguments, nevertheless, point to a chronic failure on the part of Roemer to break from the narrow confines of his economistic method.

As a consequence of a dynamic statics approach Roemer, like his neo-classical friends, takes property relations in ideal states as being given ahistorically. Given that power relations, class and exploitation are all derived from inequitable property endowments, this has serious implications. There is no explanation as to the historical accumulation of wealth. Roemer discounts the orthodox argument that surplus labour plays a role in capital accumulation. "The accumulation of capital can . . . be explained, as a technical fact, by choosing any commodity as value numeraire" (Roemer, 1982b; p 275). With no understanding of the historical process of capital accumulation there is no way to explain the inequitable distribution of wealth endowments.

A further implication of this is that with an agent's class position and degree of exploitation determined by his or her given property endowments, there is no way for such an agent to improve his or her welfare within the mode of production in which such exploitation is dominant. The only method by which the agent can break such a deterministic hold is by joining a coalition group of other exploited agents and withdrawing from that state. This argument seems to contradict the struggle of trade unions to raise the welfare and living standards of their members, usually exploited proletariat, while remaining within the confines of the capitalist economy. (A struggle which Marxists have invariably supported despite the implications of economism of such labour action.)

A further result of given property relations is that optimal technique paths are derived from those property relations prior to the determination of an agent's class position or the existence of exploitation. Production techniques are therefore taken as given and are constructed by neo-classical resource allocation exercises.

Another point of debate is Roemer's concept of 'contingently feasible alternative' states to which coalitions of agents can withdraw. It is difficult to take this notion of withdrawal literally since, as Przeworski points out, " ... the comparisons of the welfare of groups within and without a particular economy are based exclusively on the properties of static equilibria" (Przeworski: 1982; p 292). Nevertheless if, as we have seen above, agent's class position and degree of exploitation is determined by their wealth endowment, and that the only method available to them to transform their destiny is by joining a withdrawal coalition of agents, then the concept of withdrawal no longer remains a purely abstract, hypothetical formulation for the testing of exploitation; it acquires a political reality and becomes a form of concrete action. Roemer is somewhat confused on this issue. While the task of an alternative is to define exploitation in the state against which the alternative is posited, that alternative becomes somewhat more concrete than an abstract construct. As Roemer outlines

> ... the device for defining exploitation conceives of agents as exploited at a particular allocation, with respect to a particular alternative. The formulation ignores ... [the] sort of problems [such as]: Is the realisation of payoffs [to coalition agents] in some way feasible? What are the costs of coalition formation? How will the coalition arrange to distribute [endowments] among its members? (Roemer, 1982a; p 199).

In his discussion on feudal, capitalist and socialist exploitation, Roemer is fully aware that there are costs involved for the withdrawing coalitions. For example, a coalition of serfs withdrawing from feudalism face the loss of military protection traditionally provided by their lord. Roemer acknowledges this as a very real cost; but he argues, unless the coalition can provide protection for themselves and if the return from the lord's protection is greater than loss of welfare for a serf incurred through bondage, then the coalition will be worse off by withdrawing. If this is so, Roemer argues, then such a group of agents is not feudally exploited in the first place. The same argument can thus be applied to coalitions withdrawing from capitalism or socialism. This leads us to the question of how one is to quantify the costs of withdrawal or, for that matter, the costs of coalition formation? Roemer does not explain how exploited agents can actually form an organised, cohesive, coalition through cooperation, and furthermore, in what fashion can they actually withdraw. As he implies unless one is aware of these costs it is not possible to judge whether a withdrawing coalition is 'properly exploited'.

Another point of criticism connected with the different forms of exploitation within Roemer's model is that nowhere does he mention the existence, or even possibility of, race and gender exploitation. If race and gender are seen as purely inalienable, human property then it must be considered a feature of socialist exploitation (for racism and sexism do exist in many socialist states), which co-exists in other modes of production (although many would argue that socialist societies have been far more successful at fighting racist and sexist attitudes and exploitation). It could be said, however, that race and gender exploitation are fully realised in the capitalist mode of production, such as in low-wage female sweat shop labour in Hong Kong, or low-paid (relative to their white colleagues) black miners in South Africa. Roemer seems to be unaware that racism and sexism do not only act as forms of social control and legitimation but are very real methods of economic exploitation.

This leads us to Roemer's explanation of the socialist exploitation. As he outlines inequalities exist under socialism due to skill differentials, i e, inequitable distribution of inalienable, human, property. Hence the basis of socialist exploitation. Another exploitative feature under socialism, he argues, is status exploitation. Benefits derived through membership of the party, fringe benefits acquired by party and state-bureaucratic elites. Although such status exploitation is anomolous to socialism, it is a common feature of socialist societies where Stalinist party structures predominate (it should be noted that only the Chinese have attempted to eradicate status exploitation during their Cultural Revolution, although it would seem that the attitude of the present leadership is to provide tacit encouragement to status exploitation). Under certain conditions, capitalist exploitation may also be a feautre of socialism, implemented by the state in order to raise the level of the productive forces.*

Skill and wage differentials are for Roemer a necessary feature of socialism:

> It is not the historical task of the socialist transition to eliminate socialist exploitation. What inequalities exist because of differential remuneration to skills should be expected under socialism (Roemer, 1982a; pp 259-60).

Consequently Roemer criticises the Chinese Cultural Revolution for attempting to combat inequalities that lay beyond the task of socialist societies. Their efforts at "the elimination of skill wage differentials led to a retardation in development, labour productivity and material welfare ... these egalitarian experiments were premature" (Roemer, 1982a; p 241). In Roemer's eyes, therefore, socialism's concern lies solely in raising the levels of the productive forces of society, and not in transforming the social relations of production.

Despite Roemer's concern in incorporating inequalities under socialism within his general theory of exploitation, we are not entirely convinced that his method of doing so provides us with a satisfactory basis on which to analyse the laws of motion of socialism. In our opinion an understanding of a given socialist society must incorporate a historical analysis of the process of revolutionary change, of the class structures and dynamics that bring about the revolutionary transformation. These are the forces that in many respects work

tion of the nature of the socialist society. Finally, we believe that no analysis of socialist societies is complete without an account of the state and the bureaucracy. The monolithic structure of the state and party under socialism has to be adequately explained. Roemer, it seems, is apparently aware of the monolithic state and the relative autonomy that it and the bureaucracy enjoy, yet he does not include this within his discourse on the socialist mode of production.

> It is precisely the role of the bureaucracy and the state which obscures the nature of the property relations between the means of production and the workers (Roemer, 1982a; p 253).

Consequently it seems to us that it is far more preferable to use Marxist theories of the state than Roemer's theory of exploitation to analyse socialist societies.

Roemer notes that there is a tendency amongst some Marxist writers of confusing alienation under socialism with exploitation under capitalism by placing an undue emphasis upon the analysis of the labour process. "A misplaced emphasis on the labour process", he argues, "can lead to a faulty, or at least non-materialist analysis" (Roemer, 1982b; p 267). Study of the labour process concerns itself with the organisation of the workplace, and given that Roemer rejects the surplus labour value theory for a property rights model, such work as undertaken by Braverman and others do not, for Roemer, shed any light on exploitation. For him exploitation can be logically divorced from the point of production. A direct result of his rejection of the notion that exploitation is necessarily linked to a market for the exchange of labour power. Roemer's 'historical materialism' concerns itself with an anlysis of property relations rather than the organisation of work. In response to the tendency to equate alienation under socialism with exploitation under capitalism due to similar forms of organisation at the workplace, he argues that the distinguishing features are the given property relations.

> When two different regimes give rise to similar organisational work forms, it is the property relations that define the nature of exploitation and surplus extraction, not the organisational work forms which define the nature of alienation (Roemer, 1982b; p 267).

While we acknowledge the distinction to be made between alienation and exploitation, Roemer's dismissal of the labour process analysis as having little significance leads us back to our first and most substantive criticism of Roemer, namely his rejection of the labour theory of value, and with it the idea that surplus value is created by labour at the point of production and, hence, it is at the point of production, i e within the labour process, that exploitation is located in the capitalist mode of production. Roemer argues that

> ... to characterise Marxian exploitation, [i e exploitation within the capitalist mode of production] in terms of property relations is

---

* Capitalist exploitation, Roemer argues, is apparent in Yugoslavia where there exists unemployed labour which could improve its welfare if it was given its per capita share of the means of production.

> superior to doing so in terms of surplus value. The idea of property relations makes clear what is the ethical imperative when one speaks of exploitation in that it allows us to conceive of an alternative in which the proletariat [or the exploited coalition] has access to its per capita share of society's productive assets (Roemer, 1982b; p 280).

We now turn to our defence of the labour theory of value.

## IV

## Labour Theory of Value and Its Ethical Imperative

There is, it seems, a misconception on the part of many writers and Roemer is certainly not the first, as to the true meaning of the labour theory of value. There is a tradition amongst some mathematically inclined economists imbued in the method of neo-classical economics, and yet identifying themselves with the political economy school, and here the names of Morishima, Catephores and Roemer spring to mind, to conceive Marx as a proto-mathematical economist whose objective lay in constructing economic models. These writers have been concerned solely with one aspect of the value theory, that is the value magnitude or the determination of commodity prices and have neglected the critical qualitative features of value theory, namely the value form and the substance of value. This betrays a very odd, to say the least, reading of Volume 1 of Marx's "Capital". In keeping with this tradition Morishima transforms the classical Marxist theory of value as follows:

> The classical labour theory of value is rigorously mathematised in a familiar form parallel to Leontief's inter-sectoral price-cost equations. The hidden assumptions are all revealed and, by the use of the mathematics of the input-output analysis, the comparative statistical laws concerning the behaviour of the relative values of commodities are proved. There is a duality between physical outputs and values of commodities, which is similar to the duality between physical outputs and competitive prices. It is seen that the labour theory of value may be compatible with the utility theory of consumers' demand or any of its improved variations (Morishima, 1973; p 5).

The labour theory of value does serve a purpose in determining prices of commodities, under general commodity production, by aggregating the socially necessary labour time embodied within the commodities. This, as Marx notes in Volume 3 of "Capital", leads to first approximations for commodity prices. In other words those commodities with identical exchange values, that is equal amounts of socially necessary labour time embodied within them will exchange on a one-to-one basis. Consequently prices of commodities can be obtained as ratios of the money commodity, i e the representation of general, social, abstract labour. Any distortion of the price from the socially necessary labour time embodied within the commodity is due to the short term vagaries of supply and demand; nevertheless, as a first approximation labour values and prices will tend to be equated.

But there is more to Marx's value theory than purely a formation to determine prices on the basis of social labour embodied within commodities. That takes us little further than the Ricardian theory of value. Ricardo's prime concern lay in estimating prices for which he picked labour as the value numeraire. What sets Ricardo's value theory apart from Marx's was that Ricardo failed to realise that labour had two distinct forms.

In order to understand this one needs to explain Marx's method. Whereas Ricardo and more recently the neo-Ricardians concern themselves with prices at the level of appearance, and hence fall into the trap of vulgar economy which Marx describes "feels especially at home in the alienated external appearances of economic relations" (Marx, 1959; p 796); Marx abstracts from value at the level of superficial appearances to present the real process underlying it, the essence or its inner nature. Having separated the essence from appearance one simply retraces one's steps back to the level of appearance; the apparent form is consequently realised.

Marx applied this method of abstraction to the apparent or specific commodity form to find that property which was common to all commodities, namely simple labour or labour in its social form. That is, while labour produced commodities which bore use-value and therefore were the product of a concrete and specific type of productive labour activity, once commodities were exchanged they also began to embody exchange value. Thus what was common amongst exchanged commodities was not only use-values (without which of course they could not be traded) but exchange value. They were the product of labour, general social labour, abstract labour, i e, sheer physical human energy. It was the possession of this common property of commodities that led to their exchange. Thus under exchange relations all concrete or specific productive labour activity could be reduced to abstract or social labour.

Ricardo's value numeraire of concrete, specific and heterogeneous labour is hence inadequate in estimating the value magnitude or the ratio or basis of exchange between two commodities. As Marx noted

> Ricardo's mistake is that he is concerned only with the magnitude of value ... But the labour embodied in [commodities] must be represented as social labour (Marx, 1971; p 131).

Roemer, like Ricardo and the neo-Ricardian writers in the transformation problem debate has, it seems, failed to grasp the dual character of labour, the distinction between individual concrete labour and general social labour. Under general commodity production a traded commodity is a bearer of exchange value, and the exchange value of the commodity is the aggregate of the abstract labour embodied within it, in other words socially necessary labour time. With abstract labour as the property or characteristic common to all traded commodities and the measure of exchange value it is, therefore, also the essential money commodity.

The significance of this finding that all commodities bearing exchange value embody abstract social labour is not simply to assist in the purely accounting task of price estimation, but to understand that all commodities are the bearers of social relations of production between commodity producers. Within bourgeois society the direct producers of commodities are increasingly detached from their exchange forum, the market place. Consequently the social relations of production between producers are represented as social relations between products. The commodity takes on a social form and thus gains a relative 'independence' from its producer. It becomes reified and hence both mystifies and dominates its producer. The phenomena of commodity fetishism is no illusion, rather its form is real, but it obscures the underlying relationship between commodity producers such that they are expressed as material relations between labour and social relations between commodities. The producers of commodities for exchange do not perceive their products as social objective forms embodying general labour but rather as having mystical and sensuous characteristics, consequently the social aspect of labour is shrouded from their view. This is the 'natural' outcome when commodities are transformed into exchange values. In the contradictory nature of capitalist production

> It was solely the analysis of the prices of commodities which led to the determination of the magnitude of value, and solely the common expression of all commodities in money which led to the establishment of their character as values. It is however precisely this finished form of the world of commodities—the money form—which conceals the social character of private labour and the social relations between the individual workers, by making those relations appear as relations between material objects, instead of revealing them plainly (Marx, 1976; pp 168-69).

The consequence of this for commodity producers is that "their own movement within society has for them the the form of a movement made by things, and these things far from being under their control, in fact control them" (Marx, 1976; pp 167-68).

Thus we arrive at what may be called the 'ethical imperative' of historical materialist study, praxis. The lifting of the veil of false consciousness, which shrouds the minds of direct commodity producers through the fetishism of commodities, is the political imperative to which Marx directs us.

Roemer argues that the superiority of the property rights approach lies in its explicit statement of the ethical imperatives of historical materialist study by positing 'feasible alternatives' to exploitations within a given mode of production. While it is undoubtedly true that the labour theory of value is of use to us purely for the purpose of analysing the capitalist mode of production and no other; yet it is within the labour theory of value that the 'ethical imperatives' lie. If, as Roemer argues, our taks is to explain and direct class struggle, the only fashion by which this can be done is by understanding the process of valorisation. Labour creates surplus value, capital utilised in the productive process can itself be reduced to embodied dead labour, the labour of a previous production process. It is by way of this method that we can understand the history of capital accumulation. The labour theory of value, by explaining the process of surplus value creation at the point of production, i e, within the labour process, brings to us the proof of the existence of capitalist exploitation. The false consciousness that arises through commodity fetishism, i e, the domination and mystification of the producers by the product in commodity exchange leads naturally to the imperative of political action in raising the veil from the true and contradictory nature of capitalist production.

The beauty of the labour theory of value is that it provides the links between commodity exchange, the labour process and capitalist exploitation. By encapsulating all three within one unified structure, Marx is able to put forward the true 'ethical imperative' of political action. Elson summarises it as follows:

> What Marx's theory of value does is provide a basis for showing a link between money relations [commodity exchange] and labour process relations in the process of exploitation. The process of exploitation is actually a unity . . . Neither money relations nor labour process relations in themselves constitute capitalist exploitation; and neither one can be changed very much without accompanying changes in the other. Marx's theory of value is able to show this unity of money and labour process because it does not pose production and circulation as two separate, discretely distinct spheres, does not pose value and price as discretely distinct variables . . . The key to understanding this contradictory process [of capitalist exploitation] is that although money relations and labour process are aspects of the same unity, internally dependent on other, they are nevertheless relatively autonomous from one another. In that relative autonomy lie the seed of potential crisis. This is important politically, not because such a crisis in itself constitutes the breakdown of capitalism—it clearly does not—but because it indicates a potential space for political action (Elson, 1979, pp 172-73).

This is the true 'ethical imperative' of dialectical historical materialism, not Roemer's 'alternatively feasible states'. In rejecting the labour theory of value Roemer rejects the Marxian method. Consequently his anslysis of the capitalist mode which can only be applied at the level of circulation, concerns itself solely with superficial phenomena and fails to grasp the inner content of generalised commodity production.

## V

## Conclusion

John Roemer's property rights model of exploitation is undoubtedly unique; nevertheless, as we have shown in our discussion on the labour theory of value, it is devoid of a crucial aspect of Marxian political economy, namely, an explanation of social relations of production between commodity producers as embodied within the commodity form.

His failure to grasp the dialectical method reflects his concern with the superficial aspects of economic modelling, consequently the essence of commodity production escapes him. Roemer's attempt at putting forward a taxonomy of exploitation which incorporates feudal and socialist exploitation with capitalist exploitation within a single, highly technical, model has been described by some commentators as a 'tour de force' (a reflection possibly of the mathematical fetishism that such commentators suffer from). It is certainly laudatory that Roemer has attempted to tackle the thorny question of the nature of the socialist mode of production. As we are all fully aware, socialist societies are presently undergoing a crisis of immense proportions. A crisis of the legitimacy of the state and the crisis of alienation in the workplace. The sole attempt by a socialist state to comprehensively deal with such crisis, namely, the Chinese Cultural Revolution, is under ridicule. Marxists have to focus their thoughts on these questions, for it is only by presenting a clear picture of the socialist mode can they muster the progressive forces for political action against the capitalist mode of production and its resultant form of social relations. In order to do so one needs the labour theory of value.

It is far from being iconoclastic to suggest that if there is a central concept within the Marxian method, it lies within the labour theory of value. Without it there cannot be a Marxian analysis of bourgeois economy nor an understanding of the political imperative facing those who desire to change such societies. Roemer cannot have it both ways, rejecting the labour theory of value and still proclaiming himself as a concerned Marxist.

The question then that has to be faced is where does Roemer really lie. We have argued that his analysis cannot be seen as Marxist; nor, despite the extensive use of general equilibrium models, can it be considered as neo-classical. His concern with the apparent, phenomenal, form of economic relations, his failure to recognise abstract labour as the common denominator of all commodities and his arguments on price preceding value would suggest that Roemer's true company lies amongst the neo-Ricardians who occupy the expansive and ill-defined grey area separating the polar camps of the Marxists and the neo-classicals.

# Sizing Up the Black Economy
## Some Issues Raised by the NIPFP Methodology

**Arun Kumar**

*The method used by the National Institute of Public Finance and Policy in its report "Aspects of the Black Economy in India" to obtain the size of the black economy, while representing a major new effort, promises far more than it delivers and a reliable and accurate method of estimating the size of the black economy still remains elusive.*

*The questions raised by the NIPFP's estimate of the size of the black economy are definitional and methodological.*

THE National Institute of Public Finance and Policy (NIPFP) reports that, "For 1980-81, our calculations indicated black income generation in the sectors covered could be placed in the range of 18-21 per cent of GDP" (NIPFP, 1985: 432). It is further assumed that, "the same percentage of GDP were generated as black incomes in those sectors in 1983-84 . . .". On this basis, it is then stated that, "A total black income generation of Rs 36,786 crore or in round numbers Rs 37,000 crore out of a total GDP of factor cost of Rs 1,73,420 crore seems to be on the high side, although it turns out to be less than 30 per cent of GDP as against some extravagant estimates placing it at 50 or even 100 per cent of GDP" (p 434).

These statements suggest two things. First, that a certain degree of confidence can be attached to the range of 18-21 per cent of GDP for the size of the black economy in India. This is in contrast to statements made at other points that what is presented is "a rough estimate of black income generated in India" (Preface). One may also note that not only are the various components of the estimate given 'guesstimates' (see pp 166 to 168) but it is clearly stated that, "our basic, official NAS-based estimates of tax-evaded income are, very probably, quite conservative" (p 175) and further, "for lack of sufficient data, we have been forced to adopt in some cases, what may be called the minimum estimate approach" (p 409).

In effect, the accuracy that the final estimate claims is not borne out by the assumptions used in the calculations. Thus, the obvious question in the reader's mind is what is the degree of reliability of the now widely quoted figure of Rs 37,000 crore or of the estimate of 18-21 per cent of GDP.

Secondly, there is also an attempt to compare the estimate obtained by the fiscal method used in the report with alternative figures arrived at by using other methods (specifically, the monetarist approach yielding the approximate figure of 50 per cent). The question arises, are the definitions of black incomes used in the different approaches the same, i e, could we be comparing oranges and apples by comparing the different estimates?

In a nutshell, the questions raised by the NIPFP estimate of the size of the black economy in India are definitional and methodological. On both these grounds, the study raises more questions than it provides answers to. Thus, instead of the hoped for clarity on the subject, greater confusion is likely to be the outcome, in spite of the enormous effort that has gone into the exercise.

## I

The NIPFP estimate bases itself on the definition that black incomes are those "incomes which are taxable but are not reported to the tax authorities" (p 10). This is a definition in which a tax man is interested.[1] The definition does not discriminate between whether the economic activity in which the black income is generated is legal or illegal. However, the definition leaves out all incomes which may be illegally generated but lie below the taxable limit.

The definition is also unconcerned with issues of whether the national accounts total is underestimated either on account of deficiency of data or due to tax evasion itself or that capital gains and certain transfers that take place between individuals (bribes and pay-offs) are not included in the national income total.

The monetarist approach generally used tries to identify all transactions where cash is used either with the object of evading taxes or where some illegality is involved. The incomes associated with these transactions are assumed to be black incomes. Thus, all incomes (including those below the taxable limit) which are not a part of the white economy are treated as black. Further, since the white economy is taken to be the accounted national income, the portion of national income not accounted for by deficiency of data and methodology also becomes black.

In the fiscal approach, these last two elements are excluded. Only incomes above the taxable limit are involved. Also, the national accounts total as measured is used as the controlling total. No accurate estimate of the missing total on account of deficiency of data and methodology can be made. Further, apart from a guesstimate, no accurate estimate is possible of underestimation of national income on account of under-reporting of output for tax related reasons.

Thus, *a priori*, one may expect that the estimate of black incomes based on the monetarist approach would be higher than the one obtained from the fiscal approach.[2] The monetarist measure would be higher by the extent of black incomes below the taxable limit and the underestimation of national incomes both due to methodological and data deficiency problems as also under-reporting for tax related purposes.[3]

The NIPFP methodology attempts to incorporate the last element through a guesstimate but only to the extent that incomes are above the taxable limit. Thus, the NIPFP estimate is not directly comparable to the estimate given by the monetarists.

This is a fairly simple proposition. What is far less clear is what exactly does the NIPFP methodology include? There are two kinds of estimates that are given. The first, presented in Chapter V and claiming a fair degree of rigour, tries to estimate the black incomes generated in current legal activities only, excluding capital gains on sale of assets. There is another total, given in Chapter XII, called the 'global estimate'. It is an amalgam of the first estimate and various other guesstimates.

The guesstimates include undeclared capital gains on the sale of immovable assets, black incomes generated in exports, imports, fixed capital formation in the private corporate sector and public sector, smuggling of gold, and finally, import licences and imported goods. A number of problems arise here.

The most obvious and one which is theoretically intractable is that of adding stocks and flows. Undervaluation of immovable property has been taken to be the black income generated in the sale of these assets. This is not correct since only the increment in the undervaluation (the difference between the present and the previous transaction) can be taken as the undisclosed capital gain. This is the black income which accrues in that year. It may be noted, this issue is in addition to the as yet unresolved problem of whether or not capital gains ought to be included in national income accounts, and, if so, in what form?

The treatment of undervaluation of immovable properties as black incomes is also not consistent with the definitions of black income used (NIPFP, 1985: 10). There are two reasons for arguing this. First, as pointed out above, undervaluation of immovable property is not the income that ought to have been reported to the tax authority but was not. The black costs need to be subtracted first. Second, various deductions are available on capital gains and to be consistent with the methodology in Chapter V, these need to be taken into account. Some of these allowed deductions can go upto 100 per cent of the capital gains.

The only redeeming feature of the formulation is that the income tax department would treat the entire undervaluation, if discovered, as undisclosed income for that year. Thus, the total as calculated may be of interest to the income tax department. However, theoretically, as pointed out above, the NIPFP total for black incomes is neither definitionally consistent nor a dimensionally homogeneous total. In addition to these theoretical problems, there are errors in the calculation of the capital gains itself and we take them up below.

The global estimate also suffers from the problem of degree of reliability that can be placed on the final figures given. For instance, if it was assumed, following the data collected for Delhi, that only 50 per cent of the value of documents registered in Book I (the register so designated for the compulsory registration of certain documents pertaining to the transfer of immovable property under the Indian Registration Act, 1908) corresponds to the sale of immovable property, the black income estimates would have come down substantially (50 per cent). However, if following the analysis of lower value property in the Delhi data, it was assumed that the black to white ratio is 2:1 and not 2:3 (as assumed in the Report, p 414), the black income total would have gone up by 300 per cent. Thus, the final figure for 1975-76 could decrease by Rs 1,100 or go up by Rs 4,500 crore. The uncertainty amounts to about 8.5 per cent of the GDP at factor cost for that year. It may be made clear that these variations are in addition to the necessary corrections, mentioned above, for allowed deductions.

The above example only suggests that the various guesstimates in the global estimate are subject to wide fluctuations. Also, when compared with the methodology adopted in Chapter V, the degree of precision attempted for the guesstimates is of a very different order of magnitude. Thus, the accuracy aimed at in Chapter V is nullified. For instance, for 1975-76, the fiscal approach yields, with considerable accuracy, a total for black income generation in legal activities of Rs 3,741 crore. To this is added a figure of Rs 3,318 crore, a guesstimate on account of possible underestimation of official GDP. Another Rs 900 crore is added for illegal transfers from public expenditure (p 167). In the global estimate for 1975-76, guesstimates add upto Rs 6,200 crore, 170 per cent of the accurately arrived at figure (p 431). Thus, guesstimates dominate both for the fiscal approach estimate of black incomes generated in legal current economic activities and in the global estimate. Hence, it is the uncertainty associated with the guesstimates which would characterise the reported estimates of black incomes generated.

However, this in itself may still not be entirely objectionable. The more important drawback of the whole exercise is that it is unclear as to what are the various components of black incomes which get included in the fiscal approach used in Chapter V. In other words if one does not know whether some of the sectors of the economy are getting excluded or not then one would not be able to identify and add the missing elements alone and may end up double counting some of the components. This point is discussed below in some detail.

## II

The methodology used in the fiscal approach (pp 96-98) depends on the NCAER (1980) to provide a distribution of personal incomes for the year 1975-76. Assuming that the distribution represents the true income distribution, it is applied to the personal income total based on National Accounts Statistics (NAS). From this, using various other assumptions, the total taxable incomes are calculated. (See Appendix I of this paper for the steps used in the methodology.)

Three points arise here. First, for the NCAER data to yield the *true* income distribution in the country, households are required to report accurately their incomes, i e, their black incomes in addition to the white incomes. If black incomes are not reported by sample households, i e, only those incomes are reported which are also reported to tax authorities then the taxable incomes total calculated from the NAS should be *no* different from the total reported by the income tax department and the method should yield *zero* black income generation in the country. If black incomes are not reported by the sample households and the methodology yields a certain amount of black income generation, it may simply be the result of the assumptions made. It may be mentioned that the NCAER survey was in any case biased in favour of higher income households (NCAER, 1980: 46).

Second, working on the assumption that black incomes are also reported by sample households so that the resulting income distribution is the *true* income distribution in the country, we can argue that black incomes from illegal activities must also be reported. Black incomes from legal activity are as illegal as those from illegal activities. Since many of the illegal activities are a part of business activities (like smuggling, under- and over-invoicing of exports and imports, and bootlegging) or of other activities for which the NCAER survey sought information (like, bribes and cuts received during one's legal work or activity for which one is paid a salary or a wage), incomes from many of the illegal activities *may* have been captured in the NCAER survey.

Finally, if the NCAER sample is representative and the households report their correct incomes, the total of personal incomes from the NCAER data should at least be equal to the total of personal incomes obtained from NAS. In fact, the total should be larger for two reasons. First, for many of the sectors NAS estimates depend on tax-related data and, therefore, would be underestimated. Secondly, due to data and methodological deficiencies in the case of certain sectors, the NAS total would be expected to be short of the actual.

The implication of the above is that the personal income total from the NCAER data should be much higher than that obtained from NAS. Instead, what is observed is that higher than the NCAER total. This, in spite of the fact that the population total and its distribution between the urban and rural households is consistent with those of the 1971 and 1981 Census (p 133). In other words, a substantial portion of the household incomes are being missed out of the NCAER sample. Thus, it is unclear as to how the NCAER sample can be taken to yield the *true* distribution of personal incomes in the country.

The Report tries to argue that reporting is never satisfactory in household surveys (p 114). If this is the case then the NCAER-obtained distribution cannot be satisfactorily used. Further, much of NAS is also based on surveys of various kinds (India, 1980) and should also show the same kind of bias. Finally, much of the NAS estimation is based on surveys conducted 10 to 15 years back. It is often argued that this would bias downwards the NAS total. In contrast, the NCAER survey is less old and ought to reflect more accurately the underlying data. In other words, the lower total from the NCAER sample is probably due to reasons other than its being a household survey where there is a lack of complete reporting.

If it is argued that the NCAER data only gives the true distribution of personal incomes in the country without necessarily matching the income total, then it is not clear why the distribution is not applied straightaway to the NAS total. What is the necessity to match the NCAER total of personal incomes with that of NAS by 'scaling up' the distribution? Quite clearly, the NIPFP methodology accepts that the NCAER sample not only yields a distribution but an absolute total of personal incomes which at least ought to match the NAS total before the underlying distribution can be used. Once this is accepted, it follows that the assumption must have been made that the NCAER data yields the correct distribution of personal incomes. If this is accepted, it must follow that black incomes, whether from legal or illegal activities are assumed to have been reported to the NCAER survey.

Two things then follow. The NCAER total must turn out to be greater than the NAS total and incomes from illegal activities cannot be separately added. The NIPFP estimate errs on both these counts.

The bias in the NCAER survey which yields a lower total for personal income than the NAS estimate needs to be investigated and pinpointed before the NCAER distribution can be accepted as a true representation of the underlying data.

A possible indication of the existence of a bias is that in the NAS data the share of the sector agriculture, forestry and logging and fishing was 47.5 per cent in 1970-71 and 37.3 per cent in 1980-81 (p 584). According to the NCAER sample, the contribution of these sectors in 1975-76 would work out to 46.5 per cent (p 129) as opposed to the figure of 41.5 per cent for 1975-76 from NAS (India, 1982). One would have expected that this percentage in official statistics would turn out to be higher than the actual, given that agricultural incomes with no direct taxes to pay ought to be fully reported while other sectors would tend to under-report.[4] Further, it is the tertiary sector which has been growing the fastest and according to most observers the most underestimated in NAS. Thus, in any *true* distribution of national income, agricultural sector ought to have a much smaller weight than in NAS.

To give an example of why it is essential to first know the nature of the bias in the NCAER based distribution before applying the 'scaling up' factor, one only needs to consider who are the tax-evaders and what kind of under-reporting they would resort to. Analysis of income tax data shows the likelihood of a large number of evaders manipulating their incomes in such a manner as to not enter the tax net at all. In other words, many high income earners either do not file returns or show incomes which fall below the exemption limit [see Kumar (1985) for related data].

Most of these people are non-salary and wage earners since the scope for manipulation of incomes is far less for salary and wage earners. Thus, an equiproportionate adjustment (p 119) across all income classes would not capture the kind of under-reporting that may be the cause of the discrepancy between the NCAER and the NAS based totals of personal incomes. A large number of salary earners would find themselves moving into higher income brackets, where they would not really belong. This would also alter the amount of deductions that could be claimed. Clearly, the total for black incomes estimated on the basis of equiproportionate adjustment would be the result of the assumptions made and not related to the process of black income generation.

## III

The principal technical problem (as opposed to the above discussed methodological drawbacks) which arises is that which occurs in going from household income distribution to individual earner distribution and then 'scaling up' to account for missing incomes. In fact, the resolution of this problem *could* reduce to *near zero* the estimated size of the black income generation from current legal activities as expected (and pointed out earlier) in case reporting of data to the NCAER survey is the same as to tax authorities.

The error may be easily noted if one analyses the corrected (for under-reporting) estimated distribution of gross personal income (p 123) and the estimated distribution of the number of earners by income ranges for earners (p 547). One finds that incomes per earner in the high income groups are grossly overestimated. Actually, as the Table shows, the average income per earner in the range Rs 40,001 to Rs 60,000 turns out to be Rs 1,71,087 and in the range Rs 7,501 to Rs 10,000 turns out to be Rs 15,699, etc.

Not only are these figures inflated but they also do not lie in the correct income ranges. Thus, on the one hand, the calculation of deductions have been wrongly done while on the other hand, the taxable income has been incorrectly estimated both because the exemption limit is incorrectly applied and also because the incomes in the higher income brackets are over stated.

The equiproportionate blowing up of incomes adopted in the Report to adjust for missing incomes causes the incomes to shift out of the income ranges to which they originally belonged. For example, if in the income class Rs 15,001 to Rs 20,000 the average income per earner was even Rs 15,001, the new income per earner would be around Rs 21,000 and would no more lie in this income range. This shift of incomes across income ranges has neither been commented upon in the methodology nor seems to have been taken into account for calculating the deductions and applying the exemption limits. Thus, various errors are likely to result.

Let us now consider certain other issues related to the detailed calculations. They give the impression that there are not only *ad hoc* assumptions but that, in places, the knowledge of the functioning of the black economy has not been fully utilised.

TABLE: AVERAGE PER EARNER INCOME FOR SELECT INCOME RANGES IN NIPFP OBTAINED DISTRIBUTION

| Income Range for Earners (Rs) | Number of Earners (Millions) | Gross Personal Income (All-India) Case 1 (U:R = 1:2) (Rs Millions) | Average Income Per Earner (Rs) | |
|---|---|---|---|---|
| | | | Scaled-up Distributions | Unscaled Distribution |
| 1 | 2 | 3 | 4 | 5 |
| -1,200 | 60.4616 | 30,941.0 | 512 | 823 |
| 3,601-4,800 | 12.6835 | 77,434.6 | 6,105 | 4,121 |
| 7,501-10,000 | 4.0188 | 63,093.2 | 15,699 | 6,102 |
| 20,001-25,000 | 0.4288 | 16,861.9 | 39,300 | 22,348 |
| 30,000-40,000 | 0.0756 | 10,577.3 | 1,39,911 | 34,304 |
| 40,001-60,000 | 0.0436 | 7,459.4 | 1,71,087 | 47,252 |
| 60,001 and above | 0.0306 | 21,289.9 | 6,95,752 | 84,775 |
| Total | 177.3243 | 645,030.0 | 3,638 | 2,543 |

*Sources:* Column 2: NIPFP, 1985, p 547.
Column 3: NIPFP, 1985, p 123.
Column 4: Column 3/column 2.
Column 5: Calculated from NIPFP, 1985, pp 131-132 and column 2.

For instance, the 'missing income' has been split up between urban and rural earners in the ratio 1:2, 1:1.5 and 1:1 to represent three different scenarios (pp 117-124). This is a rather mechanical use of data. Should it not be the case that, as argued earlier, the value added from agriculture in NAS is unlikely to be under-reported,[4] so that we have a fairly accurate controlling total which could provide the 'scaling up' factor?

Similarly, the validity of the *derived* earner-wise distribution is claimed on the basis that it resembles closely the 'raw NCAER data'. However, it is well known that high income households tend to split up their incomes for purposes of tax planning (as opposed to evasion). Thus, household incomes are likely to be far more skewed than earner-wise distributions. This is also true of the NIPFP methodology even though the report does not point this out. However, from this one cannot conclude the validity of the procedure as the expected difference in the degree of skewedness has not been derived.

In going from household distribution to earner-wise distribution, it is assumed that each earner in a multi-earner household has the same income. No doubt this is a simplifying assumption; however, it would cause the income distribution to be less skewed than it should actually be. The NCAER recognises that in a multi-earner household there is a major earner (NCAER, 1980: 95). It is clear that if incomes are equally divided between all earners of a household, there would be less earners than the actual number in the high income categories. Similarly, the minor earners who should have gone lower down in the distribution move up. Thus, the procedure would tend to distort the distribution both at high and low income ranges by weighing the distribution in favour of the middle ranges. However, it is clear that equal sub-division would lead to a reduction in the net taxable incomes and the tax payable.[5]

The issue of how various deductions are to be subtracted from the gross income (pp 133-148) also needs a more careful scrutiny. Take, for example, agricultural incomes. Some households will have agriculture as their source of income while others will not. This will actually make many earners fall below the taxable limit and after the distribution of taxable incomes as compared to the case where the deductions are applied on the average to each tax slab (pp 135-140) leaving the distribution unchanged. Application of each deduction is specific to certain kind of incomes and alters the distribution of taxable income earners. Thus, the method of treating deductions would raise the total of taxable incomes.

The taxable incomes for 1980-81 are calculated from the 1975-76 data on distribution of incomes under certain assumptions regarding unchanged distribution of incomes between the rural and urban areas, across income classes and between the various sectors. This, in spite of the knowledge that the share of agriculture has declined substantially during the period. Use of agricultural incomes as a more reliable 'controlling total' may have obviated the need for some of the assumptions.

Correction for possible underestimation of GDP on account of evasion apart from being *ad hoc* and a guesstimate seems also to pose a methodological problem. It is assumed that either three-quarter or half of such 'omitted GDP' accrues to earners in the form of taxable incomes (p 164). This is in contrast to the situation where taxable incomes as a percentage of the GDP turn out to be roughly 10 per cent (p 154). Thus, the GDP and the 'omitted GDP' clearly have very different distributions and if the former is distributed log normally, the latter would not show this characteristics. The totality of all incomes would then also deviate from log normal.

Thus, the NCAER-based distribution treated in some sense as the correct distribution of national income gets distorted. The distribution that results from *ad hoc* assumptions about 'controlling totals', 'omitted GDP' and 'unchanged distribution' between 1975-76 and 1980-81 can lead to an arbitrariness in the estimated amount of black income generation.

## IV

As already argued, if the NCAER-based distribution is the true distribution, it must be so inclusive of illegal incomes and portions of undeclared capital gains which get included in business income. Thus, by adding these once again to arrive at the global estimate (pp 412-434) one may be double counting.

Additionally, various errors have crept in in the calculation of undeclared capital gains. Some of them have already been pointed out in Section I, like, the percentage of documents to be treated as constituting sales and the ratio of white to black. Further, by ignoring power of attorney transactions and sales of flats, a few hundred crores of black income generation is missed out.

One may conclude by saying that the estimate of black incomes generated in India, obtained by NIPFP, faces a major methodological problem related to the correctness of the NCAER-based distribution of personal incomes. If the distribution is broadly speaking correct, black incomes, including illegal incomes must have been reported and the absolute total of incomes from the NCAER sample must be larger than the NAS-based total of personal income. If the distribution is not representative of the true distribution, then the black incomes total estimated is a function of the assumptions made. Detailed alternate calculations using the NIPFP methodology may actually show that no black incomes are generated through legal activities. In this case, the nature of the bias in the NCAER sample needs to be explored more fully before any calculations are attempted.

In the second case, the estimate begins to approximate a guesstimate whose accuracy and reliability would be far less than claimed in the report. In any case, the magnitude of the various guesstimates (for black incomes generated in real estate, public expenditures, illegal activities, etc) added to the more 'scientifically' derived estimate to obtain the global total overwhelm the latter so that the reliability of the final total is that of the guesstimates. As shown with the example presented from real estate, depending on the assumptions, the variation from one source alone may be eight per cent of the GDP. The 'scientifically derived' estimate of black incomes generated in legal current activities itself is susceptible to far greater uncertainty than is admitted by the report.

Thus, it appears that the method used by NIPFP to obtain the size of the black economy while representing a major new effort promises far more than it delivers. As such, a reliable and accurate method for estimating the size of the black economy still eludes one.

## Appendix

The principal steps used by NIPFP to estimate the size of black incomes generated in India (NIPFP, 1985: 96-98):

(i) The official National Accounts Statistics (NAS) are used as a starting point to derive an estimate of gross personal income accruing to households.

(ii) For essentially the same concept, namely, gross personal incomes, the all-India survey of household incomes for 1975-76 by the National Council of Applied Economic Research (NCAER) provides estimates of the distribution of incomes, separately for urban and rural *households* (NCAER, 1980). These distributions by *household* are converted to distributions by *earner* on the basis of certain assumptions. To facilitate further computations the actual distributions are then approximated by normal distributions.

(iii) The total gross personal income estimated by the NCAER survey falls substantially below the corresponding estimate in the NAS. We treat the NAS total as the controlling one and 'scale-up' the NCAER-based distributions according to several alternative assumptions.

(iv) The log-normal, earner-wise distributions of income, so obtained, constitute our key analytical tools. Working with these distributions we proceed to make allowances for the major exclusions, exemptions and deductions permitted under the Income-Tax Act. This is done separately for the urban and rural distributions, with due allowance for different components of income (salary, business, etc). The result of these labours yields estimates under alternative assumptions, of the total income which should have been declared for income-tax assessment.

(v) These estimated totals are then compared with the information from the AIITS (suitably adjusted for under-coverage) about the total of non-corporate incomes *actually* assessed to tax. The discrepancies yield alternative estimates of black income under the fiscal approach.

(vi) The results obtained for 1975-76 are extrapolated to 1980-81 on the basis of a number of assumptions and some more recent information.

(vii) Thus far the analysis is predicated on the assumption that the gross personal household income is correct. Next we relax this assumption and explore the consequences of some alternative assumptions regarding the extent to which the NAS estimates may be biased downwards because of tax evasion and related factors.

(viii) The entire analysis is subject to a large number of qualifications and shortcomings. In each case we offer a judgment about the direction of resulting bias in our estimates of black income.

## Notes

1 Another definition, economically more meaningful, is also given (p 12).

2 Assuming of course that the difficulties associated with the monetarist's estimate, namely, the identification of the base year and the velocity of circulation can be taken care of satisfactorily. Further, the underestimation of the size of the accounted economy also creates its own complications.

3 For a more detailed discussion of the various definitions of black incomes and which elements are included or excluded, see Kumar (1984) and Kumar (1985).

4 Value added in agriculture, in fact, does not depend directly on reporting of incomes. It is estimated on the basis of various surveys and crop-cutting experiments (India, 1980).

5 For many of the minor earners where deductions ought not to be applicable because in actuality their incomes are below the taxable limit, deductions would be applicable in the NIPFP methodology. Further, in the taxable brackets as *net* assessed incomes rise, average deductions claimed rise in absolute amounts but fall as a percentage of the income; thus, deductions would be over-estimated if incomes are biased downwards. Finally, incomes of some major earners which should have been above the exemption limit fall below it due to equal sub-division. In these cases, the deductions would not be applied. However, in the multi-earner households, the number of minor earners would be much larger than the number of major earners hence more incomes would go up than come down. Thus, deductions are likely to be over-estimated and *net* taxable incomes and tax payable underestimated. Tax payable would also be underestimated because of the progressive nature of income taxation.

# Theory of Pricing in Socialist Countries

**B Debroy**

THE theory of pricing in socialist countries is an important enough area and any contribution towards understanding price formation in these countries would normally have been welcome. Unfortunately, the intention of Jaya Mehta's recent paper is not at all clear.[1] It cannot be taken as a description of methods of price formation in the socialist countries, since no such description is attempted. It cannot be taken to be a survey of the literature on pricing in socialist countries, since an inadequate familiarity with the literature is exhibited. There is no reference to Bettelheim's excellent survey of the debate on pricing in socialist countries, nor to Tarnovsky's illuminating account of actual methods of price formation in the CMEA countries.[2] Nor can the paper be regarded as a theoretical study which brings together under an integrated framework the different systems of pricing adopted and discussed in the socialist countries. One looks for such an integrated framework in vain.

Five different systems of pricing are mentioned and inadequately discussed in the paper—the dual price system, a price system based on values, the production price system, the two-channel price system and the shadow price approach of Nemchinov, Novozhilov, Kornai, *et al*. Strangely enough, Kornai is not even mentioned in the paper. These five systems of pricing are never contrasted with one another, their differences are not made explicit, nor are the problems associated with each price system discussed specifically. What we have instead is a welter of symbols and equations which do little to further our understanding.

Consider, for example, the dual price school which Mehta refers to as the approach of "the traditional economists". This school advocated the computation of prices on the basis of socially necessary costs augmented by a profit margin. Socially necessary costs consist of average direct and indirect labour costs. This approach thus differed from a pricing system based on values in that surplus value was not included, except through the profit margin. In actual practice, the dual price system boiled down to a pricing system based on the own cost of production or what Ganczer calls the averaged value-type price system.[3] The problems associated with this system of pricing, abundantly discussed in the literature, do not receive even a cursory mention from Mehta. For example, it does not seem to be realised that a price system based on average labour costs runs into serious problems if one takes into account the time structure of production. The dual price system also suffers from the obvious disadvantage that the scarcity value of factors of production should ideally be determined by marginal costs rather than by average costs. One also fails to understand why Turetsky and Maizenberg are mentioned in connection with the dual price school, but Mstislavsky is not. Similarly, under the value school, Strumilin and Kronrod are mentioned, but Bor and Kondrashev are not. Nor is it made clear that the value school advocated that surplus value was to be added at every stage of the production process. Herein lies the essential difference with the averaged value-type price system. Nor is it made clear that a crucial assumption was required before the price of any commodity could be obtained under the value approach. This required that the share of the surplus was proportional to labour costs. Mehta does not seem to realise that with differing capital/labour ratios, the value price school would have to face the important problem of differing profit rates in different sectors. Under the production price school, Scherbakov's name is not mentioned, nor is there any reference to the interesting arguments of Bachurin and Kulikov, even in passing. Bachurin and Kulikov argued that in obtaining prices for natural resources, differential rents should be included in addition to interest. Montias has made the point that if quasi-rents are included, the production price system is tantamount to a system of pricing based on marginal costs.[4] The paper makes no mention of another issue that was regarded as crucial by several socialist authors writing on the pricing debate. This relates to the question of circularity or the simultaneous determination of costs and prices. It is not that costs determine prices. The causal relationship runs both ways, since costs are money costs and wages cannot be determined independently of prices. The computational burdens of simultaneously determining costs and prices can be quite severe. Empirically, it is also interesting to know by how much prices based on values would differ from prices based on production prices, and by how much they would differ from prices then prevailing. Such figures are not given by Mehta although they are readily available.[5]

The upshot is that an original and integrated framework which might have made up for the lack of familiarity with the literature is missing. As such, the paper remains a maze of equations for the value school, the production price school, etc, all equations which have been reproduced a countless number of times in the literature. The only section which is purportedly novel is the section on price bases and production structure. An objection to this section is that an adequate acknowledgement to the literature has not been made. There are two references to Brody's book.[6] There is however nothing to indicate that all of the section on price bases and production structure is reproduced verbatim from pages 20-25, 29-30, 35-37, 45-46 and 81 of Brody's book, with mathematical symbols changed now and then. An example is in order. Without quotes, the paper states, "While $a_{ij}$ stands for the amount of product i used up to produce one unit of product j, $b_{ij}$ stands for the amount of product i tied up in the same process." On page 35 of Brody's book we find, "While $a_{ik}$ stands for the amount of product i used up to produce one unit of product k, let $b_{ik}$ stand for the amount of product i tied up in the same process." There are also minor inaccuracies, which a careful reading of Brody's book should have avoided. 'a' cannot be the row vector of direct labour coefficients; it has to be the row vector of direct manhour coefficients. It has to be the latter rather than the more general former to ensure consistency. In the two-channel price system, Esze and Nagy advocate prices with a mark-up on cost, with the mark-up being partly proportional to fixed capital and partly to wages. The paper seems to suggest that the mark-up is fully proportional to fixed capital and to wages. The obsession with Brody also probably explains the lack of any reference to the transformation problem, although Seton's paper is included in the bibliography. To what avail is never quite clear. It must be pointed out that whatever be the importance of the transformation problem from the theoretical point of view, and Brody would hold that it is not terribly important, Brody himself recognises the practical importance of the transformation problem in the process of computing prices from a value price system.

In discussing the current Hungarian reform, it is not made at all clear that the important point is not that the prices of traded goods should depend on world market prices, but that the prices of all goods, internationally traded or not, should depend on world market prices. The Hungarians have discussed at great length the problems of actually determining world market prices. No awareness is shown of this extensive literature.[7]

All of these objections contribute to our conviction that the paper adds nothing to our understanding of price formation in the socialist countries.

**Change is permanent**

**Change is the essence of growth, an edict of management.**

**And, in today's world, the choice before an organisation is not between 'change' and 'no change', but between managing the change and being managed by events.**

**Change, when consciously imposed from within, opens up new opportunities, new avenues of growth. Paradoxically, the process of change is, and has to be, permanent.**

**This is the philosophy behind the changing role of MMTC — from a mere canalising agency to an international trading house.**

Change, to MMTC, has meant putting its expertise in bulk buying and selling to larger purposes of national growth.

Like opening up global markets for India's small scale entrepreneurs. Adopting new strategies like Third country trading, Three-way trade, Joint ventures both in India and abroad, Equity participation abroad in sources of raw materials as well as in basic inputs.

Entering the arena of non-canalised items — ranging from importing PVC resins and mercury to exporting diamonds and graphite electrodes.

Improving customer service by decentralising operations, streamlining the distribution system and setting up Customer Service cells.

Reorienting the organisation to meet new challenges — through long-range planning, computerisation, systems reappraisal and organisation restructuring.

And this change already reflects in MMTC's performance. Non-canalised exports registered a fourfold increase in the first half of 1984-85, while the year's turnover is poised for a threefold rise. A record quantity of fertilisers was imported, at the right time, resulting in an all-time high foodgrain production and substantial savings in foreign exchange. Long-term contracts worth millions of dollars have been concluded for iron ore, exports. For the first time, a counter-trade deal has been finalised with Zimbabwe for importing Asbestos against the export of engineering goods — an important step towards diversification and growth.

All this has led to increased employment opportunities which now exceed half a million and generated a new industrial and economic prosperity.

Yes, change is permanent. A philosophy chiselled in the minds of everyone at MMTC, the cornerstone of its success.
